PART XXX

A taxonomic revision of the genus Orthopichonia

by G.J.A. Vonk

Department of Plant Taxonomy
Wageningen, Agricultural University, The Netherlands
Summary

The present publication is a monographic revision of the genus *Orthopichonia*, based on the examination of herbarium material and spirit collections.

The genus is exclusively African and counts six species. It belongs to the Landolphiinae to which a key will be published later.

History of the genus

The genus was first considered as sect. *Orthandra*, a section of *Clitandra* by Pichon (1948) who raised it later to the rank of genus, without realising that the name *Orthandra* was already used by Burret (1940) for a Tiliaceae genus. Pichon’s error was corrected by Huber (1962) who rebaptised it *Orthopichonia*.

Genus diagnosis

Map 1A

*Lianas* with copious white latex in all parts. Branchlets terete, often sulcate and angular when dried. *Leaves* opposite, petiolate; blade elliptic or oblong, sometimes obovate or ovate, cuneate at the base or decurrent into the petiole; short- or long-acuminate. *Inflorescences* usually axillary, sometimes terminal and then more or less tendril-like. Bracts persistent with collers on each side near the base. *Flowers* actinomorphic, fragrant. *Calyx* pale green, entire, imbricate in bud, erect, persistent, without collers; lobes subequal. *Corolla* mostly white; tube bottle-shaped, thin, not twisted, with indumentum interrupted behind the stamens; lobes in bud overlapping to the left, entire. *Stamens* included; anthers narrowly triangular, oblong, ovate or elliptic, acuminate or acute, sometimes apiculate at the sterile apex, rarely without sterile apex, cordate at the base, glabrous on both sides, introrse; connective widened at the back especially towards the base. *Pistil*: ovary hemi-inferior to superior, ovoid to obovoid, composed of two carpels, syncarpous, unilocular to imperfectly 2-celled; disk absent; style glabrous, cylindrical (not thickened at the apex); style and stigma persistent when the corolla is shed. Placentas two, parietal. *Fruit* of two completely united carpels, often subtended by the persistent calyx. *Seeds* often light to dark brown when dried, irregularly ellipsoid to bean-shaped, smooth; embryo 1 × (1-2) mm; cotyledons large, flat, ovate to elliptic, up to 18 mm long, cordate to slightly cuneate at the base, obtuse at the apex, with hard copious endosperm.

**Key to the species**

1. Corolla lobes in mature bud with an oblong and rounded head ............... 2
   Corolla lobes in mature bud with an attenuate and obtuse head ............... 3
2. Mature bud 7.5-13 mm; tube inside with a pilose belt, not interrupted above the stamens, throat pilose, 4.5-6.8 mm long ............... 1. *O. barteri*
   Mature bud 13.7-19 mm; tube inside with a pilose belt, glabrous above, throat glabrous or pilose, 9-15 mm long ............... 2. *O. cirrhosa*
3. Ovary densely pubescent, hairs curved; tube 4.7-6 mm long; at least young branches densely pubescent; petiole 11-22 mm long ............... 5. *O. seretii*
   Ovary more or less hirto-pubescent or glabrous; tube 6.5-14.4 mm long .... 4
4. Ovary densely hirto-pubescent; tube 12.5-14.4 mm long; corolla lobes 0.4-0.7 × as long as the tube; tube widest at 2.8-3.7 mm above the base; tube often pilose outside ........................................ 3. *O. indenicensis*
   Ovary glabrous or more or less hirto-pubescent; tube 6.5-12.4 mm long; corolla lobes 0.9-2.8 × as long as the tube ........................................ 5
5. Ovary glabrous; tube 6.5-9 mm long; corolla lobes 1.3-2.8 × as long as the tube; stamens 3.1-5.2 mm included; tube 3.5-7.2 × as long as the sepals ....... 4. *O. schweinfurthii*

MAP 2A. Orthopichonia barteri.

Ovary glabrous or, often partly, hirto-pubescent; tube 7.7-12.4 mm long; corolla lobes 0.9-1.3 × as long as the tube; stamens 5.3-9.5 mm included; tube 8.5-13.3 × as long as the sepals; tube widest at 2-2.8 mm above the base; branches more or less pubescent only at the nodes; petiole 5-12 mm long.

Clitandra kabulu De Wild., Not. Pl. Ut. Int. Congo II: 219 (1908), syn. nov. Type: Zaïre, Tshimbambange, A. Sapin s.n. (BR holo-).
Liana, up to at least 12 m long. Trunk up to 15 cm in diameter. Branches pale brown to dark brown with small lenticels, smooth; branchlets often densely pubescent at the nodes. Leaves: petiole 7-14 mm long, glabrous or only at the base sparsely pubescent; blade papyraceous when dried, glossy, elliptic or oblong, rarely ovate, 1.7-3 x as long as wide, 4-15.1 x 1.7-7.2 cm, acumen 5-15 mm long, with a rounded or truncate, sometimes obtuse point at the apex, cuneate at the base, glabrous on both sides, with 30-50 pairs of conspicuous secondary veins alternated by less conspicuous ones; tertiary venation inconspicuous above, reticulate beneath. Inflorescences axillary, often seemingly terminal, 1-4 together, sometimes rather lax, more often densely congested into a cluster of about 10-80 flowers, 12-35 x 12-35 mm. Peduncle 0.5-3 mm long; peduncle and main axis pubescent or sometimes glabrous. Pedicels 0.5-3 mm long, pubescent or glabrous. Bracts triangular, 0.7-1 x 0.7-1.3 mm, pubescent or glabrous on both sides, ciliate; colleters 1-2, 0.1-0.2 mm long. Sepals up to 0.3 mm connate at the base, triangular or ovate, sometimes suborbicular or elliptic, 0.8-1.6 x as long as wide, 0.7-1.3 x 0.6-1.2 mm, obtuse, acute or truncate, sometimes rounded at the apex, outside glabrous or sometimes minutely pubescent, more or less ciliate, inside glabrous. Corolla often with a green tube (sometimes tinged with pink), at lobes white, in the mature bud 7.5-13 mm long, forming an oblong head 0.35-0.51 of the bud-length, glabrous outside; tube 4.8-8 x as long as the sepals, 1.3-3.1 x as long as the lobes, 4.5-6.8 mm long, contracted at the base and there 0.5-0.8 mm, widened above and widest 1.9-2.9 mm above the base (0.32-0.56 of the tube) and there 0.7-1.4 mm, again contracted just above the anthers and there 0.3-0.7 mm wide, fairly abruptly widened at the throat, inside with a pilose belt from 0.8-1.7 mm above the base to the base of the lobes; lobes oblong or narrowly so, 0.3-1 x as long as the tube, 1.6-3.6 x as long as wide, 1.7-5.5 x 0.8-2.5 mm, rounded at the apex, often slightly involute at the left side, outside glabrous, more or less ciliate, inside sometimes sparsely pilose at the base. Stamens 2-4 mm included (0.44-0.57 of the tube-length), inserted 1.2-2.3 mm from the base of the tube (the base of the anthers being 1.8-2.8 mm above the base of the tube); filaments glabrous on both sides, 0.3-0.7 mm long; anthers 1.2-2.7 x as long as the filaments, narrowly triangular, narrowly ovate or narrowly elliptic, 2.5-4.5 x as long as wide, 0.5-0.9 x 0.2 mm, acuminate or acute, sometimes apiculate with an up to 0.15 mm long sterile apex. Pistil 1.4-2.3 mm long; ovary superior to inferior for one quarter, sub-globose, sometimes obovoid, 0.5-0.9 x 0.5-0.8 x 0.5-0.8 mm, glabrous, unilocular, abruptly narrowed into the style; style 0.5-1 x 0.1-0.2 mm; pistil head ovoid, sometimes cylindrical, 0.3-0.8 x 0.2-0.3 mm, split at the apex for 0.2 mm; apex of pistil 0.6-1.8 mm below apices of anthers. Placentas often much protruding, each with 10-40 ovules. Fruits with mango odour, yellow or orange, pear-shaped, sometimes globose, sometimes truncate at the apex, often bumpy, the surface minutely shallowly grooved, glabrous, with many lenticels, often subtended by the persistent calyx, 18-87 x 20-60 mm; pulp edible, acid. Seeds light to dark brown when dried, irregularly ellipsoid to bean-shaped, 10-16 x 8-13 x 6-10 mm; embryo 1 x 1 mm; cotyledons ovate to elliptic, up to 14 mm long, cordate to slightly cuneate at the base.
Geographical distribution: Tropical Africa from Ivory Coast to Zaïre.

Ecology: Tropical rain forests. Alt. 220-650 m. Flowering and fruiting throughout the year, flowering especially in the months June – February.

Geographical selection of the about 250 specimens examined:

IVORY COAST: Tai forest, de Namur 1427 (WAG); National Park Banco Forest, de Koning 4558 (WAG); Abidjan – Abosso, 43 km after Comoé Bridge, Breteler 5909 (WAG).

NIGERIA: BENDEl: Bénin, Chevalier 15133 (P); Sapoba, Kennedy 2322 (K, P); Asaba, Unwin 15 (K).

CAMEROUN: Bertoua, Breteler 2225 (BR, K, LISC, M, P, WAG); Ayos, de Wit 8126/104 (K, P, WAG); Bitye, Bates 1935 (BM, BR, MO, NY); Djoum, Letouzey 8358 (BR, K, P, WAG).

CENTRAL AFRICAN REPUBLIC: Boukoko, Tisserant 284 (BM, P, WAG).

GABON: Oveng, Louis et al. 523/83 (WAG); near Koumameyong, Reitsma et al. 3455/87 (WAG); near Makokou, Gentry 33311 (MO); 100 km S of Libreville, de Wilde et al. 858/83 (WAG); Minguembé, le Testu 8055 (BM, BR, LISC, P, WAG).

ZAIRE: EQUATEUR: Likimi, de Giorgi 1505 (BR); Dundusana, Moretehan 487 (BR); Bodala, Coulon 5 (BR); Eala, Staner 1437 (BR, C, K, MO, US); Befale, Dubois 773 (BR); Ingende, Evrad 6117 (BR); Bongoy (= Bongoie), Evrad 3192 (BR). HAUT-ZAIRE: Yangambi, Louis 12678 (BR, C, E, L, M, MO, NY, P, WAG); Itia, Jespersen 67 (BR). BAS-ZAIRE: Luki, Toussaint 309 (BR, K, P); Gimbi, Toussaint 498 (BR). KINSHASA: Menkao, Breyne 2974 (BR).

Type: Gabon, H. Soyaux 183 (M lecto-, designated here, BP, C, K, W isoleceto-).

Heterotypic synonyms: Clitandra batesii Wernh. in Journ. of Bot. 54: 227 (1916), syn. nov. Type: Cameroun, Bitye, G.L. Bates 701 (BM holo-, MO, Z iso-). Homotypic synonyms: Orthandra batesii (Wernh.) Pichon, op. cit. 224; Orthopichonia batesii (Wernh.) H. Huber, l.c.

Liana up to 35 m high climbing in trees. Branches grey-brown to purple, with small lenticels, smooth, minutely pubescent at the nodes; branchlets smooth. Leaves: petiole 4-14 mm long, glabrous, rarely pubescent above, glabrous or pubescent beneath, blade coriaceous when dried, smooth, elliptic or oblong, sometimes ovate or obovate, 1.6-3 × as long as wide, 5.4-18.2 × 2.4-8.9 cm, acumen 6-17 mm long, with a rounded or truncate point at the apex, cuneate at the base, glabrous on both sides, with midrib pale yellowish above, pale yel-
Figure 1A. (after Pichon) Orthopichonia barteri 1, flowering branch (× 2/3). O. cinhosa 2, flowering branch (× 2/3); 3, part of corolla inside (× 4); 4, pistil (× 10); 5, fruit (× 2/3). 1 from Chevalier 15133; 2-4 from Zenker 1628; 5 from Klaine 373 bis.
lowish-green or white below, with 21-44 pairs of conspicuous secondary veins alternated by less conspicuous ones (of the latter sometimes 2 between two conspicuous veins); tertiary venation reticulate. Inflorescences axillary, often seemingly terminal, 1 or 2 together, rather lax to rather congested, 5-14-flowered, up to 34 mm long, sometimes terminal and then more or less tendril-like, rather lax, 4-8-flowered, up to 29 mm long. Peduncle when inflorescences axillary up to 5 mm long, when terminal up to 14 mm long; peduncle and main axis glabrous or pubescent. Pedicels 1.5 mm long, glabrous or minutely pubescent. Bracts triangular, 0.5-1.1 × 0.6-1 mm, outside glabrous or minutely pubescent, at least near the base, ciliate, inside pubescent, rarely glabrous, colleter 1-2, 0.1-0.2 mm long. Sepals pale green to dark purple and then with white to green margins, up to 0.3 mm connate at the base, triangular to obovate, 0.8-1.7 × as long as wide, 0.9-1.7 × 0.6-1.3 mm, acute to truncate or sometimes slightly apiculate at the apex, glabrous on both sides, more or less ciliate. Corolla at lobes white, sometimes pink, and at tube reddish or yellowish-green with a pale green base;
in the mature bud 13.7-19 mm long forming an oblong head 0.26-0.37 of the bud-length, outside glabrous or sometimes minutely pubescent at wide part of tube; tube 8.5-15 × as long as the sepals, 1.7-3.3 × as long as the lobes, 9-15 mm long, contracted at the base and there 0.5-0.8 mm, widened above and widest 2.5-3.8 mm above the base (0.21-0.33 of the tube) and there 1.2-1.8 mm, again contracted just above the anthers and there 0.4-1 mm wide, fairly abruptly widened at the throat, inside with a pilose belt from 1.2-2 mm to 4.3-6.4 mm above the base of the tube, throat glabrous or almost glabrous; lobes oblong or elliptic, 0.3-0.6 × as long as the tube, 1.4-4.5 × as long as wide, 3.2-7.4 × 1.5-3 mm, rounded at the apex, sometimes slightly auriculate at the left side of the base, often slightly involute at the left side, entire or sometimes slightly undulate, outside glabrous, more or less ciliate, more so at the base, inside glabrous or minutely pilose at the base. Staminens 6-10.3 mm included (0.62-0.74 of the tube-length), inserted 2-3.2 mm from the base of the tube (the base of the anthers being 2.7-4 mm above the base of the tube); filaments glabrous on both sides, 0.5-1 mm long; anthers 0.7-1.8 × as long as the filaments, narrowly triangular or oblong, sometimes ovate or elliptic, 2.3-4 × as long as wide, 0.7-0.9 × 0.2-0.3 mm, acuminate, sometimes acute, with an up to 0.05 mm sterile apex. Pistil 1.8-2.9 mm long; ovary superior to hemi-inferior, obovoid, 0.4-1.1 × 0.5-0.9 × 0.5-0.9 mm, glabrous, sometimes unilocular, more often imperfectly 2-celled, abruptly narrowed into the style; style 0.7-1.4 × 0.1-0.2 mm; pistil head ovoid, 0.5-0.8 × 0.2-0.4 mm, split at the apex for 0.2 mm; apex of pistil 1-2.4 mm below apices of anthers. Placentas often protruding, sometimes only slightly so, each with 15-23 ovules. Fruits whitish-green or dull dark green, pear-shaped to subglobose, attenuate at the base, truncate at the apex, verrucose, glabrous, with lenticels, subtended by the persistent calyx, 24-46 × 23-36 mm. Seeds light brown when dried, irregularly ellipsoid to bean-shaped, 11-16 × 8-15 × 6-10 mm; embryo 1 × 1 mm; cotyledons ovate, 11 mm long, slightly cuneate at the base.

Geographical distribution: Nigeria, Cameroon, Gabon, Congo, Zaïre.

Ecology: Tropical rain forests. Alt. 0-700 m. Flowering throughout the year, especially in the months September – March. Fruits can be found all year round.

Geographical selection of the about 230 specimens examined:

CAMEROUN: Balangi (= Mbalange), Binuyo & Daramola FHI 35089 (B, K, P); 25 km S of Yaoundé, Breteler et al. 2467 (BR, K, LISC, M, P, WAG); Bipindi, Zenker 1628 (B, BM, BR, COI, E, HBG, K, L, M, P, S, W, WAG, WU, Z); between Longii and Songkwari, Bos 6088 (WAG); 8 km N of Kribi, Bos 4762 (BR, M, P, WAG); near Grand Batanga, Bos 3752 (P, WAG); Bitye, Bates 977 (BM, BR, MO, Z); near Ambam, Letouzey 10025 (BR, K, P, WAG).

GABON: Oyem, le Testu 9290 (B, BM, BR, LISC, P, WAG); Bélénga, Caballe 152 (WAG); Libreville, Klaine 3079 (K, P); Mont Mbékalène, Hallé & Villiers 5138 (P); Oveng, Louis et al. 381/83 (WAG); Agouma, le Testu 5822 (BM, BR, LISC, P, WAG); between Pagha and Monteté, le Testu 5110 (BM, BR, LISC, P, WAG); Guidouma, le Testu 5068 (B, BM, BR, LISC, MO, P, WAG).

Large liana at least 20 m high climbing in trees. Branches rough, dark red to brown, sometimes pale grey, with few lenticels, glabrous; branchlets glabrous. Leaves: petiole 6-10 mm long, glabrous; blade coriaceous, sometimes papery or leathery when dried, elliptic or oblong, 1.9-2.9 × as long as wide, 8-13.2 × 3-5.3 cm, acumen 4-14 mm long, with a rounded, sometimes slightly obtuse, point at the apex, cuneate at the base, glabrous on both sides, with 17-52 pairs of conspicuous secondary veins alternated by less conspicuous ones (of Wageningen Agric. Univ. Papers 89-4 (1989) 37
the latter sometimes 2 between two conspicuous veins); tertiary venation more or less reticulate. Inflorescences axillary, 1-2 together, rather congested, 5-15-flowered, up to 35 mm long, sometimes terminal and then more or less tendril-like, lax, up to 10-flowered, up to 150 mm long. Peduncle when inflorescences axillary up to 2.5 mm long, when terminal 75 mm long; peduncle and main axis glabrous or minutely pubescent. Bracts triangular, 0.7-1 × 0.6-1 mm, glabrous or pubescent on both sides, ciliate, colleters 1-2, 0.1 mm long. Sepals 0.2-0.4 mm connate at the base, triangular, 0.8-1.7 × as long as wide, 1-1.7 × 0.7-1.3 mm, acute to truncate at the apex, almost glabrous outside, ciliate, glabrous inside. Corolla often with an at least at base pale green tube, at the lobes white, in the mature bud 12.9-22.8 mm long forming an attenuate head 0.33-0.6 of the bud-length, outside glabrous or with a pilose belt from 2-3 mm above the base of the tube to the base of the lobes (indumentum somewhat less dense at narrow part of tube); tube 7.6-12 × as long as the sepals, 1.5-2.7 × as long as the lobes, 12.5-14.4 mm long, contracted at the base and there 0.6-0.8 mm, widened above and widest 2.8-3.7 mm above the base (0.2-0.28 of the tube) and there 1.1-1.5 mm, again contracted just above the anthers and there 0.7-1 mm wide, fairly abruptly widened at the throat, inside with a pilose belt from 1.2-1.7 mm to 5.8-7.5 mm above the base of the tube or to the base of the lobes (indumentum somewhat less dense or absent in narrow part of tube above anthers), in the throat somewhat less dense; lobes narrowly triangular, 0.4-0.7 × as long as the tube, 2.8-5.8 × as long as wide, 5.1-10 × 1.3-2 mm, obtuse at the apex, sometimes slightly auriculate at the left side of the base, more or less involute at the left side, outside glabrous or pilose, only so at the base, more or less ciliate, more at the base, inside sometimes glabrous, more often pilose at the base. Stamens 9-12 mm included (0.68-0.86 of the tube-length), inserted 2.3-2.8 mm from the base of the tube (the base of the anthers being 2.7-3.3 mm above the base of the tube); filaments inside glabrous or pilose, only so at the base, outside glabrous, 0.5-0.9 mm long; anthers 1.1-2.2 × as long as the filaments, oblong or narrowly elliptic, 3.3-5 × as long as wide, 0.8-1.1 × 0.2-0.3 mm, acute or acuminate with an up to 0.1 mm sterile apex, sometimes obtuse and then without sterile apex. Pistil 1.9-2.3 mm long; ovary inferior for one third, cylindrical or obovoid 0.4-0.7 × 0.6-0.8 × 0.6-0.8 mm, densely hirto-pubescent from 0.2-0.4 mm above the base, up to the apex of the ovary, unilocular or imperfectly 2-celled, abruptly narrowed into the style; style 0.6-0.8 × 0.2 mm; pistil head ovoid, 0.7-1 × 0.3 mm, split at the apex for 0.2 mm; apex of pistil 1.6-2.2 mm below apices of anthers. Placentas more or less protruding, each with 10-17 ovules. Fruits orange, sometimes dark green, with white longitudinally arranged spots, at least near apex, ellipsoid, sometimes subglobose or pear-shaped, cuneate, sometimes rounded at the base, obtuse or acuminate with an obtuse point at the apex, smooth (sometimes slightly rough when young), lenticellate, minutely hirto-pubescent at the apex when young, subtended by the persistent calyx, 24-76 × 18-60 mm. Seeds beige-ochre with a lighter coloured stripe where the two parts of endosperm are connate, irregularly shaped (to the space available), 13-22 × 18-19 × 13-14 mm; embryo 1 × 2 mm; cotyledons ovate, 18 mm long, cordate at the base.

Type: Central African Republic, G. Schweinfurth III-68 (K holo-, P iso-).

Liana. Branches dark brown or light yellowish brown to grey-brown, smooth, with lenticels; branchlets smooth, glabrous. Leaves: petiole 6-15 mm long, glabrous; blade leathery when dried, shiny above, oblong or elliptic, sometimes ovate, 1.7-2.8 x as long as wide, 5.5-12.6 x 2.5-5.7 cm, short-acuminate with an obtuse or rounded point at the apex (the acumen being up to 6 mm long), cuneate at the base, glabrous on both sides with 25-53 pairs of conspicuous secondary veins alternated by less conspicuous ones; tertiary venation more or less inconspicuous or reticulate. Inflorescences axillary, 1-2 together, rather congested, 5-8-flowered, up to 30 mm long, often also terminal and then more or less tendril-like, lax, 4-6-flowered, up to 75 mm long. Peduncle when inflorescences axillary 0.8-5 mm long, when terminal 9-44 mm long; peduncle and main axis glabrous or pubescent. Pedicels 1-2.3 mm long, glabrous or pubescent. Bracts narrowly triangular, 1.3-2 x 0.7-1 mm, glabrous or pubescent outside, ciliate, pubescent inside, at least near apex; colletor 1, 0.2 mm long. Sepals up to 0.2 mm connate at the base, narrowly triangular or ovate, 1.1-2.4 x as long as wide, 1.2-2.1 x 0.7-1.4 mm, obtuse or acute, sometimes truncate at the apex, glabrous on both sides, ciliate. Corolla with a pale yellow tube, at lobes white

to yellowish white, in the mature bud 12-18.3 mm long, forming an attenuate head 0.54-0.63 of the bud-length, glabrous outside; tube 3.5-7.2 × as long as the sepals, 0.4-0.8 × as long as the lobes, 6.5-9 mm long, contracted at the base and there 0.6-0.9 mm, widened above and widest at 2.3-3 mm above the base (0.33-0.37 of the tube) and there 0.8-1.5 mm, again contracted just above the anthers and there 0.3-0.7 mm wide, fairly abruptly widened at the throat, inside with a pilose belt from 1.3-2 mm above the base to the base of the lobes, in the throat sometimes more dense; lobes narrowly ovate to narrowly triangular, 1.3-2.8 × as long as the tube, 4.8-11.8 × as long as wide, 8.5-20 × 1-2 mm, obtuse at the apex, sometimes slightly auriculate at the left side of the base, sometimes slightly involute at the left side, outside glabrous, minutely ciliate, inside sometimes slightly pilose at the left side of the base, more often entirely glabrous. Stamens 3.1-5.2 mm included (0.47-0.68 of the tube-length), inserted 1.8-2.2 mm from the base of the tube (the base of the anthers being 2.2-2.7 mm above the base of the tube); filaments pilose inside or almost glabrous, glabrous.
outside, 0.4-0.5 mm long; anthers 2.2-3 × as long as the filaments, narrowly triangular, 3.7-6 × as long as wide, 0.9-1.2 × 0.2-0.3 mm, acute or acuminate at the for 0.05-0.1 mm sterile apex or sometimes obtuse and then without sterile apex. *Pistil* 1.7-2.2 mm long; ovary inferior for one quarter, subglobose, 0.5-0.9 × 0.4-0.8 × 0.4-0.8 mm, glabrous, unilocular, sometimes imperfectly 2-celled, more or less gradually narrowed into the style; style 0.6-0.8 × 0.2 mm; pistil head ovoid, ellipsoid or cylindrical, 0.5-0.6 × 0.3 mm, 0.1 mm split at the apex; apex of pistil 1.1-1.7 mm below apices of anthers. Placentas more or less protruding, each with 12-18 ovules. *Fruits* yellow, edible, with pulp very acid, globose, smooth, with few lenticels, glabrous, subtended by the persistent calyx, 19-35 mm in diameter; wall 1 mm thick. *Seeds* brown when dried, irregularly ellipsoid, 11-12 × 8-10 × 6-7 mm; embryo 1 × 1 mm; cotyledons ovate to elliptic, 10 mm long, slightly cuneate to cordate at the base.

Geographical distribution: Central African Republic, Northern Zaire, Sudan, Eastern Cameroun.

Ecology: Tropical rain forests or rather humid savanas. Alt. 500-1000 m. Flowering especially in the months December – May. Fruits can be found throughout the year. Common.

Geographical selection of the about 75 specimens examined:

CAMEROUN: Bouar, Mildbraed 9487 (K, paratype of *Clitandra mildbraedii*).

CENTRAL AFRICAN REPUBLIC: Ndélé, Chevalier 7902 (BR, K, P); 68 km E of Ndélé, Gui-gonis 3367 (BR); 4 km W of Pende, Fay 4313 (K); Sakala R., Fay 4298 (K); between Ouadda and Ouanda-Djala, le Testu 3781 (BM, P); Boguila Region, Fay et al. 5137 (K); 100 km SW of Bouar, Haxaire 1422 (WAG); near Bouar, Descoings 10208 (P); Lado R., Cartwright 13 (K); between Nana and Fort Sibut, Chevalier 10738 (P); between Fort de Possel and Fort Sibut, Chevalier 5384 (P); Mission de la Sainte Famille, Chevalier 5317 (P) ; near Bambari, Tisserant 17487 (BR, P); N'Zako, Pittard 25 (G); Yalinga, le Testu 2492 (B, BM, LISC, P, WAG); near Obo, Descoings 11978 (P).

SUDAN: between R. Pongo and R. Getti, Schweinfurth HI-68 (K, holotype, P, iso-).

ZAIRE: EQUATEUR: Bas-Uele, Dewulf 632 (BR).

5. *Orthopichonia seretii* (De Wild.) Vonk comb. nov.

*Type:* Zaïre, F. Seret 731 (BR holo-).

**Liana,** up to at least 50 m long. *Branches* greyish-brown with few lenticels; branchlets greyish-brown, pubescent, hairs curved. *Leaves:* petiole 11-22 mm long, glabrous or pubescent above, less hairy beneath, hairs curved; blade papery when dried, obloneg or elliptic, 2-3.2 × as long as wide, 6.1-12.1 × 2.8-4.9 cm, acumen 4-14 mm long, with a rounded, sometimes slightly obtuse point at the apex, cuneate at the base, glabrous on both sides or on midrib slightly pubescent at the base, with 28-53 pairs of conspicuous secondary veins alternated by less

conspicuous ones; tertiary venation inconspicuous to slightly reticulate. Inflorescences axillary, 1-3 together, congested, (5-)7-9-flowered, 15-20 mm long, with peduncle up to 2 mm long, rarely terminal, and then somewhat tendril-like, rather congested, 2-4-flowered, up to 20 mm long, with peduncle 3.2-6 mm long; peduncle and main axis densely pubescent, hairs curved. Pedicels 1-3 mm long, densely pubescent, hairs curved. Bracts triangular, 1.3-1.8 × 1-1.1 mm, pubescent on both sides, hairs curved, ciliate; colleters 0.2 mm long. Sepals 0.2-0.4 mm connate at the base, triangular or ovate, 0.9-1.3 × as long as wide, 0.9-1.4 × 0.9-1.3 mm, retuse to acute, sometimes apiculate at the apex, densely pubescent outside, at least near midrib and at base, hairs curved, ciliate, usually pubescent inside, hairs curved. Corolla often with a pale green tube and white lobes, in the mature bud 7.5-13 mm long forming an attenuate head (the lobes 0.47-0.54 of the bud-length), outside glabrous or sometimes with a pubescent belt from about half of the tube upwards to the base of the lobes; tube 4.2-5.5 as long as the sepals, 0.7-1.2 as long as the lobes, 4.7-6 mm long, contracted at the base and there 0.6-1 mm, widened above and widest at or just below the middle and there 1.2-1.4 mm, again contracted just above the anthers and there 0.5-0.7 mm wide, fairly abruptly widened at the throat, inside with a pilose belt from 1.4-2 mm to the apex of the anthers or the base of the lobes (indumentum less dense or absent in narrow part of the tube above anthers), in the throat somewhat more dense; lobes narrowly triangular, 0.8-1.4 as long as the tube, 2.9-5 as long as wide, 3.8-8.2 × 1.2-1.9 mm, obtuse at the apex, slightly auriculate at the left side of the base, more or less involute at the left side, outside glabrous.
sometimes pubescent at the base, hairs curved, more or less ciliate, inside pilose, only so at the auricle or sometimes entirely glabrous. **Stamens** 1.8-3 mm included (being 0.38-0.5 of the tube-length), inserted 1.8-2.4 mm from the base of the tube (the base of the anthers being 2-3.1 mm above the base of the tube); filaments 0.3-0.7 mm long, pilose inside, glabrous outside; anthers 1.4-2.7 × as long as the filaments, narrowly triangular or oblong, 3-6 × as long as wide, 0.8-1.2 × 0.2-0.4 mm, acuminate at the for 0.05-0.1 mm sterile apex or sometimes obtuse and then without sterile apex. **Pistil** 1.4-2 mm long; ovary inferior for one quarter to hemi-inferior, subglobose to obovoid, 0.5-0.9 × 0.7-1 × 0.7-1 mm, widest above the middle, almost entirely or at least apically densely pubescent (hairs short and curved, sometimes the hairs on the lower half of the ovary not curved), unilocular, abruptly narrowed into the style; style 0.6-1 × 0.2 mm; pistil head ovoid, ellipsoid or cylindrical, 0.3-0.6 × 0.2-0.3 mm, up to 0.2 mm split at the apex; apex of pistil 1.2-2 mm below apices of anthers. Placentas much protruding, each with 15-40 ovules. **Fruits** globose or obovoid, up to 7 cm in diameter, slightly bumpy, more or less lenticellate, glabrous, subtended by the persistent calyx, 2-celled; wall up to 2 cm thick. **Seeds** light green or brown when dried, bean-shaped to ellipsoid, 12-18 × 10-12 × 6-9 mm, covered by a greyish slimy layer when fresh; embryo 1 × 2 mm; cotyledons elliptic, 11 mm long, cordate at the base.

Ecology: Tropical rain forests. Alt. up to 900 m. Flowering throughout the year, especially in the months June – November.

Geographical selection of the about 70 specimens examined:

CAMEROUN: near Bafia, Benof 376 (P); Bertoua, Breteler 1671 (BR, K, LISC, M, P, WAG); Nye’ete, de Kruif 1060 (WAG); Bipindi, Zenker 550 (B, BR, C, G, GH, LD, MO, NY, P, UC, WAG).

CENTRAL AFRICAN REPUBLIC: Boukoko, Tisserant 428 (B, BM, LISC, P, WAG).

GABON: between Assok and Tchimbélé, de Wilde et al. 137/83 (WAG); Bilengue, le Testu 5487 (BM, LISC, P, WAG).

Note: When Schumann described *Clitandra visciflua* (1900), he based it on four syntypes. Out of these four, Staudt 860 was used by Stapf to create *C. staudtii* (1902). The name was maintained in the revision of Orthandra by Pichon (1953).

The present author, however, does not consider Staudt 860 as distinct, and names this specimen *O. visciflua*. Therefore the other specimens identified by Stapf, several followers and Pichon as *C. staudtii* or *O. staudtii* needed an other name: *O. seretii*.

6. Orthopichonia visciflua (K. Schum. ex Hall.) Vonk comb. nov.

Phot. 2A; Map 7A

Liana, slender. Branches grey-brown to dark brown, smooth, with lenticels; branchlets glabrous. Leaves: petiole 5-12 mm long, glabrous; blade thinly leathery when dried, elliptic or obovate, sometimes oblong, 1.7-3.6 x as long as wide, 7.3-15.8 x 3.3-6.8 cm, acumen 6-14 mm long, with a rounded point at the apex, cuneate at the base, glabrous on both sides, with 18-30 pairs of conspicuous secondary veins alternated by less conspicuous ones (of the latter sometimes 2 between two conspicuous veins); tertiary venation more or less reticulate, sometimes inconspicuous. Inflorescences axillary, often seemingly terminal, 1-3 together, rather congested, 5-9-flowered, 13-33 mm long, peduncle up to 4 mm long; peduncle and main axis glabrous, sometimes sparsely pubescent. Pedicels pale green, 1-4 mm long, glabrous. Bracts triangular, obtuse, sometimes truncate at the apex, 0.7-1.2 x 0.6-1 mm, glabrous on both sides, sometimes minutely pubescent on both sides, then at least near apex, ciliate, colleters one, sometimes two, 0.1-0.2 mm long. Sepals up to 0.4 mm connate at the base, triangular or ovate, 0.7-1.6 x as long as wide, 0.7-1.3 x 0.7-1.5 mm, obtuse or acute, sometimes truncate or apiculate at the apex, glabrous or almost glabrous on both sides, ciliate. Corolla at tube pale green or yellowish-green, sometimes with a cream top, at lobes white, in the mature bud 12.7-22 mm long, forming an attenuate head 0.48-0.53 of the bud-length, glabrous outside; tube 8.5-13.3 x as long as the sepals, 0.8-1.2 x as long as the lobes, 7.7-12.4 mm long, contracted at the base and there 0.6-1.1 mm, widened above and widest at 2-2.8 mm above the base (0.17-0.26 of the tube) and there 1-1.5 mm, again contracted just above the anthers and there 0.5-0.8 mm wide, fairly abruptly widened at the throat, inside with a pilose belt from 1-2 mm above the base to about 3 mm above the apices of the anthers or the base of the lobes (indumentum less dense or absent in narrow part of the tube above the anthers and most densely just above the anthers), in the throat somewhat more dense; lobes narrowly ovate to narrowly triangular, 0.9-1.3 x as long as the tube, 4.7-8.5 x as long as wide, 7-16.2 x 1.3-2.7 mm, obtuse at the apex, often slightly involute, outside glabrous, more or less ciliate, inside sometimes slightly pilose at the left side of the base, more often entirely glabrous. Stamens 5.3-9.5 mm included (0.68-0.79 of the tube-length), inserted 1.6-2.4 mm from the base of the tube (the base
Phot. 2. Orthopichonia viscosa (Dinklage 1161, phot. van der Maesen).

of the anthers being 2.3-3.1 mm above the base of the tube); filaments pilose inside, glabrous outside, 0.5-1 mm long; anthers 0.8-1.4 × as long as the filaments, narrowly triangular or oblong, 3.5-4.5 × as long as wide, 0.7-0.9 × 0.2 mm, acute or acuminate with an up to 0.1 mm long sterile apex. Pistil 1.5-2.4 mm long; ovary inferior for one quarter to one third, subglobose to obovoid, 0.5-0.9 × 0.6-0.7 × 0.6-0.7 mm, glabrous or with a hirto-pubescent belt from about 0.2 mm above the base to the apex of the ovary, unilocular, sometimes imperfectly 2-celled, abruptly narrowed into the style; style 0.3-0.9 × 0.1-0.2 mm; pistil head ovoid, ellipsoid or cylindrical, 0.6-1 × 0.2-0.3 mm, up to 0.3 mm split at the apex; apex of pistil 1.4-1.8 mm below apices of anthers. Placentas more or less protruding, each with 8-15 ovules. Fruits unknown.

Geographical distribution: Cameroun, Gabon.
Ecology: Tropical rain forests. Flowering especially in the months February - May and September - December.
Geographical selection of the about 200 specimens examined:

CAMEROUN: Johann-Albrechtshöhe (= Kumba), Staudt 860 (BM, GH, K, type of *Clitandra staudei*, para-); near Kribi, Bos 4166 (BR, I, LD, M, P, WAG); Bipindi, Zenker 1606 (B, BM, BP, BR, COI, E, G, HBG, K, L, M, MO, NY, P, S, W, WAG, Z lectotype); Grand Batanga, Dinklage 840 (HBG paratype); ibid., M. Dinklage 1161 (HBG, K, WAG paratype).

GABON: Oyem, le Testu 9513 (BM, P); near Libreville, Klaine 2849 (BR, P, UC); Iméno Poubi, le Testu 8600 (BM, P, WAG); Liyanga, le Testu 7707 (BM, P, WAG); Liyembo, le Testu 8784 (B, BM, LISC, P, WAG).

Note: see note under *O. seretii*.

Acknowledgements

I am also very greatful to Prof. Dr Ir L.J.G. van der Maesen for correcting the text and for the photographs, and especially to Dr A.J.M. Leeuwenberg for his supervision and critical remarks.

Special thanks are due to the Director of the Laboratoire de Phanérogamie at Paris for permission to use the Pichon's original drawings for this publication.
