

WAGENINGEN UR

For quality of life

Worldwide access to The Netherlands' greenhouse technology

Wageningen UR Greenhouse horticulture

Collaboration with Wageningen UR Greenhouse Horticulture allows to exploit state of the art knowledge and technology for the development of greenhouse production, demonstration sites and research facilities around the globe. Greenhouses which are adapted to local climate conditions and market potentials. Our partners can be assured we will optimally use the technical possibilities worldwide while securing the local feasibility and success.

Research & Technology

Already for decades Wageningen UR Greenhouse Horticulture has been one of the driving forces in research and technology development for greenhouse horticulture in the Netherlands. Our knowledge and

experience on greenhouse cultivation of ornamental and vegetable crops is unique in the world. Together with growers and high tech companies, we have developed new cultivation systems, climate control systems, revolutionary greenhouse cover materials and other innovations. The use of these applicable new technologies has made greenhouse horticulture of the Netherlands leading in the world.

Exploiting produce markets

Markets' demands vary throughout time and place. Our ambition is to allow our partners an optimal exploitation of these markets; export markets and markets close to the production site. Optimal

WAGENINGEN UR

For quality of life

production requires the right technology given the economic situation and expertise in crop production optimisation. To achieve this, we follow our “adaptive greenhouse production system design” approach for production as well as other greenhouse facilities.

Research and demonstration facilities

Greenhouse site with special functions, like research or demonstration, need a special touch to develop. We have shown to have that touch and have developed sites in several countries, e.g. Indonesia, Turkey, Malaysia and the middle east. We develop optimally tailored sites, using teams which are a clever

combination of local experts, high tech companies and our own top scientists.

Capacity building

Acquiring new technologies and market information is one step, being able to use the technology and the data to its limits is the next. We have trained numerous scientists and trainers/advisors of growers across the globe in a wide range of competences. Understanding the growth of crops, the hardware and software of the greenhouses and the markets, allows growers to make a maximum profit and enables scientists to exploit the costly greenhouses to carry out their research in an optimal way.
