

Urban Agriculture:

Bioavailability as a tool in urban agriculture?

Paul Römken, Sonia Rodrigues, Chih-Min Chiang, Horng-Yuh Guo & René Rietra

I. Urban Agriculture: a wide range of activities

Communal gardens

I. Urban Agriculture: a wide range of activities

Allotments in or near cities

I. Urban Agriculture: a wide range of activities

Agriculture near cities/highways/industry etc.

II. Problem: impact of pollution on crop quality

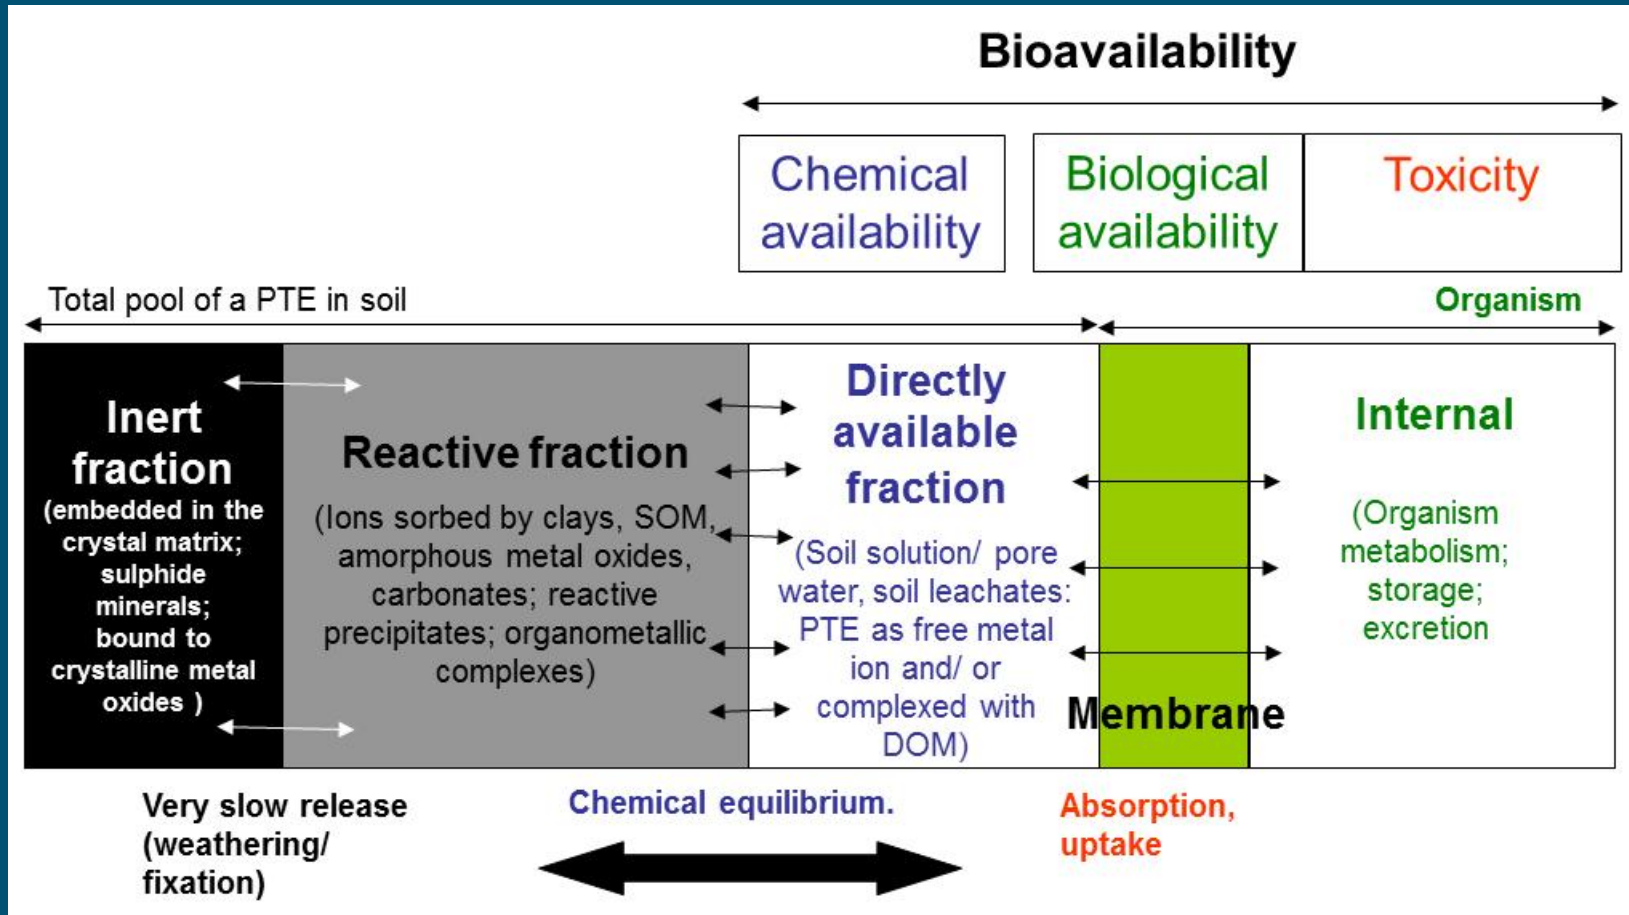

- Communal gardens and Allotments: risk of elevated levels of lead: high exposure levels
 - Can people safely use allotments and gardens to grow vegetables and eat them?
- Regular Agriculture: crop quality insufficient for sale on market
 - Can the farmer sell the product and earn an income?

II. Problem: impact of pollution on crop quality

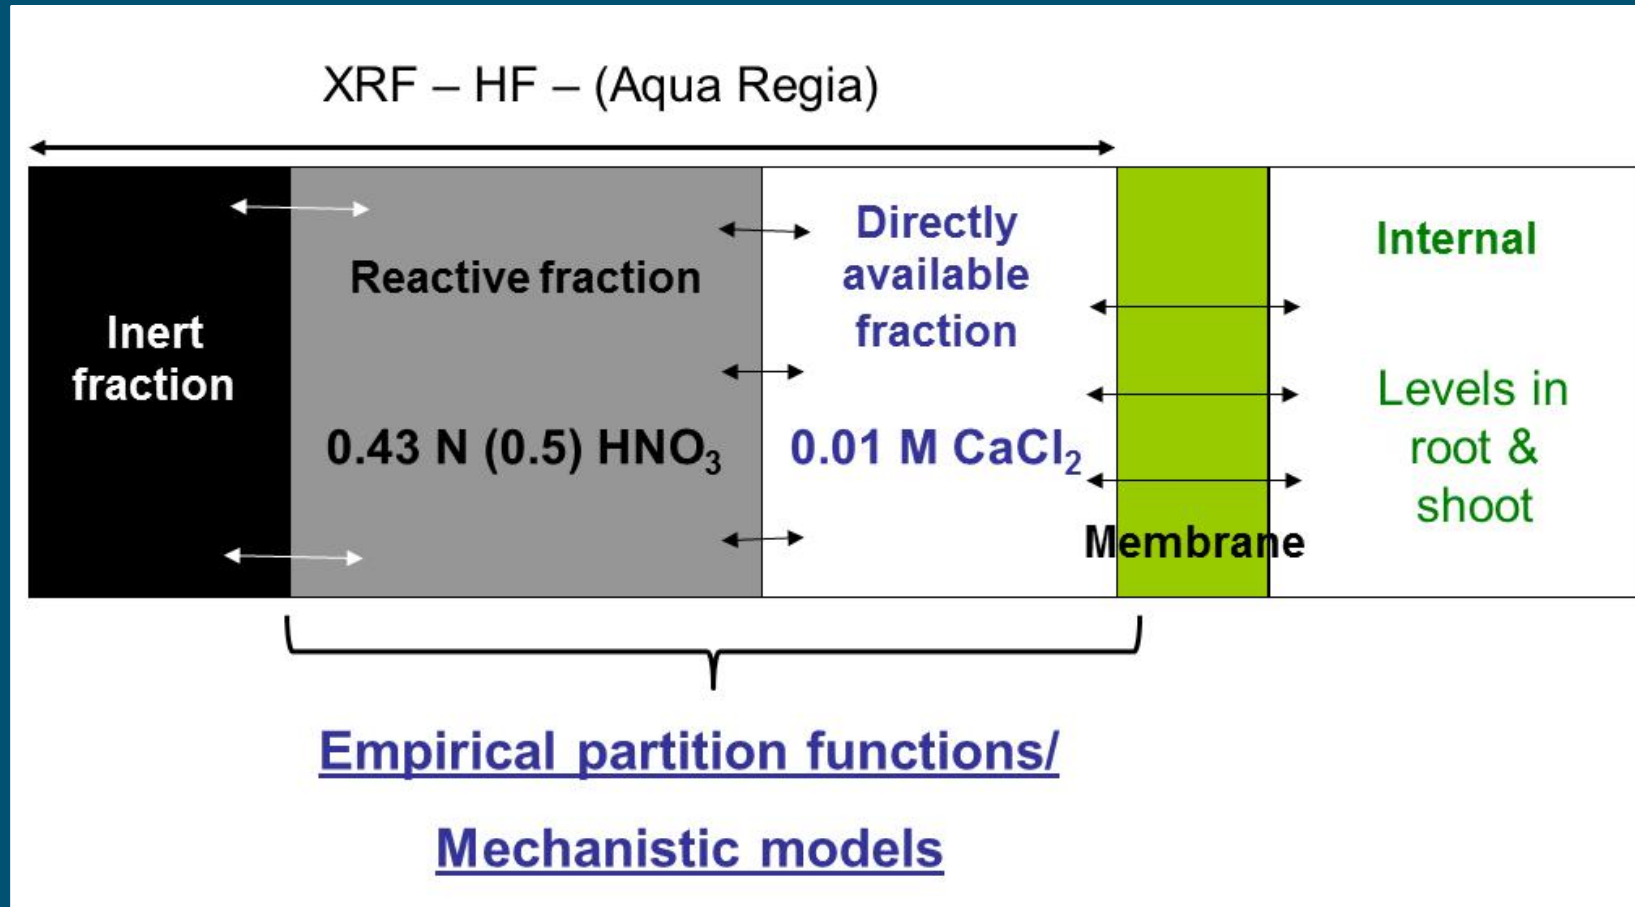

■ Why is this such an issue???

- Strict soil quality guidelines (standards) due to conservative model approaches (e.g. in case of lead: 140 mg kg^{-1})
- Limited link between levels in soil and uptake by crops
- Current soil standards do not consider availability of contaminants in soil!

III. Availability: from theoretical framework

III. Availability: to practical approach

IV. Application in urban settings: Policy development

From Field data To model development To soil standards

Pb (L. perenne)

Esposende: Agricultural fields –

Estarreja: Agricultural fields surrounding
industrial area – 39 sites

Lousal, Caveira, Aljustrel (Iberian
sulphides, pyrites, Cu extraction)
fields surrounding three mining
27+15+25 sites

	Limit soil concentrations (total*) (mg kg ⁻¹ d.w.)					
	Cd			Pb		
	pH=4; Org C=3%	pH=5; Org C=3%	pH=6; Org C=3%	Al _{ox} =50 mmol kg ⁻¹	Al _{ox} =100 mmol kg ⁻¹	Al _{ox} =150 mmol kg ⁻¹
Green fodder production (<i>Lolium perenne</i>)	2.1	3.1	4.8	411	618	789
	Limit soil concentrations (available**) (mg kg ⁻¹ d.w.)					
	Cd			Pb		
Green fodder production (<i>Lolium perenne</i>)	0.3			71		

* soil total concentrations = *aqua regia* extraction

** soil available concentrations = 0.01 M CaCl₂ extraction

Paddy Fields

- pH
- CEC
- Weather
- Cultivar
- Redox potential

	soil pH						
	4	4.5	5	5.5	6	6.5	7
1	0.1	0.1	0.1	0.0	0.0	0.0	0.0
5	0.2	0.2	0.1	0.1	0.1	0.1	0.1
1	0.3	0.3	0.2	0.2	0.1	0.1	0.1
5	0.4	0.3	0.3	0.2	0.2	0.1	0.1
2	0.5	0.4	0.3	0.3	0.2	0.2	0.1
5	0.5	0.4	0.4	0.3	0.2	0.2	0.2
3	0.6	0.5	0.4	0.3	0.3	0.2	0.2
5	0.7	0.5	0.4	0.4	0.3	0.2	0.2
4	0.7	0.6	0.5	0.4	0.3	0.3	0.2
5	0.8	0.6	0.5	0.4	0.3	0.3	0.2
5	0.8	0.7	0.5	0.4	0.4	0.3	0.2

Cd rice data (mg kg^{-1})

IV. Application in urban settings:

Allotments

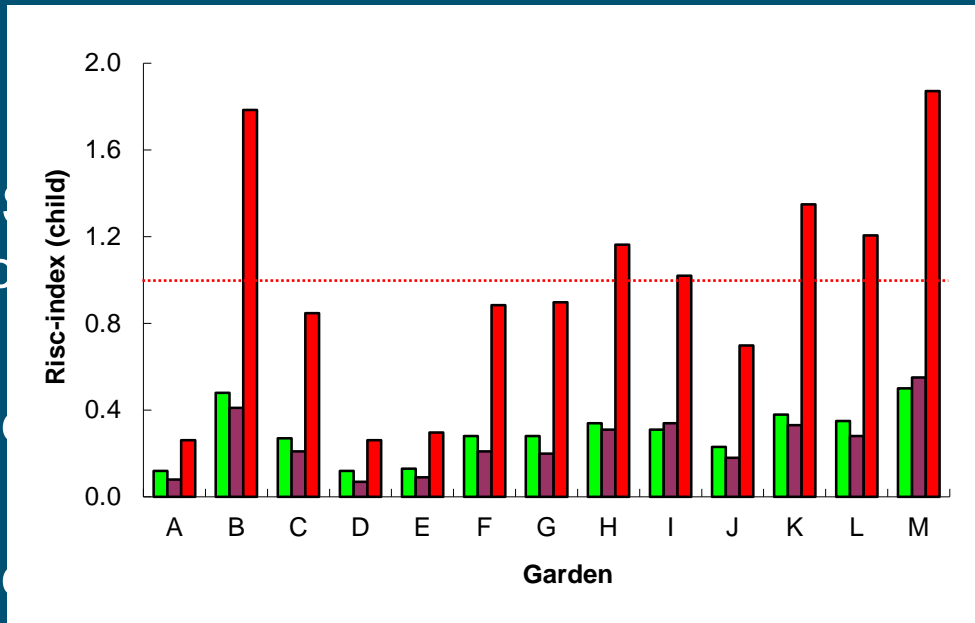

- Specific issue for lead: linear BCF leads to high (predicted!) uptake by vegetables
- This results in numerous cases of presumed risk of unacceptable exposure:
- But is that realistic?

IV. Application in urban settings: Allotments

Actions:

- Improve C-S behaviour of
- Using field c
- Test on ind

non-linear

Conclusions

- Concept of (bio)availability works in many cases
 - Improved risk assessment tools
 - Application on local, regional, national scale
 - Field testing essential
 - Still (long) way to go for generic application
 - Bút: promising approach in view of harmonization (not numbers but concepts!)
-

A photograph of a garden scene. In the foreground, there are rows of green leafy vegetables, possibly chard or beet leaves, growing in dark soil. Behind them, a dense patch of tall, green, upright plants, likely leeks or onions, is visible. In the background, a person wearing a white hat and dark clothing is working in the garden, partially obscured by the plants. A wooden trellis structure is visible behind the person. The sky is clear and blue. A large orange rectangular box is overlaid on the middle of the image, containing the text "Thank you" in white.

Thank you

Any questions: Paul.Romkens@wur.nl
