INTRODUCTION

The present publication is a revision of the African species of *Strychnos* based on the material of 75 herbaria and on studies of living plants. The author has had the opportunity of visiting Africa three times and of travelling in five different countries to collect plants and to study their habit, ecology, and distribution in the field. He has seen living plants of 40 species. Of most of the species he has studied, the habit was not sufficiently known, and only in a few cases did any idea exist about their normal size. Several species which mostly are huge lianas, had previously only been recorded as climbing shrubs.

In January 1959 when it was decided that the author would undertake the revision of the African *Loganiaceae* he travelled in the Ivory Coast. There he became acquainted with the remarkable habit of several climbing *Strychnos* species. This proved to be of great advantage because it made it possible to understand what parts of the plants had generally been collected as herbarium specimens.

The plants are so large that a herbarium sheet cannot give an impression of the way of branching, which is often characteristic for a species. In the course of his second and third stays in Africa he returned to the Ivory Coast and also travelled in Liberia, Upper Volta, Cameroun, and the Central African Republic. Numerous species were collected several times, even if only in a vegetative condition, in various localities, and this added considerably to the knowledge of their distribution.

He studied the African material of the following herbaria:

- A Cambridge, Massachusetts – U.S.A.: Arnold Arboretum.
- ABI Abidjan, Côte d'Ivoire: O.R.S.T.O.M. (Institut d'Enseignement et de Recherches Tropicales = I.D.E.R.T.).
- ABT Avon, France: Laboratoire de Botanique Tropicale.
- ALF Maisons-Alfort, France: Institut d'Elevage et de Médecine Vétérinaire des Pays Tropicaux.
- AMD Amsterdam, Netherlands: Hugo de Vries-Laboratorium.
- B Berlin, Germany: Botanisches Museum.
- BM London, Great Britain: British Museum (Natural History).
- BO Bogor, Indonesia: Herbarium Bogoriense, Lembaga Biologi Nasional.
- BOL Cape Town, South Africa: Bolus Herbarium, University of Cape Town.
- BR Bruxelles, Belgium: Jardin Botanique de l'Etat.
- BREM Bremen, Germany: Übersee-Museum.

Z	Zürich, Switzerland: Botanischer Garten und Institut für Systematische Botanik der Universität Zürich.

In addition the extra-African material was studied preserved in some herbaria: BM, BR, C, FHO, GB, H, HAL, K, L, LINN, OXF, P, S, TCD, U, UPS, US, and WU.

When the delimitation of the African *Strychnos* species was completed as far as possible on the basis of the data at present available, the extra-African material of the genus was also studied in order to obtain a better over-all view of the sectional systematy in the genus and of the synonymy and distribution of the species. The moment of undertaking this comparative study was fortunate, because revisions of the American species (with supplements) by KRUKOFF (1942-1965), of the species occurring in Malesia by LEENHOUTS (1962), and of the Asiatic species by A. W. HILL (1917) could be consulted. Many specimens annotated by the above-cited authors, especially KRUKOFF, could be examined.

The present revision, however, does not include any new information on the delimitation of extra-African species. The latter were only studied in order to obtain knowledge of their relations with the African species.

One species, *S. potatorum*, occurs both in Africa and in Asia, which was a new and surprising result of these comparative studies.

GENERAL PART

HISTORY OF THE GENUS

LINNAEUS described the genus *Strychnos* and based it upon *S. nux-vomica*, the type species, and *S. colubrina*. It was described several times afterwards by various authors with mostly different type species, as is enumerated above the genus diagnosis.

Some authors of synonyms attempted to describe genera which could be segregated from *Strychnos*, e.g. HARVEY (1842), when describing *Brehmia*, and S. MOORE (1913), who described *Scyphostrychnos*. *Brehmia* was adopted by a few authors only, e.g. DE CANDOLLE (1845), but was abandoned shortly after, because most authors arrived at the conclusion that the only species of the latter genus, *B. spinosa*, is a true *Strychnos* species. *Scyphostrychnos* was maintained by DUVIGNEAUD (1948), but reduced to synonymy by the present author (1965).

A few African species were described long before 1900, e.g. *S. potatorum* L.f. (1781), *S. spinosa* Lam. (1794), *S. madagascariensis* Poir. (1808), *S. innocua* Del. (1826), and *S. decussata* (Pappe) Gilg (1862). The majority has been described, often several times, shortly before and after 1900 by BAKER, DE WILDEMAN, and GILG.

The most important improvement in our knowledge of the genus as a whole is of more recent date. A very good revision of the American species was made by KRUKOFF & MONACHINO (1942), with several supplements, of which the 7th by KRUKOFF (1965) is the most important. The Asiatic species have been revised by LEENHOUTS (1962), as far as they occur in the area of the Flora Malesiana. Far less complete is our knowledge of the other Asiatic species, of which the most recent revision is that of HILL (1917). From Africa there are the contributions to three floras. ONOCHIE & LEEUWENBERG in Fl. W. Trop. Afr. 2 (1963) (incomplete, as some new species were discovered afterwards), BRUCE & LEWIS in Fl. Trop. E. Afr. (1960) (incomplete, as some more species were represented by incomplete material (*S. johnsonii*, *S. urceolata*), or were hidden in the wrong genus (*S. mellodora* was described from E. Africa as *Gaertnera zimmermannii*)), and VERDOORN, Fl. S. Afr. 26 (1963) (accepted here, except for the following changes: *S. stuhlmannii* = *S. potatorum*, the subspp. of *S. innocua* cited = *S. madagascariensis*).

GEOGRAPHICAL DISTRIBUTION

The genus *Strychnos* is pantropical. It can be subdivided in 3 geographically separated groups of species, one in America, one in Africa, and one in Asia and Australia. The only exception is *S. potatorum* which occurs both in Africa and Asia.

The 75 African species known at present are variously distributed. The most widely distributed is *S. spinosa* which occurs throughout tropical Africa (not in

forests). This is followed closely by *S. innocua* and *S. usambarensis* which occupy slightly smaller areas. These in turn are followed by several species occurring mainly in East Africa, *S. decussata*, *S. henningsii*, *S. madagascariensis*, and *S. mitis*.

Very small areas are those of e.g. *S. melastomatooides* in Guinea and Sierra Leone, *S. millepunctata* in the Ivory Coast, *S. ternata* in eastern Cameroun, and *S. xylophylla* in the coastal area of Tanzania.

Several areas show something of the ecology of the species. *S. aculeata*, *S. campicola*, *S. camptoneura*, *S. congolana*, *S. densiflora*, *S. floribunda*, *S. icaja*, *S. johnsonii*, and *S. longicaudata* between them inhabit almost the entire central forest area of the continent.

S. afzelii, *S. barteri*, *S. cuminodora*, *S. dinklagei*, *S. melastomatooides*, *S. millepunctata*, *S. odorata*, *S. soubrensis*, and *S. splendens* inhabit the West-African forests, but sometimes only a part of this area.

S. chromatoxylon, *S. cuniculina*, *S. dale*, *S. dolichothysra*, *S. elaeocarpa*, *S. fallax*, *S. gnetifolia*, *S. kasengaensis*, *S. malchairii*, *S. mimfiensis*, *S. moandaensis*, *S. ngouniensis*, *S. tchibangensis*, and *S. zenkeri* are confined to Central Africa or a portion of it. *S. malcoclados* and *S. nigritana* occur in West and northern Central Africa, while *S. asterantha*, *S. boonei*, *S. chrysophylla*, *S. memecyloides*, *S. samba*, *S. talbotiae*, and *S. urceolata* occur in the forest area of Nigeria and Central Africa. The majority of the above enumerated species prefer river banks.

Several of the forest species do not occur only in the forest area, but penetrate into the savannas following the gallery forests, e.g. *S. kasengaensis*, *S. longicaudata*, and *S. nigritana*. The East-African forest species, *S. melloadora*, *S. mitis*, and *S. panganensis*, are even restricted to the gallery forests in the greater part of their areas, there being only a few closed forests in their distributional area.

S. angolensis and *S. scheffleri*, being widely distributed in Central and East Africa, occur both in the closed forest area and in the gallery forests.

The majority of the forest species inhabit riverine forests and therefore it is understandable that they occur in the gallery forests which often are reduced to small groves or thickets.

The true savanna species occur normally only in woodlands and bushlands. Nevertheless they may penetrate gallery forests, as e.g. *S. gossweileri*, *S. madagascariensis*, *S. matopensis*, and *S. spinosa*.

The savanna species are generally more widely distributed than those of the forests. *S. innocua* and *S. spinosa* which occupy a horse-shoe-shaped area adjacent to the central forest area, are the most widely distributed African species of the genus. *S. cocculoides* and *S. pungens* have been collected many times throughout Central, East, and northern South Africa. *S. henningsii* and *S. mitis* occur in western Angola and the eastern part of the African continent (*S. mitis* also in the Comoro Islands). *S. decussata*, *S. madagascariensis*, *S. myrtoides*, and *S. potatorum* are known from both the eastern part of the continent and Madagascar. Five of the twelve species occurring in Madagascar are endemic:

S. bifurcata, *S. diplotricha*, *S. mostueoides*, *S. pentantha*, and *S. trichoneura*. *S. variabilis* is only known from the lower Congo basin and a few localities in the neighbourhood.

Very small areas were recorded at the beginning of this chapter. Several species, however, are presumed to occupy larger areas than those known at present, e.g. *S. asterantha*, *S. canthioides*, *S. elaeocarpa*, *S. gnetifolia*, *S. mimfiensis*, *S. ndengensis*, *S. retinervis*, *S. talbotiae*, and *S. zenkeri*.

Near the borders of their areas the species occur in isolated localities; this is known especially of widely distributed species. *S. spinosa* can maintain itself on the Jebel Marra in Sudan, a mountain which is relatively moist. In the south in Cape Province it is restricted to the isolated forest reserves along the coast. It is probable that there growing conditions approach those of the relatively dry regions in the central part of its area. The same could be concluded after comparison of the data available on *S. decussata*, *S. henningsii*, and *S. mitis*, species which may have, however, a more restricted ecology as they have distinct gaps in their areas in regions from which many collections are known. *S. decussata* and *S. mitis* have a clear gap in the centre of their areas. It may be supposed that there the degree of humidity is too high.

On the other hand, the gap in the areas of *S. henningsii*, *S. lucens*, and *S. mitis* may be caused by the dryness of central and eastern Angola.

Two pairs of closely allied vicarious species are to be found in Africa: *S. lucens* and *S. nigritana* which have completely separated areas, and *S. innocua* and *S. madagascariensis* which have slightly overlapping areas.

A clearly disjunct area is shown by *S. usambarensis*, which occurs in the forests or the gallery forests in the greater part of tropical and northern South Africa. It has, however, never been collected in Cameroun, Central African Republic, and Gabon. The present author collected it repeatedly in the Ivory Coast, but never saw it in Cameroun, a country very rich in *Strychnos* species.

Cameroun may be considered as a centre of species-concentration, as 38 of the 75 species occur there. Although the surface area of Congo (Kinshasa) is about 10 times that of Cameroun, the number of *Strychnos* species in Congo is also about 38.

HABIT AND GROWTH

Some *Strychnos* species are trees, which may be shrublike. The following are forest trees: *S. elaeocarpa*, *S. gnetifolia* (?), *S. mellodora*, *S. mitis*, *S. retinervis* (?), *S. staudtii*, *S. ternata*, *S. xylophylla*, and *S. zenkeri*. The following are savanna trees: *S. bifurcata*, *S. cocculoides*, *S. decussata*, *S. henningsii*, *S. innocua*, *S. madagascariensis*, *S. mostueoides*, *S. myrtoides*, *S. potatorum*, *S. pungens*, *S. spinosa*, *S. variabilis*, and several extra-African species like *S. lucida*, and *S. pseudo-quina*. Specimens of the latter group may be shrub-like and are then sometimes very small, e.g. *S. cocculoides*, *S. pungens*, and *S. spinosa* (see note after *S. cocculoides*). *S. usambarensis* mostly a climbing shrub or a huge liana, is often noted in collections from East Africa as being a tree.

All other species are tendrilled climbers.

The climbers always bear hooked tendrils which are arranged according to three systems which are constant within the species:

1. Solitary and placed in the axils of scale-like bracts or ordinary leaves.
2. Paired and placed in the axils of scale-like bracts.
3. Arranged in 1–3 pairs above each other on short lateral branches and also placed in the axils of scale-like bracts.

The arrangement of the tendrils may show aberrations if a whole liana with many branches is investigated, but it is of particular value in identifying incomplete specimens. Aberrations are seen in the field in well-developed richly flowering specimens, e.g. herb. Gossweiler 8701 of *S. gossweileri* and herb. Leeuwenberg 5675 of *S. samba*; but rather young, often vegetative, specimens, especially when growing in poor conditions, are very constant in this character.

This regularity seems to be the same for the Asiatic species of which many are closely allied to African species. The same may be true for the majority of the American species – this at least is suggested by the herbarium specimens examined. However, there may be more exceptions with the American representatives of *Strychnos*, as KRUOFF (in litt.) does not agree with the author's opinion on this point. The following exceptions may be noted:

S. jobertiana has solitary tendrils like *S. floribunda* in herb. Krukoff 8848 (BM) or two solitary tendrils side by side on one node of a branch in Glaziou 9941 (K, P). *S. peckii* has mostly solitary tendrils, but a compound system of tendrils is seen in herb. Krukoff 7631 (K).

The seedlings always produce two leafy cotyledons which are opposite and cordate or sometimes nearly ovate. Afterwards, there appears a leaf-bearing axis which becomes nodding when several pairs of leaves are developed. Somewhat later, a branch appears in or near the axil of one cotyledon. This branch is stronger and overtakes the apex of the plant. In its turn it becomes nodding at the apex. In the axil of a leaf on the erect portion of this branch develops an again stronger branch which again overtakes its predecessor. This sympodial growth-pattern is repeated during the plant's life-time. The third or later new apex usually bears some branches in the nodding portion when a bud in a leaf-axil on the erect portion gives way to his successor.

The present author observed this phenomenon not only in all climbers he studied alive, but also in the trees. He preserved seedlings of *S. elaeocarpa* (7006) and *S. staudtii* (6849) in the herbarium and he observed seedlings of *S. innocua* (seedling of herb. Leeuwenberg 4435) and *S. spinosa* (3508) in the hothouse.

The latter fact suggests that the tree species may have had climbing ancestors.

The young plants in the understory of the forest have usually larger, thinner, and more acuminate to even caudate leaves. In this stage even the tendrilled specimens of various species are easily confused with each other, e.g. *S. densiflora*, *S. dinklagei*, and *S. nigritana*; or *S. johnsonii* and *S. samba*; or *S. boonei*, *S. tchibangensis*, and *S. urceolata*; or *S. barteri* and *S. campitoneura*; or *S.*

soubrensis and *S. splendens*. When the tendrils are wanting, this resemblance may cause endless confusion of species, e.g. *S. dale* and *S. nigritana*; or *S. longicaudata* and *S. scheffleri*. Therefore, the young plants can be only identified by repeated comparative studies. It is impossible to make a key for them.

The plants may reach a considerable age as small shrubs in the understory of the forest before they climb to the tree tops in order to obtain enough light to flower. The latter has also been observed by KRUOFF (1942, p. 253).

Nearly all climbing species flower only when they reach a forest edge or a tree top. The flowering branches have in that case the normal leaves, indicated here as sun-leaves. A clear exception to this rule is observed in *S. malacoclados*. The present author collected a specimen with sun-leaves in bud in Liberia (4608), vegetative specimens with shade-leaves in the Ivory Coast (3994, 4032, 4114, 4486), and a specimen with shade-leaves and a single fruit in Cameroun. The plant with the sun-leaves grew at a forest edge, while the other grew in the understory of the forest. The flowering and fruiting specimens from Liberia, Ivory Coast, Ghana, and Gabon studied by the author bear sun-leaves, but the flowering specimens collected by Hanke (527) and Zenker (117, 4571) from Cameroun have shade-leaves.

Most African *Strychnos* species are unarmed. Axillary spines occur only in *S. cocculoides*, *S. congolana*, and *S. spinosa*, all of the section *Spinosae*, and *S. afzelii*. Spines occur more often in species from outside this part of the world, e.g. *S. axillaris*, *S. brasiliensis*, *S. nigricans*, *S. parvifolia*, and *S. poeppigii*.

A single species, *S. aculeata*, has spreading prickles even on the trunk. This phenomenon has never been observed in extra-African species.

The corolla may change its colour at anthesis, as is observed in *S. staudtii* (Breteler c.s. 2575) and *S. campagneura* (Leeuwenberg 7478). They are often white and turn yellow. The species with white corollas and long white filaments have pale yellow or greenish anthers which turn dark brown or black at anthesis, e.g. *S. boonei* (Breteler 2896) and *S. soubrensis* (Leeuwenberg 4146).

ANATOMY

As far as is known, all species, except those of the section *Spinosae*, and *S. henningii*, have bark-islets in the wood. This has been observed in nearly all African and some extra-African species. Dr. A. M. W. MENNEGA (Bot. Museum, Utrecht) will publish more on this subject.

FLOWERING SEASONS

A few remarks only can be made on this very incompletely known phenomenon. They are based on field observations by the present author and deduced from dates provided by herbarium specimens.

Some species show a distinct flowering period which often is short. Several savanna species flower once a year in the dry season, often just before the bush-fire; this was observed many times with *S. cocculoides*, *S. decussata*, *S. innocua*,

S. madagascariensis, *S. potatorum*, *S. pungens*, and *S. spinosa*. These species are deciduous and new leaves and flowers appear shortly after or sometimes before the fruits and old leaves are shed.

A fixed flowering season may also occur in several forest species, but our knowledge about this is very incomplete. Several of them flower and bear the fruits of the preceding year at the same time, e.g. *S. aculeata*, *S. campitoneura*, *S. congolana*, *S. lucens*, *S. nigritana*, *S. scheffleri*, *S. soubrensis*, and *S. staudtii*. They flower in the dry season often soon after the first showers announcing the rainy season. In the latter period *S. afzelii*, *S. boonei*, *S. chrysophylla*, *S. dolichothysa*, *S. soubrensis*, *S. splendens*, and *S. urceolata* also flower; however there are only a few, mostly unsatisfactory, observations on these species.

S. elaeocarpa, and perhaps also *S. canthioides*, flower once a year in the rainy season.

A number of species may flower several times a year; this is probably the case with *S. dalei*, *S. icaja*, and *S. mimfiensis*.

S. longicaudata and *S. matopensis* may have a rather long flowering period once a year, as they are often found with buds, flowers, and immature fruits on a single branchlet. For *S. longicaudata* this period is at the end of the dry and at the beginning of the rainy season.

More or less continuous or gregarious flowering may occur in *S. asterantha*, as the species has been observed with flowers and fruits at the same time from March to October (herb. Leeuwenberg 5247, 6288, 6999). This may also be true for *S. henningsii*, *S. myrtoides*, and *S. variabilis*.

VERNACULAR NAMES

The list of vernacular names compiled from the labels of all the specimens examined proved to be very heterogeneous and so of doubtful value. Usually, several names are used side by side for several species together, e.g. the large-fruited savanna species of which the pulp is edible are called: Mtonga, Mkome, or Mkwakwa in Kiswaheli. Moreover several species may have the same name in different languages, e.g. Mtonga is used in Santoba and Zigua, Mkome in Bende, Chilala, Lamba, Nyamwezi, and Sima, and Mkwakwa in Chindao, Nalwe, Venda, Zigua, and Zulu.

The most important conclusion from the study of these series of names is that only in extremely few cases a vernacular name does cover a single species. The latter can be said of some Madagascan species: *S. decussata* is called Hazomby, *S. madagascariensis* Dangoa or Vakakoa, and *S. spinosa* Mokotra or Voavontaka.

USES

The pulp of the fruit of *S. cocculoides*, *S. innocua*, *S. madagascariensis*, *S. pungens*, and *S. spinosa* is edible, but only when the fruits are absolutely mature. This may also be true for *S. lucens* and *S. nigritana*.

The wood of *S. mitis* is used as timber.

The fruits of *S. aculeata*, and less often those of *S. camptoneura*, *S. icaja*, and *S. potatorum* are used as fish poison.

A decoction of the root bark of *S. densiflora* and especially *S. icaja* is used as an ordeal poison. More complete information on this usage is given by BISSET & LEEUWENBERG in *Lloydia* 31: 208–222. 1968. There are also a few notes on medicinal uses.

CITATION OF SPECIMENS

All specimens cited have been seen by the present author, unless marked 'not seen'.

The lecto- or neotypes have been chosen by the author, unless marked 'designated by'.

The lecto- or neotypes have been chosen from among the isotypes, syntypes, or iso-syntypes: e.g. Mann 175 (K) was an isotype of *S. aculeata*; Brédo 1091 (BR) was a syntype of *S. samba*; and Bachmann 1745 (E) was an iso-syntype of *S. henningsii*. The duplicates of the lectotypes are always cited as isotypes. Because of this, several synonyms have necessarily become homotypic: e.g. the holotype of *S. subscandens*, a synonym of *S. floribunda*, is the lectotype of *S. welwitschii*; this specimen was an iso-syntype of the latter name. The lectotype of *S. unguacha* var. *grandifolia*, a synonym of *S. innocua*, chosen from among the iso-syntypes, is also the lectotype of *S. xerophila*, chosen from among the syntypes.

Neotypes have been designated for e.g. *S. camptoneura* and *S. innocua*. The best specimen collected near the type locality has served for this purpose. The neotype of *S. henningsii*, designated by E. A. BRUCE (1955) is rejected here, as according to the Code an iso-syntype should have been chosen as lectotype.

The herbaria containing WAG-duplicates are not always cited. An exception is made for the types and neotypes.

RELATIONSHIP TO OTHER GENERA

The genus *Strychnos* belongs to the tribe *Strychnae* which comprise further the genera *Gardneria* and *Neuburgia*, both from Asia. The three genera resemble each other very much in their flowers, as can be seen from the figures in the Flora Malesiana (Loganiaceae, by LEENHOUTS, 1962). Furthermore *Gardneria* and *Strychnos* have in common the horny endosperm, which surrounds the more or less straight embryo.

They differ mainly as follows:

1. Leaves mostly 3–5-plinerved; tendrils often present; fruit 1-many-seeded; stipular line faint; stipules occasional (only in section *Spinosae* where they are mostly deciduous) *Strychnos* L.
- Leaves pinninerved; tendrils absent; stipular line distinct or stipules present 2

2. Inflorescence lateral; stipular line connects petiole bases; fruit a 1–several-seeded berry **Gardneria** Wall.
- Inflorescence terminal; stipules interpetiolar, adnate to the petioles, in older leaves often split along a distinct suture; fruit drupaceous
Neuburgia Blume

TAXONOMIC PART

THE GENUS STRYCHNOS L.

Strychnos L. Sp. Pl. 189. 1753.

Type species: *S. nux-vomica* L.

Heterotypic synonyms: *Rouhamon* Aubl., Hist. Pl. Guian. 1: 93, t. 36. 1775.

Type species: *R. guianensis* Aubl. (= *S. guianensis* (Aubl.) Mart.). Homotypic synonyms: *Lasiostoma* Schreb., Gen. Pl. 75. 1789. *Chemnicia* Scop., Introd. 139. 1777. *Toxicaria* Schreb., Naturforscher 19: 146. 1783. Type species: *T. americana* Schreb. (= *S. guianensis* (Aubl.) Mart.).

Curare v. Humb. et Bonpl., Voy. Reg. Equin. (= Relat. Hist.) 2: 549. 1819.

Type species: *S. curare* H.B.K. (= *S. guianensis* (Aubl.) Mart.).

Narda Vell., Fl. Flum. 1: 108. 1825 and 3: t. 24. 1827. Type species: *N. spinosa* Vell. (= *S. brasiliensis* (Spreng.) Mart.).

Brehmia Harv. in W. J. Hooker, Lond. Journ. Bot. 1: 25. 1842. Type species: *S. spinosa* Lam. (*B. spinosa* (Lam.) Harv. ex D.C.).

Atherstonea Pappe, Sylva Cap. 2nd ed. 29. 1862. Type species: *A. decussata* Pappe (= *S. decussata* (Pappe) Gilg.).

Erect or climbing shrubs, lianas, or trees. *Lianas*: up to at least 120 m long and 45 m high climbing in trees; trunk up to 30 cm in diam.; with curled tendrils which become more woody with age and are solitary or arranged in 1–3 pairs above each other on short branches, in the axils of small bracts or – only if solitary – sometimes in the axils of ordinary leaves, morphologically occupying the place of an inflorescence. *Trees*: usually less than 10 m high (savanna spp.), 10–35 (40) m (forest spp.); trunk 10–100 cm in diam.; without tendrils, often with arching branches (*S. usambarensis*, *S. xantha*). Wood mostly hard, usually with bark-islets (in Africa only not in section *Spinosae* and *S. henningsii*); bark mostly thin, smooth or less often rough, in lianas often with large lenticels, sometimes thick and corky (*S. cocculoides*, *S. congolana*, *S. pseudo-quina*). *Branches* armed with axillary or sometimes terminal simple straight or slightly recurved spines (in Africa only in *S. afzelii* and section *Spinosae*), unarmed, or rarely with spreading prickles (*S. aculeata*), often lenticellate, rarely corky; branchlets hairy or glabrous, lenticellate or not, terete, quadrangular, or flattened (some American spp.), sometimes sulcate, especially when dry. *Stipules* reduced to an often ciliate and straight rim connecting the petiole-bases, present only in the section *Spinosae* (linear and deciduous, more or less persistent only in *S. congolana*). *Leaves* opposite, sometimes decussate, or on the main axis sometimes ternate, those of a pair or whorl equal or subequal, petiolate or sometimes subsessile, mostly inserted on distinct leaf-cushions; petiole rounded beneath, somewhat channeled above; blade variously shaped – in leaves in lianas and climbing shrubs on the main axis and at the bases of the branchlets usually smaller and comparatively wider – orbicular to narrowly elliptic, mostly coriaceous, in the shade thinner, often larger, and more acute at the apex, entire; with 1–2 (3)

pairs of distinct secondary veins from or from above the base curved along the margin, usually not fully reaching the apex, anastomosing with the other veins or less often pinnately veined. Often some pairs of scale-like cataphylls at the base of new shoots, inflorescences, and the branches of the latter. *Inflorescence* terminal, axillary, or both, thyrsoid, 1-many-flowered, shorter or longer than the leaves, lax or congested, sometimes sessile. *Flowers* 4–5-merous, actinomorphic or with only sepals unequal. *Calyx* often subtended by 1–2 sepal-like bracteoles; sepals green or coloured approximately like the corolla, free or connate up to one-half of their length, equal, subequal, or sometimes unequal, imbricate, shorter or rarely longer than the corolla (*S. longisepala*, *S. ternata*, often *S. spinosa*), orbicular to linear, outside hairy or glabrous, inside usually glabrous, mostly ciliate, herbaceous to coriaceous and incrassate; the latter only when orbicular or nearly so. *Corolla* rotate to salver-shaped, white to yellowish, greenish, pale green, or rarely orange or ochraceous, thin at the base, always more or less thickened towards the lobes, on both sides variously hairy, papillose, or glabrous, but inside at the base always glabrous, sometimes with a corona at the mouth; lobes valvate in the bud, triangular to oblong, acute or subacute, entire, erect to recurved. *Stamens* exserted or included, inserted at the mouth of or in the corolla tube; filaments glabrous or sometimes hairy; anthers introrse, orbicular to narrowly oblong, usually narrower after the pollen is shed, basifixated, variously hairy or glabrous, often apiculate at the apex, cordate, deeply so, or less often sagittate at the base; cells 2, discrete, parallel or sometimes divergent at the base, dehiscent throughout by a longitudinal split. *Pistil* variously hairy or glabrous; ovary 2- or rarely 1-celled (*S. mellodora*, *S. spinosa*, *S. xylophylla*) or incompletely bilocular (fide KRUKOFF); style simple, included or exserted – if hairy – usually only at the base, persistent; stigma pale-coloured, mostly white, capitate, less often obscurely bilobed, or occasionally conical, minutely pubescent with glandular hairs. In each cell of a 2-celled ovary one axial placenta with 2 to about 50 ovules, attached to the middle of the septum. In a one-celled ovary one basal placenta which is mostly globose, with few (*S. mellodora*, *S. xylophylla*) or many ovules (*S. spinosa*). *Fruit* a berry, 1–2-celled, globose or nearly so (most variable in shape in *S. camptoneura*), mostly yellow to red, less often green when mature, sometimes brown (*S. elaeocarpa*) or blue-black (*S. potatorum*), immature often glaucous, glabrous, subtended by the persisting calyx, 0.8–18 cm in diam., 1–145-seeded, with a certain correlation between size, number of seeds, and thickness of the wall, often mucronate, sometimes stipitate, smooth, with a granular skin, or less often warty. Wall thin and soft in small fruits, thicker and brittle in (mature) larger (very hard in nearly mature!!), or in most very large fruits (*S. aculeata*, *S. ternata*) very hard. Pulp juicy, fleshy, often edible (*S. cocculoides*, *S. innocua*, *S. madagascariensis*, *S. pseudo-quina* (sweet), *S. pungens*, *S. spinosa*, and also in some small-fruited spp.). *Seeds* large, 0.5–3 (5) cm long, variably shaped, generally disk-shaped to subglobose, with the hilum in various positions. Testa thick and osseous to very thin and membranaceous, rough and scabrid-pubescent (only when thick) or smooth and sericeous to glabrous (winged only in

S. campitoneura). Endosperm horny, slightly diaphanous, creamy to dark brown, composed of two equal portions united at the margin. Embryo surrounded by the endosperm, straight; cotyledons cordate or nearly so, leafy, veined. Sometimes some colleters above the bracts, on the base of the sepals, and near the base of the petioles.

Distribution: Circumtropical, about 170 species.

SECTIONAL ARRANGEMENT

The genus *Strychnos* is subdivided into 12 sections (references, synonymy, typifications, diagnoses, and lists of species cited below) which are arranged in a more or less natural system. The species within the sections are placed in separate series for each part of the world, again in a more or less natural order. The mutual relationships are outlined and discussed at the end of this chapter. The present author follows KRUKOFF (1965) for the American species (except for the moving of *S. oiapocensis* to a different place in *Breviflorae*). He follows LEENHOUTS (1962) for the delimitation of the Asiatic species studied by that author and HILL (1917) for the other Asiatic species. The arrangement of both the African and Asiatic species as regards sections is proposed here for the first time.

Section *Strychnos* is especially recognizable by the long slender corolla tube. The other sections, which have shorter corolla tubes, are distinguished by the indumentum on the inner side of the corolla and (excepting *Breviflorae*) also by the arrangement of the tendrils. The shape and the indumentum of the seeds are important in some sections, especially *Dolichanthae*, *Scyphostrychnos*, and *Aculeatae*. The insertion of the stamens and indumentum of the pistil also have an important diagnostic value.

1. Section *Strychnos*

Type species: *S. nux-vomica* L.

Heterotypic synonyms: *Tubiflorae* A. W. Hill, Kew Bull. 1917: 124. 1917.

Type species: *S. tubiflora* A. W. Hill.

Longiflorae Prog. in Martius, Fl. Bras. 6 (1): 271. 1868; Solereder in Engler & Prantl, Nat. Pflanzenf. 4 (2): 37. 1892, partly (excl. *S. potatorum*, *S. laurina* (= *S. cohbrina*), *S. multiflora* (= *S. colubrina*), *S. spinosa*, and *S. laxa*); Krukoff & Monachino, Brittonia 4: 261. 1942; Krukoff, Mem. N.Y. Bot. Gard. 12(2): 17. 1965. Type species not designated.

Trees, shrubs, or more often climbers, usually without spines (spines only in *S. lucida*). Tendrils – if present – solitary or paired (the latter only occasionally in some American species, e.g. *S. jobertiana*). Flowers (4–)5-merous. Sepals ovate to narrowly oblong, rounded to long-acuminate at the apex. Corolla long, glabrous or with indumentum of various densities and distributions both outside and inside, usually papillose; corolla tube manifestly longer than the calyx, longer than the lobes (except in *S. angustiflora*). Stamens hardly to conspicuously exserted, inserted at (or near?) the mouth of the corolla tube; filaments variable in length, often very short; anthers glabrous or – if pilose – acuminate at the base (American spp.). Pistil glabrous or pilose in the middle; ovary 2-celled (?); style long, slender, more than three times as long as the ovary. Fruit yellow to red (always?), globose or ellipsoid, variable in size, 1.5–12 cm in diam., 1-many-seeded. Wall thin to thick. Seeds usually flattened, mostly obliquely elliptic or nearly so, often plano-convex, often curved. Testa osseous,

thick, not sticking to the pulp and not easily overlooked when seed is washed, sericeous or densely scabrid-pubescent to subglabrous.

American species:

- S. chlorantha Prog.
- S. ramentifera Ducke
- S. colombiensis Krukoff
- S. asperula Sprague et Sandw.
- S. rondeletioides Spruce ex Benth.
- S. macrophylla Barb. Rodr.
- S. barnhartiana Krukoff
- S. brachiata Ruiz et Pav.
- S. blackii Ducke (= prec.?)
- S. trinervis (Vell.) Mart.
- S. panamensis Seem.
- S. tabascana Sprague et Sandw.
(= prec.?)
- S. divaricans Ducke
- S. eugeniifolia Monachino
- S. krukoffiana Ducke
- S. medeola Sagot ex Prog.
- S. toxifera Rob. Schomb. ex Benth.
- S. tomentosa Benth.
- S. diaboli Sandw.
- S. javariensis Krukoff
- S. jobertiana Baill.
- S. pseudo-quina A. St.Hil.
- S. xinguensis Krukoff
- S. amazonica Krukoff
- S. solimoesana Krukoff
- S. froesii Ducke
- S. lobelioides Krukoff et Barneby
- S. peckii B. L. Robinson
- S. smithiana Krukoff
- S. erichsonii Rich. Schomb. ex Prog.
- S. gardneri A. D.C.
- S. pubiflora Krukoff
- S. pedunculata (A. D.C.) Benth.
- S. mitscherlichii Rich. Schomb.
- S. dariensis Seem.

Asiatic species:

- S. kerrii A. W. Hill
- S. tubiflora A. W. Hill
- S. wallichiana Steud. ex A. D.C.
- S. cinnamomifolia Thwaites
- S. gauthierana Pierre ex Dop
- S. spireana Dop
- S. rupicola Pierre ex Dop
- S. usitata Pierre ex Dop (= prec.?)
- S. donnaiensis Pierre ex Dop (= prec.?)
- S. dinhensis Pierre ex Dop (?)
- S. cathayensis Merr.
- S. ignatii Berg.
- S. hainanensis Merr. et Chun (= prec.?)
- S. lucida R.Br.
- S. nux-vomica L.
- S. nux-blanda A. W. Hill
- S. cheliensis Hu
- S. angustiflora Benth.

Notes. The sections *Longiflorae* and *Tubiflorae* are combined here as they share the following characters: the same ratio between tube and lobes of the corolla; style long and slender; tendrils mostly solitary. The seeds also often show resemblances, e.g. those of *S. erichsonii* and *S. ignatii*. The section should be called *Strychnos* as it includes the type species of the genus.

As to the ratio between the tube and the lobes of the corolla, *S. angustiflora* should be included in section *Rouhamon*. As to its habit, its terminal inflorescences, and its fruits, however, it shows a striking resemblance to *S. cinnamomifolia*, and so the present author prefers to follow HILL (1917) in placing the species here.

The lectotype species of the synonym *Tubiflorae* is designated for the same reason as that of *Breviflorae*. For comments see there.

2. Section **Rouhamon** (Aubl.) Prog. in Martius, Fl. Bras. 6(1): 275. 1868.

Basionym: *Rouhamon* Aubl., Hist. Pl. Guian. 1: 93. 1775, as genus.

Type species: *R. guianensis* Aubl. (= *S. guianensis* (Aubl.) Mart.). Homotypic synonym: *Intermediae* Solered. in Engler & Prantl, Nat. Pflanzenf. 4(2): 40. 1892, partly (excl. *S. pungens*, *S. occidentalis*, *S. innocua*, *S. aculeata*, *S. micrantha* Thwaites, *S. dalzellii*, and *S. axillaris*); Krukoff & Monachino, Brittonia 4: 295. 1942; Krukoff, Mem. N.Y. Bot. Gard. 12(2): 55. 1965.

Heterotypic synonyms: *Heterodoxae* Duvign., Bull. Soc. Roy. Bot. Belg. 85: 33. 1952. Type species: *S. stuhlmannii* Gilg (= *S. potatorum* L.f.).

Floribundae Duvign., l.c. p. 34. Type species: *S. floribunda* Gilg. Homotypic synonym: *Floribundae* ser. *Eufloribundae* Duvign., l.c.; Bruce & Lewis, Kew Bull. 1955: 627. 1956.

Floribundae ser. *Littorales* Duvign., l.c. p. 35. Lectotype species: *S. littoralis* A. Chev. ex Hutch. et Dalz. (= *S. floribunda* Gilg).

Booneae Duvign., l.c. p. 32. Type species: *S. boonei* De Wild.

Variabiles Duvign., l.c. p. 19. Type species: *S. variabilis* De Wild.

Unarmed climbers, shrubs, or trees. Tendrils – if present – solitary. Inflorescence axillary or less often terminal. Flowers 4–5-merous. Sepals ovate to narrowly oblong, rounded to long-acuminate at the apex. Corolla outside glabrous, minutely papillose-pubescent or puberulous (*S. boonei*); inside pilose to lanate with white hairs only in the throat to nearly on the whole surface, base of tube always, apex of lobes mostly glabrous; tube urceolate to cylindrical, variable in length (in African spp. 0.3–1.5(2) × as long as the lobes); lobes spreading or recurved. Stamens exserted, inserted at the mouth of the corolla tube; filaments variable in length, at least in African spp. usually longer when corolla tube shorter (especially *S. decussata* and *S. potatorum*), 0.5–2 × as long as the anthers which are glabrous. Pistil glabrous or less often pilose. Fruit small, yellow to red, blue-black (*S. potatorum*), or brown (*S. elaeocarpa*), globose or ellipsoid, 1–3 cm in diam., 1–2-seeded. Wall thin. Seed ellipsoid, depressed-globose, or approximately disk-like, flattened or not. Testa usually thin, cartilaginous, smooth, sticking to the pulp, densely and shortly pubescent or glabrous; or less often thick, osseous, densely scabrid-pubescent and rough or sericeous and smooth.

American species:	African species:
<i>S. guianensis</i> (Aubl.) Mart.	<i>S. potatorum</i> L.f. (also in Asia)
<i>S. glabra</i> Sagot ex Prog.	<i>S. decussata</i> (Pappe) Gilg
<i>S. subcordata</i> Spruce ex Benth.	<i>S. usambarensis</i> Gilg
<i>S. bicolor</i> Prog.	<i>S. floribunda</i> Gilg

<i>S. hirsuta</i> Spruce ex Benth.	<i>S. elaeocarpa</i> Gilg ex Leeuwenberg
<i>S. cogens</i> Benth.	<i>S. ndengensis</i> Pellegr.
<i>S. melinoniana</i> Baill.	<i>S. gnetifolia</i> Gilg ex Onochie et Hepper
	<i>S. boonei</i> De Wild.
	<i>S. variabilis</i> De Wild.

Notes. The section *Rouhamon* contains in the present author's delimitation the American species included in this section by KRUKOFF (1965) and several African species constituting four sections of DUVIGNEAUD (1952). They are here put together as they share the following characters: tendrils solitary; the same pattern of hairiness on the inner side of the corolla; rather long filaments inserted on the mouth of the corolla; the same relationship between the length of the corolla tube and of the lobes; fruits small; variation in seed characters about the same.

S. ndengensis of *Floribundae* agrees with *S. guianensis* as to the indumentum in the corolla and in addition has almost the same calyx and pistil. *S. floribunda* and *S. usambarensis* also agree with *S. guianensis* in the characters mentioned above, except that the indumentum in the corolla is less dense. *S. decussata*, included by DUVIGNEAUD in *Micranthae*, resembles *S. floribunda* strikingly in floral and seed characters, but the variation in proportions between the corolla tube and lobes and the length of the filaments is greater. The same is true for *S. potatorum*. *S. hirsuta* and *S. variabilis* agree more or less as to the sepals, the indumentum in the corolla, and the pistil.

S. floribunda should be the type species of section *Floribundae* according to the Code (Art. 22), and not *S. dale* which was chosen by DUVIGNEAUD.

3. Section **Breviflorae** Prog. in Martius, Fl. Bras. 6(1): 277. 1868; Solereder in Engler & Prantl, Nat. Pflanzenf. 4(2): 40. 1892, partly (excl. *S. medeola*, *S. psilosperma* (= *S. axillaris*), and *S. acuminata* (= *S. colubrina*)); Krukoff & Monachino, Brittonia 4: 305. 1942; Krukoff, Mem. N.Y. Bot. Gard. 12(2): 66. 1965.

Type species: *S. breviflora* A. D.C. (= *S. brasiliensis* (Spreng.) Mart.).

Heterotypic synonyms: *Malacocladæ* Duvign., Lejeunia 11: 57. 1947, partly (excl. *S. cooperi* and *S. matopensis*). Type species: *S. malacoclados* C. H. Wright. Homotypic synonyms: *Micranthæ* Duvign., Bull. Soc. Roy. Bot. Belg. 85: 29. 1952, partly (excl. *S. matopensis* and *S. atherstonei*). *Micranthæ* ser. *Malacocladæ* (Duvign.) Duvign., l.c. p. 30, partly (see the latter); Bruce & Lewis, Kew Bull. 1956: 155. 1956, partly (excl. *S. decussata*).

Micranthae ser. *Icaya* Duvign., l.c. p. 30. Type species: *S. icaya* Baill.

Micranthae ser. *Acrotrichae* Duvign., l.c. p. 30. Type species: *S. malchairii* De Wild.

Mites Duvign., l.c. p. 23. Type species: *S. mitis* S. Moore.

Ligustroides Duvign., l.c. p. 31; Bruce, Kew Bull. 1955: 127. 1955. Type species: *S. ligustroides* Gosswe. et Mendonça (= *S. henningsii* Gilg).

Climbers with solitary (at least in *S. parviflora*, *S. castelnaeana*, *S. rubiginosa*, *S. torresiana*, *S. albiflora*, *S. parvifolia*, and the first 8 African spp.) or paired tendrils (at least in *S. grayi*, *S. nigricans*, *S. mattogrossensis*, *S. schultesiana*, and *S. chromatoxylon*, the latter with tendrils in 1–3 pairs), or trees or shrubs without tendrils (at least in *S. fendleri*, *S. brasiliensis*, *S. mitis*, and *S. henningsii*), unarmed, or with spines (*S. rubiginosa*, *S. parvifolia*, and *S. afzelii*; the latter sometimes only with blunt spines on thick branches which are thickened bases of small deciduous branchlets). Inflorescence axillary or terminal. Flowers 4–5-merous. Sepals suborbicular to narrowly oblong, rounded to subulate at the apex. Corolla outside glabrous or shortly or sparsely pubescent; tube very short, usually shorter than or about as long as the calyx, mostly as long as or shorter than the lobes, inside glabrous; lobes inside variably hairy or occasionally glabrous. Stamens more or less distinctly exserted, inserted at the mouth of the corolla tube or only in *S. mitis* in the tube itself; filaments shorter than or about as long as the anthers which are bearded or glabrous. Pistil glabrous or puberulent in the middle. Fruit small or large, ellipsoid or globose, yellow to red, about 1–10 cm in diam., one- to many-seeded. Seeds variously shaped, grooved only in *S. henningsii*. Testa either thick, rough, and scabrid-pubescent (*S. castelnaeana*, *S. rubiginosa*, *S. fendleri*, *S. acuta*, *S. parvifolia*, *S. pachycarpa*, *S. dolichothysa*, *S. urceolata*) or thinner, smooth, and glabrous (*S. brasiliensis*, *S. afzelii*, *S. mitis*, *S. henningsii*), or very thin and mostly sticking to the pulp (*S. poeppigii*, *S. longisepala*, *S. tarapotensis*, *S. icaya*, *S. mimfiensis*, *S. malchairii*, *S. campicola*, *S. malacoclados*, *S. angolensis*), or thin and woolly (*S. pachycarpa*, *S. icaya*).

American species:

- S. parviflora* Spruce ex Benth.
S. bovetiana Pires
S. castelnaeana Wedd.
S. rubiginosa A. D.C.
S. fendleri Sprague et Sandw.
S. torresiana Krukoff et Monachino

S. tarapotensis Sprague et Sandw. (= prec.?)
S. brasiliensis (Spreng.) Mart.

Notes. The indumentum on the inner side of the corolla varies as follows:

1. with small patch or line of densely pilose, lanate, or rather stiff hairs:
 - a. recurved and at apex: *S. mimfiensis*, *S. malchairii*, *S. campicola*.
 - b. slightly recurved and near apex: *S. castelnaeana*.
 - c. approximately at the middle: *S. rubiginosa*, *S. fendleri*, *S. torresiana*, *S. acuta*, *S. albiflora*, *S. oiapocensis*, *S. grayi*, *S. pachycarpa*, *S. nigricans*, *S. mattogrossensis*, *S. schultesiana*, *S. malacosperma*, *S. poeppigii*, *S. longisepala*, *S. tarapotensis*, *S. dolichothyrsa*, *S. urceolata*, *S. afzelii*.
2. with area of pilosity at base of lobes: *S. brasiliensis*, *S. icaja*, *S. malacoclados*, *S. angolensis*, *S. mitis*, *S. henningsii*.
3. completely lanate: *S. parviflora*.
4. glabrous: sometimes *S. icaja* and *S. henningsii*.

According to the present author, *Breviflorae* should contain not only the species enumerated by KRUOFF (1965), but also those of sections *Mites* and *Ligustroides* and most of those in sections *Malacocladae* and *Micranthae*. Strongly in favour of the combination of DUVIGNEAUD's sections with *Breviflorae* is the fact that several American species are more or less intermediate between the African sections in regard to the differential characters. These sections were distinguished by the indumentum of the inner side of the corolla. *S. castelnaeana* is intermediate between *S. malchairii* and the species listed under no. 1c of the above enumeration. The species of no. 2 are intermediate in this character between the latter and *S. parviflora*. The seeds of the American species, *S. castelnaeana*, *S. rubiginosa*, *S. fendleri*, and *S. acuta*, resemble strikingly those of *S. dolichothyrsa* and *S. urceolata*, both species from Africa, in their shape and indumentum. The same resemblance can be seen between *S. brasiliensis*, on the one hand, and *S. afzelii* and *S. mitis*, on the other. The characteristic grooved seed of *S. henningsii* is exceptional. Seeds with the same shape and groove are only known from *S. diplotricha*, placed in *Penicillatae*.

S. breviflora (= *S. brasiliensis*) should be considered as the type species of *Breviflorae* according to the International Code of Botanical Nomenclature (New Rule, Edinburgh, Art. 22).

S. oiapocensis, which was placed between *S. malacosperma* and *S. longisepala* on account of the inflorescence characters by KRUOFF (1965), is moved here to between *S. torresiana* and *S. acuta*. It resembles the latter two species more by the indumentum and sepals, according to the present author. Moreover, it may

be supposed that the tendrils of *S. malacosperma* and *S. longisepala* will be paired and those of *S. acuta* solitary. The tendrils of *S. torresiana* are solitary.

S. chromatoxylon is placed in *Breviflorae* with some doubt. It is related to *S. nigricans* by the narrow sepals, lenticellate branches, large fruits, and the arrangement of the tendrils, which are paired in *S. nigricans* and in 1–3 pairs in *S. chromatoxylon*. The flowers are incompletely known and the wood anatomy is very different (A. M. W. MENNEGA, personal comm.). Furthermore, the fruit is subcordate at the base instead of rounded. More complete material might give evidence as to its taxonomical position and in that case it might even represent a section of its own.

4. Section **Penicillatae** A. W. Hill, Kew Bull. 1917: 123. 1917, partly (excl. *S. ledermannii* and *S. luzonensis*); Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 22. 1952.

Type species: *S. penicillata* A. W. Hill (= *S. axillaris* Colebr.). Homotypic synonym: *Penicillatae* ser. *Eupenicillatae* Duvign., l.c. p. 23.

Heterotypic synonym: *Penicillatae* ser. *Tchibangenses* Duvign., l.c. p. 23.
Type species: *S. tchibangensis* Pellegr.

Climbers, shrubs, or trees, usually without spines (spines sometimes in *S. axillaris*). Tendrils – if present – solitary. Inflorescence axillary or terminal. Flowers 4–5-merous. Sepals ovate or nearly so, obtuse or acute (acuminate only in *S. trichoneura*). Corolla glabrous or slightly hairy outside, inside white-penicillate in the throat or on the lobes, further glabrous or (only in *S. diplotricha*) with a zone of pilosity near the insertion of the stamens; tube 1–2.5 × as long as the calyx, 0.8–1.7 × as long as the lobes which are suberect. Stamens included, inserted in the corolla tube or at the mouth (*S. benthamii*, *S. trichocalyx*, *S. dalzellii*, and often also *S. axillaris*), but always below the hairy ring; filaments mostly shorter than the anthers; anthers bearded at the base (ciliate all around sometimes in *S. myrtoides*). Pistil glabrous, often very short; ovary 2-celled (at least in African spp.); stigma capitate, sometimes subsessile. In each cell 2–30 ovules (African spp.). Fruit small, ellipsoid or subglobose, yellow to red (always?), 8–18 mm in diam. (always?), 1(–2)-seeded. Wall thin. Seed variable, mostly elliptic and flattened, ellipsoid and not flattened in *S. tchibangensis* and *S. diplotricha*, in the latter with a deep lateral groove. Testa thin, cartilaginous, sticking to the pulp, either very shortly pubescent and smooth or very shortly scabrid-pubescent and rough; glabrous in *S. diplotricha*.

African species:

- S. diplotricha* Leeuwenberg
- S. tchibangensis* Pellegr.
- S. matopensis* S. Moore
- S. longicaudata* Gilg
- S. pentantha* Leeuwenberg
- S. trichoneura* Leeuwenberg
- S. myrtoides* Gilg et Busse

Asiatic species:

- S. benthamii* C. B. Clarke
- S. trichocalyx* A. W. Hill
- S. dalzellii* C. B. Clarke (= seq.?)
- S. axillaris* Colebr.
- S. oophylla* Gilg et Bened. (= prec.?)
- S. ridleyi* King et Gamble
- S. melanocarpa* Gilg (?)

S. mostueoides Leeuwenberg
S. bifurcata Leeuwenberg

S. henryi Merr. et Yamamoto (?)

Notes. The *Penicillatae* are accepted here largely as was done by HILL. The two excluded species are moved to two other sections. *S. ledermannii* is placed in *Lanigerae* because of the woolly inner side of the corolla and the hairy pistil. *S. luzonensis* is better placed in *Brevitubae*, according to the present author, in view of its habit and floral characters, but unfortunately the tendrils are unknown. Besides the African species added to this section by DUVIGNEAUD, the present author includes further in it species from this part of the world.

Fairly constant throughout the whole section is the distance between the base of the corolla and the insertion of the stamens; this is also true for the distance between the base of the corolla and the brush-like ring and mostly also for the length of the corolla. The only character which varies is the length of the corolla tube, which may be shorter or longer than the lobes. The tube ends where the stamens are inserted or where the hair-ring is inserted. The former situation is found in the first three Asiatic species and often in *S. axillaris*, the latter in all other species and also often in *S. axillaris*. As these two different forms are known for *S. axillaris*, the present author prefers to leave these first three species in this section, although they approach *S. afzelii*, an African species of *Breviflorae*, in this character. In favour of this decision is that *S. trichocalyx* and *S. dalzellii* resemble strikingly *S. axillaris* and *S. longicaudata* in habit and shape of the flowers, and that *S. benthamii* shows an even more striking resemblance in these characters to *S. pentantha*.

As in *Breviflorae*, the species whose epithet is the basis for the section name, is considered as the type species. *S. penicillata* should also be the type species of the synonym *Penicillatae* ser. *Eupenicillatae*, and not *S. scortechinii* which was chosen by DUVIGNEAUD. The latter fact does not lead to any important changes in this case, as both the species names mentioned are synonymous with *S. axillaris*.

5. Section **Aculeatae** Duvign., Bull. Soc. Roy. Bot. Belg. 85: 21. 1952.

Type species: *S. aculeata* Solered.

The only species of this section is described on p. 49.

6. Section **Spinosae** Duvign., Bull. Soc. Roy. Bot. Belg. 85: 19. 1952; Bruce, Kew Bull. 1955: 35. 1955; Leeuwenberg, Act. Bot. Neerl. 14: 226. 1965.

Type species: *S. spinosa* Lam. Homotypic synonym: *Brehmia* Harv. in W. J. Hooker, Lond. Journ. Bot. 1: 25. 1842; De Candolle, Prod. 9: 18. 1845; Bentham, Journ. Linn. Soc. 1: 108. 1856 (as genus).

Shrubs, trees, or climbers, unarmed (*S. ternata*) or with straight or recurved spines. One pair of free narrowly oblong deciduous stipules or several pairs of

more or less connate and persistent linear stipules (*S. congolana*) in each leaf. Tendrils (only in *S. congolana*) paired. Bark often pale brown and corky. Wood without bark-islets. *Branches* lenticellate or not. *Inflorescence* terminal. *Flowers* 5-merous. *Sepals* pale green, connate at the base, narrowly oblong, subequal or sometimes unequal, acuminate to subulate at the apex. *Corolla* shorter or longer than the calyx, urceolate or campanulate, pale green (sometimes white in *S. coccoides*), outside glabrous or minutely pubescent, inside with an entire narrow white-penicillate corona at the mouth; tube 1–2.7 × as long as the lobes (tube cleft from the insertion of the stamens to the corona in *S. congolana*); lobes triangular, erect or suberect. *Stamens* included, inserted on or near the base of the corolla tube; filaments glabrous, shorter to longer than the anthers which are ciliate all around with villose or sometimes pilose hairs. *Pistil* pubescent or glabrous (often in *S. congolana*), short; stigma often subsessile, capitate. Ovary 2- or 1-celled (only in *S. spinosa*), with many ovules. *Fruit* large, yellow, orange, or green, globose, 6–15 cm in diam., many-seeded. Wall hard, thick. Pulp often edible. *Seed* flattened, obliquely elliptic or nearly so, often curved. Testa thick, osseous, smooth or slightly rough, shortly pubescent to practically glabrous.

Species (only in Africa):

- S. coccoides* Bak.
- S. spinosa* Lam.
- S. congolana* Gilg
- S. ternata* Gilg ex Leeuwenberg

Notes. The *Spinosae* are maintained in accordance with DUVIGNEAUD's conception. The recently described *S. ternata*, which falls completely within it, is added.

7. Section **Brevitubae** A. W. Hill, Kew Bull. 1917: 123. 1917, partly (excl. *S. maingayi*, *S. ovata*, *S. villosa*, *S. lanceolaris*, *S. hirsutiflora* (= *S. villosa*), *S. andamensis*, and *S. panayensis* (= *S. ovata*)); Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 25. 1952.

Lectotype species: *S. vanprukii* Craib.

Heterotypic synonym: *Sambae* Duvign., l.c. p. 28. Type species: *S. samba* Duvign.

Spineless trees (*S. mellodora* and *S. xylophylla*) or more often climbers with paired tendrils. *Branches* usually not or hardly lenticellate; branchlets very often quadrangular. *Inflorescence* axillary or sometimes terminal. *Flowers* 4–5-merous, mostly small. *Sepals* ovate or orbicular, rounded to acute at the apex. *Corolla* glabrous or slightly hairy outside, inside pilose in the throat and/or on the lobes, but base of tube and mostly apex of lobes glabrous; tube often shorter than the calyx, lobes 1–6 × as long as the tube, spreading or recurved. *Stamens* hardly to conspicuously exserted, inserted at the mouth of the corolla

tube; filaments variable in length, but mostly as long as or longer than the anthers which are usually glabrous (at least in all African and some Asiatic spp.). *Pistil* glabrous or sometimes with some minute hairs; ovary mostly 2-celled (at least in African spp. except *S. mellodora* and *S. xylophylla*) or 1-celled (*S. mellodora* and *S. xylophylla*); style short; stigma capitate or sometimes obscurely bilobed. In each cell (2)5–25 ovules (only seen in African spp.); in 1-celled ovary 2–9 ovules. *Fruit* yellow to orange as far as is known, small (at least in African and some Asiatic spp.), about 1.5–2 cm in diam., globose or nearly so, 1–2(3)-seeded. *Seed* ellipsoid or nearly so, slightly flattened, not as much as in section *Lanigerae*. *Testa* thin, cartilaginous, sticking to the pulp and easily overlooked when seed is washed, pubescent and smooth (when known), rough only in *S. flavesiensis*.

African species:

- S. mellodora* S. Moore
- S. xylophylla* Gilg
- S. samba* Duvign.
- S. johnsonii* Hutch. et M. B. Moss
- S. cuniculina* Leeuwenberg
- S. cuminodora* Leeuwenberg
- S. millepunctata* Leeuwenberg

Asiatic species:

- S. umbellata* (Lour.) Merr.
- S. paniculata* Champ. ex Benth. (= prec.?)
- S. aenea* A. W. Hill
- S. vanprukii* Craib
- S. tetragona* A. W. Hill
- S. confertiflora* Merr. et Chun
- S. luzonensis* Elm.
- S. quadrangularis* A. W. Hill
- S. flavesiensis* King et Gamble
- S. bicirrhosa* Lesch. ex Roxb.
- S. vitiensis* A. W. Hill

Notes. *Brevitubae* in the delimitation of the present author comprise those species of HILL's *Brevitubae* and *Lanigerae* which are characterized by paired tendrils, a glabrous or hardly hairy pistil, and a thin testa. *Sambae* of DUVIGNEAUD fall completely within this delimitation. The only species in this section with rough seeds, common in *Lanigerae*, is *S. flavesiensis*. It is placed here as it has glabrous pistils in small flowers.

S. johnsonii and *S. vanprukii* resemble each other strikingly by the quadrangular branchlets, the leaves, and the flowers. They share this character of the branchlets with *S. samba*, *S. tetragona*, and *S. quadrangularis*. The small flowers of *S. samba* come very near to those of *S. tetragona* and *S. vitiensis*.

The lectotype species designated here is representative for the section.

8. Section ***Lanigerae*** A. W. Hill, Kew Bull. 1917: 123. 1917, partly (excl. *S. potatorum* and *S. flavesiensis*).

Lectotype species: *S. colubrina* L.

Heterotypic synonym: *Heterophyllae* Duvign., Bull. Soc. Roy. Bot. Belg. 85:

25. 1952; Bruce & Lewis, Kew Bull. 1956: 154. 1956. Type species: *S. moandaensis* De Wild.

Climbers. *Branches* lenticellate or not. Tendrils paired. *Inflorescence* axillary and/or terminal. *Flowers* (4–)5-merous, often small. *Sepals* ovate or orbicular or nearly so, rounded to acute at the apex. *Corolla* outside glabrous or sparsely and/or minutely pubescent, inside with a zone of pilosity or villosity in the throat, in the tube, and/or on the base of the lobes, but base of tube always and apex of lobes mostly glabrous; tube very short to rather long; lobes 0.6–3(10) × as long as the tube, triangular to oblong, suberect to recurved. *Stamens* hardly to conspicuously exserted, inserted at the mouth of the corolla tube; filaments variable in length, sometimes very short; anthers mostly bearded at the base, less often glabrous, or rarely ciliate all around (*S. dinklagei*). *Pistil* minutely pubescent to hirsute-pilose (glabrous only in *S. maingayi* subsp. *borneensis* Leenh.), especially in the middle; ovary usually glabrous at the base, 2-celled (at least in African spp.); style mostly glabrous at the apex; stigma rather large, capitate or sometimes (*S. scheffleri*) saucer-shaped. In each cell 5–20(25) ovules. *Fruit* orange or orange-yellow (at least in the African and some Asiatic spp.), small or medium-sized, globose or obliquely ellipsoid, 0.8–4(5) cm in diam., 1–10(15)-seeded. Wall thin or rather so. *Seed* mostly flattened, obliquely ovate, elliptic, or trullate, or tetrahedral, often irregularly curved. Testa osseous, with mostly thick, very short, erect hairs, rough (smooth only in *S. moandaensis*), rather thick, not sticking to the pulp.

African species:

- S. talbotiae* S. Moore
- S. chrysophylla* Gilg
- S. memecyloides* S. Moore
- S. splendens* Gilg
- S. soubrensis* Hutch. et Dalz.
- S. ngouniensis* Pellegr.
- S. scheffleri* Gilg
- S. kasengaensis* De Wild.
- S. moandaensis* De Wild.
- S. panganensis* Gilg
- S. fallax* Leeuwenberg
- S. dinklagei* Gilg

Asiatic species:

- S. hypogyna* C. B. Clarke
- S. andamensis* A. W. Hill
- S. maingayi* C. B. Clarke
- S. ovata* A. W. Hill
- S. villosa* A. W. Hill
- S. curtisii* King et Gamble
- S. coriacea* Thwaites
- S. polytrichantha* Gilg
- S. oleifolia* A. W. Hill
- S. lanata* A. W. Hill
- S. micrantha* Thwaites
- S. myrioneura* Gilg
- S. colubrina* L.
- S. lenticellata* A. W. Hill
- S. borneensis* Leenh.
- S. ledermannii* Gilg et Bened.
- S. lanceolaris* Miq.
- S. polyantha* Pierre ex Dop
- S. thorelli* Pierre ex Dop
- S. rufa* C. B. Clarke

Notes. *Lanigerae* in the conception of the present author comprise those species of HILL's *Lanigerae* and *Brevitubae* which have paired tendrils, a pilose pistil, and a mostly rough and rather thick testa. As *Heterophyllae* agree perfectly with this conception of *Lanigerae*, they are included in this section.

Several Asiatic species, e.g. *S. andamensis*, *S. colubrina*, and *S. borneensis*, approach *S. scheffleri* and *S. splendens* in leaf and flower characters. The indumentum, the fruit, and the seeds of *S. kasengaensis* resemble very much those of *S. thorelii* and *S. rufa*.

9. Section **Phaeotrichae** Duvign., Bull. Soc. Roy. Bot. Belg. 85: 18. 1952.

Type species: *S. phaeotricha* Gilg.

The only species of this section is described on p. 215.

Note. *Phaeotrichae* are somewhat exceptional in the genus by the pubescent glands on the corolla lobes and the filaments.

10. Section **Densiflorae** Duvign., Bull. Soc. Roy. Bot. Belg. 85: 24. 1952, partly (excl. *S. vanderystii*); Bruce & Lewis, Kew Bull. 1956: 269. 1956.

Type species: *S. densiflora* Baill.

Shrubs, trees, or climbers. *Branches* mostly lenticellate. Tendrils – if present – paired. *Inflorescence* axillary or ramiflorous. *Flowers* 4–5-merous. *Sepals* ovate or orbicular or nearly so, mostly rounded at the apex (sometimes acute or obtuse in *S. pungens*). *Corolla* outside glabrous, inside with a brush-like ring of white lanate hairs in the throat and just at the base of the lobes (a second ring only in *S. staudtii*); tube cylindrical or nearly so, (0.7)1–1.7 × as long as the lobes; lobes narrowly triangular, thick, spreading. *Stamens* hardly exserted; anthers sessile or subsessile at the mouth of the corolla tube, mostly glabrous. *Pistil* pilose or hirsute-pilose in the middle (glabrous only in *S. staudtii*); ovary glabrous at the base, 2-celled; style thick, glabrous at the apex; stigma rather large. In each cell 6–60 ovules. *Fruit* orange or yellow, rarely white (*S. staudtii*), nearly mature bluish-green, globose or nearly so, few- to many-seeded, with somewhat granular skin, either large, 4–12 cm in diam., hard, and thick-walled, or smaller, not very hard, and thin-walled. Wall in thick-walled immature or dry fruits woody, in mature fresh fruits easily broken by hand. Pulp orange, often edible. *Seeds* mostly flattened, obliquely ovate, elliptic, or trullate, or tetrahedral, usually irregularly curved. Testa osseous, with thick, very short, erect hairs, rather rough, thick, not sticking to the pulp.

Species (only in Africa):

S. pungens Solerđ.

S. innocua Del.

S. madagascariensis Poir.

S. lucens Bak.

- S. nigritana* Bak.
S. densiflora Baill.
S. zenkeri Gilg ex Bak.
S. staudtii Gilg

Note. Densiflorae are practically as in DUVIGNEAUD, only *S. vanderysti* is transferred to *Lanigerae*.

11. Section **Dolichanthae** Duvign., Bull. Soc. Roy. Bot. Belg. 85: 35. 1952.

Type species: *S. gossweileri* Exell.
 Heterotypic synonym: *Syringiflorae* Duvign., l.c. p. 32, partly (excl. *S. subaquatica* and *S. sumbensis*). Type species: *S. syringiflora* A. Chev. (= *S. melastomatoides* Gilg).

Often climbing shrubs, lianas, or sometimes small trees with often liana-like branches (*S. xantha*). Branches not lenticellate; branchlets terete or quadrangular. Tendrils – if present – in 1–3 pairs, occasionally in more or less irregular groups. Inflorescence axillary and sometimes also terminal. Bracts often shovel-shaped. Flowers 4(–5)-merous. Sepals orbicular or nearly so, at the apex mostly obtuse or rounded, sometimes acute. Corolla mostly white or creamy, outside glabrous or sometimes minutely papillose-pubescent, inside (often densely) pilose, but glabrous at the base of the tube and mostly at the apex of the lobes. Tube cylindrical or nearly so, shorter (0.6 ×) or longer (up to 3 ×) than the lobes which are oblong or narrowly triangular and recurved (spreading in *S. asterantha*). Stamens exserted, inserted at the mouth of the corolla tube; filaments glabrous, about 1–2.5 × as long as the anthers which are glabrous and cordate at the base. Pistil glabrous; ovary 2-celled, more or less abruptly narrowed into the slender style; stigma small, not thicker than the style, obscurely bilobed or capitulate. In each cell 2–10 ovules. Fruit orange or yellow, when nearly mature pale green or glaucous, small or rather so, mostly soft, ellipsoid, obovoid, or less often globose, 2–2.5(4) × 1.5–2(3.5) cm, 1–10-seeded. Wall usually thin, when dry less than 1 mm thick, sometimes thicker (*S. barteri*, *S. tricalysioides*). Seed mostly flattened, often obliquely elliptic or ellipsoid, usually not curved, at one side with a deep pit, at the other with a bulge surrounded by a shallow groove, seemingly papillose; false papillae simulated by short curved hairs.

Species (only in Africa):
S. melastomatoides Gilg
S. xantha Leeuwenberg
S. odorata A. Chev.
S. asterantha Leeuwenberg
S. penninervis A. Chev.
S. barteri Solered.
S. gossweileri Exell

S. canthioides Leeuwenberg
S. tricalysioides Hutch. et M. B. Moss

Notes. The type species of *Syringiflora* is chosen in accordance with the Code. The rejected type species of DUVIGNEAUD, *S. subaquatica* (= *S. scheffleri*), belongs to *Lanigerae*; it has the pilose pistil and the rough seeds which are characteristic for the majority of *Lanigerae*. *S. syringiflora* (= *S. melastomatooides*) has a glabrous pistil and seeds characteristic only of species of *Dolianchanthae*.

12. Section *Scyphostrychnos* (S. Moore) Leeuwenberg, comb. nov.

Basionym: *Scyphostrychnos* S. Moore in Cat. Talbot's Nigerian Pl. 71. 1913, as genus.

The only species of this section is described on p. 75.

Notes. The most typical characters for this section are the corona and the flat winged seeds arranged in horizontal layers. This species is placed in the genus *Strychnos*, as it is more closely allied to the other species of the genus than was supposed by S. MOORE (1913; see also Act. Bot. Neerl. 11: 48. 1962).

DISCUSSION OF THE RELATIONSHIP OF THE SECTIONS

The more or less reticulate relationship of the sections is figured in chart 1. The lines of relationship will be discussed below after the corresponding letters.

A. The sections *Strychnos* and *Rouhamon* have several characters in common: tendrils solitary; the seeds show the same range of variation, e.g. those of *S. dariensis* resemble strikingly those of *S. guianensis*, those of *S. nux-vomica* and *S. lucida* resemble those of *S. potatorum*; *S. nux-vomica* and *S. potatorum* also show a striking resemblance as to branching and leaves.

B. The relationship between the sections *Rouhamon* and *Breviflorae* is based upon the following arguments. Primarily, they both have solitary tendrils and stamens inserted at the mouth of the corolla. Furthermore, *S. parviflora* has many hairs on the inner surface of the corolla lobes, just like *S. ndengensis* and *S. guianensis*, but the latter two also have hairs inside the tube. The corolla of *S. usambarensis* resembles strikingly that of *S. brasiliensis* but differs in the place of insertion of the indumentum, which is in the throat instead of on (the base of) the lobes. Furthermore, the ellipsoid seeds of the latter two species are very much alike in their thin, smooth, cartilaginous testa.

C, D. The section *Rouhamon* resembles both *Lanigerae* and *Brevitubae* in regard to the place of insertion of the stamens and of the indumentum in the corolla, but it differs from them in that its species have solitary instead of paired tendrils.

E. *Breviflorae* are related to *Penicillatae*. They both have small flowers, and brushes in the corolla (the latter in part of *Breviflorae* only); the seeds show the

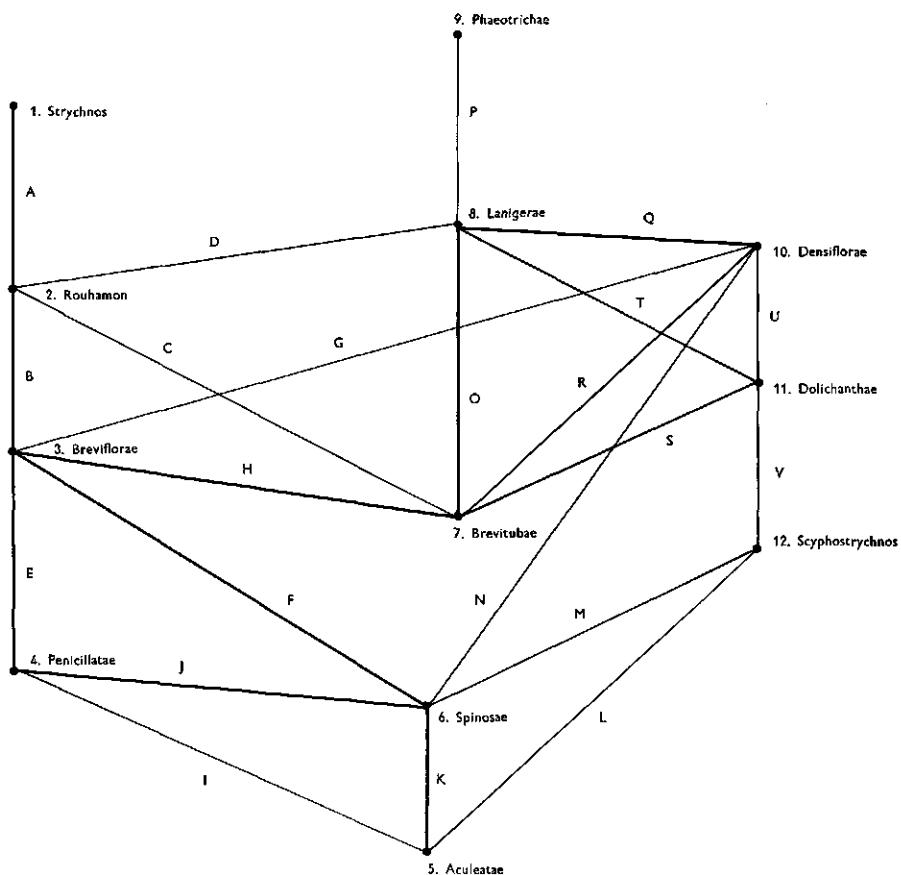

CHART 1. Relationship of the sections of *Strychnos*. The letters refer to the paragraphs of the discussion.

same range of variation. A curious feature is the glabrous, ellipsoid, deeply grooved, and strongly enrolled seeds found in both *S. henningsii* and *S. diplotricha*.

F. The relationship between *Spinosae* and species in *Breviflorae* which have paired tendrils is based upon the common characters of paired tendrils, narrow sepals, brushes on the inner surface of the corolla, and big fruits.

G. The same species in *Breviflorae* with paired tendrils resemble *Densiflorae* as they both have paired tendrils and mostly big fruits. The former differ from the latter by the narrow instead of broad sepals and by the indumentum on the inner surface of the corolla and on the pistil.

H. The resemblance of *Breviflorae* to *Brevitubae* is less evident, as the hairs in the corolla are on the lobes and not in the throat and the tendrils are mostly solitary instead of paired. The only clearcut character they have in common is the insertion of the stamens.

I, J, K. As to the flowers, *Aculeatae* are identical with the majority of *Penicillatae* and come close to *Spinosae*, but the tendrils are placed in 1–3 pairs instead of solitary and the fruits are big instead of small. These big, hard-walled, many-seeded fruits they share also with *Spinosae*, but they are laterally compressed, not globose as in the latter.

L. The *Aculeatae* and *Scyphostrychnos* have the habit, the tendrils in 1–3 pairs, and the big fruit in common, but the former differs from the latter by the lack of the corona, the laterally compressed, subglobose fruit (instead of not compressed and variable), and the rough, curved seeds (instead of smooth, not curved, and winged).

M. Characters, common to *Spinosae* and *Scyphostrychnos*, are the corona (less conspicuous in the former), the big fruits, and the paired tendrils (1–3 pairs in the latter). A difference is in the place of insertion of the stamens: in the corolla tube in *Spinosae*, at the level of the mouth of the corolla in *Scyphostrychnos*.

N. Characters, common to *Spinosae* and *Densiflorae*, are the paired tendrils, the narrow corona (in the latter section only present in *S. staudtii*), and the mostly big globose fruits. The fruits in *Spinosae* have a very hard wall which cannot be broken by hand when the fruit is mature and fresh as can be done with those of *Densiflorae*. Furthermore, the hairs in the corolla of *Densiflorae* are not as stiff as those of *Spinosae*, the stamens are inserted at the mouth and not in the tube of the corolla, and the pistil of the former is conspicuously pilose.

O. The relationship of *Brevitubae* with *Lanigerae* is based on the common occurrence of paired tendrils and on the similar indumentum in the corolla and on insertion of the stamens. The most important difference lies in the indumentum on the pistil.

Borderline taxa are *S. flavesrens* of *Brevitubae*, with a glabrous pistil and rough seeds, and *S. maingayi* subsp. *borneensis* of *Lanigerae*, also with a glabrous pistil. *S. maingayi* subsp. *maingayi* has a hairy pistil and rough seeds.

P. The resemblance of *Lanigerae* to *Phaeotrichae* concerns the paired tendrils, the place of insertion of the stamens, and the flattened seeds.

Q. *Lanigerae* are related to *Densiflorae* by the following characters: paired tendrils, the place of insertion of the stamens, a pilose pistil, and flat, often rough seeds. The difference lies mainly in the indumentum inside of the corolla.

R. *Brevitubae* have the following characters in common with *Densiflorae*: paired tendrils and insertion of the stamens at the mouth of the corolla. The former differ from the latter by the sparsely hairy or glabrous instead of distinctly pilose pistil, in the indumentum in the corolla, and by the small fruits.

S. The resemblance of *Brevitubae* to *Dolichanthae* concerns the indumentum in the corolla, the insertion of the stamens, and the paired tendrils (1–3 pairs in *Dolichanthae*). The curious dented seeds of *Dolichanthae* with curved hairs are unique in the genus.

T. *Lanigerae* and *Dolichanthae* have the indumentum in the corolla and the insertion of the stamens in common. However, the tendrils of the former are

paired instead of placed in 1–3 pairs, the seeds lack the curved hairs and are not dented, and the pistils are pilose instead of glabrous.

U. *Densiflorae* resemble *Dolichanthae* by the insertion of the stamens and the paired tendrils, but differ very much by their mostly pilose pistil with large stigma, the brushes in the corolla, and the rough, flat, not dented seeds with straight instead of curved hairs.

V. *Dolichanthae* resemble *Scyphostrychnos* by the arrangement of the tendrils, but differ strikingly in the flower, fruit, and seed characters.

KEY TO THE AFRICAN SPECIES BASED ON FLOWERING SPECIMENS

1. Stems with spreading prickles 1. *S. aculeata*
Stems without prickles, sometimes with axillary spines 2
2. Inflorescence terminal 3
Inflorescence axillary and sometimes also terminal at the same time 23
3. Sepals narrow, twice as long as wide or more, acuminate to subulate 4
Sepals orbicular to triangular, rounded to acute; fruits small, up to 3 cm in diam. 10
4. Inflorescence large, paniculate, lax; mostly brown-hirsute liana with subcordate leaves; tertiary venation forming characteristic mussel-shell markings beneath 55. *S. phaeotricha*
Inflorescence mostly smaller, seemingly umbellate 5
5. Small hirto-pubescent tree; leaves often subcordate; corolla densely villose inside, with spreading lobes; fruits small. Lower Congo Basin 72. *S. variabilis*
Pubescent or glabrous plants (if hirto-pubescent climbing); white-penicillate hairs on base of the suberect corolla lobes 6
6. Small hirto-pubescent liana with solitary tendrils; leaves up to 3 cm long; fruits small, about 1 cm in diam. Madagascar 69. *S. trichoneura*
Glabrous or pubescent trees or lianas with larger leaves and large globose thick-walled fruits, more than 5 cm in diam.; tendrils paired or absent (*Spinosa*) 7
7. Climber with paired tendrils; stipules more or less persistent, 4–12 on each node; corolla tube split 14. *S. congolana*
Shrub or tree without tendrils; stipules soon deciduous, 4 on each node at the bases of the petioles; corolla tube not split 8
8. Medium sized forest tree; leaves large, 10–20 × 4–10 cm; colleters in the axils of the bracts; fruit wall 9–22 mm thick 68. *S. ternata*
Mostly small savanna shrubs or trees; leaves smaller than in the preceding species, mostly less than 8 cm long; colleters absent or occasional; fruit wall 2–5 mm thick 9
9. Sepals outside mostly, at least apically glabrous, never with an even indumentum; branchlets usually glabrous; branches and bark not corky; ovary 1-celled 63. *S. spinosa*
Sepals outside with an even pubescence; branchlets usually pubescent;

- branches and bark corky; ovary 2-celled 13. *S. cocculoides*
10. Pistil pilose, 3.5–4 mm long or more; corolla lobes recurved; stamens well-exserted 11
 Pistil glabrous or not, if pilose or pubescent up to 2 mm long and stamens not well-exserted; corolla lobes not recurved 12
11. All flowers distinctly pedicellate; leaves rather thin. East Africa
 52. *S. panganensis*
 At least some flowers sessile; leaves rather thick. Western Central Africa 45. *S. moandaensis*
12. Inflorescence paniculate, large, lax, many-flowered 13
 Inflorescence small, when lax few-flowered, otherwise congested and seemingly umbellate 16
13. Branchlets square, with square yellow pith; corolla glabrous outside
 59. *S. samba*
 Branchlets terete or nearly so, with terete pith; corolla minutely pubescent outside 14
14. Branches lenticellate; tendrils paired; pistil pubescent. West Africa
 20. *S. dinklagei*
 Branches not lenticellate; tendrils solitary; pistil glabrous 47
15. Pistil pilose; corolla with pilose ring inside; lobes spreading; stamens slightly exserted 16
 Pistil glabrous; corolla with stiff bristles inside on the base of the erect or suberect lobes by which the stamens are concealed (*Penicillatae*) 17
16. Branchlets and leaves glabrous; leaf blades 3–11 cm long 24. *S. fallax*
 Branchlets brown-pubescent like leaves beneath on main veins; leaf blades 12–22 cm long 41. *S. memecyloides*
17. Corolla pubescent outside; inflorescence dense, about 15–50-flowered; sepals pubescent outside 18
 Corolla glabrous outside; inflorescence lax, 3–10-flowered; sepals mostly glabrous outside (see also 38. *S. matopensis*) 20
18. Branchlets quadrangular; tertiary venation prominent on both sides; corolla with two rings of hairs inside. Madagascar 21. *S. diplotricha*
 Branchlets terete or nearly so; corolla with bristles only at the base of the lobes 19
19. Branchlets densely appressed-pubescent; inflorescence very compact; leaves usually ovate or orbicular, mostly 2–5 × 1–3 cm, shortly petiolate (1–3(4) mm). East Africa 38. *S. matopensis*
 Branchlets sparsely pubescent to nearly glabrous; inflorescence lax, at least at the base; leaves usually elliptic, mostly 4–10 × 1.5–4 cm, with longer petiole (3–7 mm). Western Central Africa 66. *S. tchibangensis*
20. Liana with lenticellate branches and solitary tendrils; leaves rounded to emarginate at the apex 54. *S. pentantha*
 Shrub or tree; branches not lenticellate; leaves mostly acuminate 21
21. Leaves hairy above; pistil much longer than the calyx, 2–2.5 mm long; sepals halfway connate 6. *S. bifurcata*

Leaves mostly glabrous above; pistil slightly longer than the calyx, up to 1.5 mm long	22
22. Leaves 1.2–3(3.3) cm long, rounded to acute or broadly and bluntly acuminate; hairy beneath and often also above; sepals connate up to one-third of their length	47. <i>S. myrtoides</i>
Leaves 2–7 cm long, often long-acuminate, mostly glabrous above and often also beneath; sepals nearly free	46. <i>S. mostueoides</i>
23. Sepals narrow, at least twice as long as wide, acuminate to subulate; large liana with lenticellate branches and tendrils in 1–3 pairs	11. <i>S. chromatoxylon</i>
Sepals orbicular to triangular, rounded to acute	24
24. Pistil pilose or pubescent	25
Pistil glabrous or (in 36. <i>S. malacoelados</i> and 59. <i>S. samba</i>) sometimes with a single hair	42
25. Leaves with a sharp apex; savanna tree or shrub with densely lenticellate branches and large globose fruits	57. <i>S. pungens</i>
Leaves not with a sharp apex	26
26. Corolla with a brush-like ring in the throat; sepals always rounded or obtuse (<i>Densiflorae</i>)	27
Corolla pilose or villose inside	32
27. Flowers 4-merous; savanna shrub or tree with mostly rounded leaves (acuminate leaves almost only in Madagascar)	28
Flowers 5-merous; forest plants with acuminate leaves	29
28. Leaves glaucous, not or hardly paler beneath, mat or dull with mostly pale green reticulate prominent venation on both sides	30. <i>S. innocua</i>
Leaves shining and dark green above, more distinctly paler beneath; tertiary venation reticulate, not or hardly prominent above	35. <i>S. madagascariensis</i>
29. Tree; branches not lenticellate	75. <i>S. zenkeri</i>
Lianas with paired tendrils; branches lenticellate	30
30. Leaves rather thickly coriaceous, with distinctly prominent reticulate tertiary venation; inflorescence-axis mostly pubescent; mature flower-buds 5.5–7 mm long; pistil 4.5–6 mm long	34. <i>S. lucens</i>
Leaves with or without prominent venation; – if inflorescence-axis pubescent – leaves rather thin and less shining, drying darker; mature flower-bud 7.5–11 mm long; pistil 6–9 mm long	31
31. Branchlets usually distinctly lenticellate; old leaves often thinly coriaceous, usually drying with a flat margin and with a rather conspicuously reticulate tertiary venation above; inflorescence mostly congested; inflorescence-axis and pedicels often sparsely pubescent; mature bud 7.5–8 mm long, tube 1.5 × as long as the lobes, lobes about twice as long as wide, 3–3.5 mm long	19. <i>S. densiflora</i>
Branchlets lenticellate or not; old leaves often thickly coriaceous, usually drying with a recurved margin and smooth above; inflorescence lax; inflorescence-axis and pedicels glabrous; mature bud 7.5–11 mm long,	

- tube 1–1.3 × as long as the lobes, lobes 2.2–3 × as long as wide, 4–5 mm long 50. *S. nigriflora*
32. Corolla lobes suberect; branchlets and leaves glabrous 33
 Corolla lobes spreading or recurved; branchlets and leaves usually with at least some hairs (see also 20. *S. dinklagei*) 34
33. Mature bud 4.5–6 mm long; glabrous or minutely pilose-pubescent outside on lobes; pistil pilose-pubescent, except for the glabrous base of ovary and apex of style, 3.2–4 mm long; calyx glabrous on both sides
 12. *S. chrysophylla*
 Mature bud 2 mm long, sparsely pubescent outside; pistil with a few hairs at apex of ovary, 2.5 mm long; calyx inside at base pubescent
 65. *S. talbotiae*
34. Leaves 12–22 cm long; pistil 2–2.2 mm long; stamens slightly exserted; branchlets brown-pubescent 41. *S. memecyloides*
 Leaves up to 12 cm long; pistil 4–8 mm long, sometimes shorter; stamens well-exserted 35
35. Corolla lobes 3–7 × as long as the tube; tube mostly shorter than the calyx; mature bud and pistil 3–4 mm long. West Africa (see also the east-African 52. *S. panganensis*) 63. *S. splendens*
 Corolla lobes 0.5–2 × as long as the tube; tube rarely shorter than the calyx 36
36. Leaves papery or thinly coriaceous 37
 Leaves coriaceous 39
37. Inflorescence lax; mature bud and pistil about 4–5 mm long; tendrils solitary 7. *S. boonei*
 Inflorescence congested; mature bud and pistil 6–8(9) mm long; tendrils paired 38
38. Leaves often subcordate, rarely cuneate at base; pistil at very base usually not glabrous, hirsuto-pubescent; anthers with stiff erect hairs, if hairy
 49. *S. ngouniensis*
 Leaves cuneate at base, occasionally subcordate; pistil glabrous at base, further pubescent; anthers with pilose hairs, if hairy 61. *S. soubrensis*
39. All flowers distinctly pedicellate; leaves small, rather thin; mature bud 3.5–4 mm long; pistil 3.5–5 mm 52. *S. panganensis*
 At least some flowers nearly sessile 40
40. Leaves glabrous above; mature bud 7–9.5 mm long, glabrous outside or with a single hair; branchlets mostly glabrous, sometimes sparsely pubescent; main secondary leaf-veins prominent above. 60. *S. scheffleri*
 Leaves mostly pubescent on costa above and branchlets pubescent, if mature bud and pistil 6–7 mm long; main secondary veins less conspicuous, mostly not prominent above 41
41. Leaves mostly shining; inflorescence mostly about as long as the leaves; mature bud and pistil up to 4 mm long; fruit 13–15 mm diam.; seed smooth 45. *S. moandaensis*
 Leaves mostly mat; inflorescence much shorter than the leaves; mature bud

and pistil (4)6–7 mm long; fruit about 3 cm diam.; seed rough	32. <i>S. kasengaensis</i>
42. (24). Branchlets pubescent, often sparsely so	43
Branchlets glabrous (see also 1. <i>S. aculeata</i>)	52
43. Branches lenticellate	44
Branches not lenticellate	46
44. Stamens inserted in corolla tube; anthers bearded; inflorescence congested; mature bud 3.5–4 mm long. Forest tree. East Africa	44. <i>S. mitis</i>
Stamens at mouth of corolla tube; anthers glabrous; inflorescence often lax	45
45. Mature bud 4–6 mm and pistil 4–5 mm long; inflorescence lax; leaves obtuse, rounded, or broadly and bluntly acuminate (see also 25. <i>S. floribunda</i>)	18. <i>S. decussata</i>
Mature bud 2–3.5 mm and pistil 1–2.5 mm long; inflorescence congested or not; leaves acuminate	71. <i>S. usambarensis</i>
46. Inflorescence with some leafy bracts, large, lax, paniculate	47
Inflorescence with some scale-like bracts only, congested or not	48
47. Leaf blades glabrous, dull beneath; plant with cloves-odour, especially when living	22. <i>S. dolichothrysia</i>
Leaf blades slightly shining or mat beneath; barbate in the axils of the second pair of secondary veins	70. <i>S. urceolata</i>
48. Peduncle longer than the remaining part of the inflorescence which is more or less congested. West Africa	2. <i>S. afzelii</i>
Peduncle shorter than the remaining part of the inflorescence	49
49. Petioles rugulose, pubescent like branchlets; inflorescence lax, sometimes transformed into rose-like galls	50
Petioles not rugulose; inflorescence congested	51
50. Sepals glabrous outside; corolla glabrous or minutely pubescent outside; leaves obtuse or nearly so, never sharply acuminate	3. <i>S. angolensis</i>
Sepals and corolla pubescent outside; leaves sharply acuminate	36. <i>S. malacoclados</i>
51. Corolla lobes with recurved brushes at apices inside; stamens inserted at the mouth; branchlets brown-pubescent like petioles and main leaf-veins beneath	8. <i>S. campicola</i>
Corolla with a stiff erect brush-like ring in throat; stamens inserted in tube; branchlets – if hairy – usually sparsely pubescent; leaf-veins beneath glabrous or with some hairs	33. <i>S. longicaudata</i>
52. Corolla with a distinct corona; flowers large; large glabrous black drying liana with tendrils in 1–3 pairs	9. <i>S. camproneura</i>
Corolla without or with an obscure corona	53
53. Branches lenticellate	54
Branches not lenticellate (see also 58. <i>S. retinervis</i>)	65
54. Inflorescences in axils of scales at base of branchlets; branches dichoto- mously branched	56. <i>S. potatorum</i>
Inflorescences in axils of ordinary leaves and sometimes also terminal .	55

55. Mature flower-bud 2–3 mm and pistil 0.8–2.5 mm long 56
 Mature flower-bud 4–11 mm and pistil (3)4–10 mm long (see also 44. *S. mitis*) 59
56. Corolla inside with recurved brushes at apices of lobes 67
 Corolla inside pilose, villose, or rarely glabrous 57
57. Peduncle and pedicels glabrous; two distinct arcuate veins along leaf-margin; large liana 29. *S. icaja*
 Peduncle and pedicels pubescent; secondary veins not distinctly different.
 Forest trees. East Africa 58
58. Inflorescence lax, many-flowered; flowers 4-merous; corolla lobes 4–5 × as long as tube; anthers glabrous 40. *S. mellodora*
 Inflorescence more or less congested; flowers 4–5-merous; corolla lobes 0.8–1.6 × as long as the tube; anthers bearded 44. *S. mitis*
59. Mature bud 7–11 mm long; forest trees with congested inflorescences (habit of 58. *S. retinervis* unknown) 60
 Mature bud 4–6 mm long 62
60. Corolla inside with two rings of brush-like hairs 64. *S. staudtii*
 Corolla with one wide zone of pilosity inside 61
61. Stamens well-exserted; leaves coriaceous; several pairs of secondary veins as conspicuous as the arcuate; tertiary venation prominent on both sides 58. *S. retinervis*
 Stamens slightly exserted; leaves thickly coriaceous; secondary veins, except for the arcuate pair, not very conspicuous 23. *S. elaeocarpa*
62. Leaves rounded to bluntly acuminate; savanna trees and shrubs without tendrils, with lax inflorescences 18. *S. decussata*
 Leaves acuminate; forest lianas with solitary tendrils 63
63. Corolla lobes inside densely pilose all over; flowers 4-merous; sepals obtuse or rounded 48. *S. ndengensis*
 Corolla lobes inside at apex glabrous; flowers (4–)5-merous; sepals acute or less often subacute 64
64. Leaves with prominent reticulate venation on both sides or only beneath, usually larger than in the next species; mature buds and pistils 4–4.5 mm long 17. *S. dale*
 Leaves with venation not or obscurely prominent beneath, not so above; mature buds and pistils (4.5)5–6 mm long 25. *S. floribunda*
65. Corolla inside with brushes 66
 Corolla inside pilose 68
66. Brushes on apices of lobes, recurved; stamens on mouth of corolla tube 67
 Brushes in throat, erect; stamens in tube 33. *S. longicaudata*
67. Leaves much paler and dull beneath, coriaceous or thinly coriaceous; secondary veins and costa shape a rather small angle 37. *S. malchairii*
 Leaves not or slightly paler and shining beneath, papery; secondary veins and costa shape a right angle 43. *S. mimfiensis*
68. Leaves with inconspicuous venation, dull on both sides; peduncle with a pair of bracteoles 26. *S. gnetifolia*

Leaves with conspicuous venation, mat or shining at least above; peduncle without bracteoles	69
69. Mature flower-bud 1.8–3(4) mm and pistil 0.8–2.4(3) mm long (see also 53. <i>S. penninervis</i>)	70
Mature flower-bud (3.5)4–8 mm and pistil (3)4–7 mm long (see also 51. <i>S. odorata</i>)	79
70. Savanna tree or shrub without tendrils	71
Forest liana with tendrils	73
71. Inflorescence 1–2 cm long, congested; flowers 5-merous	28. <i>S. henningsii</i>
Inflorescence 3–11 cm long, lax; flowers 4-merous	72
72. Peduncle and pedicels pubescent; leaves coriaceous; main secondary veins not much longer than the others	40. <i>S. mellodora</i>
Peduncle and pedicels glabrous; leaves thickly coriaceous; main secondary veins nearly reaching the apex	74. <i>S. xylophylla</i>
73. Branchlets square; flowers 5-merous; inflorescence lax, usually distinctly pedunculate (see also 15. <i>S. cuminodora</i>)	74
Branchlets terete or subangular and sulcate; flowers 4–5-merous, if 5-merous inflorescence congested and obscurely pedunculate	75
74. Branches and branchlets hollow, with a smooth-walled cylindrical cavity or less often not hollow and without a distinct pith; pale greenish on section when dry; mature buds 3.5–5 mm long	31. <i>S. johnsonii</i>
Branches and branchlets with square yellow pith, which might shrink and leave a cavity in dry young thick branches, on section dark yellow when dry; mature buds 2.2–2.5 mm long	59. <i>S. samba</i>
75. Main secondary veins reaching the leaf-apex; tendrils solitary, usually on the branches where they are umbellately branched; flowers 4-merous; inflorescence lax	29. <i>S. icaja</i>
Main secondary veins not reaching the leaf-apex; tendrils in 1–3 pairs; flowers 4- or 5-merous; inflorescence lax or congested	76
76. Leaves dull beneath, coriaceous; main secondary veins rather faint, not more conspicuous than the other; pistil 0.8 mm long; inflorescence very small, but lax; peduncle and pedicels very thin; flowers very small, 4-merous; sepals acute	4. <i>S. asterantha</i>
Leaves mat or shining, papery or nearly so, main secondary veins more conspicuous than the other; pistil 2–2.5 mm long	77
77. Branchlets not grooved below the stipular line; leaves not punctate; tendrils in 1–2 pairs; seeds with a deep pit, seemingly papillose	51. <i>S. odorata</i>
Branchlets grooved below the stipular line; tendrils paired; seeds not dented, smooth	78
78. Leaves with many minute translucent dots. Liberia, western Ivory Coast	15. <i>S. cuminodora</i>
Leaves without or less often with some translucent dots. Congo (Kinshasa)	16. <i>S. cuniculina</i>
79 (69). Leaves rounded, acute or sometimes shortly acuminate (see also 42. <i>S. millepunctata</i>)	80

Leaves acuminate or caudate	82
80. Four equal pairs of secondary veins; leaves dull beneath	
53. <i>S. penninervis</i>	
Basal pair of secondary veins arcuate along the margin	81
81. Stamens well-exserted; filaments about twice as long as the anthers. West Africa	5. <i>S. barteri</i>
Stamens slightly exserted; filaments up to as long as the anthers. Central Africa	27. <i>S. gossweileri</i>
82. Leaves caudate, thinly coriaceous; 3 main veins impressed above.	68. <i>S. tricalyptoides</i>
Leaves acuminate, coriaceous or not	83
83. Inflorescence lax; peduncle and its branches longer than flowers	84
Inflorescence congested or rather so; at least branches shorter than flowers	85
84. Branchlets square; leaves 3.5–10(14.5) cm long, slightly shining, also beneath	31. <i>S. johnsonii</i>
Branchlets terete; leaves 8–19 cm long, dull beneath. Guinea, Sierra Leone	39. <i>S. melastomatooides</i>
85. Leaves with minute translucent dots; corolla outside pubescent. Ivory Coast	42. <i>S. millepunctata</i>
Leaves without dots; corolla outside glabrous	86
86. Tertiary venation prominent on both sides; leaves mostly drying pale greenish-brown, mostly dull. East Africa	73. <i>S. xantha</i>
Tertiary venation not or not distinctly prominent above; leaves drying dark brown and slightly shining. Cameroun	10. <i>S. canthioides</i>

KEY TO THE AFRICAN SPECIES BASED ON FRUITING SPECIMENS

This key is based on living and dry material with mature fruits. The seeds of herbarium specimens were boiled and gently stripped of the pulp. In some species, especially in the sections *Rouhamon* and *Breviflorae*, the testa is very thin and therefore readily rubbed off. The fruits of some species are not yet known. These species key out with the related ones, as it is supposed their fruits and seeds will be alike. *S. canthioides* is related to *S. barteri*, *S. gnetifolia* and *S. ndengensis* to *S. floribunda*, *S. pentantha* and *S. trichoneura* to *S. bifurcata*, and *S. retinervis* to *S. elaeocarpa*. For this reason most species cited between brackets are not encountered elsewhere in the key. Pistil and sepal characters are used, if necessary, as there are often incomplete dry flowers in the infructescence. Moreover the sepals are persistent under the fruit.

1. Branchlets with prickles; fruit large, subglobose, laterally compressed,
about 10–18 cm. diam. 1. *S. aculeata*
 Branchlets without prickles, sometimes with axillary spines; fruits – if
 large – not laterally compressed 2
2. Fruit 4–15 cm diam.; wall 5–20 mm thick, rarely less; seeds (10)30–100 . 3

Fruit about 1–3 cm diam.; wall 1–3 mm thick; seeds 1–2(12) (see also 26. <i>S. gnetifolia</i>)	13
3. Seed winged, about 3–5 cm diam., smooth, glabrous; pulp orange, turning black; fruit often very large, pear-shaped, ellipsoid, or nearly so; large liana, drying black	9. <i>S. camptoneura</i>
Seed unwinged, mostly scabrid or pubescent	4
4. Seed with a deep pit at one side; glabrous liana with thin caudate leaves (see also 69)	68. <i>S. tricalysioides</i>
Seed not dented	5
5. Inflorescence terminal; branches often spiny; sepals narrow; fruits strictly globose (<i>Spinosae</i>)	7 of first key, p. 36
Inflorescence axillary; spines none	6
6. Leaves with sharp apex; savanna tree or shrub	57. <i>S. pungens</i>
Leaves not sharp	7
7. Savanna shrubs or trees; leaves rounded at apex, acute or acuminate only present in Madagascan and some east-African specimens	28 of first key, p. 38
Climber, mostly in the forest	8
8. Branches not lenticellate; branchlets often sulcate when dry; inflorescence large	12. <i>S. chrysophylla</i>
Branches lenticellate	9
9. Fruit subcordate at the base; leaves not triplinerved; tendrils in 1–3 pairs	11. <i>S. chromatoxylon</i>
Fruit rounded at the base; leaves triplinerved; tendrils paired	10
10. Leaves thickly coriaceous, with more or less revolute margin	11
Leaves thinner, coriaceous; margin not revolute	12
11. Inflorescence-axis mostly pubescent. Congo, Angola, East Africa	34. <i>S. lucens</i>
Inflorescence-axis glabrous. West Africa, Cameroun, Central African Republic, northern Congo	50. <i>S. nigritana</i>
12. Fruit pale yellow; wall about 5 mm thick; branchlets lenticellate	19. <i>S. densiflora</i>
Fruit darker, wall about 2 mm thick; branchlets not lenticellate, usually sulcate when dry, often also when living	60. <i>S. scheffleri</i>
13(2). Fruit blue-black, with one ellipsoid sericeous seed; branches repeatedly dichotomously branched; shrub or tree (see also 7. <i>S. boonei</i>)	56. <i>S. potatorum</i>
Fruit orange, yellow, red, or dark brown	14
14. Fruit orange, yellow, red, or rarely white, not lenticellate	15
Fruit dark brown, distinctly lenticellate	61 of first key, p. 41
15. Seed not dented, sometimes grooved and then glabrous; pistil hairy or not	16
Seed with a deep pit at one side, covered by false papillae simulated by curved hairs; pistil glabrous (<i>Dolichanthae</i>)	68
16. Seed ellipsoid or subglobose, not or hardly flattened, smooth	17

Seed obliquely elliptic or tetrahedral, flattened, often rough	42
17. Seed with a deep groove, glabrous (see also 54. <i>S. pentantha</i> and 69. <i>S. trichoneura</i>)	18
Seed without groove, pubescent or glabrous	19
18. Climber with solitary tendrils and terminal infructescences; branchlets pubescent. Madagascar	21
Shrub or tree, without tendrils; infructescences axillary; branchlets glabrous	28
19. Infructescence terminal	20
Infructescence axillary and sometimes also terminal at the same time	25
20. Sepals narrowly triangular to subulate; plant hirsute-pubescent	21
Sepals orbicular to triangular; plant glabrous or pubescent	22
21. Shrub or small tree; leaves 3–9 cm long. Congo	72
Climber with solitary tendrils; leaves 1.2–3.3 cm long. Madagascar	69
<i>S. trichoneura</i>	
22. Infructescence up to 1.5 cm long. Madagascar	24
Infructescence about 3–15 cm long. Central Africa	23
23. Branchlets square, glabrous; infructescence paniculate, up to 15 cm long; tendrils paired	59
Branchlets terete, usually with some hairs; infructescence seemingly umbellate, about 3–5 cm long; tendrils solitary	66
24. Leaves rounded to emarginate; climber with solitary tendrils	54
<i>S. pentantha</i>	
Leaves acuminate; repeatedly dichotomously branched shrub or treelet	6
<i>S. bifurcata</i>	
25. Branchlets pubescent (see also 25. <i>S. floribunda</i>)	26
Branchlets glabrous	30
26. Branches not lenticellate; climbers with solitary tendrils	27
Branches lenticellate; climbers, shrubs or trees	36
27. Peduncle longer than the remaining part of the infructescence which is more or less congested; fruit laterally compressed. West Africa. 2. <i>S. afzelii</i>	
Peduncle shorter than the remaining part of the infructescence; fruits not compressed	28
28. Petiole sparsely pubescent; pistil 4–5 mm long, pilose; infructescence lax	
<i>S. boonei</i>	
Petiole densely appressed-pubescent; pistil 1–2 mm long, glabrous or occasionally with a single hair	29
29. Petiole rugulose, pubescent like branchlets; infructescence lax	
<i>S. gnetifolia</i>	
Petiole not rugulose; infructescence congested; plant dark brown-pubescent, drying dark brown	8
<i>S. campicola</i>	
30. Branches not lenticellate (see also 58. <i>S. retinervis</i>)	31
Branches lenticellate	36
31. Leaves dull, with inconspicuous venation. Nigeria, Cameroun	
<i>S. gnetifolia</i>	

- Leaves mat or shining; venation conspicuous 32
32. Tendrils solitary; fruit about 2.5–3 cm long 33
 Tendrils paired; fruit about 1–2 cm long 34
33. Fruit subglobose, 2.5–3 cm diam., with one large subglobose seed; leaves with 3 distinct nerves, not or slightly paler and shining beneath
 29. *S. icaja*
- Fruit ellipsoid, about 2.5×1.7 cm, with one ellipsoid seed; leaves with less conspicuous veins, distinctly paler and dull beneath. Congo (Kinshasa)
 37. *S. malchairii*
34. Leaves thinly coriaceous or papery; pistil 2–2.5 mm long
 79 of first key, p. 42
 Leaves coriaceous; pistil 3–4.5 mm long, rarely shorter 35
35. Branchlets square; leaves without dots 31. *S. johnsonii*
 Branchlets terete; leaves with minute translucent dots. Ivory Coast
 42. *S. millepunctata*
36. Tree or shrub, the latter only in savannas (see also 71. *S. usambarensis*) 37
 Climber with solitary tendrils 38
37. Forest tree; leaves mostly acuminate; pistil 2.3–3 mm long; seed glabrous
 44. *S. mitis*
 Savanna tree or shrub; leaves rounded, obtuse, or broadly and bluntly acuminate; pistil 4–5 mm long; seed minutely pubescent 18. *S. decussata*
38. Fruit subglobose, 2.5–3 cm diam.; leaves mostly large, dark green on both sides, with 3 distinct pale green nerves; seed large, subglobose, about 1.5–2 cm diam.; testa usually not visible 29. *S. icaja*
 Fruit ellipsoid, up to 2.2 cm long (see also 48. *S. ndengensis*) 39
39. Leaves papery, with distinctly impressed main veins above, often slightly bullate; fruit $1.5 \times$ as long as wide; seed about $1.5–2 \times$ as long as wide
 43. *S. mimfiensis*
 Leaves coriaceous or nearly so, not bullate; fruit $1–1.25 \times$ as long as wide; seed subglobose or nearly so 40
40. Leaves dull and distinctly paler beneath; testa sticking to the pulp, usually not visible 37. *S. malchairii*
 Leaves mat or shining beneath; testa clearly visible, minutely pubescent 41
41. Pistil 1–2.5 mm long; style on fruit – if present – up to 1.5 mm long, with capitate stigma; branches with epidermis peeling off; fruit often stipitate and/or laterally compressed 71. *S. usambarensis*
 Pistil 4–6 mm long; style on fruit – if present – 3–5 mm long, with capitate stigma; fruit sometimes stipitate, not compressed 63 of first key, p. 41
- 42(16). Seed smooth, minutely pubescent or glabrous (see also 65. *S. talbotiae*) 43
 Seed rough, scabrid; testa rather thick 48
43. Brown-hirsute climber with subcordate leaves; tertiary venation forming characteristic mussel-shell markings beneath 55. *S. phaeotricha*
 Plants glabrous or pubescent 44
44. Tree; branchlets glabrous. East Africa 72 of first key, p. 42

Climber; branchlets glabrous or not	45
45. Branchlets square, with square yellow pith; infructescence large	59. <i>S. samba</i>
Branchlets terete or nearly so	46
46. Tendrils solitary; infructescence congested; leaves glabrous on both sides or with some stiff brown hairs on main veins beneath	33. <i>S. longicaudata</i>
Tendrils paired; infructescence lax or nearly so	47
47. Leaves 2–7 cm long; fruits about 1.5 cm diam.	45. <i>S. moandaensis</i>
Leaves (7.5)12–22 cm long; fruits about 2–3 cm diam.	41. <i>S. memecyloides</i>
48. Infructescence terminal	49
Infructescence axillary and often at the same time terminal	56
49. Infructescence congested, with many dried up flowers; branchlets appressed-pubescent; leaves often orbicular	38. <i>S. matopensis</i>
Infructescence lax, without or with few dried up flowers	50
50. Pistil 3.5–4 mm long, pilose; leaves rather small, thin; fruit 8–18 mm diam.; branchlets mostly pubescent	52. <i>S. panganensis</i>
Pistil 1–2.2 mm long, glabrous or pubescent	51
51. Fruit 6–9 mm diam.; pistil glabrous; shrub or treelet. 22 of first key, p. 38	
Fruit mostly more than 15 mm diam.; pistil glabrous or not; climbers	52
52. Leaves glabrous on both sides	53
Leaves partially hairy beneath	55
53. Fruit laterally compressed, obliquely ovoid. West Africa	
Fruit subglobose or ellipsoid	20. <i>S. dinklagei</i> 54
54. Leaves dull and much paler beneath, when young sparsely pubescent; tendrils solitary; pistil glabrous. Cameroun	22. <i>S. dolichothysra</i>
Leaves slightly shining beneath or nearly so; tendrils paired; pistil pilose. Gabon, Congo (both)	24. <i>S. fallax</i>
55. Leaves large, (7.5)12–22 cm long, sparsely pubescent on main veins beneath, not barbate; tertiary venation prominent beneath	41. <i>S. memecyloides</i>
Leaves smaller, 3–7.5(11.5) cm long, often barbate in angles of second pair of secondary veins; tertiary venation not or slightly prominent beneath	
70. <i>S. urceolata</i>	
56. Savanna tree or shrub; leaves rounded at apex, acuminate only in Madagascan and some East-African specimens	28 of first key, p. 38
Climber with paired tendrils or forest tree; leaves acuminate or nearly so. 57	
57. Forest tree	58
Climber	59
58. Pistil pilose; leaves 4–14 cm long	75. <i>S. zenkeri</i>
Pistil glabrous; leaves (8)10–20 cm long	64. <i>S. staudtii</i>
59. Leaves thickly coriaceous, mostly glabrous on both sides; margin revolute; tertiary venation prominent on both sides	60
Leaves coriaceous or papery; margin not revolute	61
60. Branches lenticellate; branchlets not sulcate when dry; leaves dark green	
34. <i>S. lucens</i>	

Branches not lenticellate; branchlets distinctly sulcate; leaves often pale brownish-green when dry	12. <i>S. chrysophylla</i>
61. Leaves 8–50(67) mm long, ovate to elliptic, often cordate; fruit 8–18 mm diam.; seed 7–10 mm long	52. <i>S. panganensis</i>
Leaves about 5–20 cm long	62
62. Leaves (7.5)12–22 cm long, glabrous above; branchlets brown-pubescent .	41. <i>S. memecyloides</i>
Leaves mostly about 5–10 cm long	63
63. Pistil 2.5 mm long; branches not lenticellate; branchlets glabrous like the leaves which are drying pale brownish-green (see also 12. <i>S. chrysophylla</i>)	65. <i>S. talbotiae</i>
Pistil 3–9 mm long; branches lenticellate or not; branchlets glabrous or not like the leaves	64
64. Leaves glabrous on both sides and coriaceous	65
Leaves hairy above, if coriaceous	66
65. Fruit mostly 15–25 mm diam., with 1–2, rarely up to 6 seeds. West Africa	63. <i>S. splendens</i>
Fruit 3–4(6) cm diam., with 6–15 seeds. Central and East Africa	60. <i>S. scheffleri</i>
66. Leaves coriaceous	67
Leaves thinly coriaceous or papery	38 of first key, p. 39
67. Leaves pubescent on costa above; branchlets pubescent. 32. <i>S. kasengaensis</i>	
Leaves glabrous above; branchlets sometimes sparsely pubescent	60. <i>S. scheffleri</i>
68(15). Infructescence minute, lax; pistil 0.8 mm long; leaves dull beneath; main secondary veins not more conspicuous than the other secondary veins	4. <i>S. asterantha</i>
Infructescence rather large and/or congested; pistil more than 2 mm long	69
69. Leaves rounded, acute, or sometimes shortly acuminate	81 of first key, p. 43
Leaves acuminate or caudate	70
70. Leaves caudate, thinly coriaceous; 3 main veins impressed above; pistil 4–4.5 mm long	68. <i>S. tricalysioides</i>
Leaves acuminate; main veins not impressed above or only near the base	71
71. Leaves thinly coriaceous; pistil 2.4 mm long. Ivory Coast. 51. <i>S. odorata</i>	
Leaves thicker; pistil at least 4 mm long	72
72. Leaves 8–19 cm long, dull beneath. Sierra Leone, Guinea	39. <i>S. melastomatoides</i>
Leaves 3–11 cm long	86 of first key, p. 43

1. *S. aculeata* Solered. in Engler, Bot. Jahrb. 17: 556. 1893; Baker in Fl. Trop. Afr. 4(1): 520. 1903; Hutchinson & Dalziel, Fl. W. Trop. Afr. 2: 22. 1931; Chevalier, Rev. Bot. Appliq. 2: 363. 1947; Bruce & Lewis in Fl. Trop. E. Afr. Loganiaceae 20. 1960; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 43. 1963.

Figs. 1, p. 50, 2, p. 52; Map 1, p. 60

Type: Fernando Po: Mann 175 (holotype not seen, destroyed in B; lectotype: K, isotypes: GH, P).

Heterotypic synonyms: *S. mortehani* De Wild., Bull. Jard. Bot. Brux. 5: 50. 1915. Type: Congo: Equateur, Bumba Territory, Dundusana, Mortehan 485 (BR, holotype, photograph in K, neg. 2310; isotype: BR).

S. pseudo-jollyana A. Chev., Rev. Bot. Appliq. 23: 366. 1947, partly (excl. Chevalier 16360). Type: Ivory Coast: Guidéko, Sassandra R. basin, Chevalier 16395 (P, holotype, photograph in K, neg. 4482; isotype: K).

Large liana, at least up to 100 m long and 40 m high climbing in trees. Trunk 2.5–20 (22) cm in diam., prickly. Bark pale brown or pale grey-brown, shallowly fissured, not lenticellate; wood pale yellowish, fibrous. *Branches* not lenticellate, dark green or pale brownish; branchlets often sulcate when dry, variously prickly like trunk and branches (occasionally some not prickly), glabrous, dark green and shining when living. Prickles 3–5(9) mm long and at the base 3–5(9) mm wide, straight or recurved, flat. Tendrils in 1–3(4) pairs. *Leaves*: petiole glabrous, 2–12 mm long; blade shining on both sides, pale to dark green above, paler beneath, coriaceous to thickly papyraceous also when living, elliptic, oblong, or narrowly elliptic, comparatively narrower and usually larger towards the apices of the branchlets, 1.7–3.5 × as long as wide, (5)8–18 × (3)3.5–8 cm, in the shade up to 24.5 × 10 cm, apiculate or acuminate at the apex, at the base rounded or in apical leaves often cuneate, glabrous on both sides; one pair of secondary veins from or from above the base curved along the margin and often a faint submarginal pair; costa and main secondary veins in living leaves impressed above and prominent beneath; leaves at the base of the branchlets often suborbicular, 1.1–1.3 × as long as wide, 29–50 × 21–45 mm or smaller and often with inflorescences in the axils, usually rounded or retuse at the apex, rounded at the base. *Inflorescence* axillary, much shorter than the leaves, 1.5–7 × 0.8–3 cm, congested, seemingly umbellate. Peduncle 1–3 × as long as the remainder of the inflorescence, 0.7–5 cm long, glabrous as its branches, the pedicels, and the very small bracts. *Flowers* 5-merous. *Sepals* pale green, connate for one-third to one-half of their length, broadly orbicular or nearly so, about as long as wide, 1.5–1.8 mm long, rounded or obtuse at the apex, minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 2–2.7 × as long as the calyx, 2.4–5 mm long (complete bud 3–5 mm), white with outside pale green tube or pale green with greenish-white inner side, glabrous outside, inside with a flat brush of white hairs on the lobes; tube 0.8–1.9 × as long as the calyx, 1–2 × as long as the lobes, 1.2–3.2 mm long, amply cylindrical, slightly widened towards the throat, 1.5–2 mm wide at the base, 1.8–3 mm at the throat; lobes thick, triangular to ovate, 1–1.5 × as long

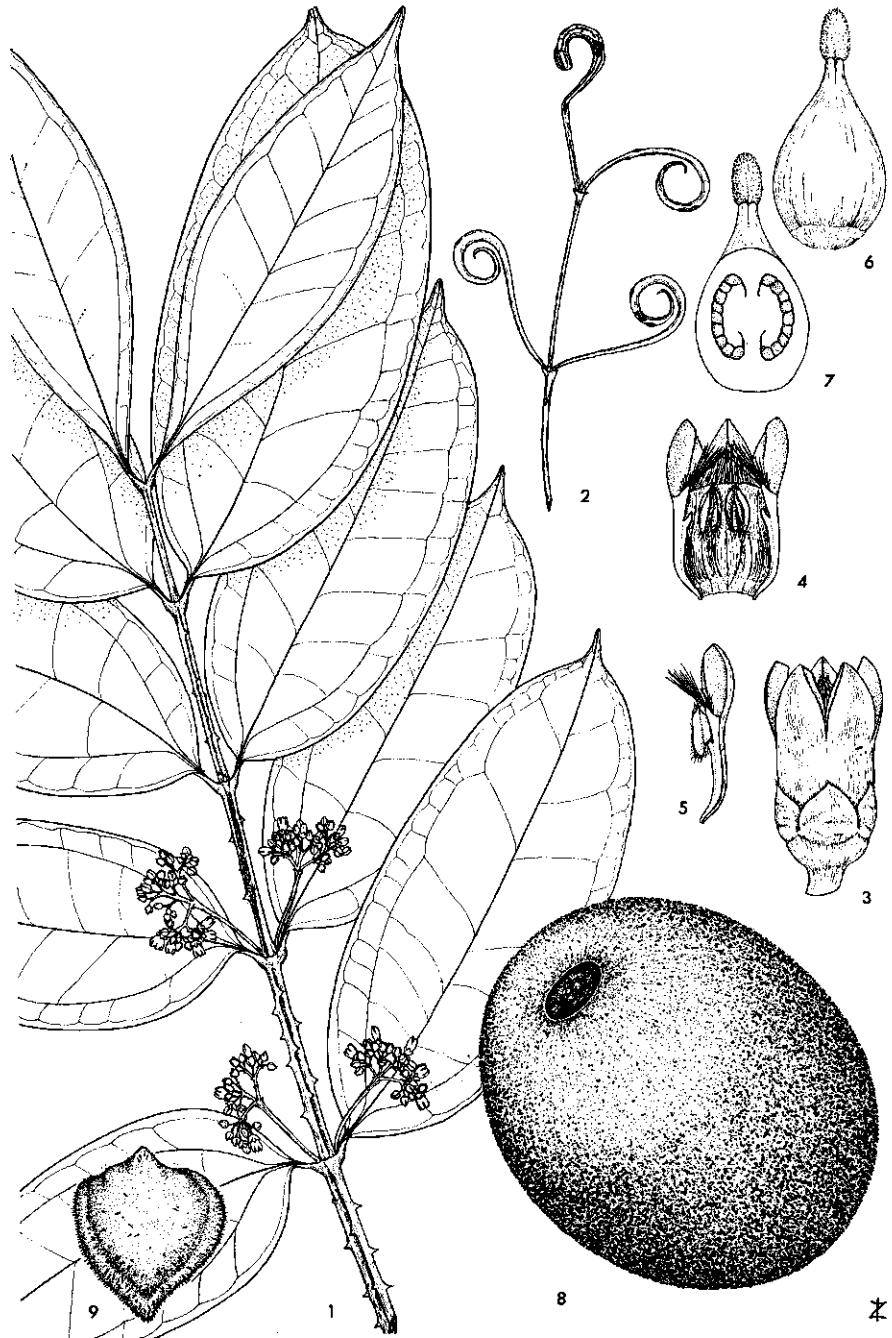

FIG. 1. *S. aculeata*: 1. branch, $\frac{1}{2} \times$; 2. tendrils, $\frac{1}{2} \times$; 3. flower, $5 \times$; 4. opened corolla with stamens, $5 \times$; 5. corolla lobe with stamen, $5 \times$; 6. pistil, $10 \times$; 7. pistil with longitudinal section of ovary, $10 \times$; 8. fruit, $\frac{1}{2} \times$; 9. seed, $1 \times$ (1. Le Testu 1937; 2. Mildbraed 8829; 3-7. Leeuwenberg 3923; 8. Leeuwenberg 3091; 9. Leeuwenberg 3981).

as wide, $1.2-2 \times 1.2-1.5$ mm, acute, erect. *Stamens* included; filaments glabrous, very short, about $0.5-1 \times$ as long as the anthers, inserted on or somewhat above the middle of the corolla tube; anthers cordate, about $1-1.5 \times$ as long as wide, $0.8-1.2 \times 0.8-1$ mm, deeply cordate at the base, ciliate with strigillose hairs all around, nearly so, or only at the base; cells divergent at the base. *Pistil* glabrous, $2-2.5$ mm long; ovary ovoid, $1.5-2 \times$ as long as wide, $1.5-2 \times 0.8-1.5$ mm, acuminate at the apex, 2-celled; stigma subsessile, oblong. In each cell many ovules. *Fruit* large, very hard, like a bowl, subglobose, laterally compressed, dark green, yellow-green, or sometimes yellow, shining, $(8 \times 8.5 \times 7.5) 10 \times 10.5 \times 9 - 12 \times 12.5 \times 11 (16.5 \times 18.5 \times 14.5)$ cm, 1-2-celled, with (20) 50-90 (145) seeds. Wall thick, very hard, coloured and hard like ivory when fresh, not shrinking, slightly knobby inside by which the thickness varies from 8 to 15 mm (even in a single fruit). Pulp creamy (like fruit wall on section and inside), few, containing saponine (producing much foam), with very strong fibres shaping an inner fruit-wall layer and the septum, if present. *Seeds* flattened, more or less plano-convex, obliquely ovate, elliptic, or trullate, usually irregularly curved, $1.2-1.8 \times$ as long as wide, $20-35 \times 16-25 \times 4-8$ mm, with thick mostly short erect hairs, rough, often with a raised line at one side with a cushion (hilum) in the middle.

Ecology: Rain forests or secondary forests, spread throughout the forest, not on river banks; alt. 0-700 m.

Distribution: West and Central Africa.

Uses: Fruits used as fish poison (testibus: Gossweiler 7585, 7664; Leeuwenberg 3981; Louis 3092; Offokansi FHI 59073; Oldeman 455; Serv. For. Côte d'Ivoire 1686; Tisserant 1237).

Sierra Leone: Bagru R. (Apr.) Mann 853 (K); Njala (May) Deighton 5052 (B, BR, K, P).

Liberia: near Yoma, left bank Mahe R., NE. of Bomi Hills, Leeuwenberg 4865 (WAG); ibid. (dry fr. only) van Meer 403a (WAG); Dukwia R. (dry fr. only) Cooper 319 (K); Bong Range, 32 km N. of Kakata, Leeuwenberg & Voorhoeve 4931 (WAG); Tapita area (July) Kwewon in coll. van Harten 20 (WAG); Sanokwele, Ganta District, Baldwin 9236 (K), (dry fr. only) Baldwin 9335 (K); Nimba Mts. (imm. fr.) Adam 20708 (K).

Ivory Coast: Tabou (Dec.) Serv. For. 1686 (P); 31 km S. of crossing of Hana R. and road Tai-Tabou (Mar.) J. de Wilde & Leeuwenberg 3590 (BR, K, WAG); 4 km N. of crossing of Hana R. and road Tai-Tabou (fr. Mar.) J. de Wilde & Leeuwenberg 3533 (BR, K, WAG); near Buyo, near Sassandra R. (Apr.) Oldeman 13 (WAG); 5 km S. of Tapéguhé, right bank Sassandra R., about 50 km NW. of Soubré (fr. June) Leeuwenberg 4515 (WAG); Guidéko (fr. May) Chevalier 16368 (P), 16395 (K, P, type of *S. pseudo-jollyana*); about 60 km WNW. of Sassandra, 5 km E. of Toro R. (fl., fr. Apr.) Leeuwenberg 4038 (WAG); about 40 km W. of Sassandra (fl., fr. Apr.) Leeuwenberg 4052 (WAG); about 30 km SW. of Guéyo (fl., fr. Mar. Leeuwenberg 3750 (WAG), 3793 (WAG), 3794 (WAG); 61 km N. of Sassandra, W. of Niapidou, Leeuwenberg 2532 (WAG); 56 km N. of Sassandra, E. of Béyo (Apr.) Leeuwenberg 3196 (BR, FHO, K, P, WAG), (seedlings) 4551 (WAG); 81 km NNE. of Sassandra, near Gobroko R. (fl., fr. Mar.) Leeuwenberg 3091 (BR, K, WAG); 55 km ENE. of Sassandra, about 15 km N. of Fresco (Mar.) Leeuwenberg 3083 (K, WAG); Nzida (June) Herb. I.D.E.R.T. 1589 (ABI); 9 km N. of Cosrou (May) Leeuwenberg 4252 (WAG); about 20 km W. of Abidjan (fr. Apr.) Leeuwenberg 3981 (ABI, WAG); ibid. (Oct.) Oldeman 455 (WAG), 458 (WAG); ibid. (Oct.) Fig. 3, p. 54; Map 2, p. 60

Type: Sierra Leone: near top of Sugarloaf Mt., Freetown, Scott Elliot 4015 (K, lectotype; isotypes: BM, GH, P).

Heterotypic synonyms: *S. zizyphoides* Bak., Kew Bull. 1895: 96. 1895 and l.c. Type: Ghana: sin. loc., Burton & Cameron s.n. (K, holotype).

S. erythrocarpa Gilg in op. cit. 23: 199. 1896; Baker in Fl. Trop. Afr., l.c. Type: Togo: Misahöhe, Baumann 558 (holotype not seen, destroyed in B; no isotypes seen).

Liana, at least 10–50 m long, 3–40 m high climbing in trees. Bark dark brown, shallowly fissured, lenticellate. Branches terete, not lenticellate, dark brown or dark greenish-brown; branchlets ochraceous-pubescent, glabrescent, terete, often slightly sulcate and medium brown when dry, medium green when living; lateral branches in shade often thickened at the base, loosing the apex, and being transformed into rather blunt spines which are 7–25(35) mm long. Tendrils solitary, in the axils of ordinary leaves or small bracts. Leaves when living with odour of cloves, on the main axis often ternate or decussate; petiole short, 1–5 mm long, ochraceous-pubescent, glabrescent; blade slightly shining

FIG. 3. *S. afzelii*; 1. branch, $\frac{1}{2} \times$; 2. flower (usually broader), $8 \times$; 3. portion of corolla with stamen, $8 \times$; 4. stamen, $16 \times$; 5. pistil with ovary on longitudinal section, $32 \times$; 6. fruit, $\frac{1}{2} \times$; 7. seed, $1 \times$; 8. longitudinal section of seed with embryo, $1 \times$; 9. leaves, $\frac{1}{2} \times$ (1–5. Dinklage 2685; 6–8. Roberty 7855; 9. Leeuwenberg 3242).

and pale to dark green above, hardly shining and paler beneath, coriaceous or in the shade papyraceous or subcoriaceous, extremely variable in shape and size, orbicular, elliptic, obovate, or oblong, in leaves on the main axis and at the bases of the branchlets comparatively wider and often slightly broader than long, $(0.8)1-2(3) \times$ as long as wide, $12-110(145) \times 9-55(65)$ mm, the largest mostly at the apices of the branchlets, especially in the shade, emarginate, rounded, obtuse, apiculate, or acuminate at the apex, more acute towards the apices of the branchlets, and in the shade, subcordate, rounded, or cuneate at the base, also more acute towards the apices of the branchlets, sparsely appressed-pubescent on both sides when young, glabrescent; one pair of secondary veins from above the base curved along the margin to the apex or nearly so, often also a faint submarginal pair. *Inflorescence* axillary, usually about half as long as the leaves, up to twice as long when flowering, elongate after anthesis, congested, or not, often nearly capitate, seemingly umbellate, about 4 \times branched, $2 \times 1 - 5 \times 3$ (8×5) cm. Peduncle about twice as long as the remainder of the inflorescence, densely to sparsely ochraceous-pubescent as the branches and the very short pedicels. Bracts small, very narrowly elliptic, sparsely pubescent. *Flowers* 5-merous. *Sepals* pale green, up to halfway connate, broadly triangular to suborbicular, about as long as wide, 0.5–0.6 mm long, acute, slightly apiculate, or obtuse at the apex, pubescent outside, ciliate, glabrous inside, without colleters. *Corolla* in the mature bud 3–4 \times as long as the calyx, 1.8–2.2 mm long, white, creamy, pale yellowish-green with slightly darker lobes, or creamy at the base and pale green at the apex, changing at anthesis, urceolate or amply infundibuliform, sparsely pubescent outside, inside with a flat brush of white hairs on the lobes; tube 1–1.6 \times as long as the calyx, 0.4–1 \times as long as the lobes, 0.6–1 mm long, 0.5–0.6 mm wide at the base, 1–2.2 mm at the throat; lobes thick, narrowly triangular, 1.6–2.7 \times as long as wide, 1–1.6 \times 0.6–1 mm, acute, erect or suberect. *Stamens* included by the lobes; filaments short, about as long as the anthers, glabrous, inserted at the mouth of the corolla tube; anthers cordate, about as long as wide, 0.4–0.5 mm long, bearded with white hairs at the cordate base; cells divergent at the base. *Pistil* glabrous, 1.2 mm long; ovary broadly ovoid, 0.5 \times 0.5 mm, acuminate, 2-celled; style very short; stigma white, globose or nearly so. In each cell 5 ovules. *Fruit* orange, obliquely ellipsoid, obliquely pedicellate, laterally compressed, slightly longer than wide and mostly somewhat wider than thick, $11 \times 9 \times 9 - 16 \times 13 \times 11$ mm, 1(-2)-seeded; wall thin, rather hard; pulp few, orange. *Seeds* smooth, glabrous, ellipsoid, slightly flattened, more flattened and disk-shaped when dry, $10 \times 9 \times 4 - 14 \times 11 \times 6.5$ mm, umbonate at one side in the middle.

Ecology: On river banks or on moist places in usually periodically inundated rain forests, secondary forests, or in coastal swamp forests; alt. 0–700 m.

Distribution: West Africa.

S. cinnabrina var. *klaineana* Duvign., l.c. p. 67. Type: Gabon: near Libreville, Klaine 1540 (P, holotype, photograph in K, neg. 2556; isotypes: BR, K).

Climbing shrub or liana, 3–30 m high climbing over shrubs and in trees, or small semiscendent tree, 5–12 m high. Trunk 4–20 cm in diam. Bark smooth, thin, pale brown, not or slightly lenticellate, on section pale yellow; wood pale yellow. Branches not lenticellate, medium to dark brown when dry, usually hairy like the branchlets; branchlets ochraceous-pubescent, green, terete, not sulcate and medium brown when dry. Tendrils solitary, in the axils of small triangular bracts. Leaves: petiole ochraceous-pubescent, mostly transversely rugose when dry, 1–5(6) mm long; blade shining or mat and medium to dark green above, paler and with often dark veins beneath, papyraceous, coriaceous, or subcoriaceous, thinner in the shade, also when living, very variable in shape and size, ovate, broadly ovate, elliptic, narrowly elliptic, or narrowly ovate, 1–3.5 × as long as wide, broadest on the main axis and at the base of the branchlets, 1.8–7(10) × 1–4(5) cm, usually obtuse and apiculate, but often acute, sometimes obtusely acuminate or emarginate at the apex, rounded, cuneate, or sometimes subcordate at the base, glabrous or ochraceous-pubescent beneath on the costa and main secondary veins, especially at the base, and above on the costa near the base; one or two pairs of secondary veins from or from above the base curved along the margin; tertiary venation inconspicuous above, prominent beneath. Inflorescence axillary and sometimes also terminal, solitary, lax, few-flowered, about 0.5–1 × as long as the leaves, 1–5.5 × 0.6–2 cm, sometimes transformed into rose-like galls. Lateral branches usually 3-flowered. Peduncle and branches slender, ochraceous-pubescent as the very short pedicels. Bracts narrowly triangular or sepal-like, above glabrous or sometimes pubescent and with some large colleters at the base, beneath usually pubescent. Flowers 4–5-merous, even in a single inflorescence. Sepals pale green, equal or sometimes unequal and the larger about twice the size of the smaller, connate at the base up to one-third of their length, broadly ovate, 0.7–1.2 × as long as wide, (0.5)0.8–1.2 × (0.5)0.7–1 mm, acute or obtuse at the apex, glabrous on both

MAP 1. *S. aculeata*; MAP 2. *S. afzelii*; MAP 3. *S. angolensis*; MAP 4. *S. asterantha*.

sides, ciliate, without colleters. Corolla in the mature bud 2.5–3 × as long as the calyx, 2–2.5 mm long, white or yellow, fading from white to yellow, subrotundate, 4–4.5 mm in diam., glabrous or minutely papillose-pubescent outside, inside on the base of the lobes densely pilose with dirty white hairs (sometimes complete lobes pilose); tube very short, shorter than the calyx, 0.4–0.6 mm long; lobes ovate to triangular, 2.7–4.5 × as long as the tube, comparatively wider

in 4-merous flowers, $1.2-1.7 \times$ as long as wide, $1.5-2 \times 1-1.4$ mm, acute, spreading. *Stamens* just exserted; filaments about as long as the anthers, inserted at the mouth of the corolla tube; anthers yellow, glabrous, ovate or suborbicular, $0.5-1 \times 0.5-0.8$ mm, deeply cordate at the base; cells parallel or slightly divergent at the base. *Pistil* glabrous, 1.2–1.6 mm long; ovary globose or broadly ovoid, $0.8-1.2 \times 0.6-0.9$ mm, more or less gradually narrowed into the style; style short or very short, 0.1–0.7 mm long; stigma capitate. In each cell 4–6 ovules. *Fruit* orange or red, immature glaucous, small, soft, ellipsoid or globose, $12 \times 12 - 22 \times 18$ mm, 1-seeded, with smooth skin, slightly shining or mat, obliquely pedicellate. Wall thin, 1 mm thick. Pulp slimy, dirty brown. Seed shining when living, dark brown, smooth, approximately bean-shaped with an impressed hilum or ellipsoid, $8.5 \times 6 \times 5 - 15 \times 11 \times 9$ mm, glabrous; testa very thin, easily rubbed off.

Distribution: Nigeria, Central and East Africa.

Ecology: On river banks in rain forests or in gallery forests; alt. 0–1500 m.

Nigeria: Eket District, Talbot anno 1913 (BM, K, Z); Oban Forest, Orem Res., Onochie FHI 36285 (FHI).

4. *S. asterantha* Leeuwenberg, sp. nov.

Fig. 5, p. 63; Map 4, p. 60

Liana silvae ripariae. Cirrhi per 1-3 paria dispositi. Folia petiolata laminis coriaceis ellipticis apice acuminatis utrinque glabris. Inflorescentia parva gracilis axillaris pauciflora. Flores minimi tetrameri. Sepala pallide viridia

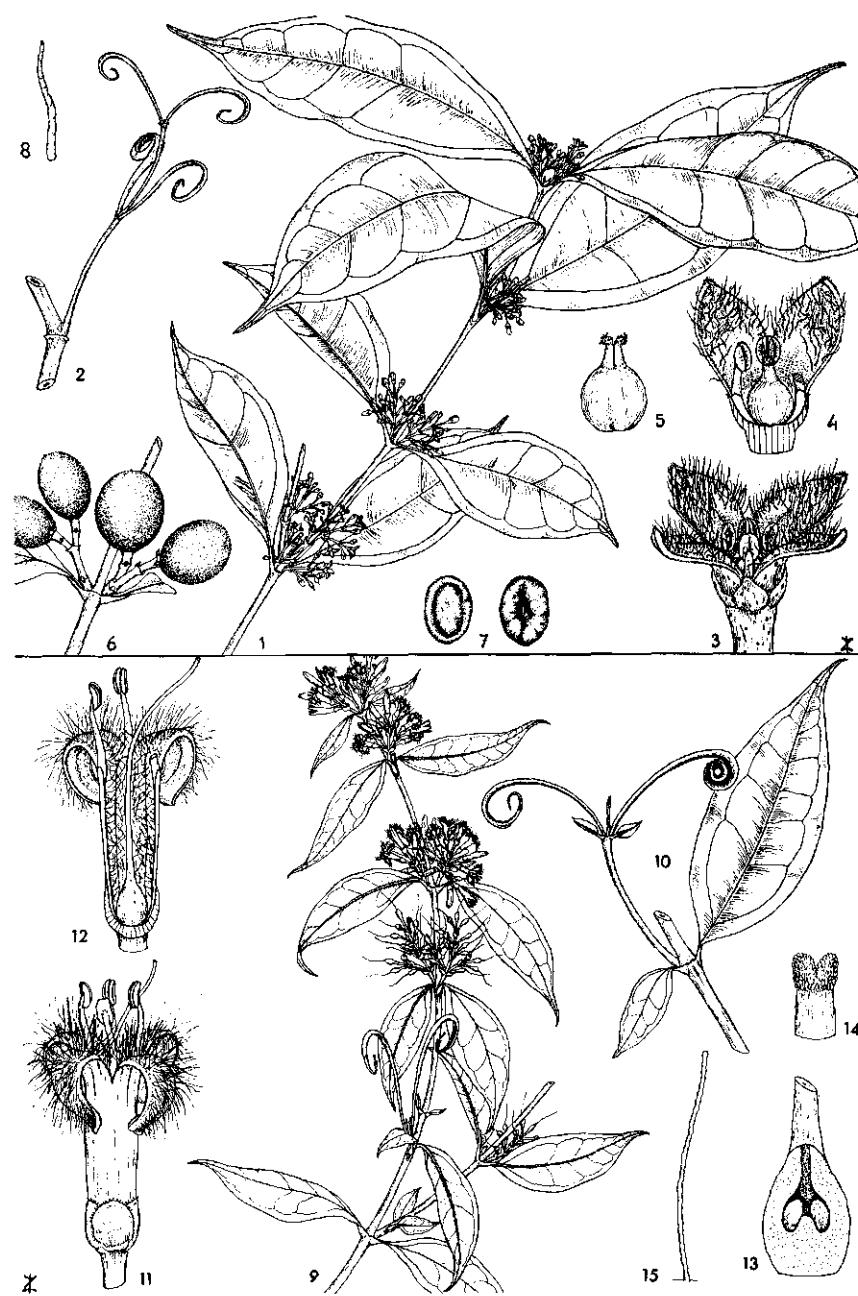

FIG. 5. 1–8. *S. asterantha*: 1. branch, $\frac{1}{2} \times$; 2. tendrils, $\frac{1}{2} \times$; 3. flower, $10 \times$; 4. opened flower, $10 \times$; 5. pistil, $15 \times$; 6. fruits, $\frac{1}{2} \times$; 7. seed both sides, $\frac{1}{2} \times$; 8. hair of corolla, $40 \times$ (1. Leeuwenberg 5247; 2. Leeuwenberg 7363; 3–5 and 8. Breteler 2963; 6–7. Leeuwenberg 6999). 9–15. *S. canthioides*: 9. branch, $\frac{1}{2} \times$; 10. branch with tendrils, $\frac{1}{2} \times$; 11. flower, $5 \times$; 12. opened flower, $5 \times$; 13. longitudinal section of ovary, $15 \times$; 14. stigma, $40 \times$; 15. hair of corolla, $30 \times$ (9–15. Leeuwenberg 7008).

triangularia vel suborbicularia apice acuta utrinque glabra. Corolla pallide flava extus glabra intus lobis pilosa. Stamina fave corollae inserta filamentis antherisque glabris. Pistillum glabrum ovario biloculari. Fructus aurantiacus parvus ellipsoideus mono- vel bispermus semine ellipsoideo uno latere profunde excavato ut videtur papilloso papillis falsis pilis incurvatis compositis.

Type: Cameroun: 27 km SW. of Bertoua, near Doumé, Breteler 2963 (WAG, holotype; isotypes: A, BR, FI, K, LISC, M, P, SL, UC, YA, Z).

Liana 10 m high climbing in trees, 20 m long or more. Trunk 3 cm in diam. or more. Bark dark brown, with large lenticels; wood yellowish or pale yellow. Branches dark green to black, not lenticellate, terete, when dry medium brown and not sulcate; branchlets glabrous, dark green, when dry pale greenish-brown or medium brown, with epidermis peeling off, and often slightly sulcate. Tendrils in 1–2 pairs. Leaves: petiole glabrous, 4–7 mm long; blade dull or slightly shining on both sides, medium green above, pale green, with paler midrib, and dark green venation beneath, coriaceous also when living, elliptic, (1.5)2–3 × as long as wide, (3)5–11(15) × (1.2)2.5–6 cm, acuminate at the apex, cuneate at the base, glabrous on both sides; one inconspicuous pair of secondary veins curved along the margin; tertiary venation not very conspicuous, reticulate, prominent on both sides (in dry leaves); margin slightly revolute. Inflorescence axillary, rather congested, small, few-flowered, about 1 × 1 cm, slightly larger when in fruit, 2 × irregularly branched; branches subopposite. Peduncle, branches, and pedicels thin, glabrous. Bracts small, narrowly triangular, glabrous above, without colleters. Flowers 4-merous. Sepals pale green, connate at the base up to about one-third of their length, equal or sub-equal, triangular to suborbicular, 0.5 × 0.5 mm, acute at the apex, minutely ciliate, glabrous on both sides, without colleters. Corolla in the mature bud 3.5 × as long as the calyx, 1.8 mm long, and rounded at the apex, pale yellow, outside glabrous, inside pilose all over the lobes; tube very short, 0.3 mm long; lobes oblong, 5 × as long as the tube, 1.5 × 0.9 mm, acute, spreading. Stamens exserted; filaments slightly longer than the anthers, 0.6 mm long, glabrous, inserted at the mouth of the corolla tube; anthers oblong, 0.5 × 0.3 mm, deeply cordate at the base, glabrous; cells parallel. Pistil glabrous, 0.8 mm long; ovary broadly ovoid, 0.5 × 0.5 mm, 2-celled, rather abruptly narrowed into the style; style very short, 0.3 mm long; stigma capitate. In each cell 2 ovules. Fruit orange, immature dark green with glaucous bloom, 16 × 11 × 10–22 × 20 × 20 mm, 1–2-seeded. Wall thin. Seed flattened, obliquely elliptic, at one side with a deep pit, at the other with a bulge surrounded by a shallow groove, seemingly papillose; false papillae simulated by short curved hairs. Testa thick.

Distribution: Nigeria, Cameroun.

Ecology: Secondary forests, or riverine and gallery forests; alt. 0–700 m.

Nigeria: Sapoba For. Res., Ugboko District (June) Onochie FHI 31247 (FHI, K).

Cameroun: 17 km E. of Kopongo, along road to Masok, right bank Bolobo R. (fl. Mar., Aug., fr. Oct.) Leeuwenberg 5247 (WAG), 6288 (WAG), 6999 (WAG), all numbers of same

plant; 27 km SW. of Bertoua, near Dimako (May) Breteler 2963 (A, BR, FI, K, LISC, M, P, SL, UC, WAG, YA, Z, type); 10 km N. of Doumé, along road to Bertoua, Leeuwenberg 7373 (WAG).

Note. This species resembles *S. malchairii* De Wild. by the dull leaves, but differs strikingly by the tendrils in 1–2 pairs instead of solitary and the thin corolla lobes which are entirely pilose inside instead of thick and with recurved apical brushes.

5. ***S. barteri*** Solereder. in Engler, Bot. Jahrb. 17: 556. 1893; Oliver in W. J. Hooker, Icones 23: t. 2284. 1894; Baker in Fl. Trop. Afr. 4(1): 523. 1903; Hutchinson & Dalziel, Fl. W. Trop. Afr. 2: 24. 1951; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 44. 1963. **Fig. 6, p. 66; Map 5, p. 73**

Type: S. Nigeria: Onitsha, Barter 1246 (holotype not seen, destroyed in B; lectotype: K, other isotypes seen: GH, LE, P).

Large liana, 30–100 m long and 10–40 m high climbing in trees. Trunk 3–16 cm in diam. Bark dark brown, with large lenticels; wood hard, pale yellowish. *Branches* not lenticellate, sometimes slightly sulcate when dry; branchlets glabrous, medium to dark green, pale or dark brown when dry, terete, not sulcate. Tendrils in 1–3 pairs. *Leaves*: petiole glabrous, 4–10 mm long; blade in flowering branches: shining and pale to dark green above, hardly shining and slightly paler beneath, often drying black and/or turning greyish beneath, coriaceous also when living, elliptic, narrowly elliptic, or narrowly obovate, 1.5–2.8 × as long as wide, 3–10 × 1.5–6 cm, rounded, apiculate, or shortly acuminate at the apex, cuneate at the base, glabrous on both sides; one pair of secondary veins from somewhat above the base curved along the margin and often a faint submarginal pair; tertiary venation reticulate, prominent on both sides; in shade-branches (differential characters only): often much larger, but very variable in shape and size, thinly coriaceous or papyraceous, usually more shining beneath, up to about 20 × 8 cm, acuminate to caudate at the apex, cuneate or rounded at the base; on main axis: suborbicular, cordate, or nearly so, 1–1.5 × as long as wide, about 3 × 2.5–7 × 6 cm, rounded or cordate at the base, rounded to acuminate at the apex; main secondary veins from or from above the base. *Inflorescences* axillary, several together, congested or sometimes not, 0.2–0.4 × as long as the leaves, 1–3 × 1–2 cm, 2–3 × branched, few-flowered. Peduncle, branches, and pedicels glabrous, short. Bracts ovate, approximately shovel-shaped, and about 3 × as long as the sepals, or sepal-like, glabrous. *Flowers* 4-merous. *Sepals* equal, connate at the base up to one-quarter of their length, ovate to suborbicular, 1.4–2 × as long as wide, 1–1.5 × 0.7–1.1 mm, acute, obtuse, or rounded at the apex, minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 4–6 × as long as the calyx and 5.8–7 mm long, white, outside glabrous, inside pilose on the base of the lobes and on the tube except for the glabrous base;

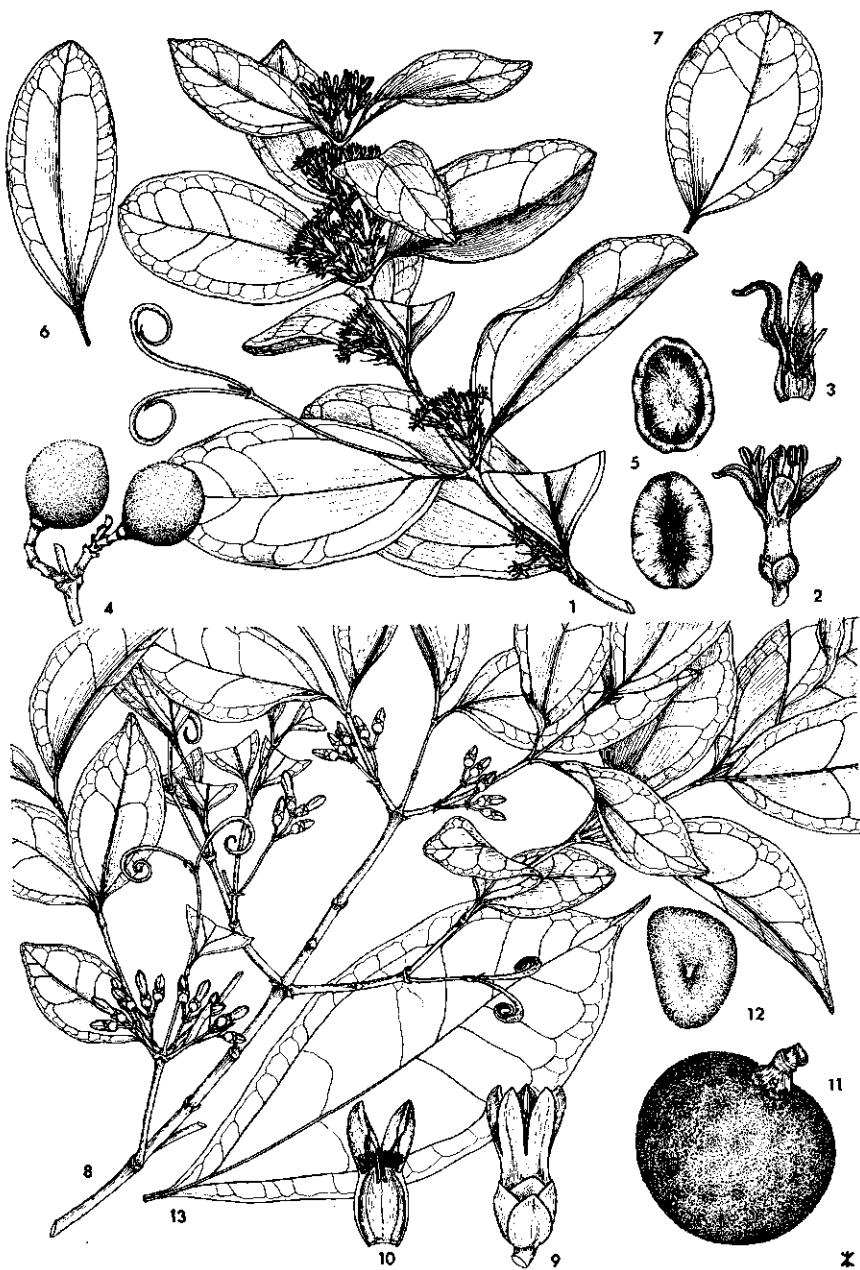

FIG. 6. 1-7. *S. barteri*: 1. branch, $\frac{1}{2} \times$; 2. flower, $3 \times$; 3. portion of corolla with stamen, $3 \times$; 4. fruits, $\frac{1}{2} \times$; 5. seed, two sides, $1 \times$; 6-7. leaves, $\frac{1}{2} \times$ (1-3. Barter 1247; 4-5. Leeuwenberg 3855; 6. FHI 16060; 7. FHI 3363); 8-12. *S. nigritana*: 8. branch, $\frac{1}{2} \times$; 9. flower, $2 \times$; 10. portion of corolla with stamen, $2 \times$; 11. fruit, $\frac{1}{2} \times$; 12. seed, $1 \times$; 13. leaf, $\frac{1}{2} \times$ (8. Irvine 2766; 9-10. FHI 21957; 11-12. J. de Wilde c.s. 3602; 13. Freeman 319).

tube about twice as long as the calyx, $0.9-1.5 \times$ as long as the lobes, $2.8-4.5$ mm long, slightly widened towards the throat; lobes oblong, $2-3.5 \times$ as long as wide, $2.5-3.2 \times 0.9-1.3$ mm, acute, recurved. *Stamens* well-exserted; filaments glabrous or sparsely pubescent, about twice as long as the anthers, $1-2.5$ mm long, elongating at anthesis, inserted at the mouth of the corolla tube; anthers oblong, $0.6-1.1 \times 0.4-0.6$ mm, glabrous, rounded at the base; cells parallel. *Pistil* glabrous, $4-6$ mm long; ovary globose or ovoid-conical, 1×1 mm, 2-celled, rather abruptly narrowed into the style; style $3-5$ mm long, elongating at anthesis, thin; stigma obscurely bilobed. In each cell 10 ovules. *Fruit* orange, obliquely ellipsoid or obovoid, $20 \times 16 \times 15-32 \times 22 \times 22$ mm, 1- or several-seeded. Wall thin, rather hard, $1-2$ mm thick. *Seed* white (in dry fruits often dark brown), obliquely ellipsoid, $13 \times 10 \times 4-20 \times 14 \times 10$ mm, at one side with a deep pit, at the other with a bulge surrounded by a shallow groove, seemingly papillose; false papillae simulated by short curved hairs.

Distribution: West Africa.

Ecology: Mostly on river banks in rain forests, montane rain forests, and secondary forests, which are often periodically inundated; alt. 0-1300 m.

Guinea: Niger R. source, Jaeger 103 (WAG); Nimba Mts., Schnell 3497 (P), 4397 (ABT).

Sierra Leone: Rowal, Thomas 1055 (K); Tingi Mts., N. Kono (fr. Apr.) Morton & Gledhill SL 1920 (WAG); near Madina, Limba (fl., fr. Apr.) Scott Elliot 5569 (K), 5659 (K); Loma Mts. (Mar.) Jaeger 1615 (K, WAG), 7108 (WAG), 7653 (WAG), 8499 (WAG), 8503 (WAG), 9673 (WAG).

Liberia: Bong Range, 32 km N. of Kakata, Leeuwenberg & Voorhoeve 4964 (WAG); Ganta (?), Harley s.n. (LIB); Nimba Mts. (fr. Jan.) Adam 20554 (K, P); ibid., Leeuwenberg & Voorhoeve 4688 (WAG), 4747 (WAG), 4761 (WAG); near Nimba Mts., Mt. Bélé (fr. Mar.) Adam 21222 (P).

Ivory Coast: W. of road Tai-Tabou, between Troiya and Cavally R., Aké Assi 6911 (WAG), 6915 (UCI); ENE. of Néromer, Guillaumet 1379 (ABI, WAG); Mt. Tonkoui, Aké Assi 5520 (WAG), 6946 (WAG); ibid. (fr. Apr.) Leeuwenberg & Bouquet 3855 (ABI, WAG); 10 km W. of Tapéguhé, right bank Sassandra R., about 50 km NW. of Soubré, Leeuwenberg 4511 (WAG); Guidéko, near Sassandra R. (fr. May) Chevalier 16351, partly (P), 16360 (P); 31 km S. of Gagnoa, bank Davo R., Leeuwenberg 4116 (WAG); about 30 km SW. of Guéyo, Leeuwenberg 4103 (WAG); 56 km N. of Sassandra, E. of Béyo, Leeuwenberg 3996 (WAG); about 25 km W. of Sassandra, Leeuwenberg 4037 (WAG); 72 km N. of Sassandra, along road to Lakota, Leeuwenberg 4077 (WAG); Affouka, bank la Mé R., Adzopé Road (fr.) Debray 24 Jan. 1964 (WAG); Forêt du Téké, Aké Assi 6892 (WAG); 15 km N. of Aboisso, Leeuwenberg 4500 (WAG); about 15 km NE. of Bianouan, Leeuwenberg 3952 (WAG); Abengourou (fr. Feb.) Aké Assi 6969 (UCI).

Ghana: near Elmina (?), Scholes 47 (GC).

Nigeria: Shasha For. Res., Ijebu Province (Feb.) Richards 3094 (BM, BR, COI, GB, LISC, MO, NY, S, US, WAG), 3429 (BM, MO); Omo and Shasha For. Cameroun: about 20 km W. of Victoria, Leeuwenberg 6910 (WAG); 3 km S. of Victoria, near Bimbia, Leeuwenberg 6960 (WAG), 6961 (WAG).

Cult.: Adiopodoumé, Ivory Coast, seedling of herb. Leeuwenberg & Bouquet 3855; Leeuwenberg 4570 (WAG).

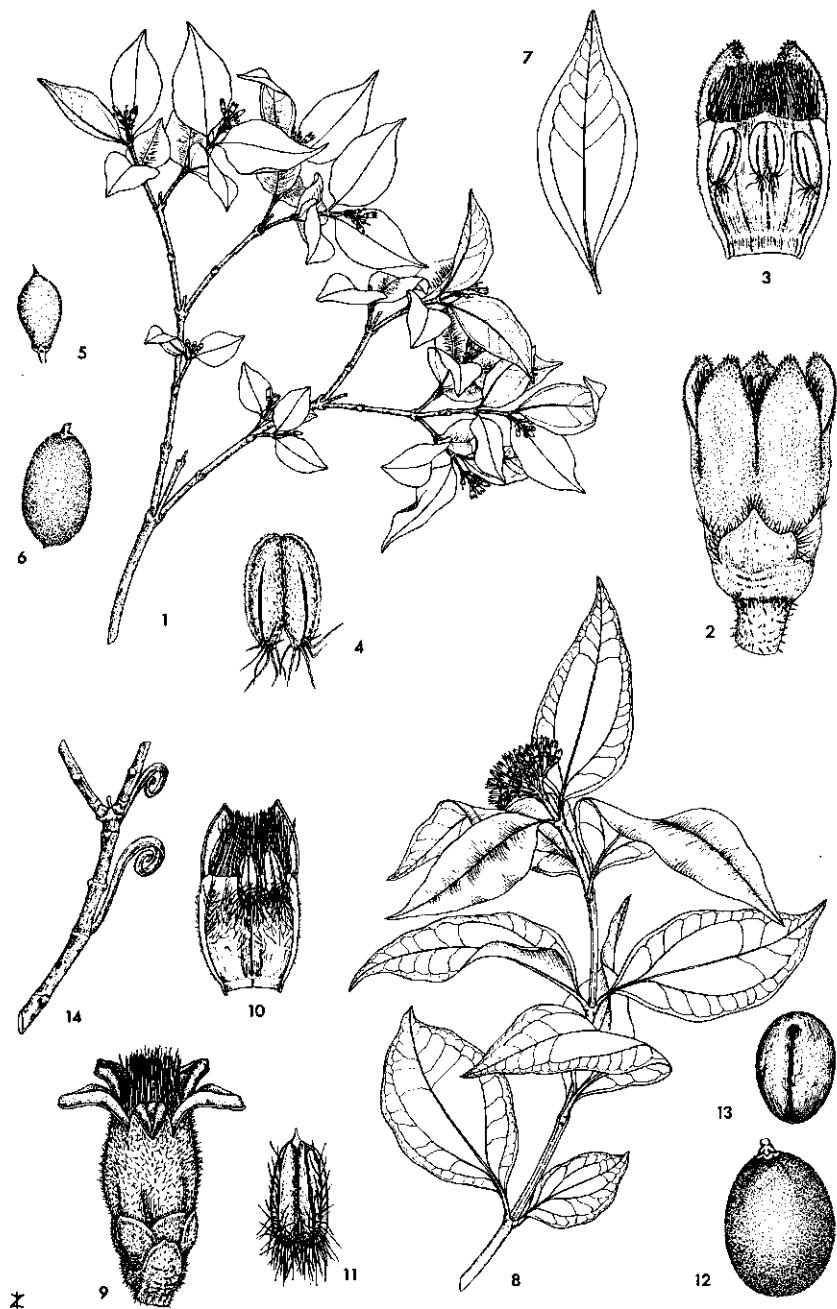

FIG. 7. 1-7. *S. bifurcata*: 1. branch, $\frac{1}{2} \times$; 2. flower, $10 \times$; 3. portion of corolla with stamens $10 \times$; 4. anther, $20 \times$; 5. immature fruit, $1 \times$; 6. mature fruit, $1 \times$; 7. leaf, $\frac{1}{2} \times$ (1-4. Res. Nat. 9719; 5, 7. Perrier de la Bathie 9558; 6. Serv. For. 12851); 8-14. *S. diplocarpha*: 8. branch, $\frac{1}{2} \times$; 9. flower, $5 \times$; 10. portion of corolla with stamens, $10 \times$; 11. anther, $10 \times$; 12. fruit, $1 \times$; 13. seed, $1 \times$; 14. branch with tendrils, $\frac{1}{2} \times$ (8-11. Humbert 28340; 12-13. Perrier de la Bathie 16941; 14. Humbert 30025).

Note. The only clearcut differential character distinguishing *S. barteri* from *S. gossweileri* is the length of the filaments:

S. barteri:

Filaments about $2 \times$ anthers.

S. gossweileri:

Filaments $0.2\text{--}1 \times$ anthers.

6. ***S. bifurcata*** Leeuwenberg, sp. nov.

Fig. 7, p. 68; Map 6, p.73

Arbor parva ramis saepissime bifurcatis inermibus. Folia breviter petiolata laminis subcoriaceis ovatis vel ellipticis apice acuminatis. Inflorescentia terminalis perparva laxa pauciflora pedunculo pedicellisque pubescentibus. Flores pentameri parvi. Calyx cupuliformis. Corolla extus glabra, intus basi loborum suberectorum penicillata. Stamina inclusa filamentis brevibus medio tubo insertis antheris oblongis pilis basi cordata barbatis. Pistillum glabrum ovario biloculari. Locula placentis ovula pauca gerentibus. Fructus monospermus ellipsoideus. Semen ellipsoideum testa laevi glabra.

Type: Madagascar: Andromomavo Canton, Soalala District, Randriamiera in coll. Res. Nat. 9719 (P, holotype; isotype: WAG).

Tree, 5–10 m high. *Branches* not lenticellate, pale grey or pale brown, repeatedly dichotomously branched; branchlets brown-pubescent, often sulcate when dry. *Leaves*: petiole short, pubescent, 1–4 mm long; blade slightly shining on both sides or not, somewhat paler beneath, thinly coriaceous, ovate, elliptic, or narrowly elliptic, 1.5–3 × as long as wide, 15–70 × 10–28 mm, obtusely or acutely acuminate at the apex, cuneate at the base, minutely pubescent on the costa above and sometimes also beneath; one pair of secondary veins from or from above the base curved along the margin; tertiary venation not or slightly prominent on both sides. *Inflorescence* terminal, very small, lax, few-flowered, 0.5 × 0.5–1 × 1 cm, 1 × branched. Peduncle, branches, and pedicels pubescent. Bracts small, approximately sepal-like. *Flowers* 5-merous. *Calyx* cup-shaped; sepals halfway connate, equal or subequal, nearly triangular, 1–1.4 × 0.8–1.2 mm, acute at the apex, minutely ciliate, glabrous on both sides or outside with a single hair, without colleters. *Corolla* in the mature bud 2.5 × as long as the calyx, 3–3.5 mm long, white (?), outside glabrous, inside with a brush of stiff white (?) hairs on the base of each lobe; tube 1.6 × as long as the calyx, 2–2.5 × as long as the lobes; lobes oblong, 1 × 0.6–1.2 × 1 mm, acute, suberect. *Stamens* included; filaments short, about 0.3 × as long as the anthers, inserted on the middle of the corolla tube; anthers oblong, 0.8 × 0.4–1 × 0.5 mm, bearded with pilose hairs at the cordate base; cells parallel. *Pistil* glabrous, 2–2.5 mm long; ovary ovoid or nearly so, 0.8–1 × 1 mm, 2-celled; style 1.2–1.5 mm long; stigma capitate. In each cell 8–12 ovules. *Fruit* small, ellipsoid, about 1–1.5 cm in diam., 1-seeded. *Seed* ellipsoid, probably shaped like that of *S. henningsii*. Testa smooth, glabrous, rather thick.

Distribution: Madagascar.

Ecology: Woodlands.

Madagascar: Andromomavo Canton, Soalala District (Oct.) Randriamiera in coll. Res. Nat. 9719 (P, WAG, type); Stampitso, Ambongo, Perrier de la Bâthie 9558 (P, paratype); Filanjara (fr. Jan.) Serv. For. 12851 (P, paratype).

Note. This species differs from the nearest relative as follows:
Costa pubescent above; sepals halfway connate; pistil much longer than the calyx, 2–2.5 mm long, with distinct style *S. bifurcata*
Costa glabrous above; sepals nearly free; pistil comparatively short, hardly longer than the calyx, 1 mm long; stigma sessile *S. mostueoides*
They resemble each other by the shape of the leaves, the disposition of the inflorescence, the indumentum in the corolla, and the insertion of the stamens.

7. *S. boonei* De Wild., Bull. Jard. Bot. Brux. 5: 45. 1915; Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 32. 1952; Duvigneaud, Staquet & De Wit, Bull. Soc. Roy. Bot. Belg. 85: 56. 1952; Bruce & Lewis, in Fl. Trop. E. Afr. Loganiaceae 30. 1960; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 43. 1963.

Fig. 8, p. 71; Map 6, p. 73

Type: Congo: Orientale, Nala, Boone 83 (BR, lectotype; photograph in K, neg. 2516; isotype: BR).

Large liana, at least 5–20 m high climbing in trees, 30–100 m long or more. Trunk 3–10 cm in diam., or perhaps even more. Bark smooth, pale brown, thin, often inconspicuously lenticellate; wood pale yellow. *Branches* not lenticellate, pale grey-brown; branchlets sparsely appressed-pubescent with especially below the stipular line ranked hairs, terete, not sulcate and dark brown when dry. Tendrils solitary, in the axils of small bracts. *Leaves*: petiole sparsely pubescent, 2–7 mm long, blade mat or slightly shining, above medium to dark green, beneath paler and often with dark veins, papyraceous to thinly coriaceous, also when living, ovate, narrowly ovate, elliptic, or narrowly elliptic, comparatively wider on the main axis and at the bases of the branchlets, 1.6–3 × as long as wide, 3–10 × 1–4.5 cm, acuminate at the apex, cuneate, rounded, or on the main axis sometimes subcordate at the base, above glabrous (often with pubescent hairs on the costa when young), beneath sparsely pubescent on the costa and main secondary veins, especially at the base; one pair of distinct secondary veins from or from somewhat above the base curved along the margin and a faint submarginal pair; tertiary venation close, reticulate. *Inflorescence* axillary and terminal, solitary, 0.2–0.5 × as long as the leaves, 1.5–3 × 1–2.5 cm, lax, 2–4 × branched from low down, few-flowered. Peduncle, branches, and pedicels appressed-pubescent with often ranked hairs to subglabrous. Bracts small, triangular to ovate, pubescent to subglabrous beneath, lower above often pubescent and with minute colleters at the base, other glabrous above, without colleters. *Flowers* 5-merous, sweet-scented. *Sepals* green, connate at the base, equal or subequal, broadly ovate, ovate, or nearly triangular, (0.8)1–1.5 × as long as wide, (0.8)1–1.5 × 1–1.2 mm, obtuse, acute, or less often rounded at the apex, minutely ciliate, minutely puberulous

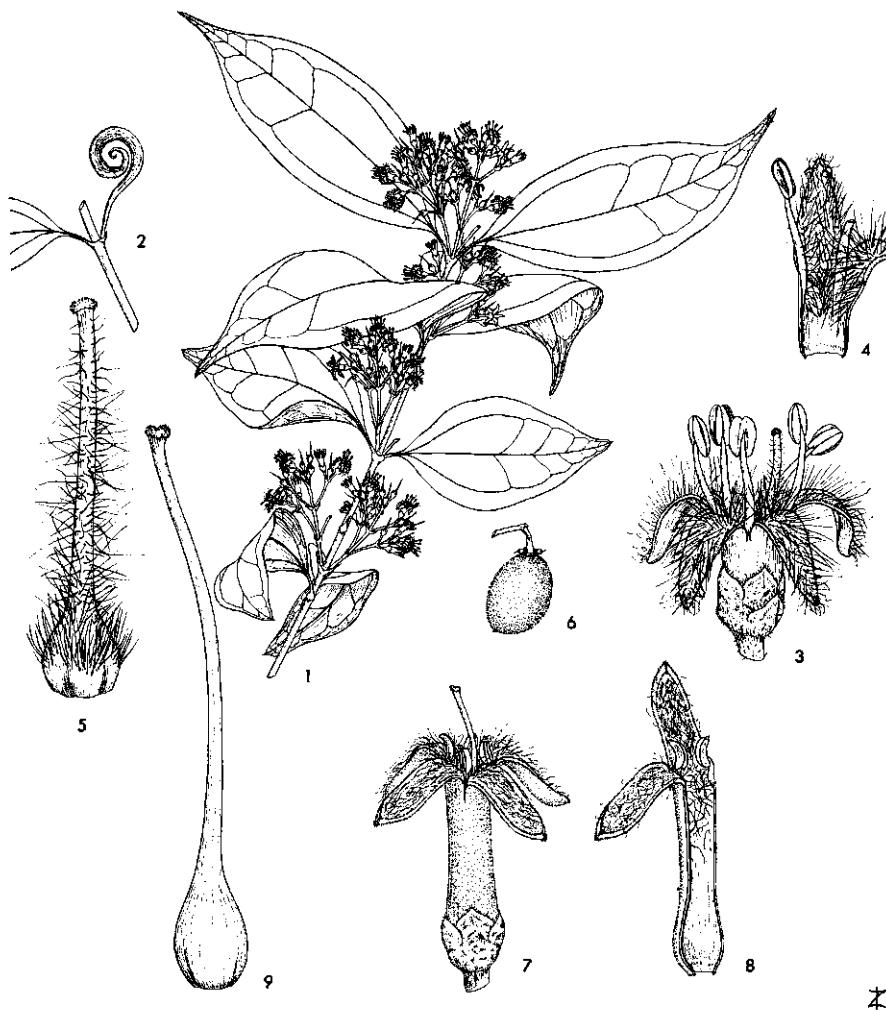

FIG. 8. 1–6. *S. boonei*: 1. branch, $\frac{1}{2} \times$; 2. portion of branch with tendril, $\frac{1}{2} \times$; 3. flower, $5 \times$; 4. opened corolla with stamen, $5 \times$; 5. pistil, $10 \times$; 6. fruit, $\frac{1}{2} \times$ (1–5. Breteler 2954; 6. Gérard 5256). 7–9. *S. gossweileri*: 7. flower, $5 \times$; 8. portion of corolla with stamens, $5 \times$; 9. pistil, $10 \times$ (7–9. Gossweiler 9180); habit, leaves, and seeds as in *S. barteri*.

本

to glabrous outside, glabrous inside, without colleters. *Corolla* in the mature bud 3–5 \times as long as the calyx, (4.2) 4.5–5 mm long, and rounded at the apex, white or creamy, in bud yellow or orange, outside obscurely puberulous to glabrous, inside densely pilose except for the glabrous base of the tube (lobes entirely hairy inside); tube short, 0.9–2.2 \times as long as the calyx, 1.2–2.2 mm long; lobes oblong, 1.4–2(2.5) \times as long as the tube, 2.7–3.5 \times as long as wide, 2.7–3.2 \times 0.8–1.2 mm, acute, recurved (in young flowers spreading). *Stamens* well-exserted; filaments white, glabrous, 1.7–2.5 \times as long as the

anthers, 1.8–2.5 mm long, narrowed towards the apex, inserted at the mouth of the corolla tube; anthers yellow, turning black, oblong, about twice as long as wide, $0.8-1.2 \times 0.4-0.7$ mm, deeply cordate at the base, glabrous; cells parallel. *Pistil* pilose, 4.2–5.4 mm long; ovary globose or ovoid, $0.8-1.2 \times 0.8-1.2$ mm, pilose except for the usually glabrous base, rather abruptly narrowed into the style, 2-celed; style pilose (apex often glabrous), rather thin, 3–4.2 mm long; stigma capitate. In each cell 5–9 ovules. *Fruit* dark purple with plum-like bloom (teste Charter FHI 38704), immature glaucous, small, soft, ellipsoid or subglobose (?), 2.5 cm in diam. (teste Charter), 1-seeded, with a somewhat granular skin. Wall thin. *Seed* ellipsoid, slightly flattened at one side, $14 \times 7-11 \times 4-9$ mm; testa not seen, deciduous, sticking to the pulp.

Distribution: Nigeria and northern Central Africa.

Ecology: Rain forests or secondary forests, often on river banks; alt. 200–1300 m.

Nigeria: Sapoba For. Res., Benin District (May) Keay FHI 37032 (FHI, K); Ugo, Usognibe District (fr. July) Charter FHI 38704 (FHI, K); Ugun For. Res., Ishan District (June) Olorunfemi FHI 38067 (FHI, FHO, K, P, WAG).

Fig. 24, p. 175; Map 7, p. 73

Liana vel frutex scandens ferrugineo-pubescentis cirrhos solitarii. Folia laminis etiam viventibus coriaceis, subcoriaceis vel papyraceis ellipticis vel ovatis. Inflorescentia axillaris congesta foliis multo brevior. Flores pentameri parvi. Sepala late ovata vel triangularia apice acuta. Corolla lutea extus breviter pubescens intus lobis suberectis crassis apice pilis incurvatis profulta. Stamina corollae fauce inserta filamentis brevibus antheris basi sagittata pilis rigidis minimis barbatis. Pistillum glabrum ovario biloculari. Locula placentis ovula pauca gerentibus. Fructus ellipsoideus monospermus. Semen opacum ellipsoideum testa laevi.

Type: Cameroun: N. of Nkolbisson, W. of Yaoundé, Leeuwenberg 5447 (WAG, holotype; isotypes: A, B, BR, C, COI, E, EA, F, FHO, FI, G, GOET, HAL, HBG, IFAN, K, L, LD, LISC, LY, M, MO, NY, P, PRE, S, TCD, U, UC, W, WRSL, YA, Z).

Climbing shrub or liana, 3–20 m high climbing in trees or over shrubs, at least up to 25 m long, mostly very dark brown when dry. Trunk at least 4.5 cm in diam. Bark pale grey, smooth, thin, lenticellate; wood pale yellowish. Branches not lenticellate, terete, dark brown and not or hardly sulcate when dry; branchlets dark rusty-brown, rusty-brown-pubescent. Tendrils solitary. Leaves: petiole rusty-brown-pubescent, 3–9 mm long; blade slightly shining and medium to dark green above, mat and paler beneath, coriaceous, thinly coriaceous, or papyraceous also when living, thinner in the shade, elliptic, narrowly elliptic, ovate, or narrowly ovate, comparatively narrower towards the apices of the branchlets, (1.2) 2–3 (3.5) × as long as wide, (5) 7–11 (13) × (1.5) 2.5–5 (7.5) cm, acuminate or in the shade often nearly caudate at the apex, cuneate or rounded at the base, glabrous above, rusty-pubescent especially or only on the costa and main secondary veins beneath; one or sometimes two pairs of secondary veins from or from above the base curved along the margin and mostly a faint submarginal pair; other secondary veins very small; costa and main secondary veins impressed above and tertiary venation, which is reticulate, prominent on both sides when leaves dry. Inflorescence axillary, solitary, congested, several-flowered, much shorter than the leaves, 1 × 1–2 × 2 cm, 2–3 × branched. Peduncle, branches, and pedicels short, rusty-pubescent. Bracts small, approximately sepal-like, glabrous above, without colleters. Flowers 5-merous. Sepals pale green, connate at the base, equal or subequal, broadly ovate to triangular, inside 1 × 1 mm (outside 1.5 × 1 mm), acute at the apex, ciliate, outside rusty-pubescent, inside glabrous, without colleters. Corolla in the mature bud 2–2.5 × as long as the calyx (as only 1 mm of corolla tube in calyx) and 2.5–3.3 mm long, yellow, outside shortly pubescent except for the glabrous base (in calyx), inside with small recurved brushes of white (?) hairs just below the apex of the lobes, further glabrous; tube short 1–1.5 mm long, wide, gradually widened towards the throat, at the base 1 mm, at the

throat 1.5–1.8 mm wide; lobes narrowly triangular, 1.6–2 × as long as wide, 1.5–1.8 × 0.9–1 mm, thick at the apex, acute, suberect. *Stamens* slightly exserted; filaments short, 0.5–1 × as long as the anthers, glabrous, inserted at the mouth of the corolla tube; anthers oblong, 0.8–0.9 × 0.5–0.7 mm, with some minute stiff hairs at the deeply sagittate base; cells often slightly divergent at the base. *Pistil* glabrous, 2 mm long; ovary ovoid or broadly ovoid, 1.1–1.2 × 0.8–0.9 mm, rather abruptly narrowed into the style; style 0.8 mm long; stigma capitate. In each cell 5–6 ovules. *Fruit* orange (?), immature pale green, small, ellipsoid, about 1.2 × as long as wide, 16–21 × 13–17 mm, narrower when immature, 1-seeded. Wall thin, about 0.3 mm thick in dry fruits. *Seed* ochraceous, not flattened, ellipsoid, 9 × 7 × 6—17 × 11 × 9 mm, glabrous, smooth; testa thin, usually sticking to the pulp.

Distribution: West and Central Africa.

Ecology: Rain forests, secondary forests, gallery forests, or thickets on rocky slopes; alt. 0–900 m.

Guinea: Nimba Mts. (?), Schnell 821 (IFAN, P).

Ivory Coast: 7 km N. of crossing of Hana R. and road Tai-Tabou, J. de Wilde & Leeuwenberg 3523 (WAG); Mt. Niéonkoué, Guillaumet 1504 (ABI, WAG); 10 km W. of Tapéguhé, right bank Sassandra R., about 50 km NW. of Soubré, Leeuwenberg 4516 (WAG).

Large liana, up to 120 m long, 20–45 m high climbing in trees, drying dark brown or black. Trunk 2–25 cm in diam. Bark dark brown, with large lenticels, with annular leaf scars; wood pale yellow to deep ochraceous, with pale brown bark-islets. *Branches* not or slightly lenticellate, sometimes sulcate when dry; branchlets glabrous, not lenticellate, shining and dark green, dark brown to black when dry, terete or nearly so, often slightly sulcate when dry; main axis terete. Tendrils in 1–3 pairs. *Leaves*: petiole glabrous, 7–17 mm long, blade shining and dark green above, less shining to dull and mostly paler beneath, drying dark brown to black, coriaceous or thinly coriaceous also when living, thinner in the shade, elliptic, narrowly elliptic, or on the main axis often ovate, larger or smaller in the shade, smaller and comparatively wider on the main axis and at the bases of the branchlets, (1.2) 1.5–3 × as long as wide, 6–22(31) × 3–10(12) cm, acute or shortly acuminate at the apex, often longer acuminate in the shade, cuneate or rounded at the base, on main axis rounded to cordate, margin revolute in sun leaves (flowering branches), glabrous on both sides; the basal pair of secondary veins larger than the other but mostly not more conspicuous, curved along the margin. *Inflorescence* axillary or occasionally terminal, solitary, often branched from low down, lax or congested, 0.3–0.7 × as long as the leaves, 4.5–6.5 × 4–6 cm, few-flowered, 2–3 × branched. Peduncle and branches mostly long, glabrous and pale green as the pedicels and bracts. Bracts glabrous, approximately sepal-like, lower larger, upper smaller than the sepals. *Flowers* 5-merous. *Sepals* pale green, connate at the base, orbicular, 2–3.5 mm long, rounded at the apex, minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 3.3–4 × as long as the calyx, 8–11.5 mm long, and rounded at the apex, white or yellow, outside glabrous, inside with a minutely ciliate undulate or more or less distinctly 5-lobed corona that is contracted at the mouth; corona lobes – if present – truncate and only at the apex undulate and minutely ciliate; corolla tube campanulate or cylindrical, often ventricose when living, 1.7–2 × as long as the calyx, 0.9–1.2 × as long as the lobes, 4–6 mm long; lobes thick, triangular to ovate, 1.7–2.6 × as long as wide, 4–6 × 1.7–3 mm, acute, spreading or recurved. *Stamens* included in the corona; filaments glabrous, very short, about 0.2–0.4 × as long as the anthers, inserted at the mouth of the corolla tube (corona thought away); anthers narrowly oblong, 2.2–3 × 0.6–0.7 mm, sagittate at the base, ciliate all around

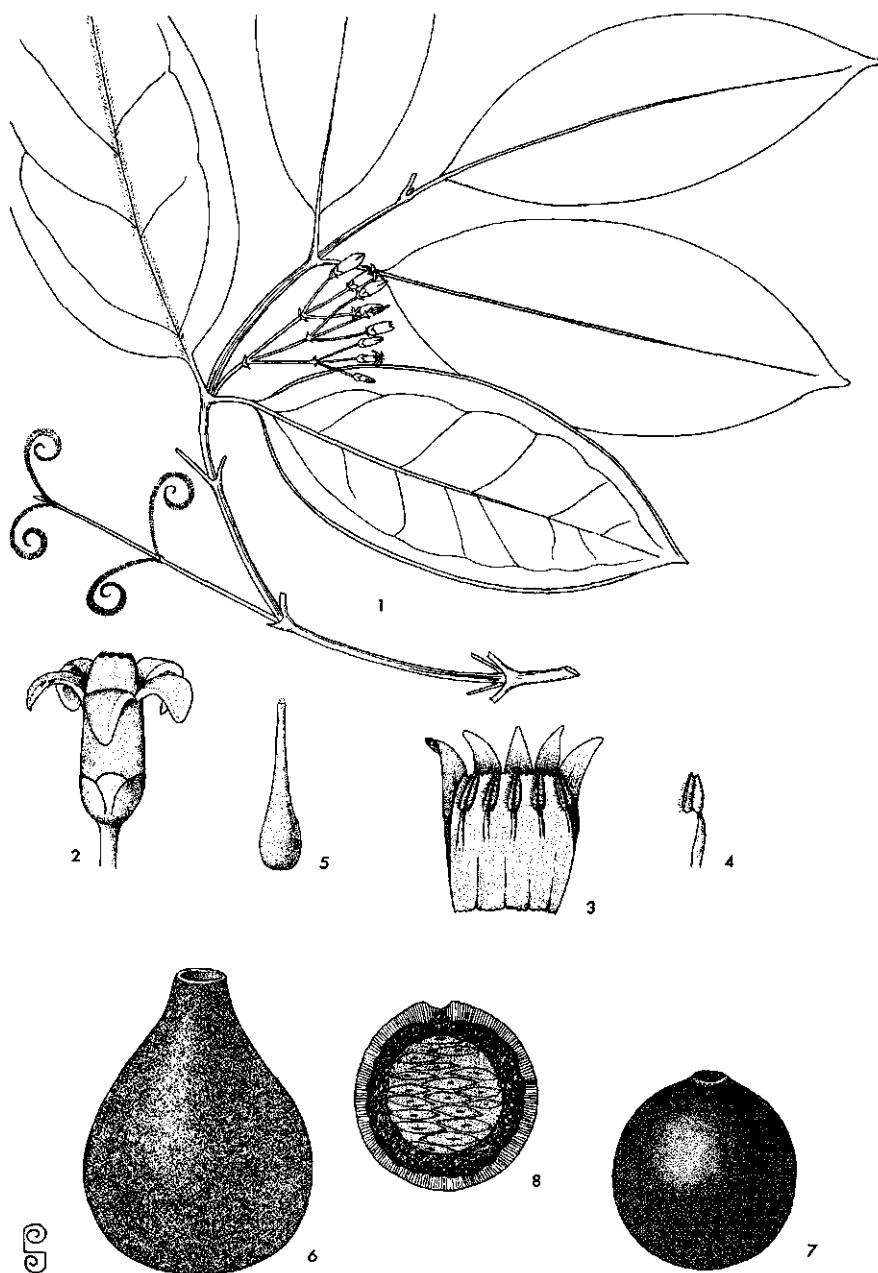

FIG. 9. *S. campagneura*: 1. branch, $\frac{1}{2} \times$; 2. flower, $3\frac{1}{2} \times$; 3. opened corolla with stamens, $3\frac{1}{2} \times$; 4. stamen, $5 \times$; 5. pistil, $3\frac{1}{2} \times$; 6-7. fruits, $\frac{1}{2} \times$; 8. longitudinal section of fruit preserved in spirit, $\frac{1}{2} \times$ (1, 3-5. Breteler 1332; 2, 6. Leeuwenberg 7478; 7-8. Leeuwenberg 3974).

or only at the base; cells parallel. *Pistil* glabrous, 8–9 mm long; ovary ovoid, about $1.5 \times$ as long as wide, $3-4 \times 2-2.5$ mm, 2-celled, gradually narrowed into the style; style 5–5.5 mm long; stigma capitate. In each cell about 50 ovules. *Fruit* large, hard, like a bowl, often slightly obliquely pedicellate, variable in shape and size, globose, ellipsoid, slightly pear-shaped, or sometimes ovoid, mat, pale glaucous to yellow, usually somewhat longer than wide, $6.5 \times 6-20 \times 13.5$ cm, apiculate or rounded at the apex, 2-celled, with (2) 10–112 seeds in horizontal layers. Wall thick, hard, knobby inside by which the thickness varies from (2) 6 to 13 mm (even in a single fruit). Pulp orange, turning black, containing very strong fibres shaping an inner fruit-wall layer and the septum. *Seeds* medium brown, darkening in rotting fruits, flattened, convex, especially at one side, obliquely suborbicular, ovate, triangular, or oblong, not or slightly curved, $1-1.7 \times$ as long as wide, $25-50 \times 20-40 \times 3-6$ mm or sometimes smaller, glabrous, with a narrow irregular wing, which is 1–6 mm wide.

Distribution: West and northern Central Africa.

Ecology: In rain forests or secondary forests, often on moist places; alt. 0–700 m.

Fig. 5, p. 63

Liana glabra silvae densae cirrhis per paria dispositis. Folia laminis subcoriaceis plerumque anguste ovatis vel ellipticis apice acuminatis. Inflorescentia axillaris et terminalis pauciflora. Flores tetrameri omnes pedicellati odorantes. Sepala suborbicularia apice rotundata. Corolla alba extus glabra intus dense pilosa tubo cylindrico lobis oblongis recurvatis. Stamina exserta fauce corollae inserta filamentis longis albis antheris glabris cordatis. Pistillum glabrum ovario biloculari. Locula placantis ovula dua gerentibus stylo filiforme. Fructus ignotus verisimiliter parvus monospermus.

Type: Cameroun: 3 km E. of km 58 of Edéa-Kribi road, Leeuwenberg 7008 (WAG, holotype; isotypes: A, B, BM, BR, C, COI, E, FHO, FI, G, HBG, K, L, LD, LISC, M, MO, P, PRE, S, U, W, YA, Z).

Liana climbing in trees. *Branches* green, terete, not lenticellate, like the branchlets which are glabrous and often sulcate when dry. Tendrils in 1 (-3) pairs. *Leaves*: petiole 2-4 mm long, glabrous; blade shining on both sides, less so to mat when dry, not or hardly paler beneath, rather thinly coriaceous, mostly narrowly ovate to narrowly elliptic, but on main axis often ovate, (1.5) 2-4 × as long as wide, 3-11 × 0.8-3.7 cm, acuminate at the apex, cuneate or rounded at the base, glabrous on both sides; one pair of secondary veins from or from above the base, curved along the margin and often a faint submarginal pair; costa and base of main secondary veins somewhat impressed above; tertiary venation reticulate, not very conspicuous. *Inflorescence* axillary and terminal, rather lax, few-flowered, shorter than the leaves, 1 × 1-5 × 3 cm, 1-3 branched. Peduncle, branches, and pedicels glabrous. Lower bracts leafy, other shovel-shaped, glabrous on both sides, without colleters, and about 2-3 × as long as the sepals. *Flowers* 4-merous, sweet-scented, all pedicellate. *Sepals* pale green, connate at the base, suborbicular, as long as wide, 1-1.2 mm long, rounded at the apex, glabrous on both sides, minutely ciliate, without colleters. *Corolla* in the mature bud 5-6 × as long as the calyx, 5-7 mm long, and tapering at the apex, white, outside glabrous, inside densely pilose except for the glabrous very base of the tube; tube cylindrical or nearly so, 2.5-3.5 × as long

as the calyx, 1–1.4 × as long as the lobes, 2.5–4 mm long; lobes oblong, 2–3 × as long as wide, 2.2–3.2 × 1–1.2 mm, acute, recurved. *Stamens* exserted; filaments white, glabrous, 2.4–3 × as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 0.5–0.6 × 0.3–0.4 mm, glabrous, cordate at the base. *Pistil* glabrous, 4.5–6.2 mm long, ovary often broadly ovoid, 0.5 × 0.5–1 × 0.6 mm, 2-celled, pale green; style filiform, white, 4–5.2 mm long; stigma very small, often obscurely bilobed. In each cell 2 ovules. *Fruit* unknown, supposed to be small. *Seeds* are supposed to be like those of *S. barteri*.

Distribution: Only twice collected in one locality in Cameroun.

Ecology: Rain forest or old secondary forest with *Lophira alata* Banks ex Gaertn. f.; alt. about 100 m.

Cameroun: 3 km E. of km 58 of Edéa-Kribi road (Oct.) Leeuwenberg 6814 (A, B, BR, BREM, COI, E, EA, ENT, F, FHO, FI, G, GOET, HAL, HBG, IFAN, K, L, LD, LISU, LY, M, NY, P, SL, SRGH, TCD, U, UPS, US, WAG, YA, paratype), 7008 (type, herbaria see above).

Note. *S. canthioides* is closely allied to *S. barteri* and *S. tricalysioides* by the branches, tendrils, and flowers. It differs from them as follows:

Sun-leaves coriaceous, shining, rounded to shortly acuminate; tertiary venation reticulate, prominent on both sides; about 10 ovules *S. barteri*
Sun-leaves rather thinly coriaceous, acuminate; costa not or slightly impressed above; tertiary venation hardly prominent; 2 ovules *S. canthioides*
Sun-leaves subcoriaceous, dull, caudate; costa distinctly impressed above; about 10 ovules *S. tricalysioides*

11. ***S. chromatoxylon* Leeuwenberg, sp. nov.** **Fig. 10, p. 81; Map 9, p. 83**

Liana magna silvae densae. Lignum trunci et ramorum colores varias ostendens. Folia petiolis glabris laminis penninerviis coriaceis vel papyraceis ellipticis apice acuminatis glabris. Inflorescentia axillaris pedunculis pedicellisque minute pubescentibus. Flores pentameri solum in albastro noti. Sepala angusta subulata. Corolla extus glabra. Stamina corolla inserta antheris cordatis. Fructus subglobosus basi subcordatus durus parie lignosa seminibus paucis oblique ellipticis testa rugosa.

Type: Cameroun: near Dimako, 28 km SSW. of Bertoua, Breteler 2161 (WAG, holotype; isotypes: G, P, YA).

Large liana, at least 30 m long and 20 m high climbing in trees. Trunk 3–5 cm in diam. or more. Bark pale grey, with some large lenticels, thick, outer bark on section orange-brown; wood pale yellow, with large bark-islets which are whitish or yellowish and turning reddish as the wood when freshly cut. *Branches* pale grey-brown, lenticellate, terete, not or slightly sulcate when dry; branchlets glabrous, not lenticellate, when dry dark brown and sulcate, or when leaves

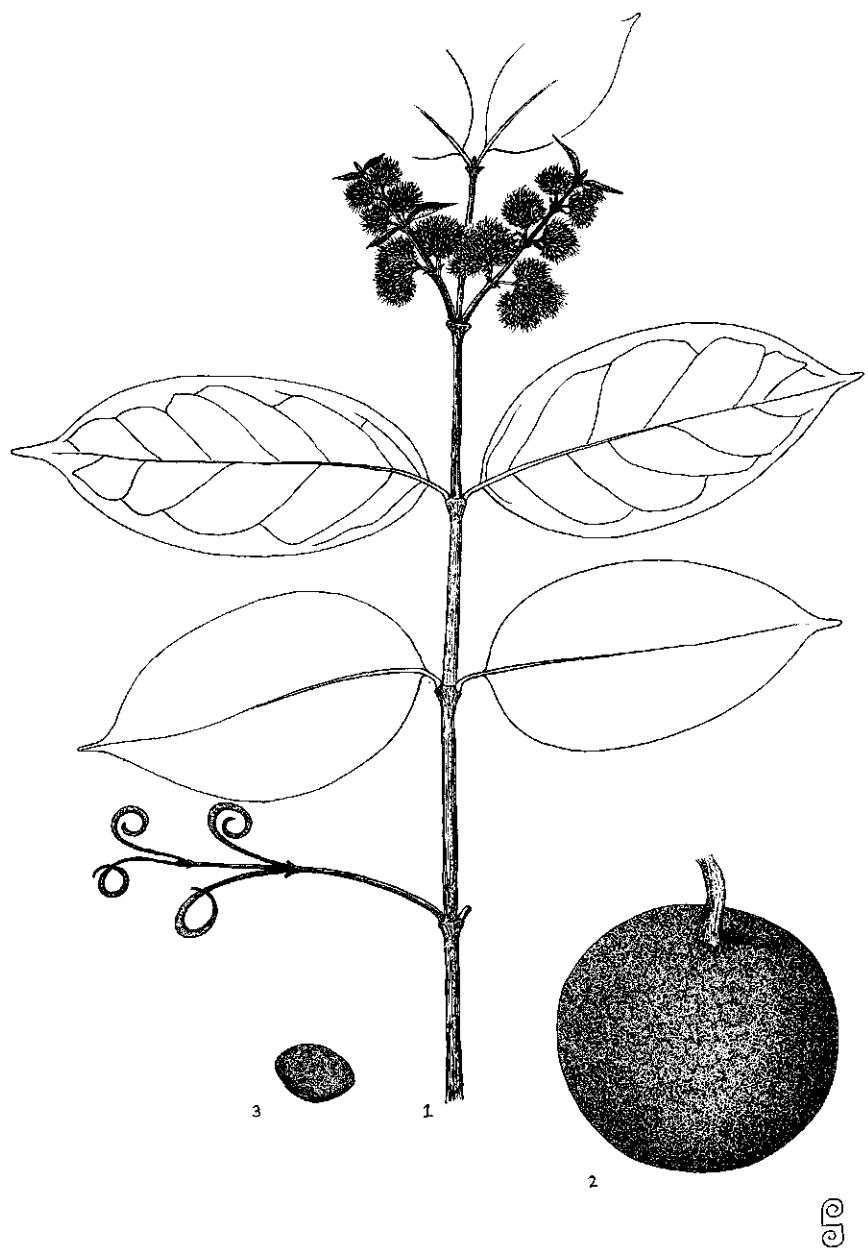

FIG. 10. *S. chromatoxylon*: 1. branch, $\frac{1}{2} \times$; 2. fruit, $\frac{1}{2} \times$; 3. seed, $\frac{1}{2} \times$ (1. Breteler 2161; 2-3. Tisserant 43).

mature like branches. Tendrils in 1–3 pairs. *Leaves*: petiole glabrous, 5–11 mm long; blade slightly shining or mat and dark green above, mat and paler beneath, coriaceous or papyraceous, also when living, elliptic, $(1.7)2-3 \times$ as long as wide, $5-15 \times 2.5-6$ cm, acuminate or in the shade caudate at the apex, cuneate or rounded at the base, glabrous on both sides; 4–6 pairs of secondary veins, basal pair not longer as is usual in the genus; tertiary venation reticulate, prominent beneath, inflorescence axillary, congested (?). Peduncle, branches, and pedicels minutely pubescent. *Flowers* 5-merous. *Sepals* narrowly triangular, subulate, glabrous. *Corolla* glabrous outside. *Stamens*: filaments inserted at the mouth (?) of the corolla tube; anthers cordate, bearded (?). *Pistil* glabrous (?). *Fruit* large, depressed-globose, $6 \times 6 - 6.5 \times 7$ cm, subcordate at the base, rugulose, about 5-seeded. Wall very hard, 5 mm thick. Much fibrous pulp. *Seed* flat, obliquely elliptic, about 1.5–2 cm in diam., scabrid; testa thick.

Distribution: Eastern Cameroun, western Central African Republic.

Ecology: Rather dry forest with *Celtis* and *Sterculiaceae*; alt. 400–650 m.

Cameroun: near Toungrélo, 27 km SW. of Bertoua, along road to Doumé, Breteler 2621 (K, WAG, YA); near Dimako, 28 km SSW. of Bertoua (galled buds) Breteler 2161 (G, P, WAG, YA, type).

Central African Republic: Boukoko, N. of Bangui (fr. Dec.) Tisserant 43 (P).

Notes. *S. chromatoxylon* resembles *S. congolana* of section *Spinosae* and some American species of *Breviflorae* (*S. nigricans*, *S. mattogrossensis*, and *S. schultesiana*) by the narrow sepals and the tendrils, although these are in 1–3 pairs in *S. chromatoxylon* and in a single pair in the others. It resembles the above-mentioned American species of *Breviflorae* also by the lenticellate branches. From *S. congolana* it differs especially by the bark-islets in the wood which are absent in *S. congolana*, the not corky bark, the absence of spines, and the depressed-globose basally subcordate instead of strictly globose fruits.

From these American *Breviflorae* species it differs in the same fruit characters and by the thick bark and larger bark-islets.

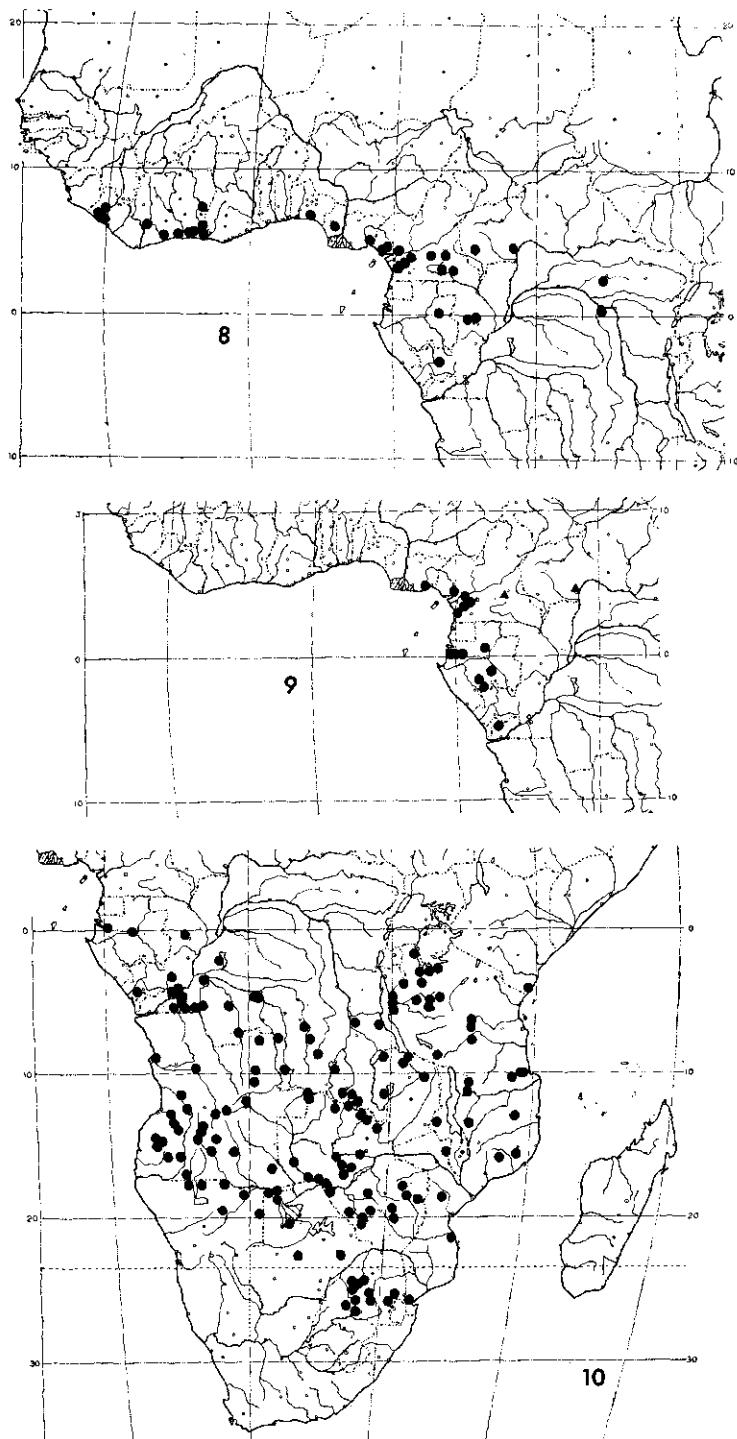

Although this new species differs widely from the species of *Breviflorae* indicated, it is preferred to include it in *Breviflorae* because of the characters available at the moment. When the species is more completely known, it might represent a section of its own.

12. *S. chrysophylla* Gilg in Engler, Bot. Jahrb. 28: 119. 1899; Baker in Fl. Trop. Afr. 4(1): 525. 1903; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 43. 1963.

Fig. 11, p. 85; Map 9, p. 83

Type: Cameroun: Waterfall near Ebéa, Lokoundjé R., Dinklage 221 (holotype not seen, destroyed in B; lectotype which was isotype seen: HBG).

Heterotypic synonym: *S. eketensis* S. Moore, Journ. Bot. 52: 29. 1914; Hutchinson & Dalziel, Fl. W. Trop. Afr. 2: 24. 1931. Type: S. Nigeria: Eket District, Kwa Ibo R., Talbot 3237 (BM, holotype; isotypes: BM, K, Z).

MAP 8. *S. camponeura*; Map 9. ● *S. chrysophylla*, ▲ *S. chromatoxylon*; Map 10. *S. cocculoides*.

Large liana, 10–25 m high climbing in trees, at least 40 m long. Trunk 8 cm in diam. Bark pale brown, thin, inconspicuously lenticellate, on section pale yellow; wood pale yellow, with brown bark-islets. *Branches* greenish-brown to pale brown, not lenticellate, often sulcate like the branchlets; branchlets glabrous, pale green to greenish-brown and dark-brown-spotted, often sub-quadrangular and 4-sulcate when living, distinctly sulcate when dry. Tendrils paired. *Leaves* usually large; petiole glabrous, 5–10 mm long; blade shining or hardly so when living, dark green above, paler, often yellowish-green, beneath, when dry greenish-brown, coriaceous also when living, elliptic or narrowly elliptic, comparatively wider in leaves on the main axis and at the bases of the branchlets, 1.25–3 × as long as wide, (4)8–20(25) × (2.5)4–11 cm, apiculate or acuminate at the apex, cuneate or rounded at the base, glabrous on both sides; one or two pairs of secondary veins from or from above the base curved along the margin and often a faint submarginal pair; costa impressed above and as the veins prominent beneath, tertiary venation reticulate, prominent on both sides. *Inflorescence* axillary, solitary, 0.3–1 × as long as the leaves, often large, rather lax, many-flowered, about 1.2–2 × as long as wide, (2.5)6–14 × (1.5) 4–7 cm, 3–4 × branched. Peduncle and branches rather stout, glabrous as the short pedicels. Bracts triangular, sepal-like, or occasionally leafy, glabrous on both sides, with or without colleters above at the base or in the middle, lower about 3 × as long as the sepals. *Flowers* 5-merous. *Sepals* pale green, connate at the base up to one-quarter of their length, orbicular, oblong, or ovate, 1–1.5 × as long as wide, 1.5–2 × 1–1.5 mm, rounded or obtuse at the apex, ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 3–4 × as long as the calyx, 4.5–6 mm long and rounded at the apex, pale green, campanulate, 3 mm wide at the throat, rather abruptly thickened in the throat, outside glabrous or sparsely and minutely (pilose-)pubescent on the lobes, inside with a ring of villose hairs in the throat; tube short, 0.7–1.5 × as long as the calyx, 1.5–2 mm long; lobes thick, 1.8–2.3 × as long as the tube, oblong, 2.2–2.5 × as long as wide, 3–4 × 1.4–1.8 mm, acute, suberect. *Stamens* exserted; filaments 0.7–1 × as long as the anthers, 0.9–1.5 mm long, glabrous, inserted at the mouth of the corolla tube; anthers oblong, 1.3–1.5 × 0.9–1 mm, bearded at the cordate base with pilose hairs; cells parallel. *Pistil* pilose-pubescent, 3.2–4 mm long; ovary ovoid, pilose-pubescent, except for the glabrous base, 2–2.5 × 1.2–1.4 mm, gradually narrowed into the style, 2-celled; style short, 1.2–1.5 mm long, pilose at the base; stigma capitate. In each cell 10–15 ovules. *Fruit* yellow (teste Klaine 2140), not very large, rather soft when mature, globose, 3–4 cm in diam., with 3–6 or more seeds. Wall rather thick. *Seed* flattened, more or less plano-convex, obliquely ovate, elliptic, or trullate, usually irregularly curved, 22–25 × 14–20 × 5–6 mm, with thick very short erect hairs, rather rough. Testa thick.

Distribution: S. Nigeria, Cameroun, Gabon, Congo (Brazzaville).

Ecology: Rain forests, often on river banks; alt. 0–700 m.

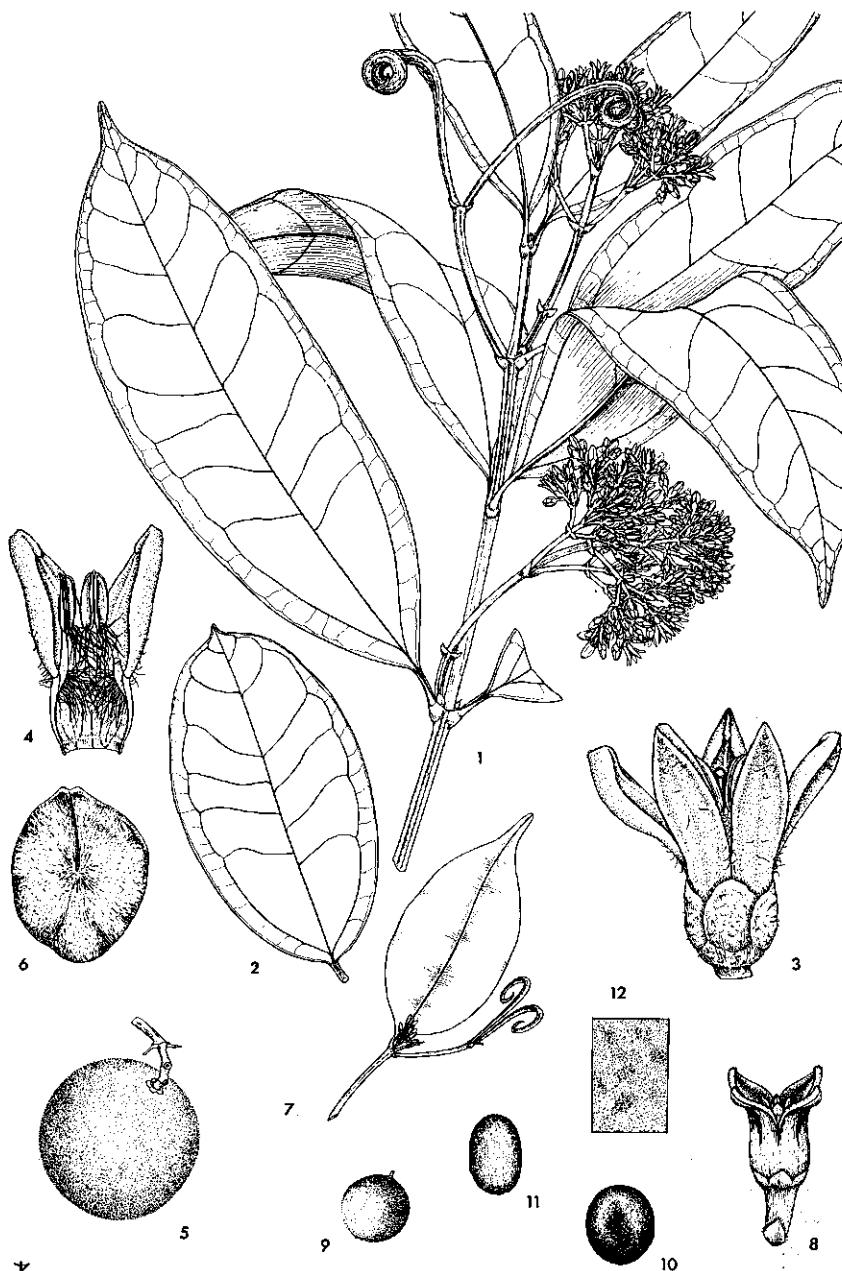

FIG. 11. 1-6. *S. chrysophylla*: 1. branch, $\frac{1}{2} \times$; 2. leaf, $\frac{1}{2} \times$; 3. flower, $5 \times$; 4. portion of corolla with stamens, $5 \times$; 5. fruit, $\frac{1}{2} \times$; 6. seed, $1 \times$ (1, 3-4. Le Testu 9377; 2. Leeuwenberg 7456; 5-6. N. Hallé & Cours 6152). 7-12. *S. cuniculina*: 7. branch, $\frac{1}{2} \times$; 8. flower, $5 \times$; 9. fruit, $\frac{1}{2} \times$; 10-11. seeds, two sides, $1 \times$; 12. portion of leaf, $15 \times$ (7-11. Germain 4502; 12. Jans 1053).

Nigeria: Eket District, Kwa Ibo R., Talbot 3237 (BM, K, Z, type of *S. eketensis*).

Cameroun: 39 km E. of Douala, along road to Edéa, Breteler, J. de Wilde & Leeuwenberg 2610 (BR, K, P, WAG, YA); 13 km SW. of Eséka, bank Nyong R., Leeuwenberg 5159 (WAG); 10 km W. of Masok, near Ekem R., right bank Sanaga R. Deciduous shrub or small tree, (0.30) 1–6 (8) m high, sometimes flowering on one-year shoots with small leaves on old fire-cut stumps. Trunk 4–25 cm in diam., branched from low down; bark pale grey to pale brown, thick, corky, longitudinally ridged, not scaly, nor lenticellate; wood hard, whitish, without bark-islets. *Branches* pale to dark brown when dry, more or less fissured and corky by which often irregularly thickened, not lenticellate, often with recurved or sometimes straight spines, sometimes terminating in a straight spine; branchlets yellow-green and often tinged with red, when living greenish-brown, dark brown, reddish-brown, or purplish-brown and often sulcate when dry, pubescent or sometimes glabrous, sometimes (especially when older) fissured like branches. Stipules deciduous or sometimes persistent, 4 on each node, at the bases of the petioles, narrowly triangular, 1–2 mm long. *Leaves*: petiole short, pubescent or less often glabrous, 2–8 mm long; blade mat or shining and pale to dark green above, mat and paler beneath, veins often pale on both sides, coriaceous, young thinner and papyraceous when dry, very variable in shape and size, orbicular, ovate, elliptic, or sometimes narrowly elliptic, usually comparatively wider on flowering branches, smaller (as in *S. spinosa*) on the very spiny young shoots on fire-cut stumps), 1–1.5(2.2) × as long as wide, 2–6(10) × 1–5(9) cm, emarginate, rounded to acute and apiculate, or sometimes acuminate at the apex, rounded, subcordate, or cuneate at the base, often slightly bullate or subpapillose, often with hair-pockets in the angles of the main veins beneath, pubescent or less often glabrous on both sides; 1–3 pairs of secondary veins from or from above the base curved along the margin; venation impressed above, prominent and conspicuous beneath. *Inflorescence* terminal, seemingly umbellate, congested, 2.5–4 × 2–5 cm, mostly many-flowered, 3–4 × branched. Peduncle, branches, and pedicels sometimes sparsely pubescent. Bracts linear or nearly so, upper sepal-like, lower larger, sometimes sparsely pubescent beneath, above mostly pubescent at the apex and with some hairs at the base, occasionally also some colleters at the base. *Flowers* 5-merous. *Sepals* pale green, connate at the base, narrowly triangular, equal, subequal, or some-

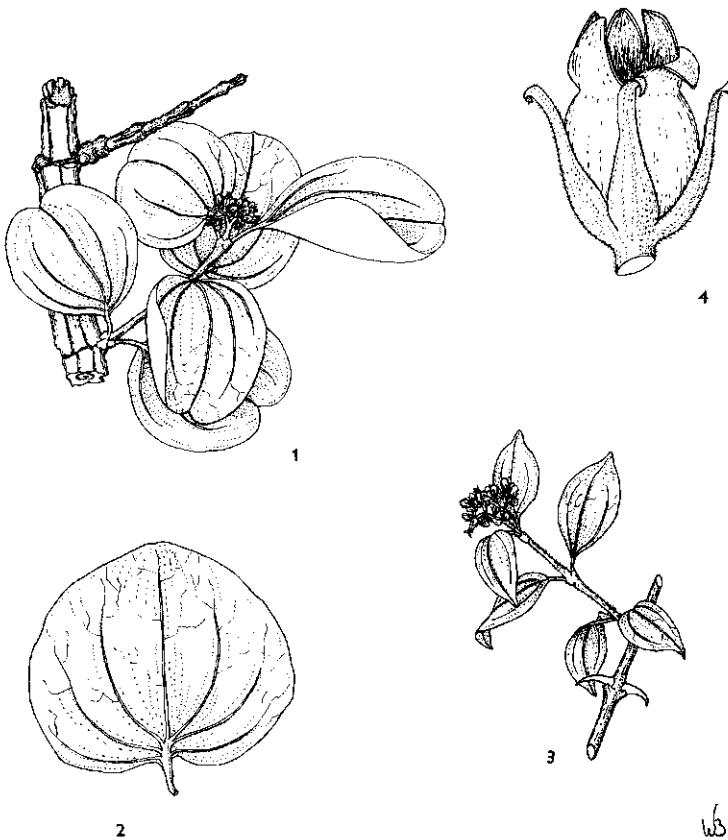

FIG. 12. *S. cocculoides*: 1, 3. branches, $\frac{1}{2} \times$; 2. leaf, $\frac{1}{2} \times$; 4. flower, $6 \times$ (1. O. B. Miller 1946; 2. Eyles 4547; 3. Gossweiler 1520 b; 4. Brain 6556).

times unequal, (2)2.5–5 × as long as wide, 2–5 × 0.7–1.3 mm, elongate at anthesis, acuminate or subulate at the apex, not distinctly ciliate, outside pubescent with an even indumentum of mostly erect hairs, inside pubescent at the apex and glabrous at the base or sometimes entirely pubescent, without colleters. *Corolla* when mature 1–2 × as long as the calyx, (3.4)4–5 mm long, pale green, greenish, white, or greenish-yellow, sparsely pubescent or glabrous outside, inside with a narrow entire white-penicillate corona at the mouth of the tube; tube 1–2 × as long as the lobes, (2)2.5–3 × 2–3 mm, urceolate or campanulate, often somewhat contracted at the throat; lobes triangular, 1–2 × as long as wide, 1.3–2.5 × 1–1.5 mm, acute, erect or suberect. *Stamens* included; filaments glabrous, 0.4–1 × as long as the anthers, inserted at 0.4–1 mm from the base of the corolla; anthers oblong or elliptic, 1.2–1.5 × 0.8–1.2 mm, deeply cordate at the base, ciliate with villose hairs all around by which they are coherent; cells parallel. *Pistil* pubescent, 1.8–2.8 mm long; ovary ovoid, broadly

ovoid, or globose, $0.8-1.3 \times$ as long as wide, $1-1.6 \times 1-1.4$ mm, acuminate or rounded at the apex, 2-celled; style mostly very short; stigma oblong, large, up to 0.9 mm long. In each cell about (30-) 50 ovules. *Fruit* large, hard, resembling an orange, globose, yellow or orange, often speckled with green, nearly mature dark green and mottled with pale green, when immature often blue-green, often slightly shining, with granular skin, 6-11 cm in diam., with about 10-100 seeds. Wall rather thick, 2-5 mm thick, thickened inside above the pedicel. Pulp edible. *Seeds* ochraceous, flattened, more or less plano-convex, obliquely ovate or elliptic, usually irregularly curved, about $1.2-1.6 \times$ as long as wide, $12 \times 8 \times 2.5 - 22 \times 15 \times 4$ mm, slightly rough, very shortly pubescent.

Distribution: Central, East, and northern South Africa.

Ecology: Woodland; alt. 400-2000 m.

S. lecomtei A. Chev. ex Hutch. et Dalz., Fl. W. Trop. Afr. 2: 22. 1931 and Kew Bull. 1937: 333. 1937 (Chevalier, Expl. Bot. Afr. Occ. Franç. 1: 443. 1920, nomen); Chevalier, Rev. Bot. Appliq. 27: 368, pl. 17 B. 1947. Type: Ivory Coast: near Bingerville, Chevalier 15402 (P, holotype, photograph in K, neg. 2296).

Liana, at least 20–35 m long, often shrublike and flowering when regrowing from stump. Trunk 3–10 cm in diam.; bark pale brown, thick, corky, not lenticellate; wood pale yellowish, without bark-islets. Branches with some mostly recurved spines, not lenticellate; branchlets pale green to pale brown, pubescent or glabrous. Tendrils paired. Stipules on main axis and often on

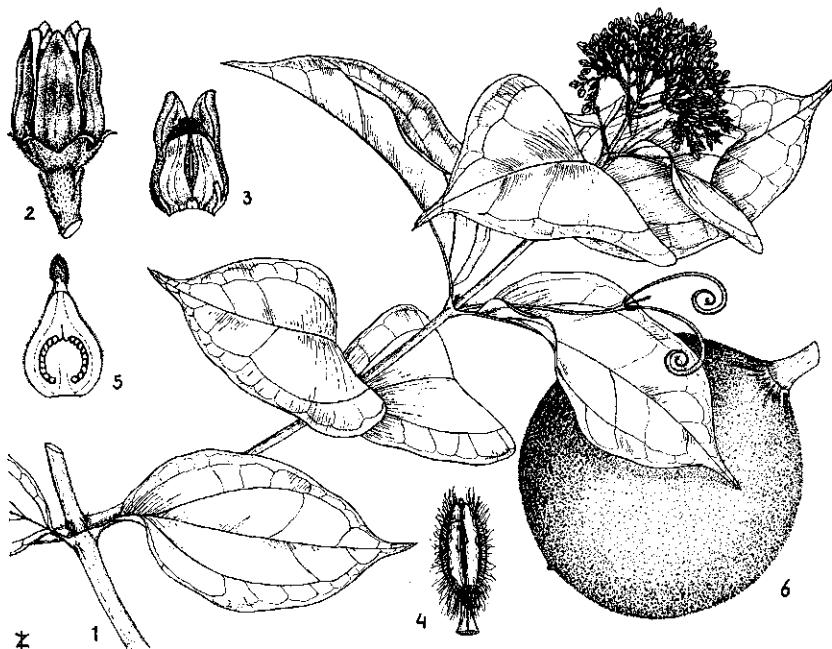

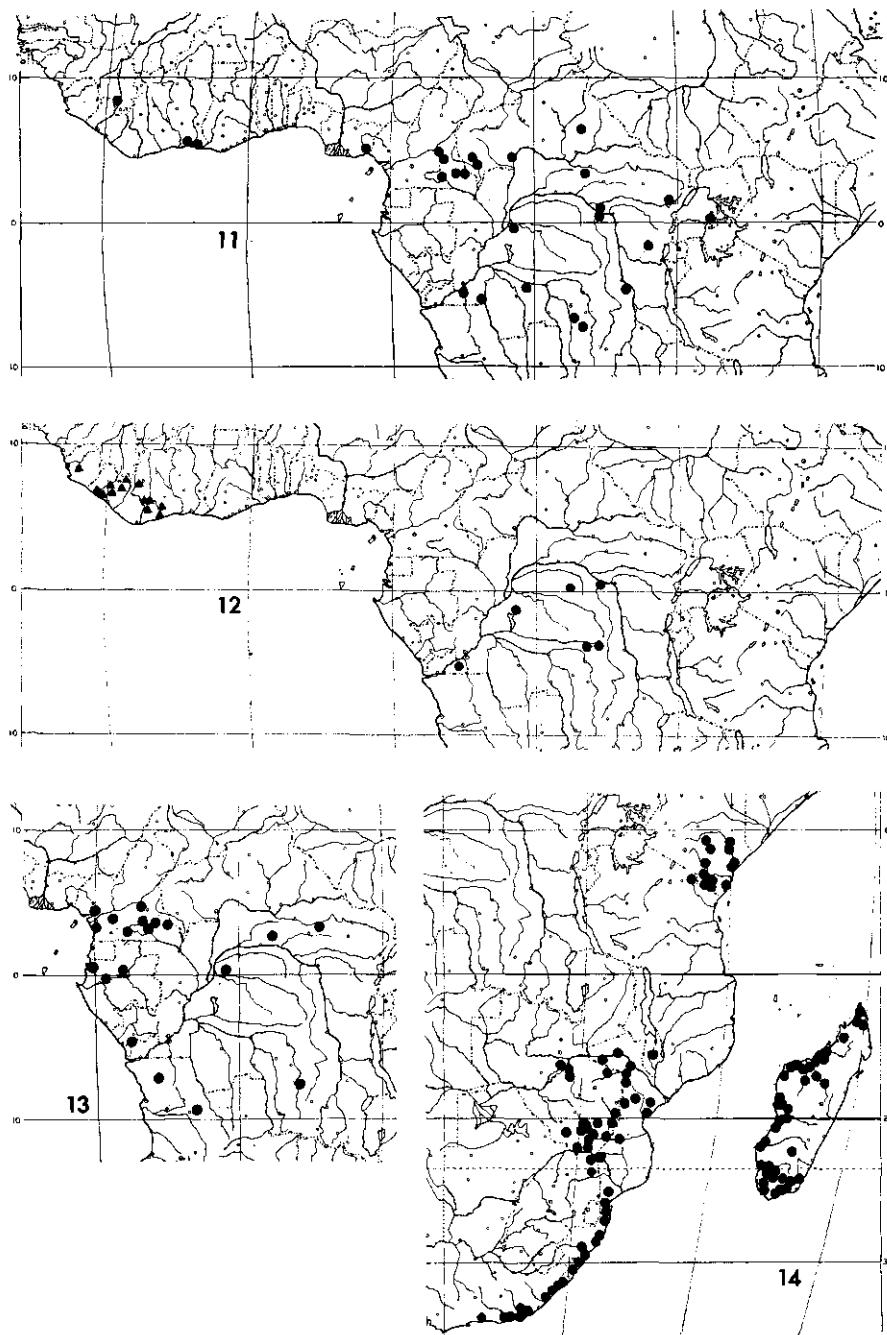

FIG. 13. *S. congolana*: 1. branch with linear stipules, $\frac{1}{2} \times$; 2. flower, $4 \times$; 3. longitudinal section of corolla inside with bases of filaments; lobes inside partially united by corona, $4 \times$; 4. stamen, $8 \times$; 5. longitudinal section of ovary, $8 \times$; 6. fruit, $\frac{1}{2} \times$ (1-6. Leeuwenberg 3146).

branches, linear, very small, 4–12 on each node. *Leaves*: petiole short, pubescent or glabrous, 2–7 mm long; blade mostly shining and pale to dark green above, less shining to mat beneath, herbaceous or in the sun more often thinly coriaceous, mostly papyraceous when dry, ovate, narrowly ovate, or oblong, 1.5–2.5 × as long as wide, 5–15 × 2–7.5 cm, usually abruptly acuminate to caudate at the apex, rounded or subcordate at the base, pubescent or glabrous on both sides; 1 or 2 pairs of secondary veins from above the base and an additional faint pair curved along the margin; venation reticulate. *Inflorescence* terminal, 2–3 × 2.5–6 cm, many-flowered, 4–5 × branched, rather congested. Bracts sepal-like, pubescent to nearly glabrous beneath, without colleters. Peduncle, branches, and pedicels pubescent. *Flowers* 5-merous. *Sepals* pale green, connate at the base, equal or subequal, narrowly oblong, 1.8–3 × as long as wide, 1.2–3 × 0.6–1 mm, long-acuminate at the apex, usually not ciliate, glabrous or especially at the base puberulous outside, glabrous inside, without colleters. *Corolla* when mature 1.8–3.3 × as long as the calyx and 3–5 × 2–3.5 mm, pale green, widely cylindrical to urceolate, glabrous or minutely puberulous outside, inside with a narrow white-penicillate corona; tube 1–2 × as long as the calyx, 1.7–2.5 × as long as the lobes, longitudinally cleft from the

MAP 11. *S. conglana*; Map 12. ▲ *S. cuminodora*, ● *S. cuniculina*; Map 13. *S. dale*; Map 14. *S. decussata*.

insertion of the stamens to the corona (by which it is actually false from the insertion of the stamens); lobes triangular, 1.2–1.6 × as long as wide, 1.2–1.8 × 0.8–1.3 mm, acute, erect. *Stamens* included; filaments as long as the anthers, glabrous, inserted near the base of the corolla tube (actually on the mouth); anthers oblong, 1 × 0.8–1.2 × 1 mm, cordate at the base, ciliate all around with villose hairs; cells parallel. *Pistil* glabrous or pubescent, 2 mm long; ovary ovoid, 2-celled, gradually narrowed into the very short style; stigma capitate. In each cell about 40–50 ovules. *Fruit* large, globose, pale green to yellow (?), 7–10 cm in diam., thick-walled, many-seeded. Wall 5 mm thick. *Seeds* pale ochraceous, obliquely ovate or elliptic, 20 × 12–14.5 × 5 mm, often rather smooth, glabrous or nearly so.

Distribution: West and northern Central Africa.

Ecology: Rain forests, secondary forests, or gallery forests; alt. 0–900 m.

Type: Ivory Coast: 25 km SW. of Guéyo, Leeuwenberg & Brader 3737 (WAG, holotype; isotypes: A, BR, K, MO, P).

Liana, up to 40 m long and 20 m high climbing in trees. Trunk at least 6 cm in diam. Wood yellowish. *Branches* not lenticellate; branchlets glabrous, pale green, often dark brown when dry, with 2 longitudinal grooves below the stipular line, often subquadangular; main axis when young sometimes also grooved, but less so. Tendrils paired. *Leaves*: petiole glabrous, 2–7 mm long; blade dark green and slightly shining above, paler, often with darker veins and mat beneath, thinly coriaceous or papyraceous also when living, ovate, narrowly ovate, elliptic, or narrowly elliptic, 1.5–3.6 × as long as wide, (2)3–10(11.5) × 1.5–6 cm, distinctly acuminate at the apex (acumen 7–15 mm long, narrow), cuneate, rounded, or occasionally subcordate at the base, glabrous on both sides, without odour when living, often with a faint sal-ammoniac- or *Cuminum*-odour when dry; one pair of secondary veins from or from above the base curved along the margin and often a faint submarginal pair. *Inflorescence* axillary, rather congested, short, 0.1–0.2 × as long as the leaves, 1–1.2 × 1–1.2 cm, few-flowered, 1–2 × branched. Peduncle, branches, and pedicels short, glabrous. Bracts narrowly triangular or sepal-like, glabrous beneath, pubescent above at the base, without colleters. *Flowers* 4–5-merous. *Sepals* pale green, connate at the base up to about one-third of their length, equal, broadly ovate, about as long as wide, 0.5–1.2 × 0.5–1.2 mm, obtuse or acute at the apex, minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 2–6 × as long as the calyx, 2–3(4) mm long, and rounded at the apex, pale yellow, outside glabrous, inside pilose except for the glabrous apices of the lobes and base of the tube or practically entirely glabrous; tube short, 1–2.4 × as long as the calyx, 1.2 mm long; lobes 1–1.5 × as long as the tube, oblong, 1.3–1.8 × 0.8–1.2 mm, acute, suberect. *Stamens* exserted; filaments glabrous, about 1–1.5 × as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong or ovate, 0.6 × 0.3–0.5 mm, deeply cordate at the base, glabrous; cells parallel. *Pistil* glabrous, 2–2.4 mm long; ovary ovoid or globose, 0.6 × 0.6 mm, 2-celled; style 1.2–1.7 mm long; stigma obscurely bilobed or capitate. In each cell 5–9 ovules. *Fruit* orange, small, soft, globose, 10–12 mm in diam., one-seeded. Wall thin. *Seed* subglobose, at least 7 × 6 × 6 mm, smooth. Testa thin.

Distribution: Guinea (Nimba Mts.), Liberia, western Ivory Coast.

Ecology: Moist places in rain forests or secondary forests, often on river banks; alt. 0–700 m.

Guinea: Nimba Mts., Schnell 4459 (ABT).

Sierra Leone: Yonibana, Thomas 4085 (K), 5027 (K), 5032 (K, paratype of *S. millepunctata*), 5121 (K), 5253 (K).

Liberia: 9 km E. of Yoma, 20 km NE. of Bomi Hills, Leeuwenberg 4880 (WAG); left

bank Mahe R., 12 km NE. of Bomi Hills, near Yoma, Leeuwenberg 4821 (WAG), 4857 (WAG); ibid., J. de Wilde & Voorhoeve 3857 (BR, K, WAG); Bong Range, 32 km N. of Kakata, Leeuwenberg & Voorhoeve 4920 (WAG); right bank Gbata Ck., 32 km SW. of Suakoko, Leeuwenberg & Voorhoeve 4590 (WAG); Péahtah (Oct.) Bequaert in coll. Linder 1065 (A, K); Ganta (Aug.) Harley 989 (K, LIB); Nimba Mts. (fr. Dec.) Adam 20220 (K, P); ibid., Leeuwenberg & Voorhoeve 4616 (WAG).

Ivory Coast: Man-Danané road, Aké Assi 3836 (ABI); ibid., J. de Wilde 856 (WAG); Zanié Forest, between Guiglo and Tai, Jaeger 4535 (WAG); ibid., Schnell 6016 (ABT); 4 km E. of Troiya, 24 km S. of Tai, Guillaumet 1445 (ABI, WAG); 7 km N. of crossing Hana R. and Taï-Tabou road, J. de Wilde & Leeuwenberg 3526 (BR, K, WAG); ibid., Guillaumet 645 (ABI); near Tapéguhé, right bank Sassandra R., 50 km NW. of Soubré, Leeuwenberg 4529 (WAG), 4535 (WAG); Monogaga, 40 km W. of Sassandra (Nov.) Guillaumet 1604 (WAG); ibid., Leeuwenberg 4045 (WAG); 9 km NE. of Monogaga, Leeuwenberg 4055 (WAG); about 25 km SW. of Guéyo (May) Leeuwenberg & Brader 3737 (A, BR, K, MO, P, WAG, type).

16. *S. cuniculina* Leeuwenberg, sp. nov.

Fig. 11, p. 85; Map 12, p. 94

Frutex scandens cirrhis per paria dispositis. Folia elliptica vel ovata apice acuminata vel caudata utrinque glabra. Inflorescentia axillaris minima pauciflora bracteis parvis fere sepaliformibus suffulta. Flores pentameri. Sepala parte basali connata triangulari-ovata apice acuta utrinque glabra. Corolla parva extus glabra intus fauce pilis sparsis profulta. Stamina exserta filamentis antheris oblongis glabris aequilongis. Pistillum glabrum ovario late ovoideo biloculari. Fructus parvus mollis globosus vel fere globosus monospermus semine depresso-globoso vel -ellipsoideo pubescenti laevi testa tenui vestito.

Type: Congo: Orientale, between Yabongengo and Yamfela, Isangi Territory, Germain 4502 (BR, holotype; isotypes: PRE, WAG).

Liana climbing over shrubs or in trees. Trunk 2–3 cm in diam. Branches not lenticellate, terete, dark brown and not sulcate when dry; branchlets glabrous, when dry dark brown and slightly sulcate. Tendrils paired. Leaves: petiole glabrous, 2–5 mm long; blade slightly shining on both sides, paler beneath, thinly coriaceous, elliptic or ovate, (1.5)2–2.7 × as long as wide, 3–8 × 1.5–4 cm, acuminate or caudate at the apex, cuneate or rounded at the base, glabrous on both sides; one pair of secondary veins from or from above the base curved along the margin, and often a faint submarginal pair; tertiary venation reticulate, slightly prominent beneath. Inflorescence axillary, small, congested, few-flowered, 0.5 × 0.5—2 × 2 cm, 2 × branched. Peduncle, branches, and pedicels minutely pubescent or glabrous. Bracts small, approximately sepal-like. Flowers 5-merous. Sepals up to halfway connate, ovate to triangular, 1 × 0.8 mm, acute at the apex, minutely ciliate, glabrous on both sides, without colleters. Corolla in the mature bud 3.2–3.5 mm long, and rounded at the apex, white (?), outside glabrous, inside with some pilose hairs in the throat; tube 1.2–1.5 × as long as the calyx, 1.2–1.5 mm long; lobes 1.3–1.7 × as long as the tube, oblong, 2 × 1.2 mm, suberect. Stamens slightly exserted; filaments glabrous, as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 0.6–0.8 × 0.4–0.5 mm, deeply cordate at the base, glabrous; cells parallel.

Pistil glabrous, 2.2–2.4 mm long; ovary often broadly ovoid, 1–1.2 × 0.9–1 mm; style 1.2 mm long; stigma capitate. In each cell 11 ovules. *Fruit* orange, small, soft, globose or nearly so (?), about 12–15 mm in diam., 1-seeded. Wall thin. Seed ochraceous, depressed-globose or -ellipsoid, 7 × 7 × 5.5–10 × 9 × 8 mm, pubescent, smooth. Testa thin, sticking to the pulp.

Distribution: Congo (Kinshasa).

Ecology: Swamp forests, *Brachystegia* forests; alt. about 0–500 m.

Congo (Kinshasa): Léopoldville: Timansi, Zundu, Compère 1256 (BR), 1677 (BR); Nseti (fr. Feb.) Jans 1053 (BR). Equateur: Itipo-Iboko road, Bikoro Territory (fr. Apr.) Evrard 6153 (BR, WAG); Djolu, Evrard 5727 (BR, WAG). Orientale: between Yabongengo and Yamfela, Isangi Territory (fl., fr. Nov.) Germain 4502 (BR, PRE, WAG, type).

Notes. *S. cuniculina* is very closely allied to *S. cuminodora* from West Africa. The only clearcut differential character is the punctuation of the leaves. The leaves of *S. cuminodora* have many minute translucent dots, those of *S. cuniculina* not or only a few.

The name '*cuniculina*' refers to the shape of the seeds, which resemble rabbit droppings.

17. *S. dale* De Wild., Bull. Jard. Bot. Brux. 5: 47. 1915.

Fig. 14, p. 99; Map 13, p. 94

Type: Congo: Equateur, Bumba Territory, Dundusana, Mortehan 1062 (BR, holotype; isotype: K).

Large liana, 10–40 m high climbing in trees, 30–50 m long or more. *Leaves*: blade elliptic or narrowly elliptic, 1.7–3(4) × as long as wide, (5)8–17 × (2)4–9 cm, acuminate or more or less apiculate at the apex, cuneate or rounded at the base; tertiary venation conspicuous, prominent on both sides, especially beneath. *Corolla* in the mature bud (3.8)4–4.5 mm long; tube 2–3 × as long as the calyx, 1–1.5 × as long as the lobes, 2–3 mm long; lobes 1.5–2.5 × as long as wide, 1.5–2.5 × 0.8–1.2 mm. *Stamens*: anthers 0.6–1 × 0.5–0.7 mm. *Pistil* (3.8)4–4.5 mm long; ovary 1–1.5 × 0.8–0.9 mm; style 2–3.5 mm long. *Fruit* slightly larger than in *S. floribunda*, 20–22 × 15 mm, not yet seen mature. Other characters as *S. floribunda*.

Distribution: Cameroun, Gabon, Congo, Angola.

Ecology: Rain forests or secondary forests; alt. 0–750 m.

Cameroun: 25 km NE. of Douala, along road to Edéa, Leeuwenberg 6328 (WAG); E. of km 58 of Edéa-Kribi road, Leeuwenberg 5522 (WAG), 6306 (WAG), 6813 (WAG); Nkolbisson, 7 km W. of Yaoundé, Leeuwenberg 5448 (WAG); Bitye, about 60 km ENE. of Sang-mélima, Bates 1081 (BM, BR, MO, NY, Z), 1309 (BM); 44 km S. of Abong Mbang, along road to Lomié, Leeuwenberg 6489 (WAG); 8 km E. of Lomié, along road to Eschienbot, Leeuwenberg 6721 (WAG); 10 km N. of Ndembia II, S. of Ebaka, Leeuwenberg 5842 (WAG);

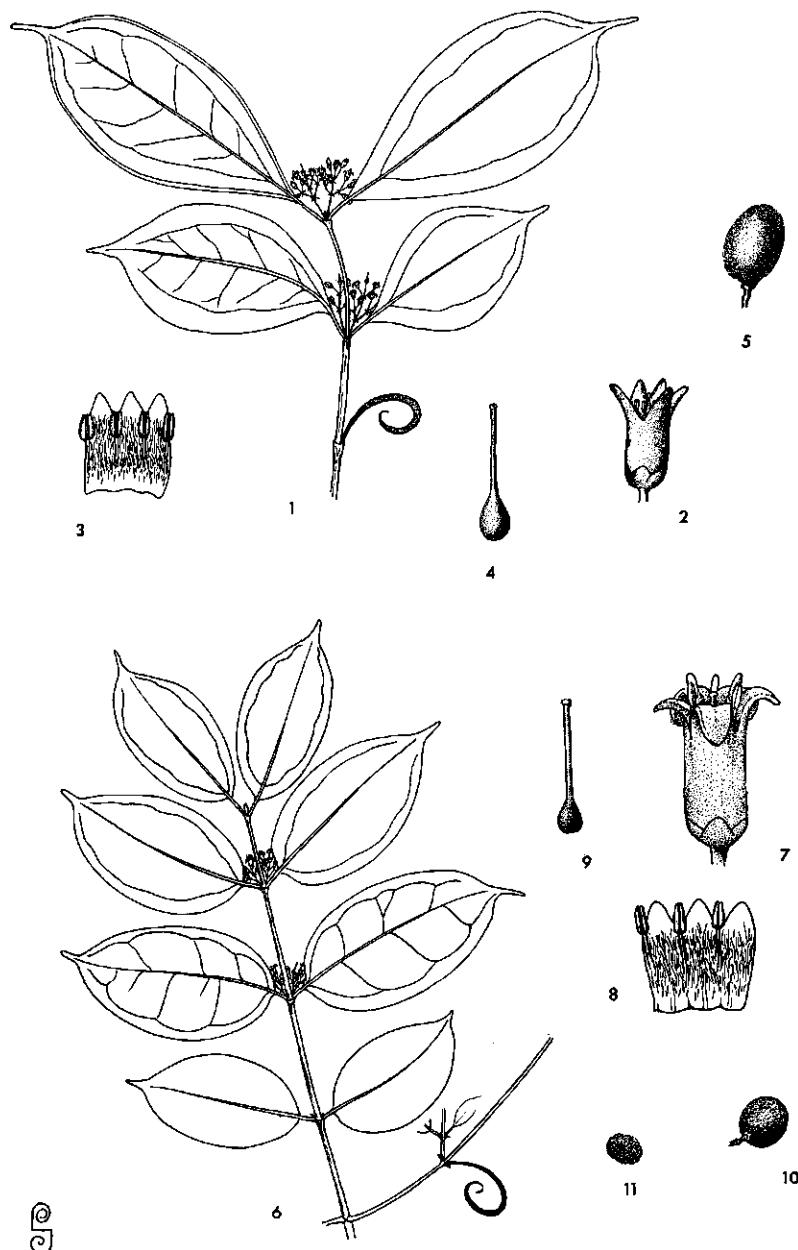

FIG. 14. 1-5. *S. dale*: 1. branch, $\frac{1}{2} \times$; 2. flower, $2\frac{1}{2} \times$; 3. portion of corolla with stamens, $2\frac{1}{2} \times$; 4. pistil, $3\frac{1}{2} \times$; 5. fruit, $\frac{1}{2} \times$ (1-4. Le Testu 9301; 5. Leeuwenberg 6813); 6-11. *S. floribunda*: 6. branch, $\frac{1}{2} \times$; 7. flower, $3 \times$; 8. portion of corolla with stamens, $3 \times$; 9. pistil, $3 \times$; 10. fruit, $\frac{1}{2} \times$; 11. seed, $\frac{1}{2} \times$ (6-9. between Mang and Asip, 60 km ENE. of Lomié, Letouzey 5562 (BR, K, P, WAG, YA); 6 km S. of Yokadouma, Leeuwenberg 6126 (WAG).

Gabon: near Libreville, Klaine 3205 (BR, IFAN, K, P, distributed as *S. trillesiana*), 3364 BR, K, P; between Ogooué R. and Cameroun boundary, Le Testu 9301 (P, WAG), 9495 (P, WAG); Ayem, 10 km SW. of Ndjolé, N. Hallé 1964 (P).

Congo (Kinshasa): Equateur: between Bokolongo and Djoa, Bolomba Territory, Evrard 3548 (BR, WAG); Dundusana, Bumba Territory (Jan.) Mortehan 1062 (BR, K, type). Orientale: Bambesa, Buta Territory (Sept.) Gérard 5694 (BR, WAG). Katanga: Kaniama, Haute Lomani, Mullenders 2343 (BR).

Angola: Cabinda: Belize (fl., fr. Feb., Nov.) Gossweiler 7578 (BM, COI, K, LISJC, LISU), 7856 (BM, BR, COI, K, LISJC, LISU, MO). Congo: Bembe (Feb.) Gossweiler 7405 (BM, COL, LISJC, LISU). Malanje: Quela (Nov.) von Nolde 494 (BM).

Notes. It is difficult to separate *S. dale* from *S. floribunda*, as there are some intermediate specimens. Although their differences are not very clear, the present author prefers to keep them separate. They can be distinguished in the field at least in Cameroun. The branchlets of *S. dale* are often more stout, the leaves usually larger and less shining to mat, and the fruits slightly larger. Mature fruits of *S. dale* are not yet known.

Differential characters of *S. dale* and *S. floribunda* are given under the description of the latter.

18. *S. decussata* (Pappe) Gilg in Engler, Bot. Jahrb. 28: 121. 1899; Verdoorn, Bothalia 3: 587–588, f. 2. 1939 and 7: 11. 1959; E. A. Bruce, Kew Bull. 1956: 156. 1956; Bruce & Lewis in Fl. Trop. E. Afr. Loganiaceae 29. 1960; Verdoorn in Fl. S. Afr. 26: 139. 1963.

Fig. 18, p. 129; Map 14, p. 94

Basionym: *Atherstonea decussata* Pappe, Silv. Cap. 2nd ed. 29. 1862.

Type: S. Africa: Cape Province, Bathurst, Kowie, Atherstone s.n. (TCD, neotype; iso-neotype: K, designated by Miss Verdoorn (1959)). Homotypic synonym: *S. atherstonei* Harv., Thes. Cap. 2: 41, t. 164. 1863 with *S. baculum* Harv. in syn.; Prain & Cummins in Fl. Cap. 4 (1): 1051. 1909; Marloth, Fl. S. Afr. 3(1): 49, pl. 14C. 1932 (as *atherstonii*); Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 30. 1952.

Heterotypic synonym: *S. boinensis* Jumelle et Perrier, Ann. Mus. Col. Marseille Sér. 2. 5: 403. 1907. Type: Madagascar: Boina, Ankaladina Forest, banks of Betsiboka R., Perrier de la Bâthie 1380 (P, holotype; isotype: K).

Shrub or small tree, 2–12 (17) m high. Trunk 8–30 (45) cm in diam. Bark smooth, pale to dark grey; wood hard. Branches lenticellate, pale brown or pale grey to black when dry; branchlets lenticellate or not, pale ochraceous or pale brown, not or obscurely sulcate, and terete or nearly so when dry. Tendrils none. Leaves: petiole glabrous, 2–7 (10) mm long; blade shining and dark green above, paler beneath, pale greenish- or yellowish-brown when dry, subcoriaceous, also when living, very variable in shape and size, obovate, elliptic, narrowly elliptic, narrowly obovate, ovate, or narrowly ovate, (1)1.5–3(4) × as long as wide, (1)2–5(11.5) × (0.4)0.8–3(6.5) cm, rounded, obtuse, or broadly

and bluntly acuminate at the apex, cuneate or rounded at the base, glabrous on both sides; one or two pairs of secondary veins from or from somewhat above the base curved along the margin and often a faint submarginal pair; tertiary venation reticulate, not very conspicuous; margin often slightly enrolled. *Inflorescences* axillary and sometimes also terminal, or ramiflorous, often appearing before the season's new leaves, often several together, lax, several-flowered, $1.5 \times 1.5 - 3 \times 2.5$ cm, 1–2 × branched. Peduncle, branches, and pedicels slender, minutely or conspicuously papillose-pubescent or less often glabrous. Bracts small, triangular or sepal-like, above glabrous, lower often with colleters at the base. *Flowers* (4–) 5-merous, fragrant. *Sepals* connate up to one-quarter of their length, equal, subequal, or occasionally unequal, broadly ovate to triangular, $1-1.5(1.7) \times$ as long as wide, $1-1.3 \times 0.6-1$ mm (when unequal smallest 0.6×0.4 mm), acute or obtuse at the apex, minutely ciliate, glabrous on both sides or like the pedicels minutely or conspicuously papillose-pubescent outside, without colleters. *Corolla* in the mature bud $3.5-5 \times$ as long as the calyx, 4–6 mm long, and rounded at the apex, white, creamy, or yellow, outside glabrous or minutely papillose-pubescent, inside densely pilose except for the glabrous apex of the lobes and base of the tube; tube short-campanulate or nearly cylindrical, often much widened towards the throat, very variable in length, $1-2.5 \times$ as long as the calyx, 1–3.2 mm long, at the throat (1.5)2–3 mm wide; lobes oblong or narrowly triangular, $0.6-3 \times$ as long as the tube, $1.7-2.5 \times$ as long as wide, $1.7-3.5 \times 1-1.6$ mm, acute, spreading or sometimes recurved. *Stamens* exserted; filaments short or long, very variable in length and elongate at anthesis, longer in flowers with shorter corolla tube (like in *S. potatorum*), $0.5-2 \times$ as long as the anthers, glabrous, often narrowing from a rather broad base, inserted at the mouth of the corolla tube; anthers oblong, $0.8-1.3 \times (0.4)0.5-1$ mm, glabrous, deeply cordate at the base; cells parallel. *Pistil* glabrous, slender, 3.8–5.2 mm long; ovary ovoid or narrowly ovoid, $1-2 \times 0.8-1.2$ mm, gradually narrowed into the style, 2-celled; style 1.8–3.9 mm long; stigma capitate or sometimes bilobed, often rather small. In each cell 5–10 ovules. *Fruit* orange, nearly mature glaucous or green, small, soft, ellipsoid or globose, sometimes stipitate, $1.5-2 \times 1.5-1.9$ mm, 1(–2)-seeded, with somewhat granular skin, slightly shining. Wall thin, dry, about 0.3 mm thick. Pulp edible. *Seeds* pale grey-brown, not or hardly flattened, ellipsoid, slightly longer than wide and wider than thick, $10 \times 10 \times 7 - 16 \times 12 \times 9$ mm, densely and shortly appressed-pubescent, smooth, with a central hilum at the flattened or shallowly dented side; testa sticking to the pulp, often wrinkled in dry fruits.

Distribution: East and South Africa and Madagascar.

Ecology: In woodlands, often near rocks, sometimes on river banks, in Madagascar in often dry forests and bushes on limetone; alt. 0–1500 m.

Kenya: Nzue District, Kitui District (fr. Jan.) Bally 1939 (EA, K); Kandelongwe (Dec.) L. C. Edwards 219 (EA); between Nuu and Mt. Endau, Vincent (?) 612 (EA); Ikutha, Kitui

Fig. 19, p. 135; Phot 1, p. 105; Map 15, p. 107

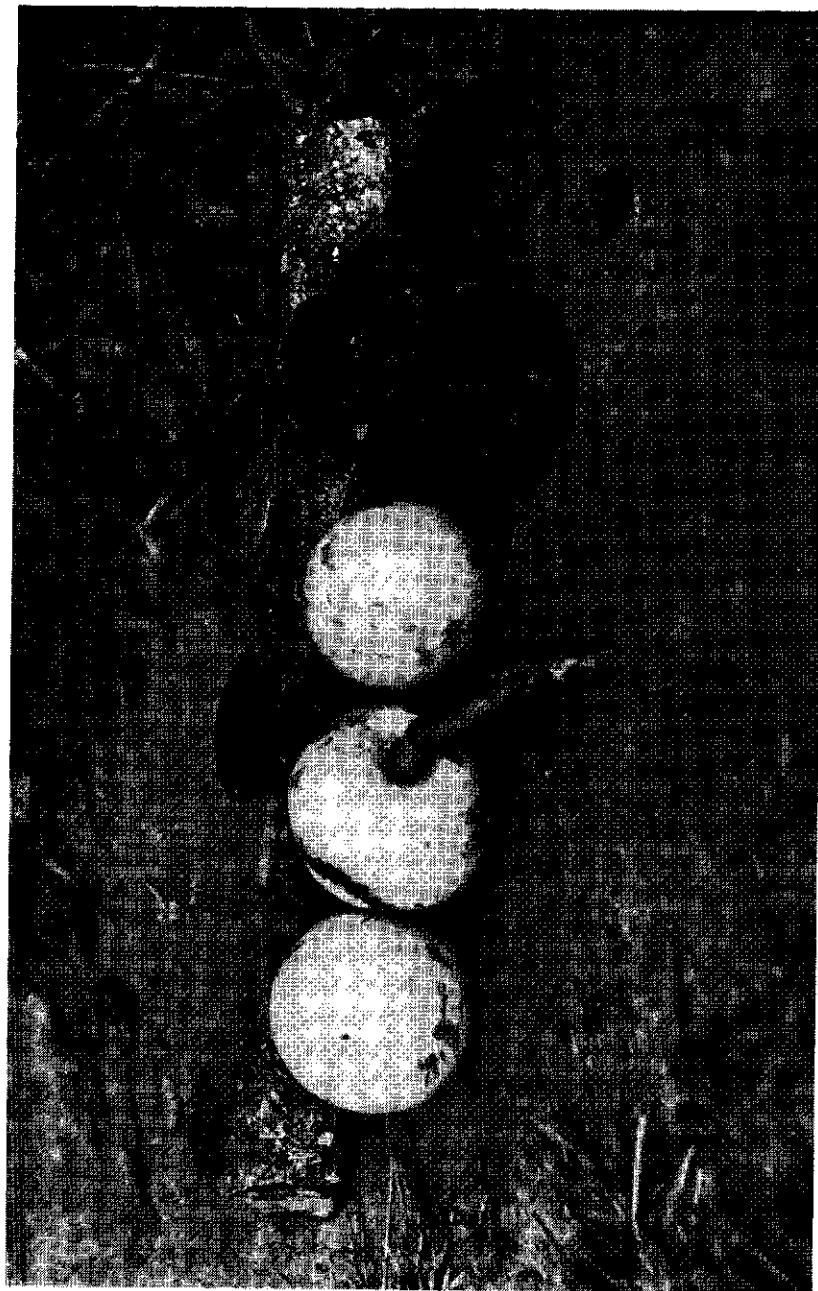

Type: Guinea: Fouta Djallon, Heudelot 861 (P, holotype; isotypes: K, WAG).

Heterotypic synonyms: *S. suaveolens* Gilg in Engler, Bot. Jahrb. 17: 566. 1893. Type: Congo: Orientale, Monbuttu Region, Gadda, Schweinfurth 3597 (K, lectotype; isotypes: P, S, WU).

S. chlorocarpa Gilg in Engler, Bot. Jahrb. 28: 120. 1899; Baker, l.c. p. 521. Type: Sierra Leone: sin. loc., Afzelius s.n. (holotype not seen, destroyed in B; lectotype: BM, other isotype seen: UPS).

S. hirsutostylosa De Wild., Bull. Jard. Bot. Brux. 5: 43. 1915. Type: Congo: Equateur, Bumba Territory, Dundusana, Mortehan 1099 (BR, holotype).

Liana, at least 20–35 m long and 20 m high climbing in trees. Trunk 7–12 cm in diam. Bark pale grey, lenticellate; wood creamy. Branches pale grey, when dry often pale brown, lenticellate; branchlets glabrous, distinctly lenticellate, glabrous, pale green to grey, when dry dark brown. Tendrils paired. Leaves: petiole glabrous, (4)6–10 mm long; blade shining or mat and dark green with often pale green costa and main secondary veins above, less shining or mat and often slightly paler and with often pale green costa beneath, coriaceous or thinly coriaceous in the sun, papyraceous or thinly coriaceous in the shade also when living, elliptic or narrowly elliptic, 1.5–3 × as long as wide, 6.5–18 × (1.5)2.5–7.5(9.5) cm, apiculate or acuminate to, especially in the shade, nearly caudata at the apex, cuneate or rounded at the base, glabrous on both sides; one pair of secondary veins from above the base and often also a faint pair from the base curved along the margin; costa and main secondary veins impressed above,

PHOT. 1. *S. densiflora*: fruits, leaves, woodsample (Leeuwenberg 7416).

prominent beneath; tertiary venation not distinctly reticulate, prominent or not; margin not or hardly revolute. *Inflorescences* axillary, usually several together, small, rather congested, $0.1\text{--}0.3 \times$ as long as the leaves, $1.5\text{--}4 \times 1.5\text{--}3$ cm, $2\text{--}3 \times$ branched, few-flowered. Peduncle, branches, and pedicels sparsely pubescent with often more or less ranked hairs or glabrous. Bracts small, approximately sepal-like, beneath glabrous, above minutely appressed-pubescent at the base or sometimes glabrous, without colleters. *Flowers* 5-merous. *Sepals* pale yellowish-green, free, subequal or unequal, broadly ovate, orbicular, or broadly orbicular, $0.75\text{--}1 \times$ as long as wide, $2\text{--}3.5 \times 2.5\text{--}4$ mm, rounded at the apex, minutely ciliate, outside glabrous, inside minutely appressed-pubescent at the base or sometimes glabrous, without colleters. *Corolla* in the mature bud $2.5\text{--}2.7 \times$ as long as the calyx, 7.5–8 mm long, and slightly tapering at the apex, white or tube greenish-white and lobes greenish-yellow, outside glabrous, inside with a brush-like ring of white hairs in the throat and just on the base of the lobes; tube $1.5\text{--}2 \times$ as long as the calyx, $1.5 \times$ as long as the lobes, $4.5\text{--}5 \times 2\text{--}3$ mm, widely cylindrical; lobes narrowly triangular, about twice as long as wide, $3\text{--}3.5 \times 1.6\text{--}1.8$ mm, very thick, especially at the apex, acute, spreading. *Stamens* slightly exserted; filaments $0.2 \times$ as long as the anthers, glabrous, inserted at the mouth of the corolla tube; anthers oblong, $2\text{--}3 \times$ as long as wide, $1.4\text{--}2.5 \times 0.7\text{--}0.9$ mm, shortly sagittate at the base, glabrous or sometimes with few pilose hairs at the base; cells parallel. *Pistil* pilose in the middle, 6–7 mm long; ovary ovoid or oblong, glabrous or pilose at the apex, $2.5\text{--}3.5 \times 1.5\text{--}2$ mm, 2-celled, gradually narrowed into the style; style thick, pilose except for the glabrous apex, $3.5\text{--}4.2$ mm long; stigma capitate. In each cell about 50 ovules. *Fruit* large, yellow, nearly mature pale glaucous, globose, 3–10 cm in diam., 8–25-seeded. Wall hard, 3–5 mm thick. *Seed* irregularly tetrahedral or elliptic, rough, about $25 \times 15 \times 7$ mm.

Distribution: West and Central Africa.

Ecology: Rain forests, mostly on periodically inundated river banks; alt. 0–500 m.

Fig. 15, p. 109; Phot. 2, p. 111; Map 16, p. 107

Type: Liberia: Grand Bassa, Fishtown, Dinklage 1690 (B, holotype; isotypes: E, P).

Large liana, 2–20 m high climbing over shrubs or in trees, 20–40 m long or more. Trunk 5–13 cm in diam. Bark pale grey or dark brown- and grey-brown-spotted, with large lenticels, on section yellow or medium brown; wood creamy. Branches lenticellate, dark brown, sometimes partially paler, not sulcate when dry; branchlets medium green, minutely pubescent to glabrous, when leaves mature often lenticellate, when dry dark brown or black and often sulcate. Tendrils paired. Leaves: petiole minutely pubescent to glabrous, 2–7 mm long; blade shining or slightly so and dark green above, less shining and paler beneath, coriaceous, also when living, thinner in the shade, elliptic or narrowly elliptic, usually comparatively narrower toward the apices of the branchlets, (1.2)1.8–3 × as long as wide, 3–10(13) × 2–5(6.5) cm, sometimes some smaller, in the shade not larger than in the sun, apiculate, acuminate, or less often some rounded at the apex, more acute in the shade, cuneate or rounded at the base, glabrous on both sides; one or two pairs of secondary veins from or from somewhat above the base curved along the margin nearly to the apex, and a faint submarginal pair; tertiary venation reticulate, prominent beneath in dry leaves, less so in living; margin of sun-leaves somewhat revolute. Inflorescence terminal, sometimes also axillary, occasionally only axillary, large, lax, many-flowered, 6 × 5—15 × 20 cm, 4–7 × branched. Peduncle, branches, and pedicels, minutely pubescent to glabrous. Lower bracts leafy; other small, narrowly triangular or sepal-like (lower most of them occasionally with minute colleters at the base above), glabrous above. Flowers 5– or occasionally 4-merous. Sepals greenish-white, free, equal, broadly ovate, about as long as wide, 0.6–1 × 0.6–1 mm, obtuse or rounded at the apex, minutely ciliate, minutely pubescent outside, glabrous inside, without colleters. Corolla in the mature bud 2.8–3.3 × as long as the calyx, 2–3 mm long, and rounded at the apex, white or greenish-white, campanulate to subrotate, outside minutely pubescent, especially near the base (very base glabrous), inside pilose at the base of the lobes; tube very short, 0.9–1.3 × as long as the calyx, 0.6–1.2 mm long, widened towards the throat; lobes thick, triangular to ovate, 1.2–2 × as long as the tube, 1–1.7 × as long as wide, 1.2–2 × 1–1.3 mm, acute, spreading. Stamens exserted;

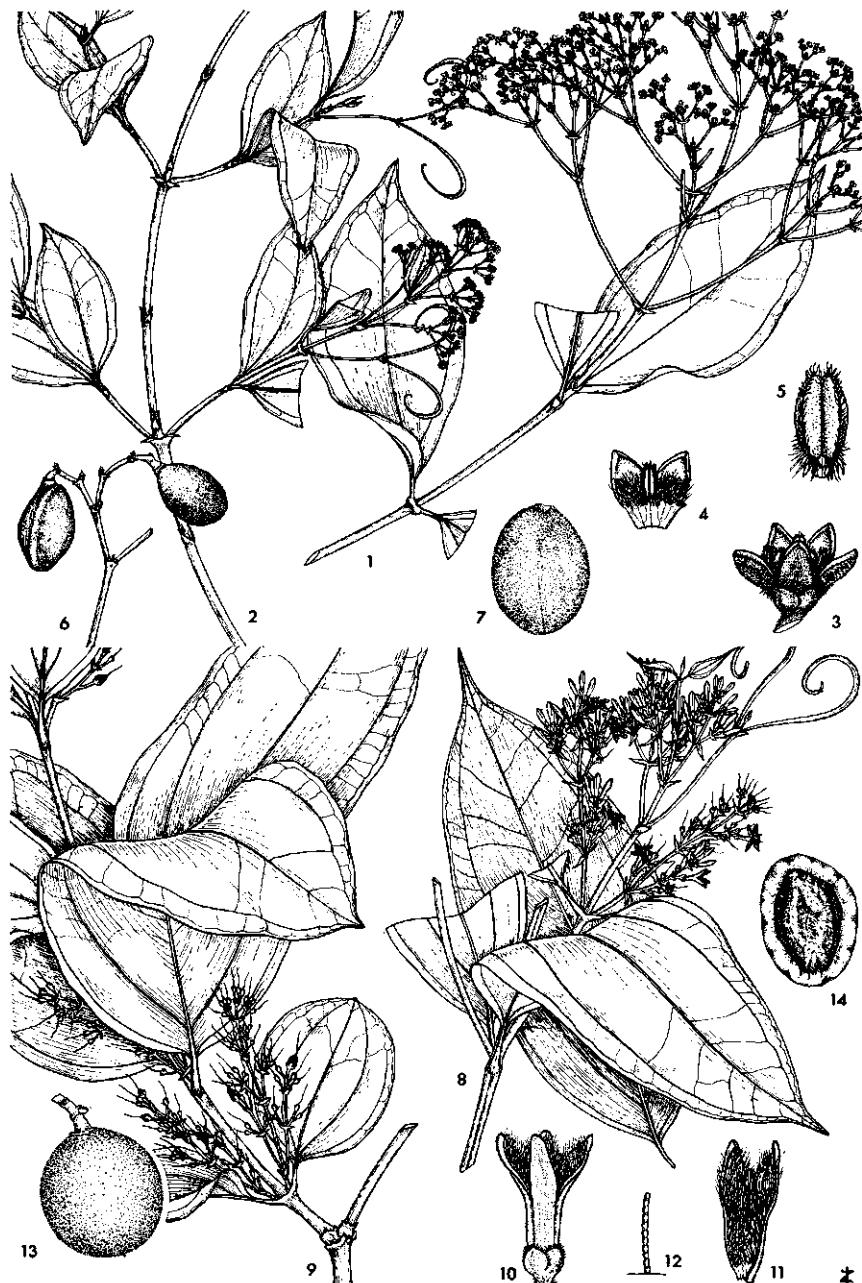

FIG. 15. 1-7. *S. dinklagei*: 1-2. branches, $\frac{1}{2} \times$; 3. flower, $4 \times$; 4. portion of corolla with stamen, $4 \times$; 5. anther, $12 \times$; 6. fruits, $\frac{1}{2} \times$; 7. seed, $1 \times$ (1, 6. Semen ellipsoideum glabrum laeve fossa longitudinali profunda profultum.

Type: Madagascar: Mts. west of Itremo, western Betsileo, Humbert 28340 (P, holotype; isotype: WAG).

Climbing shrub or often large liana. *Branches* grey-brown, lenticellate or more often not, often slightly sulcate when dry, often hairy like the branchlets; branchlets more or less appressed-pubescent with often (?) brown hairs, quadrangular, brown or ochraceous when dry. Tendrils solitary. *Leaves*: petiole short, shortly pubescent to glabrous, 2–5 mm long; blade shining and dark green on both sides, coriaceous, very variable in shape, ovate, narrowly ovate, or elliptic, 1.2–3.7 × as long as wide, (2)3–7(9) × (1)1.5–3(5.5) cm, obtuse to subacuminate or rounded and mucronate at the apex, cuneate or seemingly rounded (and cuneate at the very base) at the base, glabrous on both sides or with some minute hairs at the base of the costa beneath; one or two pairs of secondary veins from or from above the base curved along the margin and usually a faint submarginal pair; tertiary venation reticulate, when leaves dry prominent on both sides. *Inflorescence* terminal, rather congested, several-flowered, 1.5 × 1.5–4 × 3 cm, 2–4 × branched. Peduncle, branches, and pedicels pubescent. Lower bracts leafy, other small, triangular or sepal-like, glabrous above and sometimes with small colleters at the base. *Flowers* 5-merous. *Sepals* connate at the base, equal or subequal, broadly ovate, about as long as wide (inside), 1.5 × 1.2–1.7 × 1.3 mm outside and 1.2 × 1.2–1.4 × 1.3 mm inside, acute or obtuse at the apex, ciliate, shortly pubescent outside, glabrous inside, without colleters. *Corolla* in the mature bud 3–3.5 × as long as the calyx, 5–5.2 mm long, and obtuse at the apex, white or outside pale green and inside white, campanulate or nearly so, outside shortly pubescent, especially in the middle, glabrous at the base, inside white-penicillate in the throat and mostly with a narrow zone of pilose hairs near the insertion of the stamens; tube about twice as long as the calyx, 1.2–1.3 × as long as the lobes, 2.8–3.2 mm long, 2.5 mm wide at the throat; lobes thick, triangular, 1.7 × as long as wide, 2–2.2 × 1.2–1.3 mm, acute, suberect. *Stamens* included; filaments very short, 0.5–0.7 × as long as the anthers, pilose or glabrous, inserted at two-thirds from the base of the corolla tube; anthers narrowly cordate, 1.2 × 0.8 mm, bearded at the deeply cordate base; cells parallel or slightly divergent at the base. *Pistil* glabrous, 2.7–3 mm long; ovary depressed-globose, 1 × 1.2 mm, abruptly narrowed into the style, 2-celled; style 2 mm long, thick; stigma capitate. In each cell 14–20 ovules. *Fruit* orange (?) or yellow (?), small, soft, ellipsoid, 16–18 × 12–13 mm, 1-seeded, slightly shining, with smooth skin.

Wall thin. Seed not flattened, ellipsoid, $15 \times 11 \times 10$ mm, glabrous, smooth, with a deep lateral groove.

Distribution: Madagascar.

Ecology: Montane rain forests; alt. 800–1600 m.

Madagascar: Betampona, near Ambodiriana, W. of Tamatave, Perrier de la Bâthie 17452 (P); Ambatoharanana, near Antsevabe (Mar.) Cours 4100 (P); Analamazaotra Forest, Perrier de la Bâthie 8602 (P, WAG); Tsingoarivo (fl., fr. Feb.) Perrier de la Bâthie 16941 (P, WAG); W. of Itremo, W. Betsileo (Jan.-Apr.) Humbert 28340 (P, WAG, type), 30025 (P); Fajiarivo, W. of Ambositra (Jan.) Humbert & Capuron 28036 (P, WAG); Andina, near Ambositra (Dec.) Perrier de la Bâthie 18604 (P, WAG).

Notes. *S. diplotricha* belongs to section *Penicillatae* and is most closely allied to *S. tchibangensis* by the disposition of the inflorescence, the shape of the leaves, and the size of the flowers. It differs from that species by the reticulation of the leaves, the second hair ring in the corolla, which is absent in *S. tchibangensis*, and the deeply grooved seed.

22. *S. dolichothysa* Gilg ex Onochie et Hepper, Kew Bull. 16: 385. 1962; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 41. 1963 (both partly, excl. Latilo FHI 31811). **Fig. 16, p. 115; Map 16, p. 107**

Type: Cameroun: Bipindi, Zenker 4943 (K, holotype; isotypes: BM, BR, COI, FHO, G, GOET, HBG, L, LE, LY, M, MO, P, PR, PRE, S, W, WAG, Z).

Large liana, up to 40 m high climbing in trees, 40–100 m long. Trunk 3–13 cm in diam. Bark dark brown, with large lenticels; wood pale brownish. *Branches* not lenticellate, terete, dark brown and slightly or not sulcate when dry; branchlets densely and shortly appressed-pubescent with ochraceous hairs, glabrescent, terete, dark brown and not sulcate when dry. Tendrils solitary, in the axils of ordinary leaves or small bracts. *Leaves* with cloves-odour when living; petiole minutely pubescent, 4–8 mm long; blade shining or mat and dark green above, dull and very pale green beneath, coriaceous, thinner in the shade, elliptic, narrowly elliptic, or on the main axis often suborbicular, (1.2)2–3(3.7) × as long as wide, (3.5)4.5–11.5(14) × (2)3–4.5(6.5) cm, in the shade up to 16 × 7.5 cm, acuminate at the apex, cuneate or rounded at the base, sparingly and minutely pubescent on both sides when young, soon glabrous; one or two pairs of secondary veins from or from above the base curved along the margin and often also a faint submarginal pair; margin somewhat revolute, especially in the thick sun-leaves. *Inflorescence* terminal, and sometimes at the same time axillary, lax, many-flowered, about 9–20 × 5–20 cm, 4–5 × branched. Peduncle, and branches slender, shortly pubescent like the very short pedicels. Lower bracts leafy, other small, diminishing in size, narrowly triangular or approximately sepal-like, shortly pubescent on both sides, without colleters. *Flowers* 5-merous. *Sepals* pale green, about halfway connate, equal, 0.8–1 × 0.5–0.8 mm, pubescent outside, glabrous inside, without colleters;

lobes triangular, about as long as wide, acute, not distinctly ciliate. *Corolla* in the mature bud 2.5–3 × as long as the calyx, 2.5–3 × 2 mm, and rounded at the apex, greenish-white or pale green, urceolate, outside minutely pubescent, inside pilose on the base of the lobes; tube about as long as the calyx, but exceeding it as the latter is spreading in open flowers, 1(–1.2) mm long; lobes 1.5–2 × as long as the tube, triangular, 1.5–2 × 1–1.2 mm, acute, slightly spreading. *Stamens* just exserted; filaments glabrous or minutely pubescent inside, very short, 0.3–0.5 × as long as the anthers, inserted at the mouth of the corolla tube; anthers ovate, 0.8 × 0.5–0.6 mm, bearded at the cordate base; cells parallel. *Pistil* glabrous, 1.4–2 mm long; ovary globose or broadly ovoid, 0.7–1 mm in diam., often rather abruptly narrowed into the style, 2-celled; style 0.7–1 mm long; stigma capitate. In each cell about 7–10 ovules. *Fruit* orange, rather small, soft, ellipsoid, 20 × 20 × 17–32 × 32 × 26 mm, 1–2-seeded, smooth, mat. *Seed* obliquely elliptic, flattened, 15 × 13 × 3–20 × 15 × 6 mm, more or less plano-convex, rather rough, densely pubescent with very thick short erect hairs.

Distribution: Cameroun, Gabon (not yet collected), Congo (Brazzaville).

Ecology: Rain forests or secondary forests, mostly on river banks; alt. 0–800 m.

Cameroun: Bipindi, Zenker 4943 (BM, BR, COI, FHO, G, GOET, HBG, K, L, LE, LY, M, MO, P, PR, PRE, S, W, WAG, Z, type); 49 km SW. of Eséka, right bank Nyong R., about 1 km N. of Songbong (fl. Mar., fr. June) W. de Wilde 2160 (WAG), 2736 (WAG, YA), 2755 (WAG); ibid., Leeuwenberg 5113 (WAG); about 65 km SW. of Eséka, about 15 km S. of Songbong (fr. July) W. de Wilde 2804 (WAG); 25 km NE. of Douala, along road to Edéa, Leeuwenberg 6329 (WAG); 3 km E. of km 21 of Yabassi-Douala road, Leeuwenberg 6409 (WAG); 8 km W. of Masok, Leeuwenberg 5200 (WAG); 10 km W. of Masok near Ekem R. Leeuwenberg 5439 (WAG); 33 km E. of Yaoundé, along road to Ayos, Breteler, J. de Wilde & Leeuwenberg 2471 (BR, K, P, WAG, YA); km 25 of Nanga Eboko-Bertoua road, Leeuwenberg 7447 (WAG); 18 km N. of Bertoua, along road to Deng Deng, Breteler c.s. 2422 (BR, K, P, WAG, YA); near Dimako, 28 km SW. of Bertoua, Breteler 1744 (WAG, YA); 15 km E. of Dimako, Leeuwenberg 5833 (WAG), 7357 (WAG); 10 km N. of Doumé, Leeuwenberg 7359 (WAG); 5 km N. of Lomié, Leeuwenberg 6631 (WAG).

Congo (Brazzaville): near Komono, Bouquet & Sitha 2332 (IRSC, WAG).

23. *S. elaeocarpa* Gilg ex Leeuwenberg, sp. nov. (Gilg in Mildbraed, Wiss. Ergebn. Deutsch. Zentr.-Afr. Exped. 1910–11.2: 62. 1922, nomen).

Fig. 16, p. 115; Map 17, p. 107

Arbor parva silvae densae pluviosae. Truncus erectus cylindricus cortice laevi griseo vel bruneo. Rami inermi lenticellati fere nigri. Folia glabra laminis crasse coriaceis ellipticis vel anguste ellipticis apice acuminatis vel apiculatis basi cuneatis infra conspicue pallidioribus. Inflorescentia axillaris congesta ut videtur fasciculata pauciflora. Flores tetrameri. Sepala suborbicularia apice obtusa vel acuta minutissime ciliata utrinque glabra. Corolla lactea extus glabra

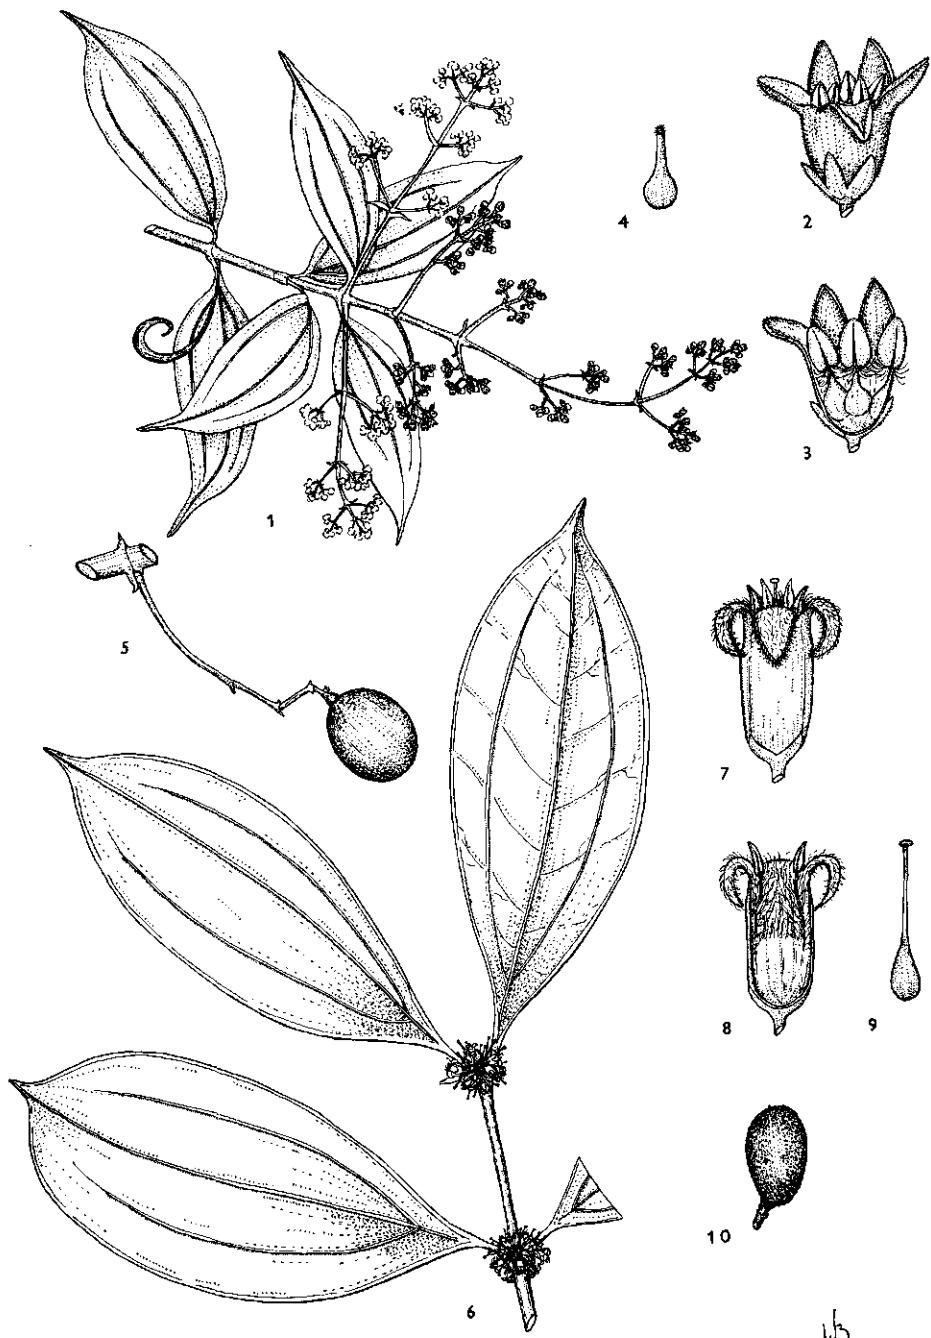

FIG. 16. 1-5. *S. dolichothysa*: 1. branch, $\frac{1}{2} \times$; 2. flower, $7 \times$; 3. opened flower, $7 \times$; 4. pistil, $7 \times$; 5. fruit, $\frac{1}{2} \times$ (1-4. Leeuwenberg 5439; 5. W. de Wilde 2755); 6-10. *S. elaeocarpa*: 6. branch, $\frac{1}{2} \times$; 7. flower, $3\frac{1}{2} \times$; 8. opened flower, $3\frac{1}{2} \times$; 9. pistil, $3\frac{1}{2} \times$; 10. fruit, $\frac{1}{2} \times$ (6-9. Leeuwenberg 7005; 10. Leeuwenberg 6305).

intus dense pilosa tubo cylindrico lobisque oblongis recurvatis. Stamina glabra paulo exserta filamentis antheras oblongas aequantibus. Pistillum glabrum ovario biloculari styloque gracili. Fructus bruneus parvus oliva similis sed conspicue lenticellatus monospermus. Semen ellipsoideum glabrum laeve testa tenuissima.

Type: Cameroun: 4 km E. of km 65 of Edéa-Kribi road, Leeuwenberg 7005 (WAG, holotype; isotypes: A, B, BM, BOL, BR, BREM, C, COI, E, EA, ENT, F, FHO, FI, G, GB, GOET, GRA, GRO, HAL, HBG, IFAN, IRSC, K, L, LD, LISC, LISU, LY, M, MO, MPU, NBG, NLI, NY, P, PRE, PRF, S, SL, SRGH, TCD, TOM, U, UC, UPS, US, W, WRSL, YA, Z).

Small tree, 6–10 m high. Trunk 15–25 cm in diam. Bark smooth, pale grey to dark brown, thin, 1.5 mm thick; wood very pale brownish, hard, with small bark-islets. *Branches* lenticellate, terete, very dark brown to black and partially pale brown, not sulcate when dry; branchlets glabrous, not lenticellate, pale to very dark brown and often somewhat sulcate when dry. *Leaves*: petiole glabrous, 7–10 mm long; blade slightly shining on both sides, dark green above, especially when living much paler beneath, thickly coriaceous, elliptic or narrowly elliptic, 1.7–3 × as long as wide, 8–17 × 3–7(9) cm, acuminate or apiculate at the apex, cuneate at the base, glabrous on both sides; one pair of secondary veins from or from above the base curved along the slightly revolute margin; tertiary venation reticulate, not very conspicuous. *Inflorescences* axillary, several together, congested, seemingly fasciculate, few-flowered, 1–1.5 × 1 cm, 1–2 × branched. Bracts approximately sepal-like. *Flowers* 4-merous, sweet-scented. *Sepals* pale green, connate at the base, subequal, suborbicular, 1–1.2 × as long as wide, 1–1.2 × 0.8–1.2 mm, obtuse to acute at the apex, very minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 6–7 × as long as the calyx, 7–8.5 mm long, and tapering at the apex, white or creamy, outside glabrous, inside densely pilose except for the glabrous base of the tube and apex of the lobes; tube cylindrical or nearly so, 3–4 × as long as the calyx, 1–1.4 × as long as the lobes, 3.7–5 mm long, at the throat 2–2.2 mm wide; lobes oblong, 2.3 × as long as wide, 3.5 × 1.5 mm, acute, recurved. *Stamens* slightly exserted; filaments glabrous, as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 1–1.1 × 0.4–0.6 mm, glabrous, cordate at the base; cells parallel. *Pistil* glabrous, 6–8.5 mm long; ovary ovoid, 1.7 × 1–1.2 mm, 2-celled; style slender, 4.5–6.8 mm long; stigma capitate, small. In each cell 5–15 ovules. *Fruit* dark brown, small, soft, obliquely ellipsoid, 20 × 13 × 13–25 × 16 × 16 mm, rounded or mucronate at the apex, distinctly lenticellate, 1-seeded, mat, with rather rough skin. Wall thin. *Seed* pale brown, ellipsoid, 15–17 × 8–10 × 7–9 mm, smooth, glabrous. Testa thin, sticking to the pulp.

Distribution: Cameroun.

Ecology: Rain forests or old secondary forests, sometimes on river banks, not far from the coast; alt. 50–200 m.

Cameroun: left bank Mungo R., near bridge in Loum-Kumba road, Leeuwenberg 6845 (WAG); Likomba Plantation, 15–35 km NE. of Victoria (fl., fr. Oct.) Mildbraed 10521 (A, K, cited by Gilg), 10527 (A, K, cited by Gilg); Tiko, Dunlap 168 (K); 2 km E. of km 58 of Edéa-Kribi road, along road to Mboké (fl. Oct., fr. Aug.) Leeuwenberg 6307 (WAG), 7009 (WAG); 5 km E. of km 65 of Edéa-Kribi road (fl. Oct., fr. Aug.) Leeuwenberg 5671 (WAG), 5671a (WAG), 6305 (WAG), 7005 (herbaria see above; type), 7006 (WAG, one year old seedlings of 7005), 7007 (WAG, very young seedlings of 7005).

Notes. Gilg cited the two above-mentioned numbers of the Mildbraed collection without description. I had the opportunity to collect a fine specimen with many duplicates, some of which were distributed before the publication of the present description, and therefore it is very suitable as the type.

The numbers 7006 and 7007 were collected at the base of 7005. Dr. T. W. J. GADELLA will publish the chromosome number. The root tips of 7007 were fixed in Karpechenko's fixation mixture in the field.

S. elaeocarpa resembles *S. ndengensis* by the dense hairiness inside the corolla, and by the lenticellate branches. The leaves are less similar. The two species differ mainly by the habit, *S. ndengensis* being a liana with solitary tendrils.

Furthermore *S. elaeocarpa* resembles *S. floribunda* more or less in the floral characters. This caused the confusion of the two species in the Flora of W. Trop. Africa. *S. elaeocarpa* differs from *S. floribunda* by the habit and the remarkable warty brown fruits. The fruits of *S. floribunda*, a liana with solitary tendrils, are smooth and orange.

24. *S. fallax* Leeuwenberg, sp. nov.

Fig. 17, p. 119; Map 17, p. 107

Liana ramis inermibus lenticellatis. Folia glabra breviter petiolata laminis subcoriaceis ellipticis apice acuminatis basi cuneatis vel rotundatis. Inflorescentia terminalis pedunculis pedicellisque glabris vel minute pubescentibus. Flores pentameri parvi. Sepala ovata vel triangularia apice acuta minute ciliata extus breviter pubescentia. Corolla extus pubescens intus fauce pilosa tubo brevi calyce aequilongi lobis patentibus. Stamina breviter exserta corollae fauce inserta antheris oblongis basi cordata barbatis. Pistillum pilosum ovario biloculari. Fructus aurantiacus parvus ovoideus lateraliter compressus bi- vel trispermus. Semen oblique ovatum vel ellipiticum scabridum testa chartacea.

Type: Congo (Brazzaville): Pointe-Noire Region, Koechlin 5507 (WAG, holotype; isotype: IRSC).

Liana. Trunk 3–10 cm in diam. *Branches* dark brown, lenticellate, not sulcate when dry; branchlets glabrous, lenticellate when leaves mature, terete or nearly so, dark brown and often slightly sulcate when dry. Tendrils paired. *Leaves*: petiole, short, glabrous, 1–4 mm long; blade slightly shining on both sides (dry), paler beneath, thinly coriaceous, elliptic, (1.5)2–3 × as long as wide, 3–11 × 1.5–5 cm, acuminate at the apex, cuneate or rounded at the base, glabrous on both sides; one pair of secondary veins from or from somewhat above the base curved along the margin, and often a faint submarginal pair; costa and often

main secondary veins impressed above; tertiary venation reticulate, prominent beneath and mostly also above. *Inflorescence* terminal, rather lax, $3-4 \times 2-3$ cm, in fruit up to 9×9 cm. Peduncle, branches, and pedicels glabrous or minutely pubescent. Lower bracts leafy, other small, narrowly triangular or sepal-like, upper most glabrous above and without colleters. *Flowers* 5-merous. *Sepals* connate for one-third of their length, equal, ovate to triangular, 1×0.8 mm, acute at the apex, minutely ciliate, shortly pubescent outside, glabrous inside, without colleters. *Corolla* in the mature bud $3 \times$ as long as the calyx, 3 mm long, and rounded at the apex, white (?), minutely pubescent outside, inside with a pilose ring in the throat; tube short, as long as the calyx, 1 mm long; lobes $2 \times$ as long as the tube, 2×1.2 mm, acute, spreading. *Stamens* slightly exserted; filaments glabrous, $0.5 \times$ as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 0.6×0.5 mm, bearded at the deeply coriate base; cells parallel. *Pistil* pilose, 1.5 mm long; ovary ovoid, 1×0.8 mm, 2-celled, gradually narrowed into the style; style 0.5 mm long; stigma capitate. In each cell 5-6 ovules. *Fruit* orange or orange-yellow, small, soft, ovoid, laterally compressed, $19 \times 18 \times 14 - 25 \times 23 \times 16$ mm, 2-3-seeded, with a smooth skin. Wall thin, dry about 0.3 mm thick. *Seed* flattened, more or less plano-convex, obliquely ovate or elliptic, often irregularly curved, $12 \times 10 \times 4 - 15 \times 12 \times 5$ mm, with an acute end, with thick very short erect hairs, rather rough. Testa chartaceous, not sticking to the pulp.

Distribution: Gabon, Congo (both).

Ecology: In moist forests (*Gilbertiodendron*), often on river banks or in gallery forests; alt. 0-1000 m.

Gabon: Bélinga, N. Hallé 4147 (P, WAG).

Congo (Brazzaville): Pointe-Noire Region (Dec.) Koechlin 5507 (IRSC, WAG, type).

Congo (Kinshasa): Léopoldville: new Boma-Banane road (fr. Feb.) Wagemans 1376 (BR), 1408 (BR); Zundu, Mpioka R. (fr. Mar.) Compère 1686 (BR); Kinkasi (fr. Feb.) Callens 301 (BR, K). Équateur: Basankusu, near Maniete R. (fr. Sept.) Evrard 4777 (BR, K, WAG); near Ingende, L. Dubois 788 (BR). Orientale: Yandji Lake, Isangi (fr. Aug.) Germain 5160 (BR, K, PRE).

Notes. The name of this species is chosen because it resembles fallaciously three well defined species which belong to three different sections. It is placed here in *Lanigerae* with the last of these three species, *S. moandaensis*.

First of all, it shows a resemblance with *S. tchibangensis* by the terminal inflorescence, the outside pubescent corolla, and the bearded anthers. It differs from the latter in leaf characters which are difficult to define and as follows: Tendrils solitary, pubescent; corolla in the mature bud 4.5 mm long; pistil glabrous; seeds ellipsoid, glabrous, smooth, not much flattened; testa thin, sticking to the pulp ***S. tchibangensis***
Tendrils paired, glabrous; corolla in the mature bud 3 mm long; pistil pilose; seeds obliquely ovate or elliptic, flattened, shortly and densely pubescent, rather rough ***S. fallax***

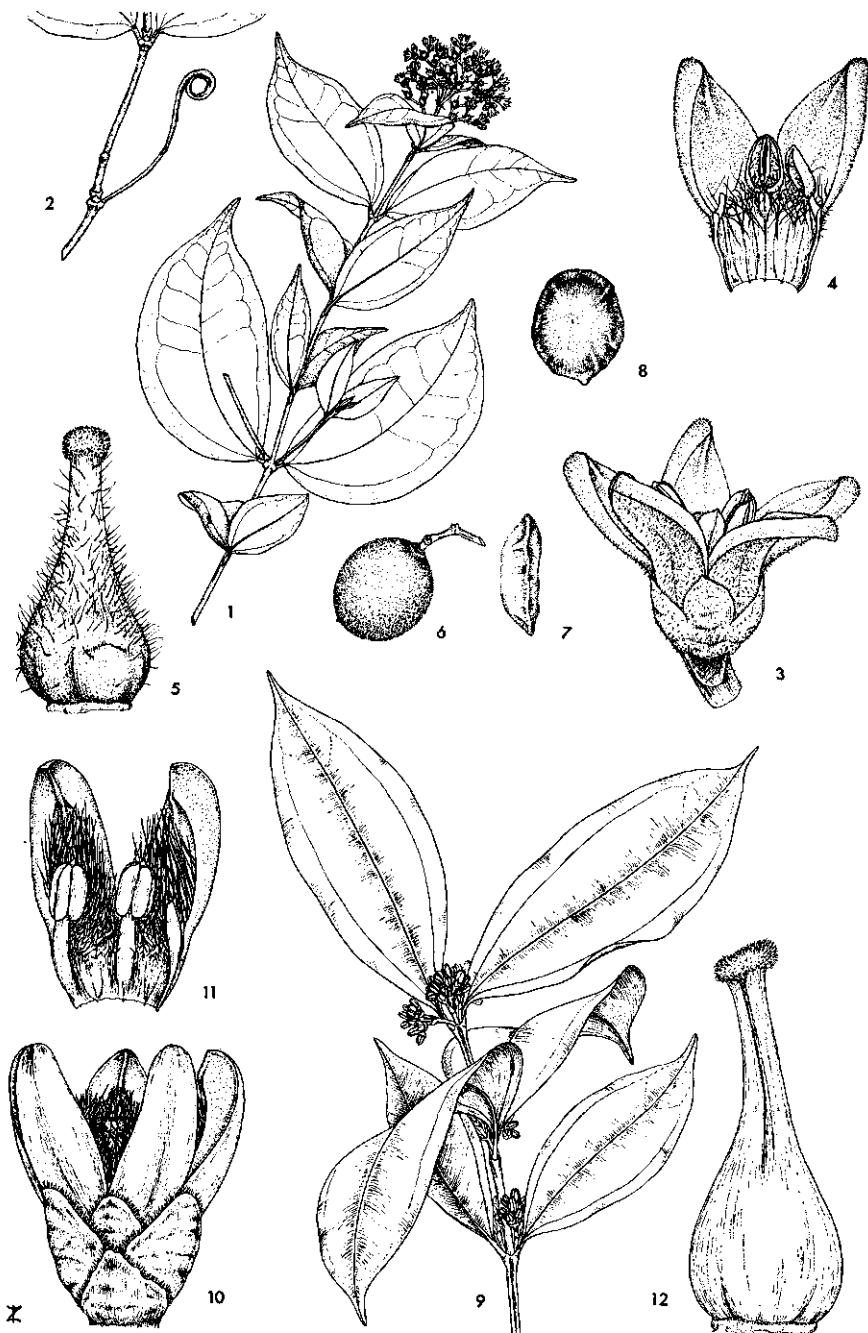

FIG. 17. 1-8. *S. fallax*: 1. branch, $\frac{1}{2} \times$; 2. branch with tendrils, of which one lost, see articulation, $1 \times$; 3. flower, $10 \times$; 4. portion of corolla with stamen, $10 \times$; 5. pistil, $20 \times$; 6. fruit, $1 \times$; 7-8. seed, two sides, $1 \times$ (1, 3-5. Koechlin 5507; 2. German 5160; 6-8. Compère 1686). 9-12. *S. gnetifolia*: 9. branch, $\frac{1}{2} \times$; 10. flower, $10 \times$; 11. portion of corolla with stamens, $10 \times$; 12. pistil, $20 \times$ (9-12. Zenker 2961).

Than it resembles *S. malchairii* by the shape and venation of the leaves and the size of the fruits. From this species it differs more clearly by the following characters:

- Tendrils solitary; leaves mostly dull beneath; corolla lobes thick, with recurved brushes at the apex; seed ellipsoid, glabrous, smooth *S. malchairii*
Tendrils paired; leaves slightly shining beneath (dry); corolla lobes not thick, pilose at the base; seed flattened (see above) *S. fallax*

Finally, it resembles *S. moandaensis* even more by the leaves, the small flowers, and the pilose pistil. From this species it differs as follows:

- Inflorescence axillary and often also terminal; branchlets mostly pubescent; pistil 2.8–4 mm long; seed smooth; fruit not laterally compressed *S. moandaensis*
Inflorescence terminal; branchlets glabrous; pistil 1.5 mm long; seed rough; fruit laterally compressed *S. fallax*

25. *S. floribunda* Gilg in Engler, Bot. Jahrb. 17: 566. 1893; Baker in Fl. Trop. Afr. 4(1): 527. 1903; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 44. 1963, partly (excl. syn. *S. togoensis* Gilg et Busse; Thomas 5032, Kersting 691, Dunlap 168, Mildbraed 10521, 10527, Chipp 574); Leeuwenberg, Act. Bot. Neerl. 14: 219. 1965.

Type: Congo: Orientale, Monbuttu Land, Kapili R., Schweinfurth 3558 (holotype not seen, destroyed in B; lectotype: K; other isotypes seen: BM, P, S).

Heterotypic synonyms: *S. welwitschii* Gilg, l.c. p. 573; Hiern in Cat. Welw. Afr. Pl. 3: 703. 1898, partly (as for Welwitsch 1260, 4765, 4774, 6017 partly, 6018); Baker, l.c. p. 524; E. A. Bruce, Kew Bull. 10: 627, f. 1A. 1956. Type: Angola: Luanda, between Quicuxé and Cacuaco, Welwitsch 6018 (BM, lectotype; isotypes: C, COI, K, LE, LISU, P). Homotypic synonym: *S. subscandens* Bak., Kew Bull. 1895: 96. 1895. The holotype of this name is the lectotype of the preceding.

S. microcarpa Bak., Kew Bull. 1895: 97. 1895. Type: Angola: Luanda, between Quicuxé and Cacuaco, Welwitsch 4765 (BM, holotype; isotypes: COI, G, K, LISU, P).

S. malifolia Bak. in Fl. Trop. Afr. 4(1): 525. 1903. Type: Angola: Luanda, Ambriz, Monteiro Oct. 1872 (K, holotype).

S. henriquesiana Gilg, Notizbl. Bot. Gart. Berlin 1: 75. 1895, not Baker (1893). Type: Angola: Luachimo R., Marques 273 (holotype not seen, destroyed in B; lectotype: LISU; other isotype seen: COI). Homotypic synonym: *S. marquesii* Bak. in Fl. Trop. Afr. 4(1): 530. 1903.

S. moloneyi Bak., Kew Bull. 1895: 97. 1895 and in Fl. Trop. Afr. 4(1): 527. 1903; Hutchinson & Dalziel, Fl. W. Trop. Afr. 2: 24. 1931, partly (excl. syns. *S. togoensis* Gilg et Busse, *S. chrysocarpa* Bak.; Johnston 98, Dunlap 168, Kersting 691, Talbot 157, and Linder 1242). Type: Sierra Leone: Near Berria, Falaba, Scott Elliott 5431 (K, lectotype).

S. littoralis A. Chev. ex Hutch. et Dalz., Fl. W. Trop. Afr. 2: 24. 1931 and Kew Bull. 1937: 334. 1937 (with *S. warneckeii* Gilg in syn.), partly (excl. Mildbraed 10521, 10527) (A. Chevalier, Expl. Bot. Afr. Occ. Franç. 1: 443. 1920, nomen); Chevalier, Rev. Bot. Appliq. 27: 370, pl. 19A. 1947. Type: Ivory Coast: between Tabou and Bériby, Chevalier 19953 (P, holotype; isotypes: K, LY, P).

Climbing shrub or liana, 1.50–30 m high climbing over shrubs and in trees, 10–30 m long or more. Trunk 4–13 cm in diam. Bark dark brown, lenticellate, smooth, thin; wood yellow. *Branches* very dark brown or paler and with epidermis peeling off, lenticellate, terete, not sulcate when dry; branchlets green, glabrous or occasionally minutely pubescent, rarely lenticellate, pale to dark brown and often slightly sulcate when dry. Tendrils solitary. *Leaves*: petiole glabrous, 2–9 mm long; blade often slightly shining and dark green above, less shining to dull and paler and often glaucous beneath, coriaceous or subcoriaceous also when living, thinner in the shade, very variable in shape and size, elliptic, narrowly elliptic, narrowly ovate, or less often ovate, sometimes narrower towards the apices of the branchlets, 1.5–3(4) × as long as wide, 4–10(12) × 1.5–5(6) cm, acuminate or in the shade often caudate at the apex, cuneate, rounded, or rarely subcordate at the base, glabrous on both sides; one or two pairs of secondary veins from or from above the base curved along the margin, outer pair usually faint; tertiary venation not very conspicuous, often slightly prominent beneath. *Inflorescence* axillary and occasionally also terminal, lax or congested, 0.1–0.5 × as long as the leaves, 1–4.5 × 1–3 cm, 1–2 × branched, few-flowered. Peduncle, branches, and pedicels thin, minutely papillose-pubescent or glabrous. Bracts narrowly triangular or almost sepal-like, at least upper often (?) without colleters. *Flowers* (4–)5-merous. *Sepals* green or greenish, connate up to one-quarter of their length, subequal or unequal and then the longest up to 1.5 × as long as the shortest and wider or narrower, triangular, ovate, or narrowly triangular, 1–2(3) × as long as wide, 0.8–1.5 × (0.3)0.6–0.8(1.2) mm, acute or sometimes subacute at the apex, minutely ciliate, glabrous on both sides or outside minutely papillose-pubescent, without colleters. *Corolla* in the mature bud 3.5–5 × as long as the calyx, 4.5–6 mm long, and rounded at the apex, white or greenish-white, outside glabrous or minutely papillose-pubescent, especially on the tube above, inside often densely pilose except for the glabrous apex of the lobes and base of the tube; tube cylindrical or nearly so, 1.7–4.4 × as long as the calyx, 0.7–1.5(2) × as long as the lobes, 2–3.3 mm long; lobes narrowly triangular, 1.5–3 × as long as wide, 1.5–3 × 1–1.6 mm, acute, spreading or recurved. *Stamens* exserted; filaments glabrous, 1–1.5(2) × as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 1.2–3 × as long as wide, 0.6–1 × 0.25–0.8 mm, rounded to deeply cordate at the base, glabrous; cells parallel. *Pistil* glabrous, 3.2–6(7) mm long; ovary globose, or ovoid to nearly conical, gradually narrowed into the style or not, 0.8–2 × 0.6–1 mm, 2-celled; style slender, 2–4.5 mm long; stigma small, obscurely bilobed or capitate (in a single inflorescence). In each cell 6–10 ovules. *Fruit* orange, immature green or glaucous,

sometimes lenticellate, small, soft, ellipsoid, $14 \times 12 \times 12 - 17 \times 14 \times 14$ mm, 1-seeded, obliquely pedicellate, sometimes shortly stipitate within the calyx, with smooth skin, mat. Wall thin, about 0.3 mm thick. Pulp pale yellow. Seed ochraceous or pale brown, slightly flattened, ellipsoid, $8 \times 7 \times 5 - 13 \times 10 \times 7$ mm, densely pubescent, smooth. Testa thin, sticking to the pulp.

Distribution: West and Central Africa.

Ecology: Rain forests or secondary forests, often on river banks; alt. 0–800 m.

Sierra Leone: near Berria, Falaba (fr. Mar.) Scott Elliot 5431 (K, lectotype of *S. moloneyi*); sin. loc., Afzelius s.n. (UPS).

Notes. *S. floribunda* is closely allied to *S. dale*. Both species can be distinguished as follows:

Leaves with prominent reticulate venation on both sides or only beneath, usually larger than in the next species; mature flower buds and pistils 4–4.5 mm long. Cameroun, Gabon, Congo, Angola *S. dale*
 Leaves with venation which is not or obscurely prominent beneath, not above; mature flower buds and pistils (4.5)5–6 mm long *S. floribunda*

MAP 18. *S. floribunda*.

26. **S. gnetifolia** Gilg ex Onochie et Hepper, Kew Bull. 16: 385. 1962; (ex Klein & Herndlhofer, Oesterr. Bot. Zeitschr. 76: 95. 1927, nomen); Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 44. 1963.

Fig. 17, p. 119

Type: Cameroun: Bipindi, Zenker 2961 (K, holotype; isotypes: BM, BR, COI, E, G, GOET, GRO, HBG, L, LY, M, MO, P, PR, S, W, WAG, WU, Z).

Tree (?) or liana (?). *Branches* not lenticellate, medium to dark brown, sometimes umbellately branched; branchlets glabrous, dark brown and slightly sulcate when dry. Tendrils not seen. *Leaves*: petiole glabrous, 5–10 mm long; blade dull on both sides when dry, slightly paler beneath, coriaceous, elliptic or narrowly elliptic, (1.5)2–3 × as long as wide, 6–13 × 2–6.5 cm, acuminate at the apex, cuneate at the base and slightly decurrent into the petiole, glabrous on both sides; one pair of secondary veins from the base curved along the margin and sometimes a faint submarginal pair; tertiary venation obscure. *Inflorescence* axillary or occasionally terminal, small, few-flowered, much shorter than the leaves, congested. Peduncle conspicuous, 5–7 mm long, with 2 stripes of minute pubescence, with a pair of sepal-like bracts or bracteoles. Branches hairy as the peduncle or practically glabrous as the pedicels. Bracts smaller than the sepals (upper without colleters). *Flowers* 5-merous. *Sepals* connate at the very base, subequal, ovate or broadly ovate, about 1.2–1.6 × as long as wide, 1.5–2 × 1.2–1.6 mm, rounded at the apex, glabrous on both sides, ciliate, without colleters. *Corolla* in the mature bud 2.2–2.6 × as long as the calyx, 3.5–4.5 mm long, and rounded at the apex, white (?), glabrous outside, inside densely pilose except for the glabrous base of the tube and apices of the lobes; tube very short, half as long as the calyx, 0.7–1 mm long; lobes thick, oblong, 3–3.5 × as long as wide, 2.8–3.5 × 0.9–1 mm, acute, slightly (?) spreading. *Stamens* exserted; filaments about 1.5 × as long as the anthers, glabrous, inserted at the mouth of the corolla tube; anthers oblong, 0.8 × 0.5 mm, subcordate at the base, glabrous; cells parallel. *Pistil* glabrous, 3 mm long; ovary ovoid, 1.5 × 1.2 mm, 2-celled, gradually narrowed into the style; style 1.5 mm long; stigma capitate. In each cell about 9 ovules. *Fruit* unknown, supposed to be small and 1-seeded.

Distribution: only once collected in Nigeria and once in Cameroun.

Ecology: Rain forests; at low elevation.

Nigeria: Oban, Talbot 574 (BM, paratype).

Cameroun: Type, see above.

27. **S. gossweileri** Exell, Journ. Bot. 67. Suppl. 2: 102. 1929; Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 35, f. 13. 1952. **Fig. 8, p. 71; Map 5, p. 73**

Type: Angola: Zaire, Sumba Peco, near Zaire R., Gossweiler 9180 (BM, holotype; isotypes: BR, K, MO, US).

Heterotypic synonym: *S. caespitosa* Good, Journ. Bot. 67. Suppl. 2: 104. 1929. Type: Angola: Huila, Fte. Amelia, Vila da Ponte, Gossweiler 2033 (BM, holotype; isotype: COI).

Small fire resistant savanna shrub, 10–50 cm high, or climbing shrub or liana, 2–5 m high climbing and about 10–20 m long or more. Trunk in shrub very thin, about 0.5 cm in diam., in liana up to 12 cm in diam. Bark dark brown, shallowly fissured, with large tuberculate lenticels; wood pale yellow. *Branches* not lenticellate, dark brown and sulcate or not when dry; branchlets green, usually quadrangular, glabrous, greenish-brown to dark brown and not or hardly sulcate when dry. Tendrils in 1–3 pairs above each other. *Leaves*: petiole glabrous, 2–5 mm long; blade mat or slightly shining and dark green above, dull or slightly shining and paler and often glaucous beneath, drying dark brown to pale greenish-brown, in the sun coriaceous, in the shade subcoriaceous, elliptic, narrowly elliptic, obovate, or on the main axis (climbers) suborbicular, (1)1.5–5.5 × as long as wide, 2–7(11) × 1–4(5) cm, acute, apiculate, or shortly acuminate at the apex, cuneate or less often rounded at the base, glabrous on both sides; one pair of secondary veins from or from above the base curved along the margin and often a faint submarginal pair; costa impressed above; tertiary venation reticulate, often prominent on both sides. *Inflorescence* axillary, solitary, more or less congested, usually few-flowered, much shorter than the leaves, 1 × 1 – 1.5 × 1.5 cm, 1–2 × branched. Peduncle, branches, and pedicels usually short, glabrous. Bracts shovel-shaped or more or less sepal-like, rather large, about 2–3 × as long as the sepals. *Flowers* 4(–5)-merous. *Sepals* connate at the base, equal or subequal, suborbicular, 1.2 × as long as wide, 1.2–1.4 × 1–1.2 mm, obtuse or acutely obtuse at the apex, glabrous on both sides, often very minutely ciliate, without colleters. *Corolla* in the mature bud (3.5)4.5–5.5 × as long as the calyx, (5.2)5.7–6.7 mm long, slightly contracted somewhat under the throat, and tapering at the apex, white with often pale green tips at the lobes, outside glabrous or sometimes minutely papillose-pubescent, inside densely pilose to glabrous on the lobes and sometimes also in the tube; tube cylindrical or nearly so, (2)3–3.5 × as long as the calyx, (1.4) 1.7–2 × as long as the lobes, (3)3.5–4.5 mm long, at the throat 1–1.4(2) mm wide; lobes oblong, 2.2–2.5 × 1–1.2 mm, acute, recurved. *Stamens* slightly exserted; filaments glabrous, usually short, 0.2–1 × as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 0.7–1 × 0.3–0.7 mm, glabrous, cordate at the base; cells parallel. *Pistil* glabrous, (3.5)5–6 mm long; ovary ovoid, 1–1.5(2) × 0.7–1(1.2) mm, 2-celled; style slender, (1.5)4–5 mm long; stigma small, capitate or obscurely bilobed. In each cell 5–9 ovules. *Fruit* orange-yellow or yellowish, immature glaucous, small, soft, obovoid or ellipsoid, 1.5 × 1 – 2 × 1.5 cm, apiculate at the apex, often slightly obliquely pedicellate, 1-seeded, with smooth skin. Wall thin. *Seed* flattened, obliquely ellipsoid, 13 × 8 × 4 – 16 × 11 × 6 mm, at one side with a deep pit, at the other with a bulge surrounded by a shallow groove, seemingly papillose; false papillae simulated by curved hairs.

Distribution: Central Africa.

Ecology: Gallery forests, groves on granitic rocks, or woodlands; alt. 0–700 m.

Cameroun: Nkolbisson, 7 km W. of Yaoundé, Breteler 2992 (WAG, YA); ibid., Leeuwenberg 5446 (WAG); 16 km S. of Djouo, 20 km E. of Somalomo, Dja R. (fl., fr. Feb.) Letouzey 4388 (P, WAG, YA), 4388 bis (P, WAG, YA).

Cult.: Kitwe, Zambia (seedling) Fanshawe 7627 (K).

Notes. *S. caespitosa* (the specimens cited above from Huila (Angola) and Zambia) is a shrub. Its stems are consumed by the annual bush fire. The base of the plant is almost completely subterranean and look rhizomatous, as is often seen in shrubs subject to burning. Shrubs having this habit are known in *S. cocculoides*, *S. pungens*, and *S. spinosa*. The latter three species are normally shrubs or trees occurring in woodlands. *S. gossweileri* is normally a tendrilled climbing shrub or liana growing in low gallery forests, groves on granitic rocks, or thickets on river banks in woodlands.

The flowers of the types of *S. gossweileri* and *S. caespitosa*, and of the other specimens examined, resemble each other strikingly in all details. The same is true for the branchlets, fruits, and seeds. The leaves on the branches of the climbers vary more or less the same way as those in the low shrubs.

It seems certain that the low shrubs become climbers, if not disturbed. Therefore, the present author proposes to reduce *S. caespitosa* to the synonymy of *S. gossweileri*.

The tendrils of *S. gossweileri* may be arranged in variously grouped pairs, which are often combined with inflorescences, e.g. in herb. Gossweiler 8701.

S. gossweileri is closely allied to *S. barteri* (q.v.). They resemble each other so much that the former might be a form of the latter. More material should be collected for evidence. The ecology of both species is very different and militates against reduction of *S. gossweileri* to a synonym of *S. barteri*. See also the notes under *S. penninervis*.

Lukafu, near Lubumbashi, Duvigneaud 1248 (BR, lectotype; isotype: WAG).

Shrub or small tree, 2–10(20) m high, with spreading rounded crown. Trunk 40–50 cm in diam. (more or less); bark pale grey or pale brown, rough. *Branches* pale grey or pale brown, sometimes shallowly fissured, not lenticellate; branchlets pale to medium brown or yellowish, conspicuously sulcate and often partially quadrangular when dry, glabrous. *Leaves*: petiole short, glabrous, 1–3 mm long; blade pale to dark green and shining above, less shining and paler beneath, coriaceous, very variable in shape and size even in a single branchlet, elliptic, oblong, narrowly elliptic, or ovate, (1.2)1.5–3(3.5) × as long as wide, (1.5)2–6(10) × (0.6)1–3(6) cm, rounded to acuminate at the apex, cuneate, rounded, or sometimes on main axis subcordate (and then comparatively wider); glabrous on both sides; one pair of secondary veins from or from above the base curved along the margin and one rarely two faint submarginal pairs; tertiary venation reticulate, prominent on both sides, especially in thick leaves. *Inflorescence* axillary and sometimes also terminal, much shorter than the leaves, 1 × 1 – 2 × 2 cm, congested, few- or many-flowered. Peduncle often very short, sparsely pubescent to glabrous like the branches and pedicels. Bracts small, upper sepal-like, lower larger, sparsely pubescent to glabrous beneath, often with colleters in the axils. *Flowers* fragrant, 5-merous, sessile or subsessile. *Sepals* pale green, connate at the base, broadly orbicular or nearly so, 1–1.4 × 1–1.4 mm, rounded or obtuse at the apex, minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 2.3–3 × as long as the calyx, 2.8–4 mm long, greenish-yellow, creamy, or white, subrotate and 4–5 mm in diam. when open, glabrous outside, inside pilose or villose at the base of the lobes or sometimes entirely glabrous; tube short, 0.7–1.2 × as long as the calyx, 0.8–1.5 mm long, wide; lobes thick, triangular to ovate, 1.7–2.5 × as long as the tube, 1.7–2 × as long as wide, 2–2.5 × 1–1.6 mm, acute, spreading. *Stamens* just exserted; filaments glabrous, 0.4–1 × as long as the anthers, inserted at the mouth of the corolla tube; anthers elliptic, 0.8–1 × 0.5–0.8 mm, deeply cordate at the base, glabrous; cells parallel. *Pistil* glabrous, 1.6–2.2(3) mm long; ovary globose, depressed-globose, or sometimes ovoid, 0.8–1.2(1.5) × 0.9 – 1.4 mm, rounded or sometimes acuminate at the apex, 2-celled; style 0.7–1 mm long; stigma capitate. In each cell 8–12 ovules. *Fruit* yellow, orange, or red, ellipsoid, 1 × 0.8 – 2 × 1.5 cm, one-seeded. Wall thin. *Seed* pale brown, ellipsoid, not flattened, 0.8 × 0.5 × 0.5 – 1.2 × 0.7 × 0.7 cm, glabrous, smooth, with a deep closed groove at one side (like coffee-bean), very minutely foveolate.

Distribution: Congo (Kinshasa), Angola, East and South Africa, and Madagascar.

Notes. The neotype designated by E. A. Bruce (1955) is rejected, because an iso-syntype was discovered in the Edinburgh herbarium.

S. henningsii is closely allied to *S. mitis* by the habit, leaves, inflorescences, and outside of flowers. They can be distinguished as follows:

Leaves reticulate; sepals glabrous on both sides, without colleters; anthers

- glabrous; ovary usually globose; seed deeply grooved, not flattened. Woodland or sometimes light forest *S. henningsii*
 Leaves not reticulate; sepals often hairy outside, inside with colleters; anthers bearded; ovary ovoid; seed not grooved, often flattened. Rain forest or gallery forest *S. mitis*

S. venulosa Hutch. et M. B. Moss in Fl. W. Trop. Afr. 2: 24. 1931 and Kew Bull. 1937: 334. 1937, partly (as for the type). Type: Sierra Leone: Falaba, Aylmer 58 (K, holotype).

Liana, 20–40 m high climbing in trees, 20–100 m long. Trunk 4–15 cm in diam. Bark pale grey to dark brown, with large lenticels, rather thin; wood creamy. *Branches* often umbellately branched, lenticellate or not, dark brown and not sulcate when dry; branchlets glabrous, dark green, not lenticellate, terete, medium or dark brown and sulcate or not when dry. Tendrils solitary, usually on the branches where they are umbellately branched in 4 branches with right angles. *Leaves*: petiole glabrous, 4–12 mm long; blade more or less distinctly shining and dark green above, as shining or less and not or slightly paler beneath, usually with pale green main veins on both sides, coriaceous, or parchmentaceous in the sun, papyraceous or thinly coriaceous in the shade, also when living, elliptic, narrowly elliptic, narrowly ovate, or sometimes ovate, (1.2)1.5–3 × as long as wide, 5–15 × 2–7 cm, in the shade and in young plants (growing in the shade on the forest floor) up to 21 × 10 cm, acuminate, apiculate, or in the shade caudate at the apex, cuneate or rounded at the base, glabrous on both sides; one pair of secondary veins from or from above the base curved along the margin, reaching the apex and often a faint submarginal pair; tertiary venation reticulate, prominent on both sides in dry leaves. *Inflorescences* axillary, several together, lax, few- to many-flowered, 0.2–0.7 × as long as the leaves, 3–7 × 2–6 cm, 2–3 × branched. Peduncle and branches slender, glabrous as the pedicels. Bracts small, glabrous on both sides, approximately sepal-like, lower up to about 3 × as long as the sepals and often with colleters at the base above, upper without colleters. *Flowers* 4-merous. *Sepals* pale green, connate at the base for about two-fifths of their length, broadly ovate to sub-

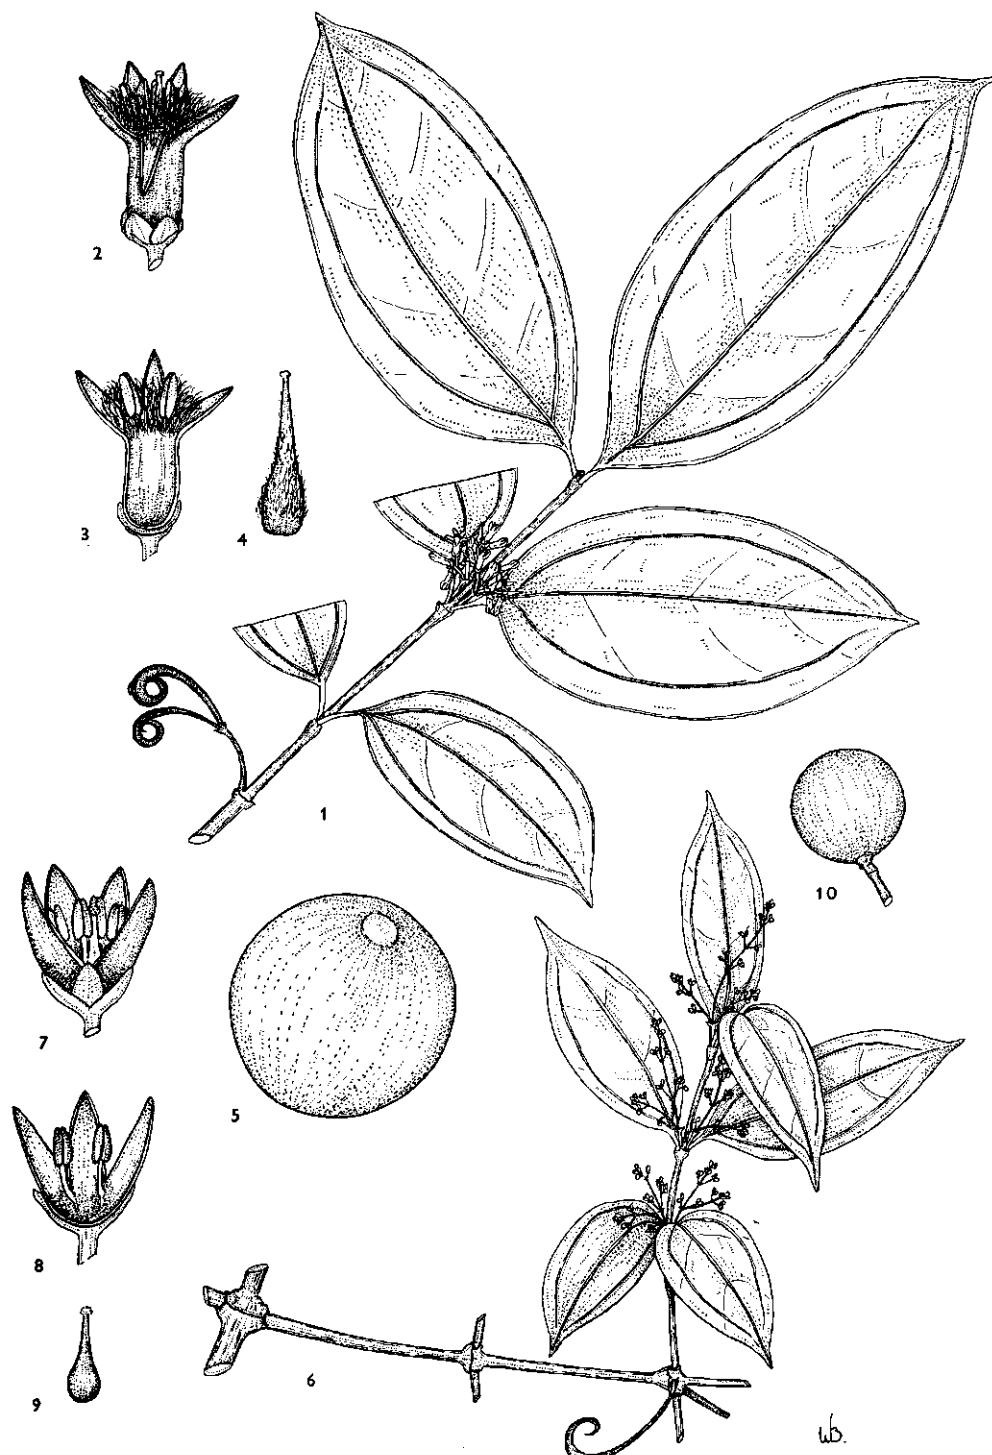

FIG. 19. 1-5. *S. densiflora*: 1. branch, $\frac{1}{2} \times$; 2. flower, $3 \times$; 3. opened flower, $3 \times$; 4. pistil, $3 \times$; 5. fruit, $\frac{1}{2} \times$ (1-4. Breteler 1434; 5. van Meer 403); 6-10. *S. icaja* (leaves mostly larger): 6. branch, $\frac{1}{2} \times$; 7. flower, $10 \times$; 8. opened flower, $10 \times$; 9. pistil, $10 \times$; 10. fruit, $\frac{1}{2} \times$ (6-9. J. de Wilde c.s. 3521; 10. Lecuwenberg 5349).

orbicular, as long as wide or nearly so, $0.4-1 \times 0.4-1$ mm, rounded, obtuse, or subtruncate at the apex, not or obscurely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud $2.5-5 \times$ as long as the calyx, $2.2-2.5$ mm long, and rounded at the apex, greenish-yellow or yellowish-white, glabrous on both sides or inside pubescent at the base of the lobes; tube short, $0.6-1.4 \times$ as long as the calyx, wide; lobes oblong to nearly ovate, $2.5 \times$ as long as the tube, $1.5-1.8 \times$ as long as wide, $1.6-1.8 \times 1-1.2$ mm, acute, spreading. *Stamens* coloured as the corolla, exserted; filaments short, $0.5-1 \times$ as long as the anthers, inserted at the mouth of the corolla tube; anthers sub-orbicular, $0.4-0.6 \times 0.3-0.5$ mm, cordate at the base, glabrous; cells parallel. *Pistil* glabrous, $1-1.4$ mm long; ovary globose, $0.5-0.6$ mm long, 2-celled, abruptly narrowed into the style; style short, $0.4-0.8$ mm long; stigma small, not or slightly thicker than the style, capitate. In each cell 3-9 ovules. *Fruit* dark yellow, immature dark green, small, soft, subglobose, $2.5-3$ cm in diam. 1-seeded. Wall thin. *Seed* ellipsoid, $16 \times 15 \times 9 - 21 \times 20 \times 15$ mm. Testa woolly, deciduous, sticking to the pulp.

Distribution: West and Central Africa.

Ecology: Rain forests and secondary forests; alt. 0-800 m.

Uses: Fish poison (Leeuwenberg 4519); bark of roots used as ordeal poison.

Guinea: Benna Plateaux, N. of Benty, Schnell 7681 (ABT); Nimba Mts., Schnell 1046 (IFAN, P), 1134 (IFAN), 1476 (IFAN), 3492 (IFAN, P).

Sierra Leone: Falaba (Apr.) Aylmer 58 (K, type of *S. venulosa*); sin. loc., Afzelius s.n. (UPS).

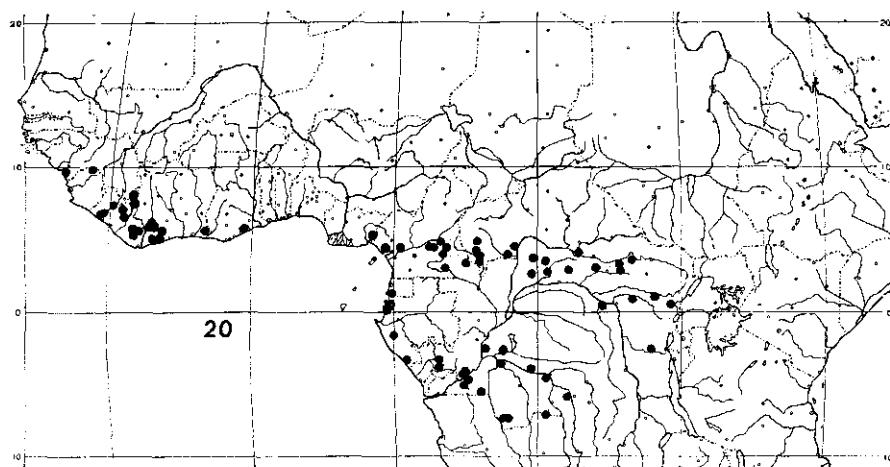

Liberia: Bong Range, 32 km N. of Kakata, Leeuwenberg & Voorhoeve 4918 (WAG), 4966 (WAG); Peátah (fr. Oct.) J. Bequaert in coll. Linder 1073, partly (K, paratype of *S. venulosa*); Ganta, Baldwin 14053 (K); Tappita area, Kwewon in coll. van Harten 19 (WAG); Nimba Mts., Leeuwenberg & Voorhoeve 4594 (WAG); Putu Range, W. of Penoken, Voorhoeve 1266 (WAG); near Kanweake, 70 km S. of Zwedru, J. de Wilde & Voorhoeve 3653 (WAG); Zwedru-Kanweake road (Feb.) van Meer 480 (WAG).

Ivory Coast: 7 km S. of Tai, J. de Wilde & Leeuwenberg 3576 (K, WAG); 7 km N. of crossing of Hana R. and Tai-Tabou road (Mar.) J. de Wilde & Leeuwenberg 3521 (ABI, BR, FHO, K, S, WAG); Buyo, Bouquet & Debray 295 (WAG); ibid., Oldeman 2 (WAG), 3 (WAG); 10 km W. of Tapéguhé, right bank Sassandra R., 50 km NW. of Soubré, Leeuwenberg 4519 (WAG); 42 km N. of Néromer, Guillaumet 1344 (ABI, WAG); Monogaga, 40 km W. of Sassandra (fr. Nov.) Guillaumet 1605 (WAG); ibid., Leeuwenberg 4044 (WAG); 20 km NW. of Sassandra, Leeuwenberg 4026 (WAG); 35 km SW. of Guéyo, Leeuwenberg 3732 (WAG); 15 km N. of Aboisso, Leeuwenberg 4501 (WAG).

Ghana: Simpa (= Winneba) (Mar.) Andoh in coll. Vigne 3255 (BM, FHO, MO, WAG).

Nigeria: Oban, Talbot 157 (BM, K, WAG, Z), 1256 (BM, K, WAG, Z, type of *S. pusilliflora*).

Cameroun: near Bimbia, 3 km S. of Victoria, Leeuwenberg 6998 (WAG); 10 km W. of Masok, Leeuwenberg 5349 (WAG); km 25 of Nanga Eboko-Bertoua road, Leeuwenberg 7448 (WAG); about 15 km W. of Minta, along road to Nanga Eboko, Leeuwenberg 5798 (WAG); 8 km SE. of Ebaka, 50 km NW. of Bertoua, Breteler 1419 (WAG, YA); between Ndjangané and Ndembé 1, about 40 km NW. of Bertoua, Breteler 2937 (BR, K, P, S, WAG); 24 km NE. of Bertoua, along road to Bétaré Oya, Breteler, J. de Wilde & Leeuwenberg 2442 (K, P, WAG); near Toungrélo, 27 km SW. of Bertoua, Breteler c.s. 2402 (P, WAG), 2452 (WAG); near Dimako (nearly mature fr. July) Breteler 1713 (K, P, WAG, YA); 14 km E. of Dimako (nearly mat. fr. Feb.) Leeuwenberg 7780 (WAG); 9 km N. of Lomié, Leeuwenberg 6742 (WAG); 7 km W. of Yokadouma, Leeuwenberg 6092 (WAG).

MAP 20. *S. icaja*.

Central African Republic: Carnot, Sandberg Carnot 50 (Pharm. Stockh., WAG); Berberati, Sanberg Berberati 7 (Pharm. Stockh., WAG); 4 km N. of Bania, along road to Berberati, Leeuwenberg 7207 (WAG); Nola, Sandberg Nola 21 (Pharm. Stockh.), Nola 39 (Pharm. Stockh., WAG); ibid., Ouzilleau 8 Oct. 1911 (LE, P); 27 km S. of Nola, along road to Salo, Leeuwenberg 7093 (WAG); Mbaiki Region, Tisserant 3694 (P); Maboké, near Mbaiki, Coll. indig. misit Resplandy 23 July 1964 (WAG); Boukoko, near Bangui (Dec.) Tisserant 529 (P, WAG).

Rio Muni: Kogo, Debeaux 11 July 1902 (P).

Gabon: Ile de Konquet, Franquet anno 1853 (P, lectotype); 18 km from Libreville (Apr.) N. Hallé 1531 (P, WAG); near Libreville (Mar.) Klaine 27 (BR, P), 974 (B, P), 1280 (P), 2154 (BR, K, P, distributed as *S. lissophylla*), 3428 (B, BR, IFAN, K, P), 3455 (P); Libreville and Ogooué R., Jolly 188 (P); Agouma, P. Du Chaillu in Torrey Herb. s.n. (NY); Mayoumba, Dybowsky 34 (P); sin. loc., Aubry Lecomte anno 1854 (P, paratype); Ribourt anno 1879 (P); Vincent anno 1872 (P, paratype).

Congo (Brazzaville): Moukina, Komono-Moetché road, Bouquet 1097 (P); Malema Mabiala, Sibiti-Komono road, Bouquet 1803 (P); between Renéville and Mbamou, Chevalier 27633 (P).

Congo (Kinshasa): Léopoldville: Kisantu, J. Gillet anno 1900 (BR); Stanley Pool District, Sabuka Region, Dewevre 845 (BR, type of *S. dewevrei*); Popokabaka Territory, Pauwels 837 (BR); Kisungu (Feb.) Callens 2453 (BM, BR); Panzi, Kwango, Kasongo Territory (fr. June) Devred 2006 (BR, K, PRE, WAG); Nioki, Flamigny 6285 (BR); Dima, Laurent 11 Dec. 1903 (BR); ibid., Sapin April 1906 (BR); Ipamu, Vanderyst 10351 (BR). Equateur: Bombura, Gemena Territory, Evrard 912 (BR, WAG); Bobutu (fr. July) Evrard 1299 (BR, WAG); Budjala, Radna June 1937 (BR); Likimi, Lemaire 88 (BR); Dundusana, Bumba Territory, Mortehan 1112 (BR, type of *S. dundusanensis*). Orientale: Lower Uele R., De Wulf 182 (BR); Eke R. (fr. Oct.-Nov.) Michelson 197 (BR); Bambessa, Evrard 698 (BR); Benge, Bondo Territory, Ghesquière anno 1934 (BR, WAG); Madabu, Zobia, Buta Territory, Gérard 2537 (BR, EA, K, PRE, WAG); Epulu, Marinos 1 (BR); Batama, near Kisangani, Claessens 289 (BR); Yangambi, Maudoux 1253 (BR); N. of Beni, Mildbraed 2181 (PRE, type of *S. mildbraedii*). Kivu: Lesse, near Semliki R., Bequaert 3170 (BR); between Nsogwameka and Madiwe, Beni Territory, P. Gille 135 (BR, K, P, PRE); Kingulube, Shabunda Territory, A. Léonard 3823 (BR, WAG). Kasai: Biengé, Callewaert 1 (BR); Miao R., Kazumba Territory, Liben 3410 (BR, WAG). Sin. loc., Longueville rec. 1938 (BR); Van der Gucht 134 (BR).

Angola: Lunda: Dundo (fr. Dec.) Cavaco 1231 (P).

Cult.: Wageningen, from seeds collected by H.C.D. de Wit near Ganta, Liberia, Leeuwenberg 4993 (WAG).

Note. The type of *S. mildbraedii*, which is richly flowering, agrees in all characters with the other flowering specimens examined and identified as *S. icaja*.

30. *S. innocua* Del., Cent. Pl. Méroë 53. 1826 = in Calliaud, Voyage à Méroé 4: 343. 1827; Mérat & De Lens, Dict. Mat. Med. 6: 556. 1834; De Candolle, Prod. 9: 17. 1845; Baker in Fl. Trop. Afr. 4(1): 532. 1903; Bullock & Bruce, Kew Bull. 1938: 46. 1938, partly (excl. syn. *S. unguacha* var. *retusa* Chiov., *S. lokua* A. Rich., and syns. moved to *S. madagascariensis*); Chevalier, Rev. Bot. Appliq. 27: 360, pl. 15. 1947, partly (excl. syns., as in preceding reference); Aubréville, Fl. Soud.-Guin. 440, pl. 96. 5-7. 1950, partly (excl. syn. *S. burtonii*); Bruce & Lewis, Kew Bull. 1956: 270. 1956 and in Fl. Trop. E. Afr. Loganiaceae 25. 1960, partly (as for subsp. *innocua*); Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 496. 1963. **Fig. 20, p. 139; Phot. 3, p. 141; Map 21, p. 143**

Types: Ethiopia: Quamamyl, Calliaud s.n. (not seen, apparently not preserved); Ethiopia: Tigré, Tacazze R. Valley, Schimper 1817 (P, neotype; isotypes: BM, BR, FI, G, GOET, HAL, K, L, LE, M, MO, P, S, UPS, W).

Heterotypic synonyms: *S. unguacha* A. Rich., Voy. Abyss. Bot. Atlas t. 73. 1847 and Tent. Fl. Abyss. 2: 52. 1851; Bentham, Journ. Linn. Soc. 1: 103. 1856; Gilg in Engler, Bot. Jahrb. 17: 562. 1893; Baker in Fl. Trop. Afr. 4(1): 534. 1903. The holotype of this name is the neotype of the preceding. Homotypic synonyms: *S. unguacha* var. *typica* Gilg, l.c. p. 563. *S. simiarum* (Hochst.) Gilg ex A. Chev., Rev. Bot. Appliq. 27: 362. 1947, in syn.

S. innocua var. *pubescens* Solered. in Engler, Bot. Jahrb. 17: 556. 1893; as var. of subsp. *innocua*: Bruce & Lewis, l.c. p. 271 and l.c. p. 26; Onochie & Leeuwenberg, l.c. p. 41. Type: Nigeria: Nupe, Barter 1160 (holotype not seen, destroyed in B; lectotype: K; other isotypes seen: GH, LE, NY, P, W). Homotypic synonyms: *S. unguacha* var. *pubescens* (Solered.) Gilg, l.c. p. 565. *S. triclisoides* Bak., Kew Bull. 1895: 98. 1895 and in Fl. Trop. Afr. 4(1): 533. 1903; Hutchinson & Dalziel, Fl. W. Trop. Afr. 2: 22. 1931. The lectotype of the latter name chosen among the syntypes is the isotype of the preceding which becomes lectotype there.

S. unguacha var. *dschurica* Gilg, l.c. p. 565. Type: Sudan: Djurland, near Wau, Schweinfurth 1672 (holotype not seen, destroyed in B; lectotype: K; isotype: P). Homotypic synonyms: *S. dschurica* (Gilg) Gilg in Engler, Bot. Jahrb. 36: 92. 1905; Chevalier, Et. Fl. Afr. Centr. Fr. 1: 203. 1913 and Expl. Bot. Afr. Occ. Fr. 443. 1920 (as *dschurica*). *S. penduliflora* Bak. in Fl. Trop. Afr. 4(1): 531. 1903 (erroneously nr. 1072). The holotype of the latter name is the lectotype of the preceding. *S. edulis* Schweinf., Im Herzen von Afrika 1: 208. 1874. The lectotype of the latter name is also the lectotype of the preceding.

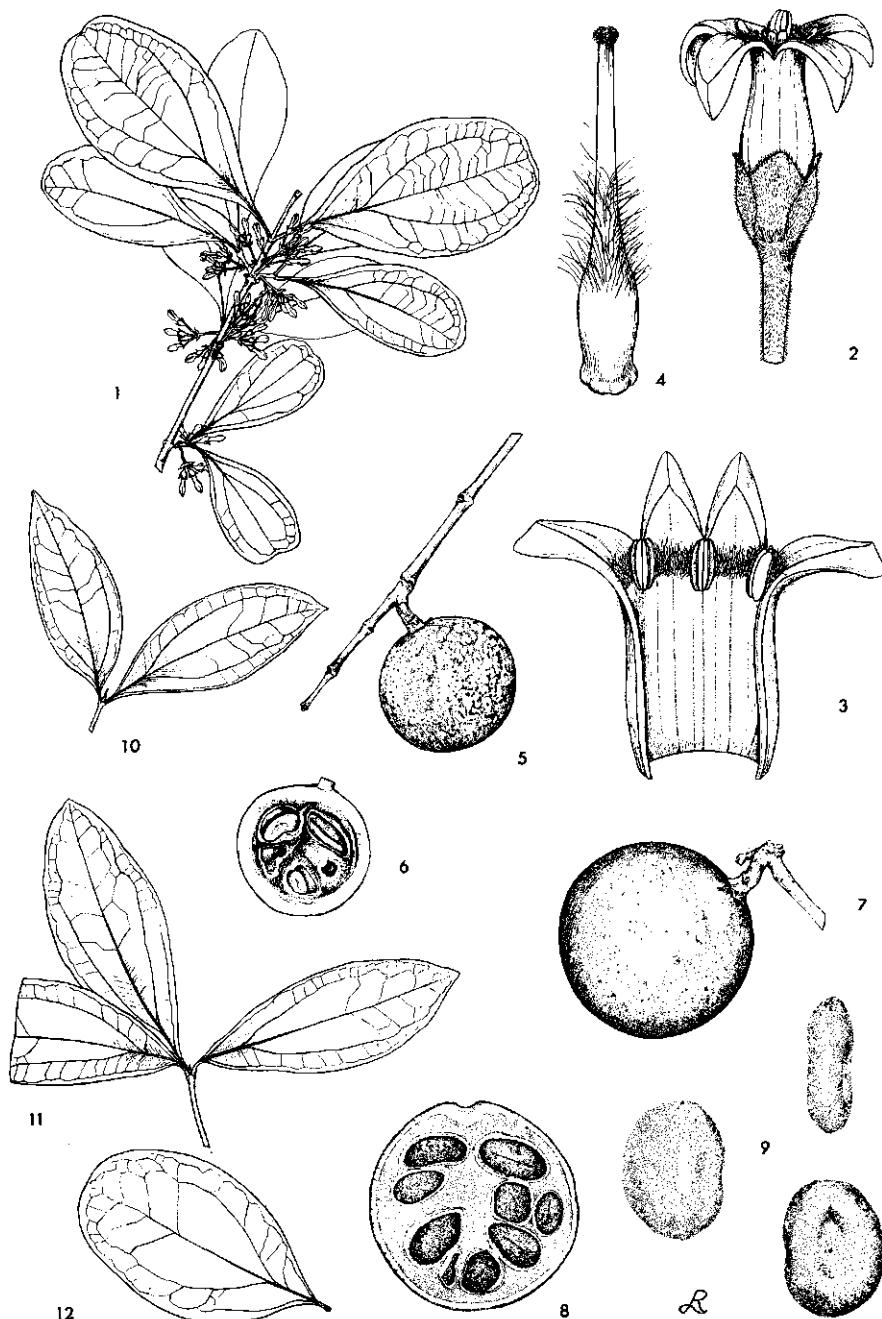

FIG. 20. *S. innocua*: 1. branch, $\frac{1}{2} \times$; 2. flower, $4 \times$; 3. opened corolla, $5 \times$; 4. pistil, $7 \times$; 5, 6. fruits, $\frac{1}{2} \times$; 7. section of nearly mature fruit 6, herbarium, $\frac{1}{2} \times$; 8. section of nearly mature fruit 7, spirit collection, $\frac{1}{2} \times$; 9. seeds, $1 \times$; 10-11. leaves of sucker shoots, $\frac{1}{2} \times$; 12. leaf of branchlet, $\frac{1}{2} \times$ (1-4, 7-9. Leeuwenberg 7482; 5-6. Leeuwenberg 7586; 10-12. Leeuwenberg 4400).

S. unguacha var. *grandifolia* Gilg in Engler, Bot. Jahrb. 17: 564. 1893. Type: Sudan: Equatoria Province, Djurland, Seriba, Kurshook Ali, Schweinfurth 1719 (K, lectotype; isotype: P). Homotypic synonym: *S. xerophila* Bak., Kew Bull. 1895: 98. 1895 and in Fl. Trop. Afr. 4(1): 534. 1903. The lectotype of this synonym is also the lectotype of the preceding.

S. unguacha var. *microcarpa* Gilg, l.c. p. 564. Type: Sudan: Bongoland, Seriba Ghattas, near Tondi, Addai, Schweinfurth 1432 (holotype not seen, destroyed in B; lectotype: K).

S. unguacha var. *steudneri* Gilg, l.c. p. 563. Type: Sudan: Bongoland, Seriba Gir, Schweinfurth 1412 (K, lectotype).

S. fischeri Gilg, l.c. p. 565; Baker in Fl. Trop. Afr. 4(1): 535. 1903. Type: Tanzania: Shinyanga District, Usule, Fischer 300 (holotype not seen, destroyed in B; no isotype seen).

S. alnifolia Bak., Kew Bull. 1895: 150. 1895 and l.c. p. 532. Type: Nigeria: Interior, Western Lagos, Rowland anno 1893 (K, holotype).

S. unguacha var. *polyantha* Gilg in Engler, Bot. Jahrb. 30: 374. 1901. Type: Tanzania: Mbeya District, near Kananda, Goetze 1436 (holotype not seen, destroyed in B; lectotype: G; other isotypes seen: A, BM, BR, L, P).

S. unguacha var. *obovata* De Wild., Ann. Mus. Congo Sér. 4. 1: 98, pl. 27. f. 6–7. 1903. Type: Congo: Katanga, Lukafu, Verdick 3 Aug. 1899 (BR, holotype).

S. huillensis Gilg et Busse in Engler, Bot. Jahrb. 36: 104. 1905. Type: Angola: Huila, Dekindt 6a (E, lectotype).

Deciduous shrub or small often much-branched tree, 2–12(18) m high. Trunk 7–40 cm in diam., branched from low down. Bark pale grey, grey-brown, or sometimes dark grey-brown, smooth, somewhat powdery, flaking in small rounded or square scales near base of trunk; wood hard, pale yellowish. Branches pale grey-brown, powdery or not, lenticellate or not, not sulcate, terete; branchlets glabrous or pubescent, pale grey-brown or grey-green, if lenticellate less so than the branches. Leaves: petiole often short, glabrous or pubescent, 2–7 mm long; blade mat or dull, glaucous, and with mostly pale green reticulate veins on both sides, beneath slightly paler, coriaceous (living and dry) or papyraceous (dry), elliptic, narrowly elliptic, obovate, or narrowly obovate, (1) 1.5–3(3.5) × as long as wide, (2) 4–10(20) × (1) 2–7(13.5) cm, rounded (or in sucker shoots often acute) at the apex, cuneate or less often rounded at the base, glabrous or pubescent on both sides; one or two pairs of distinct secondary veins from or from above the base curved along the margin and often a faint submarginal pair; tertiary venation reticulate and distinctly prominent on both sides. Inflorescences axillary or ramiflorous, usually several together, very short and nearly fasciculate, 1 × 1–1.5 × 1.5 cm, 1–2 × branched, few-flowered. Peduncle, branches, and pedicels short or very short, pubescent to nearly glabrous. Bracts small, sepal-like, above glabrous and sometimes with some large colleters at the base. Flowers 4-merous. Sepals pale green, free, subequal, the inner slightly smaller, ovate, broadly ovate, or suborbicular,

PHOT. 3. *S. imacua*; flowering branch and opened mature fruit (Leeuwenberg 7482).

$0.8-1.5 \times$ as long as wide, $1.7-3.5 \times 1.5-2.5$ mm, rounded at the apex, ciliate, glabrous or pubescent outside, glabrous inside, without colleters. *Corolla* in the mature bud $2.2-4 \times$ as long as the calyx and $(6)6.5-9(10.5)$ mm long, creamy or greenish-yellow, glabrous outside, inside with a brush-like ring of white lanate hairs in the throat and just on the base of the lobes; tube cylindrical or nearly so, $1.6-2.5 \times$ as long as the calyx, $1-1.7 \times$ as long as the lobes, $(3)3.5-5.5(6)$ mm long, $1.5-2.5(3)$ mm wide at the throat; lobes thick, narrowly triangular, $1.7-2.3 \times$ as long as wide, $3-4(4.5) \times 1.3-2(2.3)$ mm, acute or subacute, spreading. *Stamens* hardly exserted; filaments extremely short, glabrous, inserted at the mouth of the corolla tube; anthers oblong, about twice as long as wide, $1.2-2 \times 0.6-1$ mm, glabrous, deeply cordate or sagittate at the base; cells parallel. *Pistil* hirto-pilose in the middle, $(4)5-7.5$ mm long; ovary narrowly ovoid or oblong, $1.5-3 \times 1-1.5$ mm, hirto-pilose at the very apex, further glabrous, often with a disk-like base, gradually narrowed into the style, 2-celled; style thick, $(2)3-4.5$ mm long, at the base hairy like the ovary at the apex; stigma capitate. In each cell $(14) 18-30$ ovules. *Fruit* orange or yellow, nearly mature bluish-green, large, hard, globose, $(2.5)4-7.5(9.5)$ cm in diam., with $(3)8-50$ seeds, with somewhat granular skin, slightly shining. Wall thick, $2.5-5(6)$ mm thick, thicker above the pedicel, brittle in mature fruits, hard and not broken by hand when nearly mature and/or dry. Pulp orange, edible. *Seeds* pale ochraceous, flattened or not, often more or less plano-convex, obliquely ovate, elliptic, or tetrahedral, usually irregularly curved, $1-1.5 \times$ as long as wide, $17-21 \times 13-20 \times 5-8$ mm, with thick very short erect hairs, rather rough.

Distribution: Tropical Africa.

Ecology: Deciduous woodlands; alt. 0–1600 m.

Notes. The type specimen of *S. innocua* apparently is not preserved. The description of DELILE leaves no room for doubt, and so it seems preferable to

adopt the widely distributed flowering specimen, Schimper 1817, as the neotype, although DELILE describes not the flowers, but the fruit. The fact that Schimper collected this specimen in the same country as the specimen described by DELILE supports this decision.

Schweinfurth 1672 is the only *Strychnos* specimen available which covers both the description and collecting locality of *S. edulis*. It is designated as the lectotype therefore.

S. innocua is restricted here to the type subspecies of this species. The varieties are not maintained, as they grade into each other. All other subspecies are considered as synonyms of *S. madagascariensis*. Therefore, the infraspecific epithets are omitted here.

Although the difference between *S. innocua* and *S. madagascariensis* is difficult to define, it is certainly not less important than that between several other pairs of species in this genus, e.g. *S. lucens* and *S. nigritana*, *S. kasengensis* and *S. moandaensis*, *S. angolensis* and *S. malacoclados*. Except for a very few doubtful, mostly incomplete, specimens, about 300 specimens were identified as *S. innocua* and about 500 as *S. madagascariensis*.

31. ***S. johnsonii*** Hutch. et M. B. Moss in Fl. W. Trop. Afr. 2: 24. 1931 and Kew Bull. 1937: 335. 1937, partly (excl. Scott Elliot 4292); Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 44. 1963. **Fig. 21, p. 149; Map 22, p. 152**

Type: Ghana: Akropong, Johnson 802 (K, holotype).

Climbing shrub or liana, 5–20 m high climbing over shrubs or in trees, up to at least 30 m high. Trunk 3–8 cm in diam. Bark medium to dark brown, with large lenticels; wood creamy or pale yellow (paler than in *S. samba* Duvign.). Branches often quadrangular, medium to dark green, not lenticellate, often pale brown and not sulcate when dry, hollow or sometimes – if small – with an obscure terete pith; branchlets mostly quadrangular, glabrous, not lenticellate, medium to dark green, greenish-brown and sometimes slightly sulcate when dry. Tendrils paired. Leaves: petiole glabrous, 4–7 mm long; blade slightly shining and medium dark green above, paler beneath, coriaceous also when living, subcoriaceous in the shade, elliptic, narrowly elliptic, or on the main axis and at the bases of the branchlets suborbicular to nearly ovate, (1.1)1.5 × as long as wide, 3.5–10(14.5) × 1.7–5(8) cm, acuminate or acute at the apex, cuneate, rounded, or sometimes on the main axis subcordate at the base, glabrous on both sides; one pair of distinct secondary veins from just above the base curved along the margin and mostly a faint submarginal pair; costa impressed above; tertiary venation reticulate, not very conspicuous, in dry leaves prominent beneath. Inflorescence axillary, solitary, lax, about 0.2–0.8 × as long as the leaves, 1.5–4.5 × 1.5–3.5 cm, few- to many-flowered, 2–3 × branched. Peduncle and branches slender, puberulous or with two stripes of puberulence below the stipular line of the bracts. Pedicels puberulous or practically glabrous. Bracts narrowly triangular or sepal-like (those of a pair often connate at the base), without colleters, lower above often (?) pubescent at the base, upper glabrous

above. *Flowers* 5-merous. *Sepals* connate at the base, equal or subequal, ovate or orbicular, 1–1.5 × as long as wide, 0.7–1 × 0.7–1 mm, obtuse or subacute, ciliate, glabrous on both sides or occasionally with few hairs outside, without colleters. *Corolla* in the mature bud 4–6 × as long as the calyx, (3)3.5–5 mm long, and rounded at the apex, yellow or yellowish-white, outside sparsely and minutely pubescent to glabrous, inside pilose at the base of the lobes and often in the throat; tube short, 1.5–3 × as long as the calyx, 1.3–2.5 mm long, at the throat 1.5–2 mm wide; lobes 1–1.5 × as long as the tube, oblong, 2–2.5 × as long as wide, 2–2.5 × 0.9–1.2 mm, acute, reflexed from somewhat above the base. *Stamens* exserted; filaments glabrous, 1–1.5 × as long as the anthers, 0.7–1.5 mm long; inserted at the mouth of the corolla tube; anthers oblong, 0.7–1 × 0.4–0.5 mm, glabrous, deeply cordate at the base; cells parallel. *Pistil* glabrous (or sometimes minutely papillose-pubescent), (2.2)3–3.2 mm long; ovary globose or ovoid, 1 × 0.8–1 mm, usually abruptly narrowed into the style, 2-celled; style rather long, (1.2)2–2.2 mm long; stigma capitate or obscurely bilobed. In each cell 8–25 ovules. *Fruit* small, globose, about 15 mm in diam., when dry and immature stipitate. *Seed* ellipsoid, smooth, 11 × 10 × 9 mm; testa sticking to the pulp.

Distribution: West and Central Africa.

Ecology: Rain forests or secondary forests, often on river banks; alt. 0–750 m.

Uganda: Buvuma Island, Victoria Lake, Bagshawe 633 (BM).

Notes. Both *S. johnsonii* and *S. samba* have square branchlets and roots with a typical odour when living. The living leaves are very little different and so the plants are easily confused in the field, if vegetative only. They can be distinguished in the herbarium (and wood-collection) as follows:

Bark with large lenticels, thick; wood creamy or pale yellow (paler than in *S. samba*); branches and branchlets hollow, with a smooth-walled cylindrical cavity or, less often, not hollow and without distinct pith, pale greenish on section when dry; leaves drying pale greenish, veins not or hardly impressed above *S. johnsonii*
Bark not or hardly lenticellate, thin; wood yellow; branches and branchlets with square pith, which may shrink and leave a cavity in dry, young, thick branches, dark yellow on section when dry; leaves drying dark brown, with impressed main secondary veins above; tertiary venation conspicuous . . .
S. samba

32. *S. kasengaensis* De Wild., Bull. Jard. Bot. Brux. 5: 46. 1915; Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 27, f. 8C. 1952; Bruce & Lewis in Fl. Trop. E. Afr. Loganiaceae 30. 1960. **Fig. 29, p. 195; Map 23, p. 152**

Type: Congo: Katanga, Kasenga, Bequaert 237 (BR, holotype, photograph in K, neg. 2514).

Heterotypic synonym: *S. vanderysti* De Wild., l.c.; Duvigneaud, l.c. p. 24 (as *vanderystii*). Type: Congo: Léopoldville, Bas Congo, Vanderyst anno 1914 (BR, holotype, photograph in K, neg. 2311).

Climbing shrub or liana, at least up to 12 m long and 6 m high climbing. Branches not lenticellate, medium brown when dry, pubescent; branchlets brown-pubescent, pale brown, and like the branches not or hardly sulcate when dry. Tendrils paired. Leaves: petiole pubescent, 1-4 mm long; blade coriaceous, not or slightly shining when dry, elliptic, narrowly elliptic, ovate, or narrowly ovate, 1.5-3 × as long as wide, 2.5-9 × 1.5-4 cm, on main axis and at the bases of the branches comparatively wider and often smaller, acuminate at the apex, cuneate, rounded, or - if ovate - often subcordate at the base, minutely pubescent on main veins above, sparsely pubescent beneath, especially on the veins; one pair of secondary veins from or from somewhat above the base curved along the margin, and a faint submarginal pair; tertiary venation reticulate, prominent beneath. Inflorescence axillary, congested, 1 × 1 - 2.5 × 2 cm, 2-4 × branched, several- to many-flowered, mostly much shorter than the

leaves. Peduncle, branches, and pedicels pubescent. Bracts small, triangular to ovate, ciliate, pubescent beneath, lower above appressed-pubescent and with large colleters at the base, upper glabrous and without colleters. *Flowers* 5-merous. *Sepals* connate at the base, orbicular or nearly so, 1.2–1.5 mm long, obtuse or rarely acute at the apex, ciliate, mostly sparsely pubescent outside, glabrous inside, without colleters. *Corolla* in the mature bud (3.5)4.7–6 × as long as the calyx, (4)6–7 mm long, and more or less tapering at the apex, white, outside sparsely pubescent or glabrous, inside densely pilose in the tube, except for the glabrous base; tube (1.3)2.3–3.3 × as long as the calyx, (0.8)1–1.3 × as long as the lobes, (1.8)3–4 mm long, widely cylindrical; lobes oblong, 2.5–3 × as long as wide (2.4)3–4 × 1–1.2 mm, acute, spreading. *Stamens* well-exserted; filaments as long as the anthers or slightly longer, up to 1.5 mm long, glabrous, inserted at the mouth of the corolla tube; anthers oblong, 1.2–1.5 × 0.6–0.9 mm, deeply cordate and bearded with few pilose hairs at the base; cells parallel. *Pistil* pilose, (4)5–7 mm long; ovary ovoid, 2–2.5 × 1.2–1.5 mm, glabrous at the very base, 2-celled, gradually narrowed into the style; style (1.5)3–4.5 mm long, only at the base pilose; stigma capitate. In each cell 15–20 ovules. *Fruit* bright yellow, rather small, rather soft, subglobose, about 3 cm in diam., about 10–20-seeded, with somewhat granular skin, slightly shining. Wall 1 mm thick when dry. *Seed* pale brown, flattened, more or less plano-convex, obliquely ovate, elliptic, or trullate, usually irregularly curved, 12–14 × 10–11 × 4–5 mm, with thick very short erect hairs, rough.

Distribution: Congo (Kinshasa), Burundi, Tanzania, Zambia.

Ecology: Riverine forests or in crevices of granitic rocks in woodlands; alt. 0–1500 m.

Congo (Kinshasa): Léopoldville: Bas Congo, Vanderyst anno 1914 (BR, type of *S. vanderysti*). Equateur: Ikela, Germain 5052 (BR, M, PRE), 7445 (BR). Katanga: Upemba Nat. Park (Oct.-Nov.) G. F. de Witte 2985 (BR, WAG), 3216 (BR, K, P, WAG); Kasenga (Feb.) Bequaert 237 (BR, type).

Richards 19655 (K, WAG); Kambole Escarpment, Abercorn District (Feb.) H. M. Richards 8252 B (K); between Abercorn and Mpulungu (fr. Sept.) Bullock 3335 (K); Inono R., Abercorn District (Feb.) H. M. Richards 4487 (K), 11090 (BR, K).

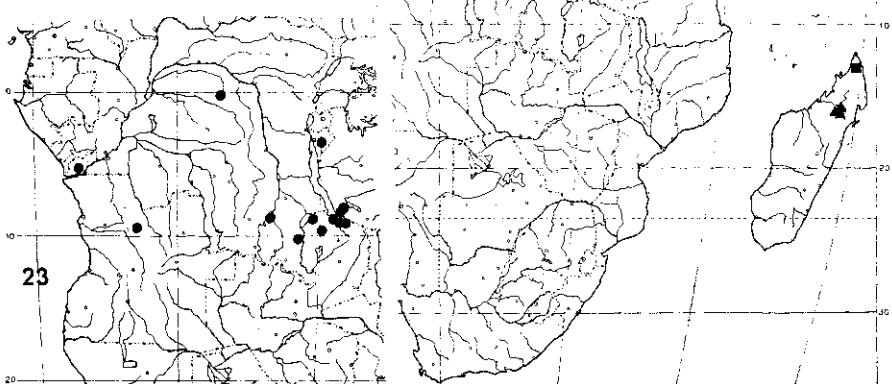

Notes. The types of *S. kasengaensis* and *S. vanderysti* differ from each other only slightly in a few characters. The sepals of the former are obtuse instead of acute and the branchlets and leaves are more hairy. Both the specimens collected by Germain are intermediate in these characters. Therefore, the present author prefers to unite both taxa.

MAP 22. *S. johnsonii*; Map 23. *S. kasengaensis*; Map 24. ● *S. longicaudata*, ▲ *S. mostueoides*, ■ *S. pentantha*.

S. kasengaensis is closely allied to *S. scheffleri* by the habit, leaves, inflorescences, the shape of the flowers, the fruits, and the seeds. They differ from each other as follows:

Branchlets pubescent; petiole pubescent; blade minutely pubescent on main veins above, sparsely pubescent beneath; corolla outside sparsely pubescent or sometimes glabrous; pistil (4)5.5–6.5 mm long *S. kasengaensis*
Branchlets glabrous or sometimes sparsely pubescent; petiole sometimes pubescent; blade glabrous on both sides or sometimes beneath pubescent on the veins; corolla outside glabrous or occasionally with some hairs; pistil 6–9 mm long *S. scheffleri*

The other closely allied species, *S. moandaensis*, usually has smaller flowers and always smooth instead of rough seeds.

Type: Congo: Orientale, Lesse, Semliki R., Bequaert 4119 (BR, holotype; isotype: US). Homotypic synonym: *S. nigrovillosa* De Wild., Pl. Bequaert. 2: 95. 1923.

S. brevicymosa De Wild., Rev. Zool. Afr. 10(1). Suppl. Bot. 6. 1922. Type: Congo: Orientale, Nandefia, Penge-Irumu, Ituri R., Bequaert 2579 (BR, holotype).

Climbing shrub or liana, 4–30 m high climbing over shrubs or in trees, 10–60 m long. Trunk 2.5–15 cm in diam. Bark dark brown, with large lenticels; wood pale dirty yellow or creamy. Branches not lenticellate, dark brown and not sulcate when dry; branchlets glabrous, with ranked hairs below the stipular line, or less often densely or sparsely pubescent, not lenticellate, terete, medium to dark green, dark brown when dry. Tendrils solitary, in the axils of ordinary leaves. Leaves: petiole pubescent or glabrous, 2–7 mm long; blade shining and dark green above, less shining to mat and paler beneath, papyraceous to subcoriaceous, also when living, thinner and often larger in the shade, elliptic, narrowly elliptic, narrowly ovate, or on the main axis often ovate, comparatively narrower towards the apices of the branchlets, (1.5)2–3 × as long as wide, 5.5–14(17.5) × 2–6(8) cm, acuminate to nearly caudate at the apex, the latter especially in the shade, cuneate or rounded at the base, glabrous on both sides or with some stiff brown hairs on the costa and main secondary veins beneath; one

pair of distinct secondary veins from or from above the base curved along the margin and a faint often submarginal pair; tertiary venation reticulate, not very conspicuous. *Inflorescence* axillary or occasionally terminal, solitary, more or less congested, $0.15-0.5 \times$ as long as the leaves, $1.5-4 \times 1.5-3.5$ cm, $2-4 \times$ branched. Peduncle and first branches not very short and as the other branches and pedicels pubescent with sometimes ranked hairs to glabrous. Bracts small, the lower often narrowly triangular, sometimes with small colleters at the base, beneath more or less and above occasionally pubescent, the other sepal-like, glabrous above and without colleters. *Flowers* 5-merous. *Sepals* pale green, connate at the base for one-third to two-fifths of their length, subequal, the inner often smaller, broadly orbicular to broadly obovate, $1-1.25 \times$ as wide as long, $(1)1.2-1.5 \times (1)1.2-1.7$ mm, obtuse at the apex, ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud $2.6-4 \times$ as long as the calyx, $4(-5)$ mm long, and rounded at the apex, greenish-white, white, or outside pale green and inside white, campanulate or widely cylindrical, outside glabrous or sometimes sparsely pubescent (base glabrous), inside white-penicillate in the throat; tube $1.6-2.5 \times$ as long as the calyx, $1.3-1.7 \times$ as long as the lobes, $2.2-2.5(3)$ mm long, $2.2-2.8$ mm wide, not widened towards the throat, with a minute hole just above the insertion of the stamens; lobes thick, triangular, $1.1-1.5 \times$ as long as wide, $1.5-2 \times 1-1.5$ mm, acute, suberect. *Stamens* included; filaments very short, $0.3-0.7 \times$ as long as the anthers, glabrous, inserted at three-fifth from the base of the corolla tube; anthers cordate, $1-1.2 \times 0.7-0.8$ mm, deeply cordate at the base, ciliate with rather stiff hairs at the base and often outside; cells slightly divergent at the base. *Pistil* glabrous, $2.1-2.4$ mm long; ovary globose or nearly so, $0.9-1.2 \times 1-1.2$ mm, 2-celled; style short, thick, $1-1.4$ mm long; stigma capitate. In each cell 9-18 ovules. *Fruit* orange or yellow-green, small, soft when mature, ellipsoid, usually slightly longer than wide and often obscurely laterally compressed, $14-17 \times 11-17 \times 11-15$ mm, 1-seeded, with smooth skin, slightly shining. Wall thin, 1 mm thick. *Seed* dark brown, flattened, more or less plano-convex, elliptic to nearly ovate, not curved, $1.3-1.6 \times$ as long as wide, $11-15 \times 8-12 \times 3-5$ mm, very shortly pubescent, smooth.

Distribution: West and Central Africa.

Cult.: Yaoundé, Cameroun, Breteler 3002 (WAG, seedlings of herb. Breteler 2135).

Notes. The types of *S. longicaudata*, *S. longicaudata* var. *niamniamensis*, *S. nigrovillosa*, and *S. brevicymosa*, all collected near the eastern boundary of the area the species, resemble each other strikingly in all details. Therefore it was easy to recognize them as representing a single species.

When vegetative, *S. longicaudata* can be confused with several other species, especially when young. These species are e.g. *S. afzelii*, *S. boonei*, *S. floribunda*, *S. scheffleri*, *S. urceolata*, and *S. usambarensis*. In addition to other characters, *S. longicaudata* differs from all of them by the insertion of the stamens

in the tube, instead of at the mouth of the corolla, and by the inside penicillate corolla.

Type: Zambia: Matonchi R., Mwinilunga District, Milne-Redhead 2947 (BR, holotype not seen; isotypes seen: K, PRE).

Climbing shrub or liana, 3-20 m high climbing, up to at least 30 m long. Trunk 2-5 cm in diam., or more; bark dark grey, lenticellate. Branches lenticellate, pale grey-brown to black; branchlets glabrous or occasionally pubescent, lenticellate, especially at the base. Tendrils paired. Leaves: petiole glabrous or with scattered hairs, 2-7 mm long; blade shining and dark green above, paler and mat or slightly shining beneath, often thickly coriaceous (thinner in the shade) also when living, elliptic, narrowly elliptic, or narrowly ovate, 1.5-3 × as long as wide, extremely variable in size, (2)4-10(16) × (1)2.5-5(8.5) cm, acute, shortly acuminate, or sometimes rounded or sub-truncate at the apex, rounded or cuneate at the base; glabrous or rarely with few hairs near the base beneath; one pair of secondary veins from above the base curved along the margin and often a faint submarginal pair; tertiary venation reticulate, prominent on both sides in dry leaves. Inflorescence axillary, 3-20-flowered, rather congested or lax, pubescent with brown hairs or sometimes glabrous, shortly pedunculate, 1.5-5 × 1.5-4 cm, 1-3 × branched. Bracts sepal-like, but smaller. Flowers 5-merous, sessile or shortly pedicellate. Sepals green, connate at the very base, usually subequal, ovate or broadly ovate, 1.2-1.5 × as long as wide, (1.7)2-3 × 1.5-2.2 mm, rounded or sometimes obtuse at the apex, ciliate, glabrous on both sides, without colleters. Corolla in the mature bud 2.2-2.5 × as long as the calyx, 5.5-7.5 mm long, and rounded at the apex, pale green-yellow, glabrous outside, inside with a white densely sericeous-villoso ring in the throat; tube nearly cylindrical, 1.2-1.4 × as long as the calyx, 0.9-1.5 × as long as the lobes, at the base 1.5-1.8 mm, at the throat 1.5-2.5 mm wide; lobes thicker towards the apex, oblong, 2-3.3 × as long as wide, 2-4 × 1-1.2 mm, acute at the apex, spreading. Stamens slightly exserted; filaments glabrous, very short, inserted at the mouth of the corolla tube; anthers oblong, 1-2 × 0.5-0.6 mm, sagittate at the base, glabrous; cells parallel. Pistil pilose or hirto-pilose in the middle, 4.5-6 mm long; ovary ovoid, 1.5-2.5 × 1-1.5 mm, glabrous at the base, usually gradually narrowed into the

style, 2-celled; style glabrous at the apex, 3–4 mm long; stigma capitate. In each cell 15–25(30) ovules. *Fruit* orange or yellow, nearly mature glaucous, small or rather large, globose, 1.5–7 cm in diam., hard when not small, (1)10–30(45)-seeded. Wall 1–3 mm thick when dry. Pulp orange or yellow, slimy. *Seed* pale brown or ochraceous, obliquely elliptic, ovate, ellipsoid, or more or less tetrahedral, 11 × 7.5 × 4–21 × 14 × 5 mm, mostly somewhat thickened at one side in the middle, rough, minutely scabrid-pubescent.

Distribution: Congo (Kinshasa), Angola, and East Africa.

Ecology: Riverine forests, gallery forests, or on rocky hills in bushlands or woodlands; alt. 0–1700 m.

Notes. <i>S. lucens</i> is most closely allied to <i>S. nigritana</i> , from which it is geographically separated. They resemble each other strikingly in habit, branches, leaves, flowers, and fruits. The most useful differential characters are:
Peduncle and pedicels pubescent or sometimes glabrous; sepals glabrous inside; mature bud 5.5–7.5 mm long; pistil 4.5–6 mm long. Central and East Africa <i>S. lucens</i>
Peduncle and pedicels glabrous; sepals inside minutely appressed-pubescent at the base; mature bud 7.5–11 mm long; pistil 7–9 mm long. West and northern Central Africa <i>S. nigritana</i>

S. innocua subsp. *burtonii* var. *glabra* Bruce et Lewis, Kew Bull. 1956: 273. 1956 and in Fl. Trop. E. Afr. Loganiaceae 26. 1960. Type: Tanzania: Tanga District, Kwamkembe-Pongwe, Greenway 4851 (EA, holotype; isotypes: FHO, K).

Often many-stemmed and much-branched shrub or small tree, 1.50–10(20) m high, deciduous. Trunk 7–60 cm in diam., mostly branched from low down. Bark mostly pale grey or greyish-white, smooth; wood whitish. *Branches* pale

grey to dark brown, powdery or not, lenticellate or not, smooth; branchlets – if lenticellate – then like the branches, glabrous or pubescent, terete. *Leaves*: petiole glabrous or pubescent, often short, 1–5 mm long; blade shining and dark green above, paler beneath, coriaceous or papyraceous, very variable in shape and size, suborbicular, elliptic, narrowly elliptic, obovate or narrowly obovate, (1)1.5–4(5) × as long as wide, 2–10(15.5) × 1–4(5.5) cm, rounded, or, especially in Madagascar and near the coast in Moçambique and Natal and furthermore elsewhere in shade branches acute or acuminate at the apex, cuneate or rounded at the base, glabrous or pubescent on both sides; one or two pairs of distinct secondary veins from or from above the base curved along the margin and often a faint submarginal pair; tertiary venation reticulate, not or slightly prominent above. *Inflorescences* axillary or ramiflorous, usually several together, very short and nearly fasciculate, 1 × 1–2 × 1.5 cm, 1–2 × branched, few-flowered. Peduncle, branches, and pedicels short or very short, pubescent or glabrous. Bracts small, sepal-like, above glabrous or with some minute hairs at the base, without colleters. *Flowers* 4-merous. *Sepals* pale green, free or nearly so, subequal, the inner slightly smaller, ovate, broadly ovate, or suborbicular, 1–1.6 × as long as wide, 1.7–2.5(3) × 1.5–2.2 mm, rounded or obtuse at the apex, ciliate, glabrous or pubescent outside, glabrous or with some minute appressed hairs at the base inside, without colleters. *Corolla* in the mature bud (1.8) 2.8–3.3(3.6) × as long as the calyx, (4.5)5–8 mm long, and tapering and obtuse at the apex, white or greenish-yellow, glabrous outside, inside with a brush-like ring of white lanate hairs in the throat and just on the base of the lobes; tube cylindrical or nearly so (1)1.2–1.8(2.2) × as long as the calyx, 0.7–1.7 × as long as the lobes, 2.5–4.5(5) mm long, 1.5–2.8 mm wide at the throat; lobes thick, narrowly triangular, 1.5–3 × as long as wide, 2–3.6 × 1–1.9 mm, acute or subacute, spreading. *Stamens* hardly exserted; filaments extremely short, inserted at the mouth of the corolla tube, glabrous; anthers oblong, about twice as long as wide, 1.2–1.8 × 0.6–0.8 mm, glabrous, deeply cordate or sagittate at the base; cells parallel. *Pistil* hirsuto-pilose in the middle, (3.5)4–6 mm long; ovary narrowly ovoid or oblong, 1.5–3 × 0.8–1.5 mm, hirsuto-pilose at the very apex, further glabrous, often with a disk-like base, gradually narrowed into the style, 2-celled; style thick (2)2.5–4 mm long, at the base hairy like the ovary at the apex; stigma capitate. In each cell 5–30 ovules. *Fruit* orange or yellow, nearly mature bluish-green, large or sometimes rather small, hard when not small, globose, 2–8(10) cm in diam., with about 5–50 seeds, with somewhat granular skin, slightly shining. Wall mostly thick, (1)2–4 mm thick, thicker above the pedicel, brittle like in *S. nigritana* in mature fruits, hard and not broken by hand when nearly mature and/or dry. Pulp orange, slimy, edible. *Seeds* pale ochraceous, flattened or not, often more or less plano-convex, obliquely ovate, elliptic, or tetrahedral, usually irregularly curved, 1.4–1.8 × as long as wide, 11–25 × 6–18 × 5–8 mm, with thick very short erect hairs, rather rough.

Distribution: East and South Africa, and Madagascar.

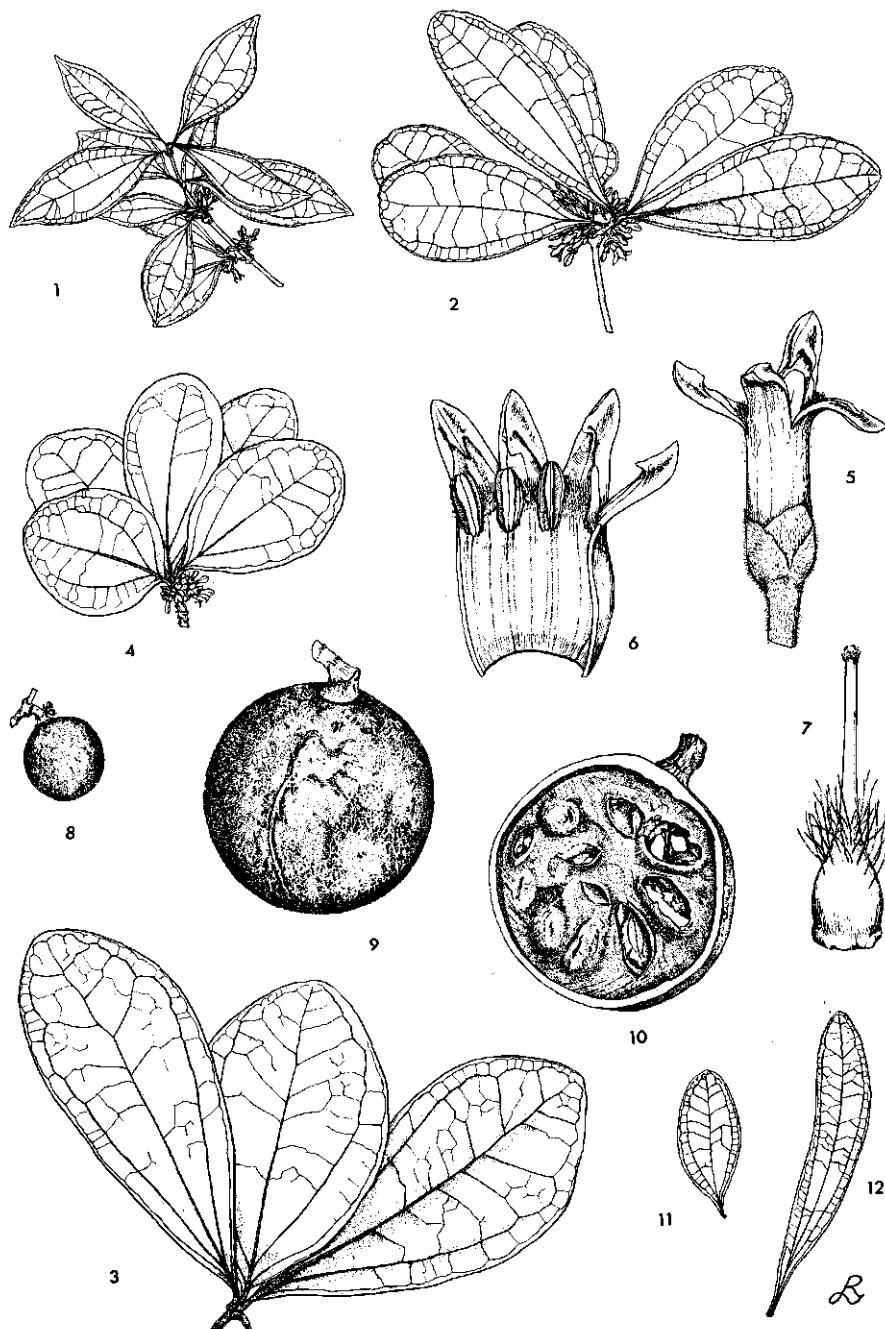

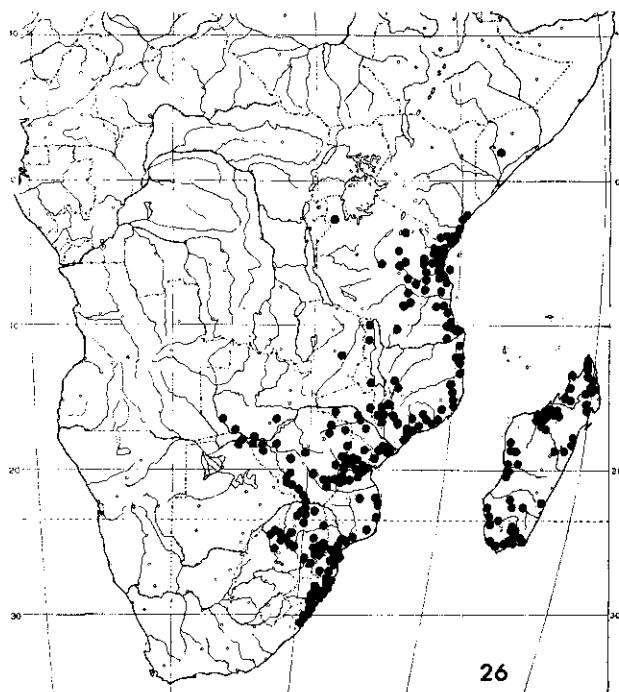

FIG. 23. *S. madagascariensis*: 1–4. branches, $\frac{1}{2} \times$; 5. flower, $4 \times$; 6. opened corolla with stamens, $5 \times$; 7. pistil, $8 \times$; 8–9. fruits, $\frac{1}{2} \times$; 10. dried slice of nearly mature fruit, testae sticking to the pulp, $\frac{1}{2} \times$; 11–12. leaves, $\frac{1}{2} \times$ (1. Notes. *S. madagascariensis* Poir. was described by DU PETIT-THOUARS as 'Caniram de Madagascar' (Dict. Sci. Nat. 6: 427. 1806). POIRET published in Lamarck, Enc. 8: 696. 1808 an extract of the above cited publication which he provided with the Latin binomial. Only a few months afterwards, another extract of the same paper appeared in Desvaux, Journal de Botanique 1: 247. Jan. 1809. The latter is entitled: 'Notice historique sur le genre Caniram ou Strychnos de Linné, par A. Aubert Du Petit-Thouars, extrait par J. Dubuisson'. On p. 250 of this article, which is almost exactly the same text as the chapter on Caniram in DU PETIT-THOUARS's Dictionnaire, is added between brackets in italics after the name 'Caniram de Madagascar' the name *Strychnos madagascariensis* Desv. MSS. It is very fortunate that POIRET was earlier, as it is very unpractical to cite a long series of authors all more or less responsible for the same name.

The species *S. madagascariensis* is very variable, which is shown by the long list of synonyms. The plants may be glabrous to densely pubescent. The branches are lenticellate or not, pale brown, grey, or black, powdery or not. The leaves are very variable in shape and size and may nearly all be described as being shaped between orbicular and narrowly oblong. They are rounded to acuminate at the apex. The fruits are very variable in size, thin- or thick-walled, and few- or many-seeded.

S. madagascariensis is composed of 5 taxa which are indicated here with the following names: *S. burtoni*, *S. dysophylla*, *S. engleri*, *S. gerrardii*, and *S. madagascariensis*. The latter comprises the majority of collections of the species from Madagascar, while the four former are from continental Africa. They have been discussed in more recent papers as follows:

S. burtoni as *S. innocua* subsp. *burtonii* (Bak.) Bruce & Lewis (1956, 1960) with two varieties, *S. dysophylla* as *S. dysophylla* Benth. subsp. *dysophylla* (BRUCE & LEWIS, 1956, 1960) and *S. innocua* subsp. *dysophylla* (Benth.) Verdoorn (1958, 1963), *S. engleri* as *S. dysophylla* subsp. *engleri* (Gilg) Bruce & Lewis (1956, 1960), *S. gerrardii* as *S. innocua* subsp. *gerrardii* (N. E. Brown) Verdoorn (1958, 1963), and *S. madagascariensis* Poir. as a synonym of *S. spinosa* Lam. (BRUCE & LEWIS, 1955, 1960). The majority of the specimens form Madagascar, cited with the description given below as *S. madagascariensis* are glabrous and with lenticellate branches and acuminate leaves. Among the latter specimens are also the types of *S. vacacoua*, *S. baroni*, and *S. mocquerysi*, which resemble the type of *S. madagascariensis* so strikingly, that they doubtless belong to a single species. The types of the other synonyms cited were placed in the four other taxa by the three authors cited: BRUCE, LEWIS, and VERDOORN.

The variability of the species may be described as follows:

The leaves may be elliptic and acuminate (*S. madagascariensis*), acute in several specimens from the coastal region of Moçambique and Natal, and elsewhere on shade branches, sucker shoots, or specimens in gallery forests (*S. gerrardii*). They may be orbicular and rounded (*S. dysophylla*, *S. engleri*) or narrowly obovate and rounded (*S. burtoni*), both taxa occurring in continental Africa. *S. dysophylla* occurs mainly in Rhodesia and South Africa, *S. burtoni* in

Tanzania and Moçambique, and *S. engleri* especially in Kenya and Tanzania. The fruits are small (about 2–3 cm in diam.) in *S. engleri*, larger (2–5 cm) in *S. madagascariensis*, and large (5–10 cm) in *S. burtoni*, *S. dysophylla*, and *S. gerrardii*. The flowers vary slightly and independently from the other parts of the plants, but show a rather distinct variation in the number of ovules in each cell of the ovary. This is correlated with the size of the fruits. *S. engleri* has 6–10(15) ovules in each cell of the ovary, *S. madagascariensis* 5–14, and the three other taxa (18)20–30. The lenticellate branches as they occur in all taxa are usually glabrous. *S. engleri*, *S. gerrardii*, and *S. madagascariensis* are always glabrous. The two other taxa, *S. burtoni* and *S. dysophylla*, can be glabrous. Powdery branches are considered as typical for *S. burtoni* and black branches are more or less typical for *S. dysophylla*. The latter character is mostly useless, as branches which were powdery might be blackened by fire. After having studied some dozens of specimens from East Africa and some from outside this part of the continent, BRUCE and LEWIS could only refer a part of the specimens of this complex to the taxa they adopted. The same is true for the elaborate studies of Miss VERDOORN of the South African material. The present author found several specimens which might belong in any of the 4 taxa they distinguished and several as intermediate between the 6 possible pairs of them. Moreover, evident intermediates between *S. dysophylla* and *S. madagascariensis* were found too. The number of intermediates is more or less dependent from the delimitation of the taxa involved, as e.g. *S. gerrardii* is more or less intermediate between *S. burtoni* and *S. madagascariensis*, and also between *S. dysophylla* and *S. madagascariensis*. Furthermore if a small-fruited specimen has some acute leaves it could be considered as intermediate between *S. engleri* and *S. gerrardii* or between *S. engleri* and *S. madagascariensis*.

As it is difficult to conceive that all specimens cited above belong to one single species, especially as only a few specimens are at hand in most herbaria, the forms are indicated here with the specimens. After the symbols of the herbaria appear the letters b for *S. burtoni*, d for *S. dysophylla*, e for *S. engleri*, g for *S. gerrardii*, m for *S. madagascariensis*, bd for intermediate between the two first taxa, be for intermediate between the first and the third, etc.

The variation is in part dependent on the ecology, as can be seen from the many specimens collected by Ward in Natal. Trees growing in groves or gallery forests are exactly like *S. gerrardii* and those growing as isolated specimens in woodland are like *S. dysophylla*. The specimens at the edges of groves are intermediate.

36. *S. malacoclados* C. H. Wright in Fl. Trop. Afr. 4(1): 523. 1903; Duvigneaud, Lejeunia 11: 61. 1947 and Bull. Soc. Roy. Bot. Belg. 85: 30. 1952; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 43. 1963.

Fig. 4, p. 58; Map 27, p. 173

Type: Cameroun: Mabam, Nkomo R., Bates 502 (K, holotype; isotypes: BM, BR, G, L, P, Z).

Heterotypic synonym: *S. limbogeton* Winkler in Engler, Bot. Jahrb. 41: 284. 1908. Type: Cameroun: Victoria, Limbe R., Hanke (Winkler) 527 (holotype not seen, destroyed in B; lectotype: G, other isotypes seen: L, MO, WAG, Z).

S. pansa S. Moore in Cat. Talbot's Nig. Pl. 68. 1913; Hutchinson & Dalziel, Fl. W. Trop. Afr. 2:24. 1931. Type: Nigeria: Oban, Talbot 1661 (BM, holotype; isotype: K).

Liana 10m high or more climbing in trees, 10–25 m long or more. Trunk 1–2 cm in diam. or more. Bark pale grey, thin, smooth, powdery, not or slightly lenticellate; wood creamy. Branches not lenticellate, pale grey or brown, dry usually darker and not or obscurely sulcate; branchlets ochraceous-pubescent, green, not lenticellate, terete, medium brown and not sulcate when dry. Tendrils solitary. Leaves: petiole ochraceous-pubescent, short, 1–3(5) mm long, mostly transversely rugose beneath; blade shining or mat and medium to dark green above, paler and often with dark reticulate venation beneath, thinly coriaceous or less often coriaceous, also when living, thinner in the shade, elliptic or narrowly elliptic, or on the main axis and at the bases of the branchlets ovate, broadly ovate, or sometimes orbicular, (1)2–3(4) × as long as wide, variable in size, 1.5–10 × 1.3–5 cm, up to 17.5 × 7.5 cm in the shade, acuminate, sometimes some obtuse or acute at the apex, cuneate, rounded, or sometimes especially on the main axis, subcordate at the base, usually sparsely pubescent on the costa on both sides and on the main secondary veins beneath; one or two pairs of secondary veins from or from above the base curved along the margin and mostly a faint submarginal pair; costa impressed above and as the veins prominent beneath; tertiary venation reticulate. Inflorescence axillary and sometimes also terminal, solitary, lax, up to about half as long as the leaves, few-flowered, 1–3 × 0.6–2 cm, 2 × branched. Peduncle and branches slender, pubescent like the very short pedicels. Bracts triangular or sepal-like, lower often (?) with large colleters at the base. Flowers 5-merous. Sepals green, connate at the base up to one-third of their length, equal or subequal, ovate or broadly ovate, 1–1.3 × as long as wide, 0.5–0.8 × 0.5–0.8 mm, subacute at the apex, ciliate, sparsely pubescent outside, inside glabrous, without colleters. Corolla in the mature bud 3–4 × as long as the calyx, 2–2.5(2.8) mm long, and rounded or slightly tapering at the apex, yellow, sparsely pubescent outside, except for the glabrous base, inside pilose on the lobes, especially at the base; tube short, 0.8–1.6 × as long as the calyx, 0.6–0.8 mm long; lobes 1.5–3.5 × as long as the tube, ovate, 1.5 × as long as wide, 1.2–2.2 × 0.8–1.4 mm, acute, spreading. Stamens just exserted; filaments glabrous, about as long as the anthers, inserted at the mouth of the corolla tube; anthers suborbicular, 0.5–0.8 × 0.3–0.8 mm, deeply cordate at the base, glabrous; cells parallel. Pistil glabrous, or with some minute hairs, 1.2–1.6 mm long; ovary ovoid or globose, 0.6–1 × 0.6–0.9 mm, glabrous, abruptly narrowed into the style or not, 2-celled; style 0.5–0.6 mm long, glabrous or with some minute hairs; stigma capitate. In each cell 5 ovules. Fruit orange, small, soft, ellipsoid, 18 × 16 × 15–27 × 18 × 18 mm, 1-seeded, with smooth skin, slightly shining, somewhat obliquely pedicellate.

Wall thin, about 1 mm thick. Seed dark brown, slightly flattened, ellipsoid, $10 \times 9 \times 6$ — $12 \times 10 \times 8$ mm, shallowly dented at one side, smooth, glabrous; testa very thin and easily rubbed off.

Distribution: West Africa, Cameroun, and Gabon.

Ecology: Moist places in rain forests or old secondary forests; alt. 0–900 m.

Ghana: Pamu, Berekum Res. (Sept.) Vigne 2515 (FHO, GC, NY).

MAP 27. • *S. malacoclados*, ▲ *S. matopensis*.

Nigeria: Oban, Talbot 1661 (BM, K, type of *S. pansa*).

Cameroun: Victoria, Limbe R. (Oct.) Hanke (Winkler) 527 (G, L, MO, WAG, Z, type of *S. limbogeton*, distributed as *S. hankei*); 3 km E. of Km 21 of Yabassi-Douala road, Leeuwenberg 6396 (WAG); Bipindi, Zenker 4571 (BM, BR, COI, E, FHO, G, GOET, HBG, K, L, LE, LY, M, MO, P, PR, PRE, S, W, WU, Z); Lokoundjé R., Zenker 117 (BR, FI, G, GH, MO, P); Bipindi, Lokoundjé R. bank, Zenker Apr. 1906 (F).

Gabon: Mabam, Nkomo R. (July) Bates 502 (BM, BR, G, K, L, P, Z, type).

Cult.: Wageningen, Leeuwenberg 4992 (WAG, seedling of herb. J. de Wilde & Leeuwenberg 3613); Adiopodoumé, 17 km W. of Abidjan, Ivory Coast, Aké Assi 5957 (WAG, originating from Téké Forest); ibid. (O.R.S.T.O.M. garden 204) Leeuwenberg 4568 (WAG); ibid., Leeuwenberg 4578 (WAG, seedling of herb. J. de Wilde & Leeuwenberg 3613).

Notes. *S. malacoclados* is closely allied to *S. angolensis* by the indumentum and colour of the plant, the rugose petioles, the shape and size of the flowers, the shape of fruit and seed, and the rose-like galls. The inflorescences are sometimes transformed into these characteristic galls like roses, occasionally seen in other species, e.g. in *S. longicaudata* (Leeuwenberg 6794).

The differences between the two related species can be defined as follows:
Leaves sharply acuminate; sepals pubescent outside; corolla pubescent outside,
except glabrous base *S. malacoclados*
Leaves obtuse or nearly so, never sharply acuminate; sepals glabrous outside;
corolla glabrous or minutely papillose-pubescent outside . . . *S. angolensis*

Young plants with shade-leaves only, growing in the understory of the forest may flower. The flowering specimens collected by Zenker, nos. 117 and 4571 and the fruiting specimen herb. Leeuwenberg 6396, have shade-leaves, like several vegetative specimen collected in the Ivory Coast by the present author. The flowering specimens collected in West Africa have sun-leaves.

37. *S. malchairii* De Wild., Bull. Jard. Bot. Brux. 5: 44. 1915; Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 30, f. 10 B. 1952 (both as *malchairi*).

Type: Congo: Equateur: Likimi, Malchair 506 (BR, holotype; photograph in K, neg. 2513). *Fig. 24, p. 175; Map 28, p. 176*

Large liana, 8–18 m high climbing in trees. Trunk 1–8 cm in diam.; bark pale brown, with some lenticels; wood pale brownish. Branches mostly pale brown when dry, slightly lenticellate, not sulcate; branchlets glabrous, not lenticellate, mostly pale greenish-brown when dry, terete, not sulcate. Tendrils solitary. Leaves: petiole glabrous, 2–7 mm long; blade shining above, dull and paler beneath, coriaceous or thinly coriaceous also when living, elliptic, narrowly elliptic, or narrowly ovate, 1.5–3 × as long as wide, 4–13 × 1.5–6(8) cm, acuminate at the apex, cuneate or rounded at the base, glabrous on both sides; one pair of secondary veins from or from above the base curved along the margin and often a faint submarginal pair; tertiary venation reticulate, prominent on both sides. Inflorescence axillary and occasionally also terminal, 0.1–0.5 × as long as the leaves, 1–3 × 1–1.5 cm, few-flowered, 2–3 × branched, rather congested, but usually with a distinct peduncle. Peduncle, branches, and pedicels

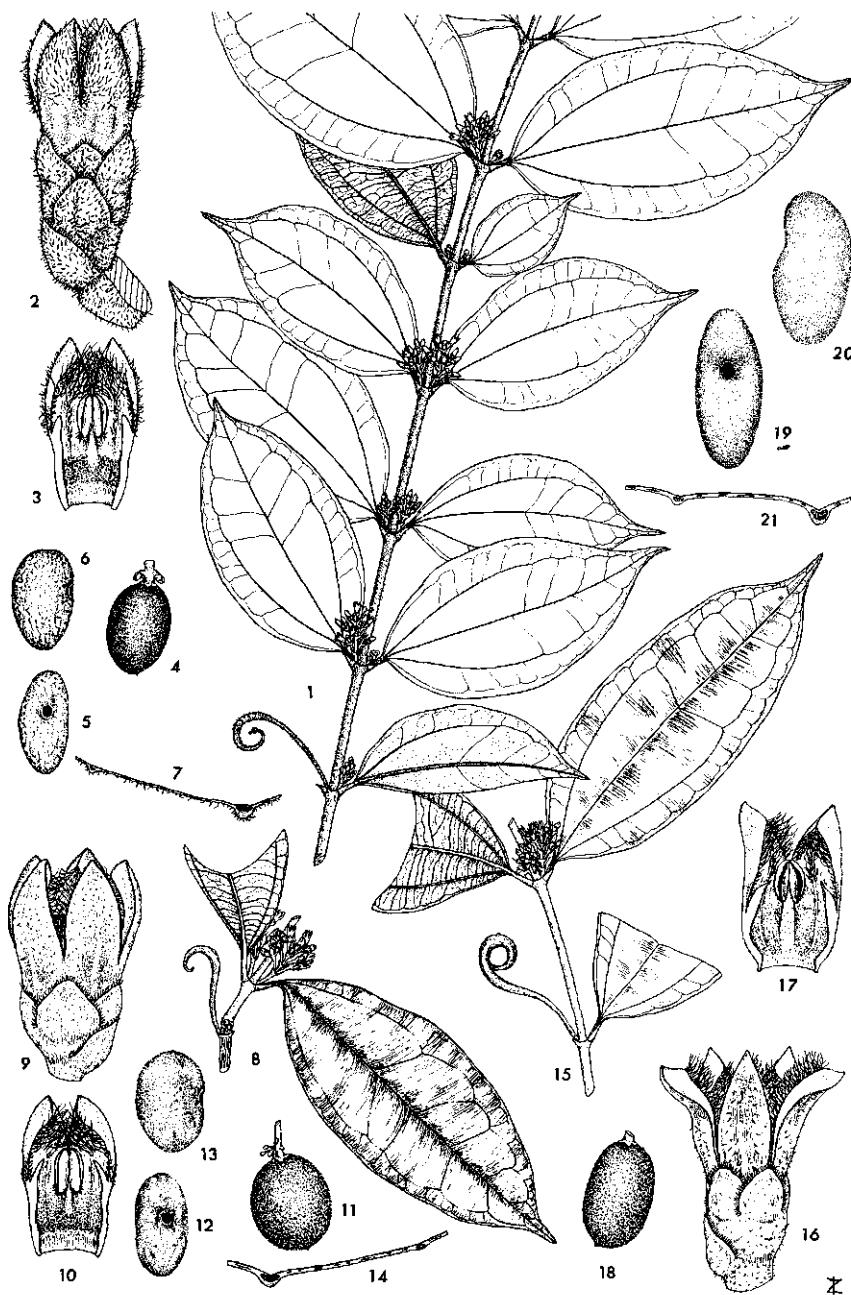

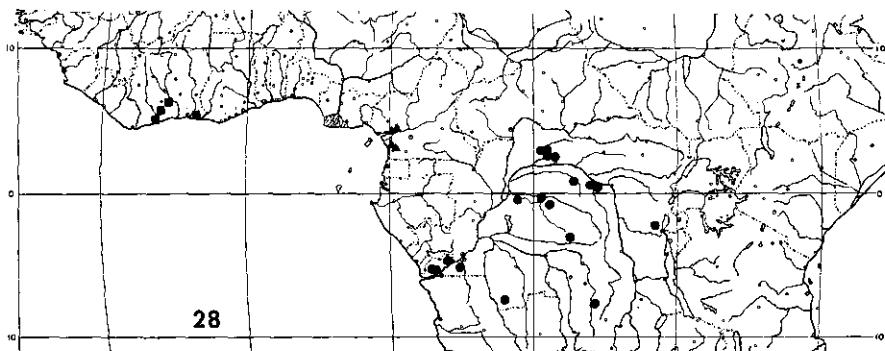

FIG. 24. 1–7. *S. campicola*: 1. branch, $\frac{1}{2} \times$; 2. flower, $7 \times$; 3. portion of corolla with stamen, $7 \times$; 4. fruit, $\frac{1}{2} \times$; 5–6. seeds, $1 \times$; 7. transverse section of leaf, $3 \times$ (1–3, 7. Leeuwenberg 5447; 4. Tisserant 2265; 5–6. Tisserant 1850). 8–14. *S. malchirii*: 8. branch, $\frac{1}{2} \times$; 9. flower, $7 \times$; 10. portion of corolla with stamen, $7 \times$; 11. fruit, $\frac{1}{2} \times$; 12–13. seeds, $1 \times$; 14. transverse section of leaf, $3 \times$ (8–10, 14. A. Léonard 699; 11–13. Léontovitsch 112). 15–21. *S. mimfiensis*: 15. branch, $\frac{1}{2} \times$; 16. flower, $7 \times$; 17. portion of corolla with stamen, $7 \times$; 18. fruit, $\frac{1}{2} \times$; 19–20. seeds, $1 \times$; 21. transverse section of leaf, $3 \times$ (15. Leeuwenberg 5550, 6821; 16–17. Leeuwenberg 6821; 18–20. Leeuwenberg 6316; 21. Leeuwenberg 5550).

glabrous or sparsely pubescent as the approximately sepal-like bracts. Bracts with colleters above. *Flowers* 4–5-merous, even in a single inflorescence, often sessile. *Sepals* yellow-green, up to half-way connate, equal, ovate or broadly ovate, 1–1.5 × as long as wide, 1–1.2 × 0.8–1.2 mm, acute or obtuse at the apex, glabrous on both sides or minutely pubescent outside, with or without colleters inside at the edges of the base only. *Corolla* in the mature bud 2.5–3 × as long as the calyx, 2.8–3 mm long, and obtuse at the apex, white, pale yellow, or orange, distinctly thicker towards the apex, outside glabrous or minutely puberulous, inside with recurved brushes of white hairs at the apices of the lobes, further glabrous or minutely puberulous (when outside so); tube about as long as the calyx, 0.8–1 mm long, wide; lobes thick, narrowly triangular, 1.8–2.5 × as long as the tube, 1.8–2.2 × 0.8–1 mm, acute, suberect. *Stamens* exserted; filaments glabrous, about as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 0.7–1 × 0.6–0.8 mm, sagittate at the base, glabrous or with few small hairs at the base; cells slightly divergent. *Pistil* glabrous, 1.6–2 mm long; ovary ovoid, 1 × 0.7–1 mm, 2-celled, rather abruptly narrowed into the style; style short, 0.6–1 mm long; stigma obscurely bilobed or capitate. In each cell 5 ovules. *Fruit* orange, small, subglobose or ellipsoid, 14 × 10–21 × 16 mm, one-seeded. Wall thin. *Seed* ellipsoid, 12 × 9.5 × 8.5–15 × 11 × 10 mm, smooth, not dented. Testa very thin, sticking to the pulp.

Distribution: Congo (Kinshasa).

Ecology: Rain forests or gallery forests; alt. 0–1000 m.

Notes. *S. malchairii* is closely allied to *S. campicola* and *S. mimfiensis* (see notes to those species). It also resembles two other species, from which it differs as follows:

- Tendrils solitary; corolla larger than in both the other species, penicillate on lobes; stamens included, inserted in tube; anthers bearded . *S. longicaudata*
- Tendrils solitary; recurved brushes on apices of lobes; stamens at mouth; lobes thick; anthers glabrous or nearly so *S. malchairii*
- Tendrils paired; corolla inside pilose or nearly glabrous; stamens at mouth; lobes thin; anthers glabrous *S. cuminodora*

Fig. 25, p. 179; Map 27, p. 173

Type: Rhodesia: Matobo Hills, Eyles 1182 (BM, holotype; isotype: SRGH).

Climber or scandent shrub, about 4 m high, forming a dense tangle. *Branches* brown or grey-brown, more or less terete, not sulcate when dry, not or hardly lenticellate, often hairy like the branchlets; branchlets pale grey- or brown-appressed-pubescent. Tendrils solitary in the axils of ordinary leaves. *Leaves*: petiole appressed-pubescent, short, 1–3(4) mm long; blade shining and dark green above, paler and less shining beneath, coriaceous, ovate, orbicular, or sometimes elliptic, 1–2(3) × as long as wide, 1.8–5(7) × 1–3(5) cm, subacuminate, acute, or rarely rounded and mucronulate at the apex, rounded to cuneate at the base, above glabrous or sparingly appressed-pubescent on the impressed costa, beneath with some appressed-pubescent hairs on the base of the costa or less often also glabrous, often minutely ciliate; one or two pairs of secondary veins from or from above the base curved along the margin and often a faint submarginal pair; tertiary venation inconspicuous. *Inflorescence* terminal (and occasionally also axillary) congested, many-flowered, 0.7 × 1 – 2 × 2.5 cm, 2–3 × branched. Peduncle and branches appressed-pubescent. Bracts small, without colleters, lower narrowly triangular, appressed-pubescent on both sides, upper sepal-like, appressed-pubescent beneath, glabrous above. *Flowers* 5-merous, sessile. *Sepals* one-third connate, equal or subequal, ovate or broadly

ovate, $1.3\text{--}1.8 \times 1\text{--}1.4$ mm, acute at the apex, ciliate, outside appressed-pubescent, especially at the base, inside glabrous, without colleters. *Corolla* in the mature bud $2.4\text{--}2.5 \times$ as long as the calyx, 3.3–4.2 mm long, and obtuse at the apex, white or pale yellow, campanulate, outside glabrous or puberulous, inside white-penicillate in the throat; tube wide, $1.3\text{--}1.5 \times$ as long as the calyx, $1\text{--}1.5 \times$ as long as the lobes, $2\text{--}2.2 \times 2\text{--}3$ mm; lobes triangular, $1.3\text{--}1.7 \times$ as long as wide, $1.3\text{--}2 \times 1\text{--}1.2$ mm, thick, acute, suberect. *Stamens* included; filaments very short, 0.7 \times as long as the anthers, glabrous, inserted at one-half to two-thirds from the base of the corolla tube; anthers nearly cordate, $0.9\text{--}1.2 \times 0.6\text{--}0.8$ mm, bearded at the deeply cordate base; cells often slightly divergent at the base. *Pistil* glabrous, 2–2.8 mm long; ovary broadly ovoid, $0.8\text{--}1.2 \times$ as long as wide, $1\text{--}1.2 \times 1\text{--}1.2$ mm, 2-celled, not much narrowed into the style; style 1–1.8 mm long, rather thick; stigma capitate. In each cell 9–12 ovules. *Fruit* orange or yellow, soft, ellipsoid, slightly longer than wide, $12 \times 9\text{--}15 \times 12$ mm, 1(–2)-seeded, with smooth skin, slightly shining. Wall thin. *Seed* dark brown, flattened, more or less plano-convex, elliptic, $9\text{--}10 \times 7\text{--}9 \times 2$ mm, with thick very short erect hairs, rather rough.

Distribution: East Africa.

Ecology: Semi-evergreen bushland or *Brachystegia*-woodland, on rocky hills and termite-mounds, and gallery forest; alt. 900–1600 m.

Fig. 15, p. 109; Map 29, p. 181

Type: Sierra Leone: sin. loc., Afzelius s.n. (UPS, holotype, annotated by Gilg; isotype: BM).

Heterotypic synonym: *S. syringiflora* A. Chev., Mem. Soc. Bot. Fr. 2: 8: 48. 1908; Hutchinson & Dalziel, Fl. W. Trop. Afr. 2: 24. 1931; Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 33. 1952. Type: Guinea: Kaba R. Valley, Farana, Chevalier 13181 (P, lectotype; isotypes: K, LY, P).

Climber. Branches not lenticellate, pale to dark brown and not sulcate when dry; branchlets glabrous, terete, pale to dark brown and not or sometimes sulcate when dry. Tendrils in 1-3 pairs. Leaves: petiole glabrous, 6-10 mm long; blade dark green and shining above, paler and dull beneath, coriaceous, elliptic, narrowly elliptic, or narrowly ovate, comparatively narrower towards the apices of the branchlets, (1.2)1.5-2.5 \times as long as wide, (4.5)8-19 \times (1.5)4-7.5 cm, distinctly and acutely acuminate at the apex, cuneate or rounded at the base, glabrous on both sides; two pairs of distinct secondary veins curved along the margin, the first from the base and the second from about 1 cm

above the base; tertiary venation reticulate, not very conspicuous, slightly prominent on both sides or only above. *Inflorescence* axillary (sometimes in the axils of small bracts) and sometimes at the same time terminal, solitary, lax, several-flowered, about half as long as the leaves, $3-6 \times 2.5-3$ cm, $2-3 \times$ branched. Peduncle, branches, and pedicels glabrous or with some hairs near the stipular line between the bracts. Bracts narrowly triangular (and slightly shovel-shaped) or sepal-like, at least the upper glabrous above and without colleters. *Flowers* 4-merous. *Sepals* free, equal or subequal, broadly ovate to orbicular, $1-1.5 \times$ as long as wide, $1.2-2 \times 1-1.5$ mm, obtuse at the apex, ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud $4-5 \times$ as long as the calyx, $5.5-8$ mm long, and approximately rounded at the apex, white, outside glabrous, inside densely pilose except for the glabrous base of the tube; tube $1.7-2 \times$ as long as the calyx, $2.5-3.5$ mm long, nearly cylindrical, gradually widened towards the throat, $1.2-2$ mm wide at the throat; lobes $1.2-1.3 \times$ as long as the tube, rather thick, narrowly triangular, $2.5-3 \times$ as long as wide, $3-4.5 \times 1.2-1.5$ mm, acute, recurved. *Stamens* exserted; filaments glabrous, $1-1.5 \times$ as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, glabrous, $1-1.2 \times 0.4-0.5$ mm, cordate at the base; cells parallel. *Pistil* glabrous, $5.5-7$ mm long; ovary ovoid, about $1.5 \times$ as long as wide, $1-1.5 \times 0.7-1$ mm, 2-celled; style slender, $4-6$ mm long; stigma small, capitate or obscurely bilobed. In each cell 10 ovules. *Fruit* orange (?), rather small, soft, ellipsoid (?), about 3 cm in diam., with 1-3 (?) seeds, with smooth skin, mat. Wall thin, dry about 0.5 mm thick. *Seed* flattened, obliquely elliptic, $18 \times 14 \times 5$ mm, at one side with a deep pit, at the other with a bulge surrounded by a shallow groove, seemingly papillose; false papillae simulated by curved hairs.

Distribution: Guinea, Sierra Leone.

Ecology: River banks in rain forests or in gallery forests; at low elevations.

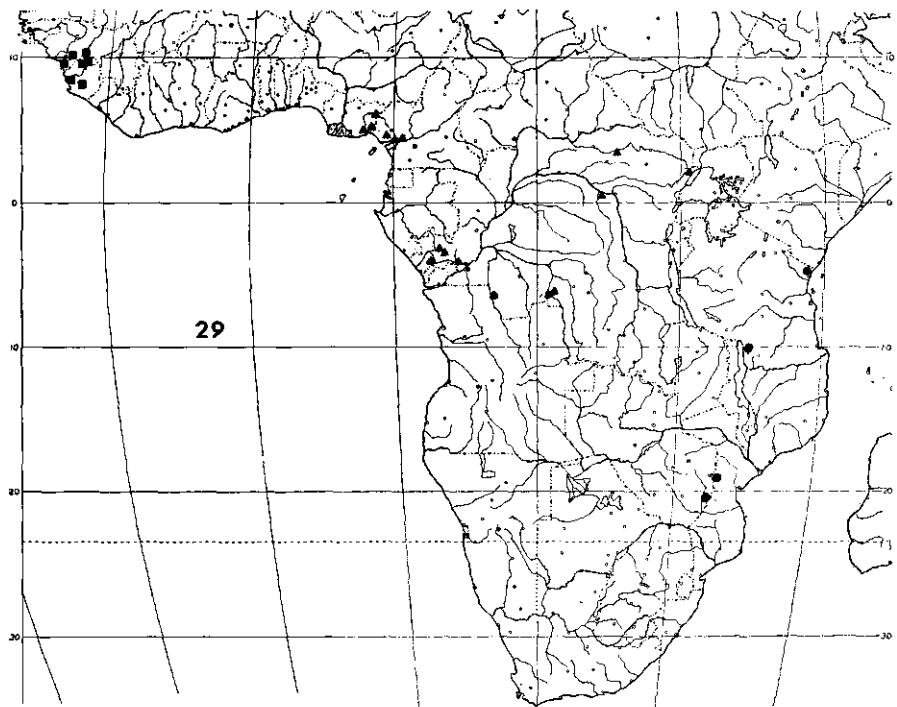

Guinea: Conakry, Maclaud rec. 20 Sept. 1897 (P); near Kindia, Jacques-Felix 75 (P, WAG); Kaba R. Valley, Farana (Apr.-May) Chevalier 13181 (K, LY, P, type of *S. syringiflora*), 13191 bis (P).

Sierra Leone: near Bayabaya, Scarcies R. (fr. Feb.) Scott Elliot 4292, partly (GH); Kahreni, Limba (Apr.) Scott Elliot 5592 (BM, K); Konnoh Country, Burbidge 485 (K); near Taiama (Mar.) Deighton 2556 (K), 3375 (BR, K, P); sin. loc., Afzelius s.n. (BM, UPS, type).

40. *S. mellodora* S. Moore, Journ. Linn. Soc. 40: 147. 1911; Bruce & Lewis in Fl. Trop. E. Afr., Loganiaceae 23. 1960.

Type: Rhodesia: Chirinda Forest, Swynnerton 101 (BM, holotype; isotypes: K, NBG, SRGH, US, Z). **Fig. 26, p. 183; Map 29, p. 181**

Heterotypic synonym: *Gaertnera zimmermannii* Krause et Gilg in Engler, Bot. Jahrb. 48: 430. 1912; Petit, Bull. Jard. Bot. Brux. 29: 41. 1959. Type: Tanzania: East Usambara Mts., Kwamkuyo, Zimmermann 2926 (holotype not seen, destroyed in B; lectotype: EA, photograph in BR, K neg. 3027).

MAP 29. ■ *S. melastomatooides*, ▲ *S. memecyloides*, ● *S. mellodora*.

Tree, 20–35 m high. Trunk 45 cm in diam. (more or less). Bark thin. *Branches* not or obscurely lenticellate, medium to dark brown and not sulcate when dry; branchlets glabrous, not lenticellate, pale greenish-brown to dark brown and usually slightly sulcate when dry, mostly darker than in *S. mitis*. A distinct stipular line present which is often torn. Stipules 2 mm long, soon deciduous, narrowly elliptic, glabrous. *Leaves*: petioles glabrous, 3–8 mm long, those of a pair joined at the base by a distinct stipular line; blade dull, drying pale greenish-brown with dark brown, paler beneath, coriaceous, elliptic or narrowly elliptic, 2–3.5 × as long as wide, 5–12 × 2–5 cm, acuminate at the apex, cuneate at the base, glabrous on both sides; secondary veins 5–8 on each side; costa and veins prominent beneath; tertiary venation not very conspicuous, slightly prominent on both sides. *Inflorescence* axillary, usually also in the axils of the apical leaves and therefore seemingly terminal, lax, many-flowered, shorter or longer than the leaves, 3–11 × 2.5–8 cm, 3–4 × branched. Peduncle, especially towards the apex, branches, and pedicels sparsely pubescent. Bracts small, sparsely pubescent beneath, lower narrowly elliptic, about 3–5 mm long, upper triangular, approximately sepal-like, and without colleters. *Flowers* 4-merous. *Sepals* free, equal, broadly ovate, about 1–1.5 × as long as wide, 0.7–1.2 × 0.7–1 mm, rounded at the apex, ciliate, outside glabrous or nearly so, inside glabrous,

without colleters. *Corolla* in the mature bud 2.5–4.5 × as long as the calyx, 2.5–3 mm long, and rounded at the apex, white, outside glabrous, inside densely pilose on the lobes (of which the apex sometimes glabrous); tube very short, 0.5–0.7 × as long as the calyx, 0.5–0.7 mm long; lobes oblong, 4–5 × as long as the tube, 1.7–2 × as long as wide, 2–2.5 × 1.1–1.5 mm, acute, spreading. *Stamens* exserted; filaments glabrous, about 1–1.5 × as long as the anthers, inserted at the mouth of the corolla tube; anthers orbicular or nearly so, 0.5–0.6 × 0.5 mm, subcordate at the base, glabrous; cells parallel. *Pistil* glabrous, 1.1–1.2 mm long; ovary depressed-globose or -ovoid, 0.7 × 0.7 mm, 1-celled, gradually narrowed into the style; style short, 0.4–0.5 mm long; stigma capitate. One basal placenta with 2–9 ovules. *Fruit* small, globose or nearly so, 12 × 10 – 18 × 18 mm, one-seeded. Wall thin. *Seed* flattened, ellipsoid, 8–9 × 6–7 × 3 mm, pubescent (?). Testa thin, sticking to the pulp.

Distribution: Tanzania, Rhodesia, Moçambique.

Ecology: Montane rain forests; alt. 800–1200 m.

Tanzania: Derema, E. Usambara Mts. (Nov.) Greenway 6053 (BR, EA); Kwamkuyo, E. Usambara Mts. (Nov.) Zimmermann 2926 (EA, type of *Gaertnera zimmermannii*); Kingori, E. of Ngurdota Crater (July) Willan 259 (EA).

Moçambique: Manica e Sofala: Chimoio, Garuzo (Nov.) Simão 637 (LISC).

Notes. *S. mellodora* is closely allied to *S. mitis* by the habit, leaf-venation, and size of flowers. They differ from each other as follows:

Branchlets glabrous; leaves drying dark brown with pale greenish-brown; flowers 4-merous; calyx not subtended by bracteoles; corolla in the mature bud 2.5–4.5 × as long as the calyx; tube 0.5–0.7 × as long as the calyx; lobes 4–5 × as long as the tube; anthers glabrous; ovary 1-celled; no colleters in the axils of the sepals *S. mellodora*

Branchlets often partially pubescent; leaves drying pale greenish-brown; flowers 4–5-merous; calyx subtended by 1 or 2 sepal-like bracteoles; corolla in the mature bud 2–2.7 × as long as the calyx; tube 0.9–1.3(1.5) × as long as the calyx and 0.6–1.2 × as long as the lobes; anthers bearded at the base; ovary 2-celled; colleters in the axils of the sepals *S. mitis*

S. mellodora is also closely allied to *S. xylophylla* (see notes to that species).

41. *S. memecyloides* S. Moore in Cat. Talbot's Nig. Pl. 69. 1913; Hutchinson & Dalziel, Fl. W. Trop. Afr. 2: 24. 1931, partly (excl. syn. *S. talbotiae* S. Moore, Chevalier 17994, and Talbot 2077); not Chevalier, Expl. Bot. Afr. Occ. Fr. 1: 443. 1920.

Heterotypic synonym: *S. memecyloides* var. *effusior* S. Moore, l.c. p. 70.
Type: Nigeria: Oban, Calabar Province, Talbot 2079 (BM, holotype; isotypes: K, WAG, Z).

Liana, at least 10–40 m long and 5–20 m high climbing in trees. Trunk 3–10 cm in diam.; bark pale brown, with large lenticels, thin; wood pale ochraceous. *Branches* not lenticellate, pale to dark brown when dry; branchlets brown-pubescent, dark brown and not or hardly sulcate when dry. Tendrils paired. *Leaves*: petiole short, brown-pubescent, 2–3 mm long; blade slightly shining and dark green above, much paler beneath when living, not when dry, coriaceous or especially in the shade papyraceous, elliptic, narrowly elliptic or narrowly ovate, comparatively narrower towards the apices of the branchlets, 2–4 × as long as wide, (7.5)12–22 × 3.5–10 cm, sometimes some smaller, distinctly acuminate at the apex, cuneate or rounded at the base, glabrous above, sparsely pubescent on the costa and main secondary veins beneath; one pair of secondary veins from above the base curved along the margin and often a faint submarginal pair; costa and mostly main secondary veins at least at the base impressed above; tertiary venation reticulate, prominent beneath. *Inflorescence* axillary or terminal or both, congested or lax, short, 0.1–0.5 × as long as the leaves, 1.5–8 × 1.5–3 cm, in fruit often much longer and up to 9 × 4 cm, many-flowered, 3–4 × branched. Peduncle, branches, and pedicels very pale green, brown-pubescent. Bracts oblong, up to 3 × as long as the sepals and like those, sparsely pubescent, without colleters. *Flowers* 5-merous. *Sepals* very pale green, connate at the base, ovate to suborbicular, 1–1.3 × as long as wide, 1.2 × 1.2 – 2 × 1.5 mm, obtuse or rounded at the apex, minutely ciliate, glabrous or sparsely pubescent outside, glabrous or appressed-pubescent at the base inside, without colleters. *Corolla* in the mature bud 2–2.5 × as long as the calyx, 3–4 mm long, and rounded at the apex, very pale green and sparsely pubescent to glabrous outside, inside white and with a pilose ring in the throat; tube 0.7–1 × as long as the calyx, 1.2–1.5 mm long; lobes 1.6–1.7 × as long as the tube, narrowly triangular, 1.6–2.8 × as long as wide, 2–2.5 × 0.9–1.2 mm, acute, spreading. *Stamens* hardly exserted; filaments short, about 0.2–1 × as long as the anthers, inserted at the mouth of the corolla tube; anthers ovate or nearly so, 0.6 × 0.4 – 1 × 0.7 mm, bearded with some pilose hairs at the subcordate base; cells slightly divergent. *Pistil* pilose, 2–2.2 mm long; ovary entirely glabrous or only at the very base, broadly ovoid, 1–1.2 × 0.8–1.2 mm, 2-celled, attenuate into the style; style pilose, short, 1–1.2 mm long; stigma capitate. In each cell 10–12 ovules. *Fruit* small, ellipsoid, laterally compressed, 2 × 1.8 × 1.5 – 3 × 2.5 × 2 cm, one-seeded. Wall thin. *Seed* flattened, more or less plano-convex, obliquely elliptic, 22 × 14 × 5 – 23 × 16 × 6 mm, very shortly and densely pubescent, rather smooth.

Distribution: S. Nigeria, Cameroun, Congo (both).

Ecology: Rain forests and secondary forests, often on river banks; alt. 0–500 m.

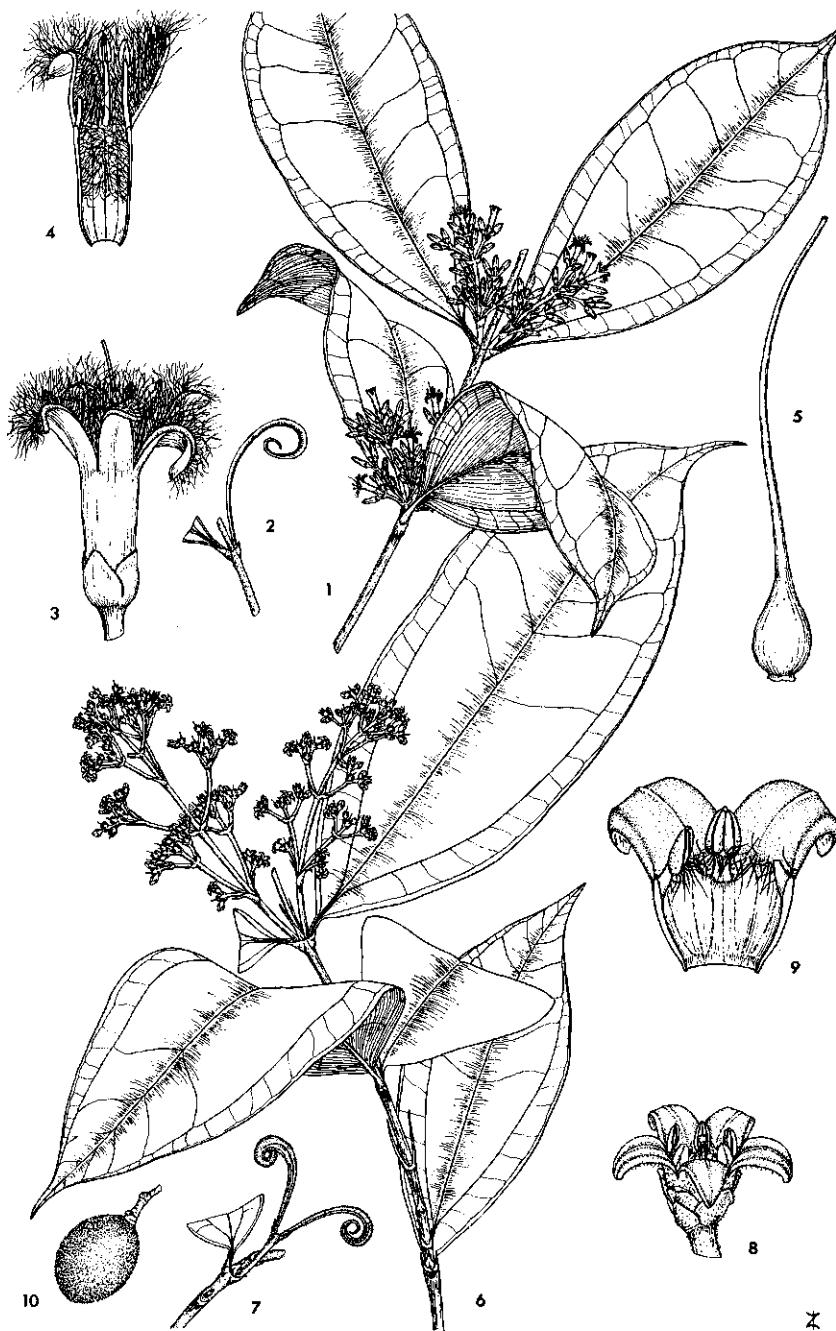

FIG. 27. 1-5. *S. ndengensis*: 1. branch, $\frac{1}{2} \times$; 2. tendril, $\frac{1}{2} \times$; 3. flower, $5 \times$; 4. portion of corolla with stamens, $5 \times$; 5. pistil, $10 \times$ (1-5. Kasai: Tshikapa, Duvigneaud 1086 (BR); 160 km S. of Luebo, along road to Tshikapa, Germain 7961 (BR, WAG).

42. *S. millepunctata* Leeuwenberg, Act. Bot. Neerl. 14: 221, f.l. 1-6. 1965, partly (excl. Chevalier 13128 and Thomas 5032). Type: Ivory Coast: Abouabou Forest, between Abidjan and Grand Bassam, Leeuwenberg 2662 (WAG, holotype; isotypes: A, B, BR, COI, FHO, G, K, M, MO, P, PRE, S, U, Z).

Fig. 28, p. 187; Map 28, p. 176

Liana at least 20–25 m long and 5 m high climbing in trees. Trunk 3 cm in diam. or more. Bark pale and dark grey-brown-spotted, not lenticellate, thin, smooth; wood pale yellow. Branches pale to medium brown, not lenticellate, not sulcate when dry; branchlets glabrous, green, terete, pale greenish-brown and often slightly sulcate when dry. Leaves: petiole glabrous, 4–10 mm long; blade slightly or hardly shining, above medium to dark green, paler beneath, coriaceous in the sun, thinly coriaceous or papyraceous in the shade, elliptic or ovate, 1.4–2 × as long as wide, 4–10(14) × 2–7(8) cm, apiculate or acuminate at the apex, cuneate or rounded at the base, glabrous on both sides, above with minute translucent dots; one pair of secondary veins from or from above the base curved along the margin and a faint submarginal pair; tertiary venation reticulate, not very distinct, prominent beneath. Inflorescence axillary, solitary, rather congested, few-flowered, short, 1–1.5 × 1 cm, 2 × branched. Peduncle, branches, and pedicels short, glabrous. Bracts small, sepal-like, glabrous above, without colleters. Flowers 5-merous. Sepals connate at the base, equal or sub-equal, broadly ovate or suborbicular, about as long as wide, 1.2–1.3 × 1.2 mm, obtuse or rounded, ciliate, glabrous on both sides, without colleters. Corolla in the mature bud about 3.5 × as long as the calyx, and about 4.5 mm long, white (?), outside pubescent; tube about 3 mm long; lobes about 1.5 mm long (only incomplete in herb. Nozeran 6 Sept. 1950). Pistil glabrous, 4.5 mm long; ovary ovoid, 1.5 × 1 mm, gradually narrowed into the style, 2-celled; style slender, 3 mm long; stigma capitate. In each cell about 6 ovules. Fruit orange, nearly mature dark green, small, soft, globose, 1–2 cm in diam., 1-seeded, with smooth skin, hardly shining, slightly obliquely pedicellate. Wall thin, about 1 mm thick. Pulp orange. Seed pale brown, slightly flattened, ellipsoid, 8 × 7 × 6–11 × 9 × 7 mm, densely pubescent, smooth; testa thin, sticking to the pulp.

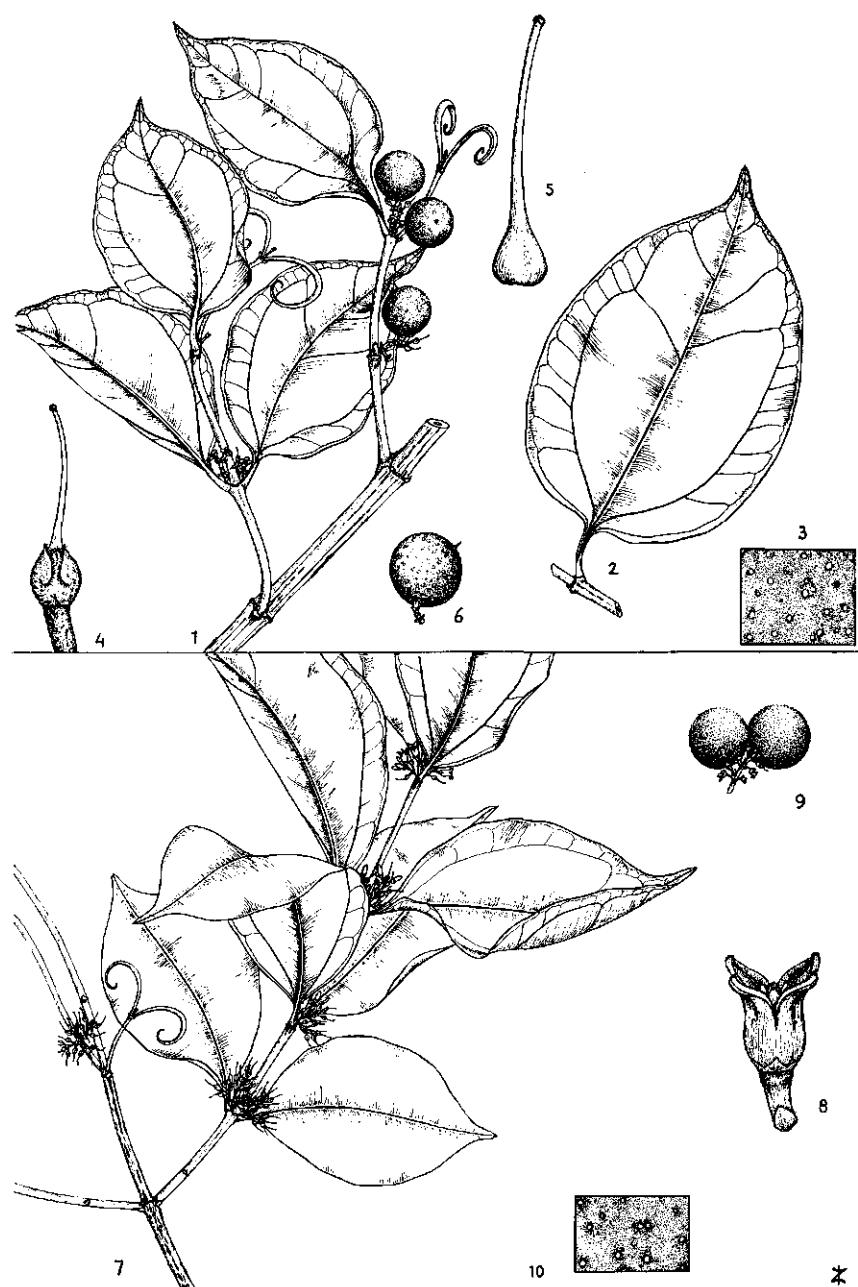

FIG. 28. 1-6. *S. millepunctata*: 1. fruiting branch, $\frac{1}{2} \times$; 2. leaf, $\frac{1}{2} \times$; 3. leaf portion above, $15 \times$; 4. calyx with pistil, $5 \times$; 5. pistil, $7 \times$; 6. fruit, $\frac{1}{2} \times$ (1-3. Leeuwenberg 2662; 4-5. Nozeran 6 Sept. 1950; 6. J. de Wilde & Leeuwenberg 3447). 7-10. *S. cuminodora*: 7. flowering branch, $\frac{1}{2} \times$; 8. flower, $5 \times$; 9. immature fruits, $\frac{1}{2} \times$; 10. leaf portion above, $15 \times$ (7, 8 and 10. Leeuwenberg & Brader 3737; 9. Guillaumet 1604).

Distribution: Ivory Coast.

Ecology: Rain forests or secondary forests, usually on river banks; alt. 0–200 m.

Ivory Coast: 15 km E. of Soubré, left bank Bo R., Leeuwenberg 4098 (ABI, WAG); 20 km NW. of Sassandra, Leeuwenberg 4030 (WAG); 7 km W. of Oumé, Leeuwenberg 4145 (WAG); Abouabou Forest, between Abidjan and Grand Bassam (fr. Feb.) J. de Wilde & Leeuwenberg 3447 (ABI, BR, K, WAG); ibid. (fr. Feb.) Leeuwenberg 2662 (herbaria see above, type); ibid. (fl. just over) Nozeran 6 Sept. 1950 (MPU); ibid., Oldeman 94 (WAG).

Cult.: Wageningen, seedling of herb. J. de Wilde & Leeuwenberg 3447: Leeuwenberg 7819 (WAG).

Notes. The paratype, Thomas 5032, has shorter pistils than the Ivory Coast collections cited above. It is identified as *S. cuminodora* here, although the leaves are rather thick for that species. The other Sierra Leone specimens of the latter species have also rather thick leaves. The identity of the vegetative specimen, Chevalier 13128, is therefore somewhat doubtful.

S. millepunctata resembles *S. floribunda* by the leaves, calyx, pistil, and size of the fruits. It differs from it as follows:

Tendrils paired; leaves minutely punctate; branches not lenticellate, dark green, turning brown; fruits globose *S. millepunctata*
Tendrils solitary; leaves not punctate; branches lenticellate, nearly black; fruits ellipsoid *S. floribunda*

Furthermore, it resembles *S. cuminodora* by the paired tendrils, the not lenticellate branches, and the minutely punctate leaves, but it differs from the latter in the following characters:

Pistil 4.5 mm long; branchlets not grooved; leaves coriaceous or nearly so in the sun *S. millepunctata*
Pistil 2–2.4 mm long; branchlets grooved below the stipular line; leaves thinly coriaceous or papyraceous also in the sun *S. cuminodora*

43. *S. mimfiensis* Gilg ex Leeuwenberg, sp. nov. (Gilg ex Duvign., Bull. Soc. Roy. Bot. Belg. 85: 31. 1952, nomen). **Fig. 24, p. 175; Map 28, p. 176**

Liana magna silvae densae cirrhis solitariis profulta. Folia glabra laminis papyraceis ellipticis apice acuminatis vel caudatis conspicue venosis. Inflorescentia axillaris parva pauciflora pedunculis pedicellisque glabris. Flores plerumque pentameri parvi. Sepala ovata subacuta ciliata utrinque glabra. Corolla pallide flava extus glabra intus lobis suberectis crassis apice pilis incurvatis profulta. Stamina corollae fauce inserta filamentis brevibus antherisque glabris basi cordatis. Pistillum glabrum ovario biloculari styloque brevi. Fructus pallide viridis parvus ellipsoideus monospermus. Semen ellipsoideum laeve testa tenuissima.

Type: Cameroun: 24 km NE. of Douala, along road to Edéa, Leeuwenberg

6821 (WAG, holotype; isotypes: A, BR, C, COI, E, FHO, G, K, LISC, M, P, PRE, S, U, UC, YA, Z).

Large liana, 50–80 m long and up to 40 m high climbing in trees. Trunk 4–8 cm in diam.; bark pale brown, with some lenticels; wood pale brownish. *Branches* pale grey or pale brown, slightly lenticellate, terete; branchlets glabrous, not lenticellate, medium green, dark brown when dry. *Leaves*: petiole glabrous, 3–7 mm long; blade more or less shining on both sides, hardly paler beneath, papyraceous or when living sometimes thinly coriaceous, elliptic, 2–3 × as long as wide, 5–11 × 2–5 cm, in the shade thinner and up to 15.5 × 6 cm, distinctly acuminate to caudate at the apex, cuneate or rounded at the base, glabrous on both sides; one pair of secondary veins from or from above the base curved along the margin, which are impressed above like the costa; tertiary venation reticulate, prominent on both sides in dry leaves, in living leaves only beneath. *Inflorescence* axillary, small, 0.1–0.2 × as long as the leaves, rather congested, but with usually distinct peduncle, few-flowered, 1–1.5 cm long and wide, 2–3 × branched. Peduncle, branches, and pedicels glabrous. Bracts approximately sepal-like, glabrous on both sides, without colleters. *Flowers* (4–)5-merous, often sessile. *Sepals* pale green, connate at the base up to one-third of their length, equal, ovate, 1–1.5 × as long as wide, 1.2–1.4 × 0.8–1 mm (inside 1 mm long), obtusely acute, ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 2–3 × as long as the calyx, 2.5–3 mm long, and obtuse at the apex, pale yellow, thin at the base, distinctly thicker towards the apex, outside glabrous, inside with recurved brushes of white hairs at the apices of the lobes; tube 0.8–1.5 × as long as the calyx inside, 0.8–1.5 mm long, wide; lobes narrowly triangular, 1–2 × as long as the tube, 1.5–1.7 × 0.8 mm, thick, acute, erect. *Stamens* hardly exserted; filaments glabrous, short, 0.7–1 × as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 0.6–0.8 × 0.6 mm, deeply cordate at the base, glabrous. *Pistil* glabrous, 1.4–1.8 mm long; ovary ovoid, 1 × 0.8–1 mm, 2-celled, rather abruptly narrowed into the style; style short, 0.4–0.8 mm long; stigma obscurely bilobed or capitate. In each cell 5 ovules. *Fruit* small, ellipsoid, mature pale green, 23 × 15–25 × 17 mm, thin-walled, 1-seeded. *Seed* ellipsoid or nearly so, smooth, 16 × 10 × 6–20 × 10 × 7 mm. Testa thin, sticking to the pulp.

Distribution: Western part of East Cameroun.

Ecology: Rain forests and secondary forests with *Lophira alata* Banks ex Gaertn. f.; alt. 0–100 m.

Cameroun: 24 km NE. of Douala, along road to Edéa (Oct.) Leeuwenberg 6316 (WAG), 6821 (type, herbaria see above), 6823 (WAG, seedlings of 6821); 17 km E. of Kopongo, along road to Masok, right bank Bolobo R., Leeuwenberg 6292 (WAG); 60 km S. of Edéa, S. of Mboké, Leeuwenberg 5550 (WAG); Bipindi (Mar.) Zenker 3341 (BM, E, G, K, US, WU), 4877 (BR, G, K, LE, MO, W); ibid., Mimfia, Zenker 521 (number in pencil, Mar. 1914: B, BOL, BREM, C, F, FI, G, GH, JE, LY, MO, NY, P, U, UC, US, WAG), June 1911 (F).

Notes. *S. mimfiensis* was used for the first time as a manuscript name by GILG on the labels of three numbers collected by Zenker, nos. 521 and 3341, cited above, and 4270 which is *S. boonei*. DUVIGNEAUD (1952) published it as a nomen nudum.

This species is closely allied to *S. malchairii* by the arrangement of the tendrils, the flowers, fruits, and seeds. It differs in the following characters: the leaves are thinner, shining instead of dull and hardly paler beneath, and darker when dry. The secondary veins deviate from the costa at a right angle instead of a rather small angle.

Fig. 26, p. 183; Map 30, p. 191

Type: Rhodesia: Chirinda Forest, Swynnerton 17a (BM, lectotype; isotypes: K, Z).

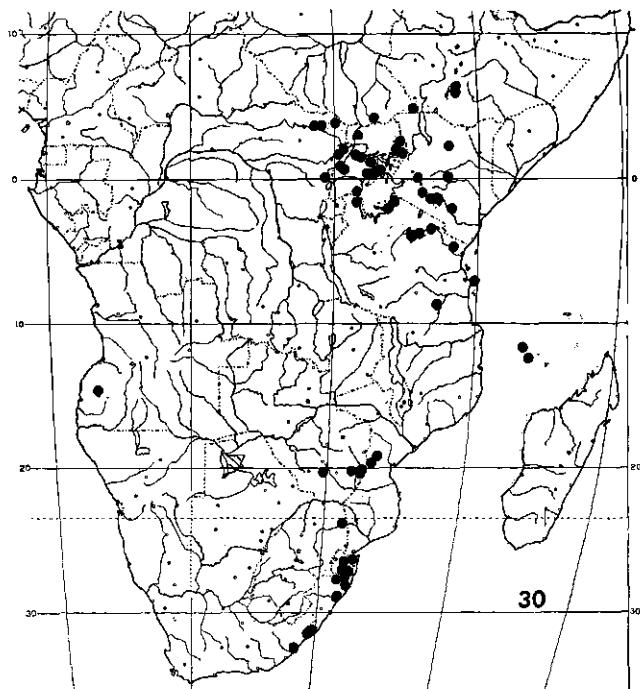

Heterotypic synonym: *S. adolphi-frederici* Gilg in Mildbraed, Wiss. Ergebn. Deutsch. Zentr.-Afr. Exped. 1907-'08. 2: 531, t. 73 F-J. 1914. Type: Congo: Orientale, Semliki R. Valley, Mildbraed 1997 (holotype not seen, destroyed in B; lectotype: PRE).

Evergreen tree with rounded crown, 6–35(40) m high (rarely shorter). Trunk 20–100 cm in diam.; bark smooth, grey, grey-green, or grey-brown; wood whitish, hard. *Branches* pale grey or buff, mostly paler than in *S. mellodora*, lenticellate, ascending, with fissured bark; branchlets glabrous or sometimes pubescent, pale grey or pale to medium brown, not lenticellate, sulcate when dry. *Stipules* none. *Leaves*: petiole short, glabrous or sometimes (if branchlets hairy) pubescent, 2–5 mm long, smooth; blade shining and dark green above, paler beneath, coriaceous (not thick), narrowly elliptic, oblong, or sometimes ovate or narrowly ovate, 1.7–3.5 × as long as wide, 4–11.5 × 1.5–5 cm, usually comparatively narrower towards the apices of the branchlets, mostly acuminate, more rarely acute or obtuse at the apex, cuneate or rounded at the base or decurrent into the petiole, glabrous or sometimes pubescent on both sides; one pair of distinct secondary veins from about 1 cm above the base and a faint submarginal pair from the base; tertiary venation spreading, not very prominent. *Inflorescence* axillary and terminal, dense or rather so, much shorter than the leaves, 1–3(4) × 1–2.5 cm. Peduncle, branches, and bracts beneath pubescent. Peduncle usually short. Bracts without colleters. *Flowers* 4–5-merous, even in a single inflorescence, sessile. *Sepals* pale green, connate at the very base, broadly ovate or orbicular, about as long as wide, 1.5–1.8 × 1.5–1.8 mm, obtusely acute at the apex, ciliate, pubescent to glabrous outside, glabrous and with colleters at the base inside. *Corolla* in the mature bud 2–2.7 × as long as the calyx, 3.5–4 mm long, and rounded at the apex, creamy, yellow, or greenish,

outside glabrous, inside densely villose at the base of the lobes; tube campanulate, $0.9-1.3(1.5) \times$ as long as the calyx, $0.6-1.2 \times$ as long as the lobes, $1.5-2.2$ mm long; lobes thick at the apex, triangular to ovate, $1.1-1.7 \times$ as long as wide, $1.5-2.5 \times 1.1-1.8$ mm, acute at the apex, often slightly widened above the base, spreading or sometimes recurved. *Stamens* just exserted; filaments glabrous, short, $0.2-1 \times$ as long as the anthers, inserted at two-thirds from the base of the corolla tube; anthers cordate-orbicular when young, becoming oblong after the pollen is shed, $1-1.2 \times 0.6-0.7$ mm, bearded at the deeply cordate base; cells parallel. *Pistil* glabrous, 2.3–3 mm long; ovary ovoid or ovoid-conical, about $1.5 \times$ as long as wide, $1-2 \times 0.7-1.3$ mm, 2-celled, gradually narrowed into the style; style 0.8–1.5 mm long; stigma capitate. In each cell about 10–15 ovules. *Fruit* yellow or orange, small, subglobose, 1–2 cm in diam. Wall thin. *Seeds* 1 (–2), pale ochraceous, subellipsoid, usually flattened at one side, $1-1.2 \times 0.8-1 \times 0.5-0.6$ cm, smooth, glabrous, not grooved, very minutely foveolate; hilum in the middle of the mostly flattened side. *Testa* thin.

Distribution: Angola, East Africa from Sudan and Ethiopia to Kentani in South Africa, and Comoro Islands.

Ecology: Upland and lowland rain forests and gallery forests; alt. 0–2100 m.

45. ***S. moandaensis*** De Wild., Ann. Mus. Congo. Sér. 5. 3: 249. 1910; Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 26, f. 8 A. 1952.

Fig. 29, p. 195; Map 31, p. 197

Type: Congo (Kinshasa): Léopoldville: Moanda, Gillet 4013 (BR, holotype). Heterotypic synonym: *S. decorsei* A. Chev., Rev. Bot. Appliq. 27: 374, pl. 19 B. 1947 (and Et. Fl. Afr. Centr. Fr. 1: 203, 1913, nomen). Type: Congo (Brazzaville): Bondjoland, Oubangui R., Chevalier 5153 (P, holotype).

Climber. *Branches* lenticellate or not, dark brown when dry; branchlets pubescent to glabrous, not lenticellate, often slightly sulcate and brown when dry. Tendrils paired. *Leaves*: petiole short, sparsely pubescent or rarely glabrous, 1–3 mm long; blade shining above, paler and less shining beneath, coriaceous, elliptic, narrowly elliptic, ovate, or narrowly ovate, 1.5–3 × as long as wide, 2–7 × 1–3 cm, acute or sometimes acuminate at the apex, cuneate, rounded or – if ovate – often subcordate at the base, glabrous or sparsely pubescent on the costa on both sides; one pair of rather faint secondary veins from the base curved along the margin; sometimes an additional fainter submarginal pair; tertiary venation reticulate, prominent on both sides or only beneath. *Inflorescence* axillary and at the same time terminal, congested or not, many-flowered, about as long as the leaves, 2 × 2–5 × 4 cm. Peduncle, branches, and pedicels sparsely pubescent. Bracts small, narrowly ovate or nearly linear, sparsely pubescent beneath. *Flowers* 5-merous. *Sepals* connate at the base, ovate, 1 × 0.8 mm, acute at the apex, ciliate, sparsely pubescent outside, glabrous inside, without colleters. *Corolla* in the mature bud 3.5–4 mm long, and rounded at the apex, white, obconical, outside glabrous or sometimes with a single hair, inside pilose in the throat, tube 1.2–2 mm long, gradually widened towards the throat; lobes 1–2 × as long as the tube, narrowly ovate, 2–3 × as long as wide, 2–2.5 × 0.8–1.2 mm, acute, spreading. *Stamens* well-exserted; filaments shorter than the anthers, 1 mm long, glabrous, inserted at the mouth

of the corolla tube; anthers oblong, $1.3-1.4 \times 0.5-0.7$ mm, deeply cordate and bearded with some pilose hairs at the base; cells parallel. *Pistil* 2.8–4 mm long, pilose; ovary ovoid, $1-1.5 \times 0.8-1$ mm, pilose, except for the glabrous very base, 2-celled, gradually narrowed into the style; style 1.8–2.5 mm long, pilose, except for the glabrous very apex; stigma capitate. In each cell 8 ovules. *Fruit* orange-yellow, small, soft, subglobose, about 13–15 mm in diam., 1–2(5)-seeded, slightly shining. Wall thin. *Seeds* medium brown, smooth, puberulous, elliptic, or – if more than 2 – trullate, flattened, $9 \times 5 \times 4 - 12 \times 9 \times 5$ mm, more or less plano-convex, acute at one end. Testa rather thick.

Distribution: Congo (both), Angola.

Ecology: Rain forests, on river banks, at low elevations.

Congo (Brazzaville): Bondjoland, Oubangui R. (fr. Aug.) Chevalier 5153 (P, type of *S. decorsei*); Foulakari Falls (Oct.) Sitha 1861 (WAG).

Congo (Kinshasa): Léopoldville: Moanda (fr. June) Donis 1789 (BR); ibid., Gillet 4013 (BR, type); Wombe, Thysville Territory (fr. Jan.) Compère 1365 (BR, K).

Angola: Luanda: Museque de Viana, Exell & Mendonça 23 (COI, LISJC); ibid. (fl. Mar., Nov.-Dec., fr. Oct.) Gossweiler 10519 (BM, COI), 10519 C, partly (NLI), 10544 (BM, COI), 11344 (COI, LISJC), March 1938 (K, LISJC); Luanda, near Bengo R. (fl., fr. May) Gossweiler 9244 (BM, COI, K, LISJC, US); km 28 of Catete Railway, Gossweiler 10445 (BM, COI); Catete, Gossweiler 9224 (BM, COI, K, US); Quiçama, Caça Res. (June) J. C. Henriques 40 (NLI). Lunda: Dundo, near Luachimo R., Gossweiler 13779 (B, BM, K, NLI, US, WAG, aberrant by large leaves and large flowers).

Notes. *S. moandaensis* is closely allied to *S. kasengaensis* (q.v.). One specimen, Gossweiler 13779, identified here as *S. moandaensis* on the ground of its inflorescence and fruit characters, is aberrant. The flowers are too large for the species, as far as is known. Flowers of this size occur in *S. kasengaensis*. The leaves are shining and large, $6-12 \times 2.5-6.5$ mm.

The flowers, fruits, and seeds of the type of *S. decorsei* agree with those of the type of *S. moandaensis* and of the other specimens examined. Only the leaves of the former are not shining beneath. This character is not important enough to keep the species apart, according to the present author.

46. *S. mostueoides* Leeuwenberg, sp. nov. Fig. 30, p. 198; Map 24, p. 152

Frutex ramis inermibus saepe bifurcatis. Folia petiolis brevibus pubescentibus laminisque subcoriaceis forma magnitudineque variabilissima ovatis, anguste ovatis vel ellipticis apice saepe longe acuminatis basi rotundatis vel cuneatis utrinque glabris vel costa sparse pubescentibus. Inflorescentia terminalis laxa pauciflora pedunculo pedicellisque glabris vel sparse pubescentibus pilis saepe seriatis. Flores pentameri parvi. Sepala fere triangularia apice acuta ciliata extus glabra vel pilis paucis profulta. Corolla extus glabra intus basi loborum suberectorum penicillata. Stamina inclusa filamentis antheris oblongis base cordatis pilis perpaucis barbatis aequilongis. Pistillum glabrum brevissimum ovario biloculari. Fructus minimus mono- vel bispermus. Semen ellipticum disciforme scabridum.

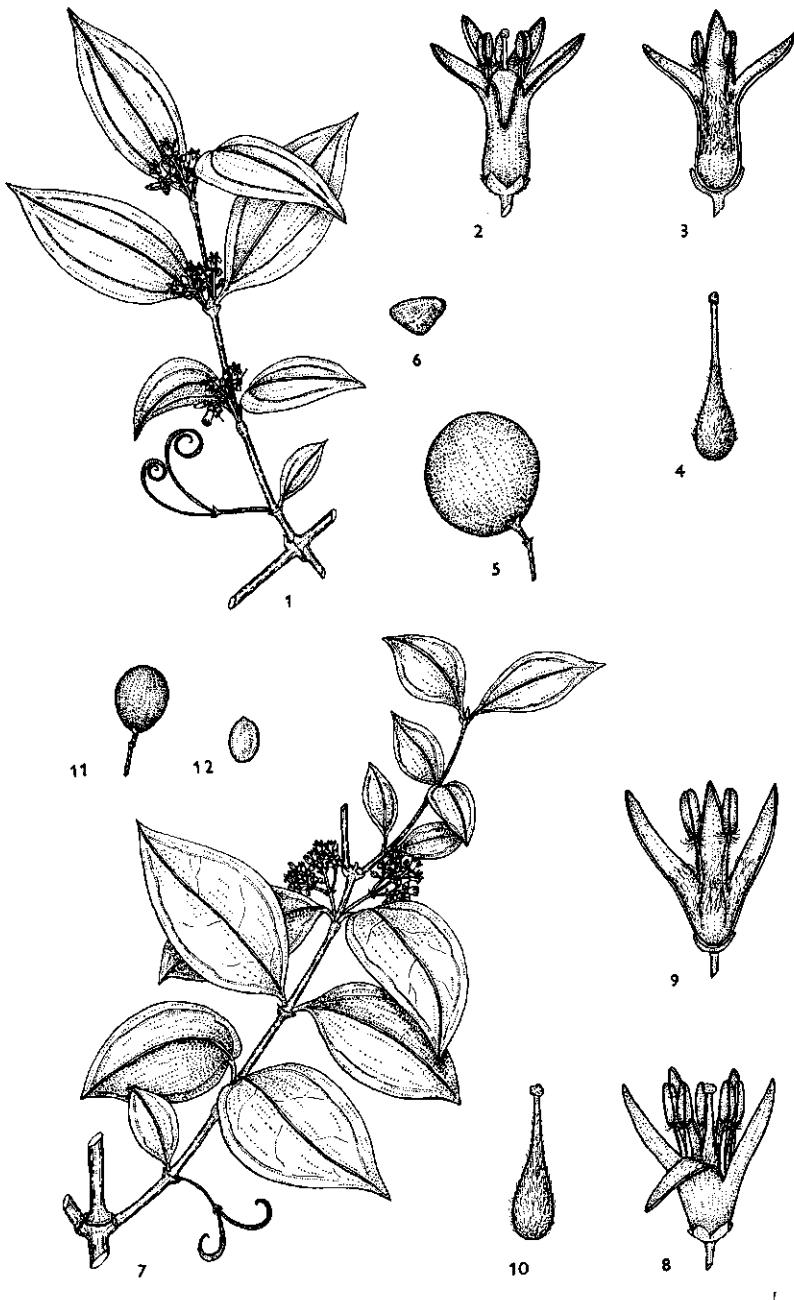

FIG. 29. 1–6. *S. kasengaensis*: 1. branch, $\frac{1}{2} \times$; 2. flower, $4 \times$; 3. opened flower, $4 \times$; 4. pistil, $4 \times$; 5. fruit, $\frac{1}{2} \times$; 6. seed, $\frac{1}{2} \times$ (1–4. de Witte 3216; 5–6. Glover in Bredo 6408); 7–12. *S. moandaensis*: 7. branch, $\frac{1}{2} \times$; 8. flower, $6 \times$; 9. opened flower, $6 \times$; 10. pistil, $6 \times$; 11. fruit, $\frac{1}{2} \times$; 12. seed, $\frac{1}{2} \times$ (7–10. Gossweiler 10544; 11–12. Gossweiler 11344).

Type: Madagascar: Sambirano R. Valley, Perrier de la Bâthie 15504 (P, holotype; isotype: WAG).

Shrub, 2–3 mm high. *Branches* not lenticellate; often dichotomously branched; branchlets sparsely pubescent with often ranked hairs or glabrous, not lenticellate. *Leaves*: petiole short, pubescent or glabrous, 0.5–2 mm long; blade shining or mat on both sides, paler beneath, subcoriaceous, very variable in shape and size, ovate, narrowly ovate, or elliptic, 1.5–4 × as long as wide, 20–70 × 9–30 mm or smaller, often long-acuminate, with a mostly obtuse apex, rounded or cuneate at the base, glabrous or sparingly pubescent on the costa on both sides or only beneath; one pair of rather distinct secondary veins from or from above the base curved along the margin and a faint submarginal pair; tertiary venation reticulate, slightly prominent on both sides. *Inflorescence* terminal, lax, few-flowered, 1 × 1 – 2 × 2 cm, 2 – 3 × branched. Peduncle, branches, and pedicels glabrous or sparsely pubescent with often ranked hairs. Bracts small, narrowly triangular or sepal-like. *Flowers* 5-merous. *Sepals* connate at the base, equal or subequal, the inner often slightly smaller, nearly triangular, 1–1.2 × 1 mm, acute at the apex, ciliate, outside glabrous or with a single hair, inside glabrous, without colleters. *Corolla* in the mature bud 4 × as long as the calyx, 4.8 mm long, cylindrical, white, outside glabrous, inside penicillate on the base of each lobe; tube 2 × as long as the calyx, as long as the lobes, 2.4 × 1.2 mm; lobes oblong, 2.4 × 0.8 mm, acute, entire, suberect. *Stamens* included; filaments short, about as long as the anthers, glabrous, inserted on the middle of the corolla tube; anthers oblong, 0.8 × 0.4 mm, with a single hair at the deeply cordate base; cells parallel. *Pistil* glabrous, very short, 1 mm long; ovary ovoid, 1 × 0.5 mm, 2-celled; stigma sessile, capitate. In each cell 2–3 ovules. *Fruit* small, 1–2-seeded, flattened when dry, 6–8 mm in diam. *Seed* elliptic, disk-like, 6 × 5 × 2 – 8 × 7 × 2 mm, rough, scabrid-pubescent. Testa rather thick.

Distribution: Madagascar and perhaps also in Congo (Kasai).

Ecology: Low forest near river banks; alt. 0–500 m.

Madagascar: Ifasy R. Valley, below Anaborano, Ambilobe District (fr. Mar.) Humbert & Capuron 25876 (P, WAG); Sambirano R. Valley (Jan.) Perrier de la Bâthie 15504 (P, WAG, type); Upper Sambirano R., Sambirano Mt. (bud. Dec.) Perrier de la Bâthie 2066 (P, WAG); Upper Mananjeba R., Sambirano R. (fr. July) Perrier de la Bâthie 2232 (P, WAG).

Notes. The following specimen which is more hairy, and which has a more congested inflorescences and outside hairy sepals may belong to this species:

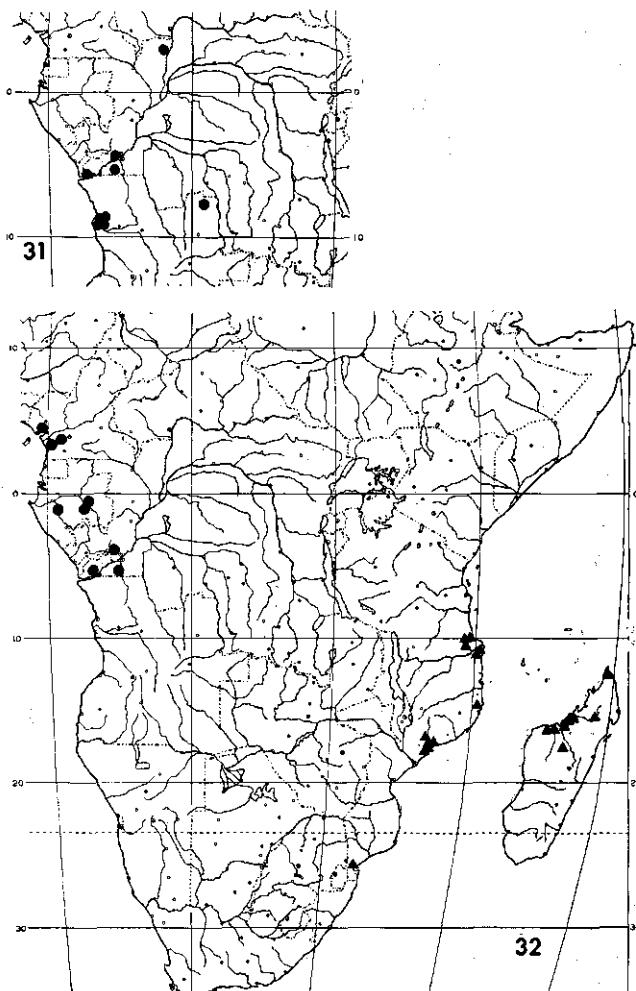

Congo (Kinshasa): Kasai: Dibaya Territory (fl. just over, Jan.) Liben 2164 (BR, WAG).

S. mostueoides is related to *S. myrtoides* by the shape of the leaves, the disposition of the inflorescence, the very small fruits, and the disk-like seeds. The differences between them are as follows:

- Leaves 2–7 cm long, often long-acuminate, mostly glabrous above and often also beneath; sepals nearly free **S. mostueoides**
 Leaves 1.2–3(3.3) cm long, rounded to acute or broadly and bluntly acuminate, hairy beneath and often also above; sepals up to one-third connate **S. myrtoides**

It is also related to *S. bifurcata* (q.v.).

The plant resembles *Mostuea surinamensis* Benth. by the habit, the inflorescence, calyx, and number of ovules. Hence the specific epithet is derived from the name *Mostuea*.

MAP 31. *S. moandaensis*; MAP 32. • *S. ngouniensis*, ▲ *S. myrtoides*.

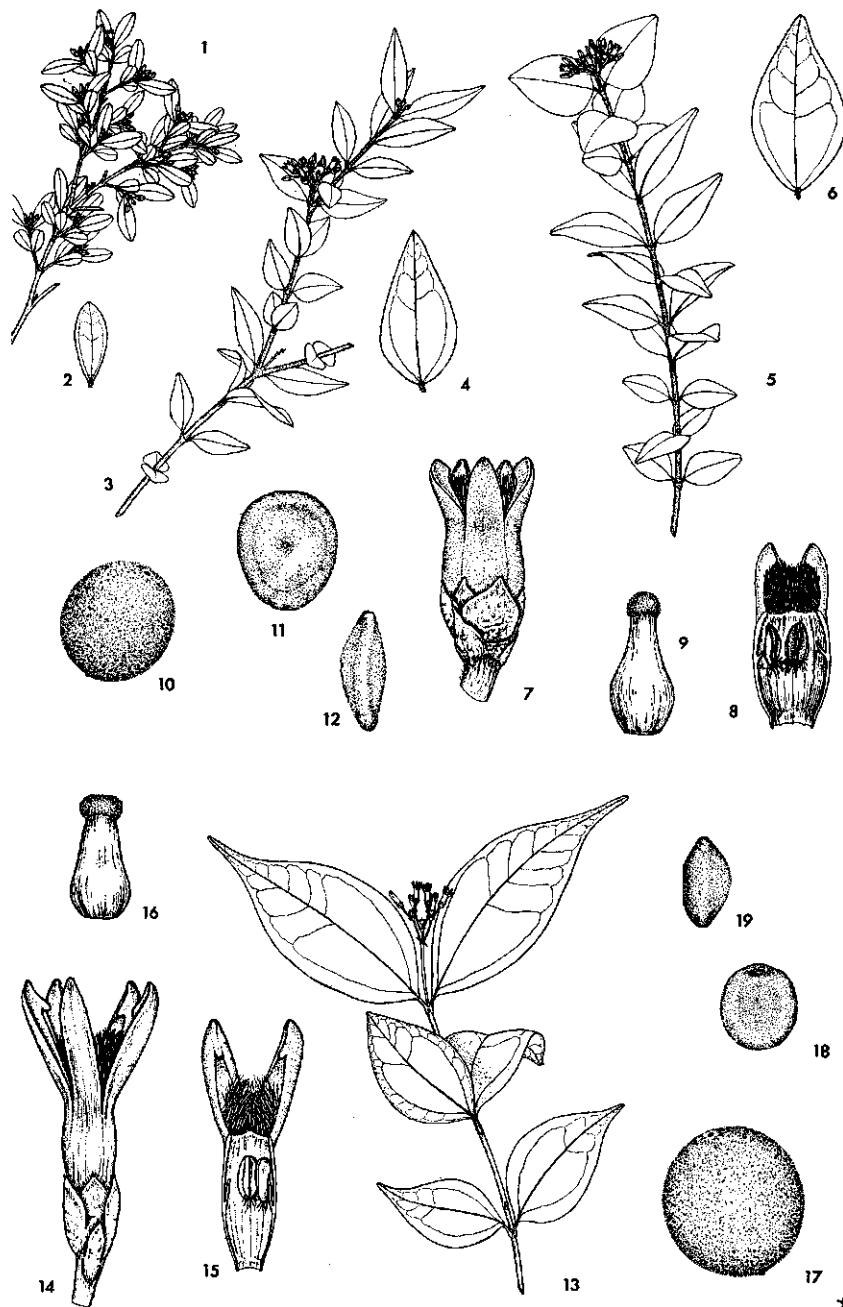

FIG. 30. 1-12. *S. myrtoides*: 1, 3, 5. branches, $\frac{1}{2} \times$; 2, 4, 6. leaves, $1 \times$; 7. flower, $6 \times$; 8. portion of corolla with stamens, $6 \times$; 9. pistil, $12 \times$; 10. fruit, $2 \times$; 11-12. seed, two sides, $2 \times$ (1-2. Busse 1108; 3-4, 10-12. Torre 5712; 5-9. Perrier de la Bathie 472). 13-19. *S. mostueoides*: 13. branch, $\frac{1}{2} \times$; 14. flower, $6 \times$; 15. portion of corolla with stamens, $6 \times$; 16. pistil, $12 \times$; 17. fruit, $2 \times$; 18-19. seed, two sides, $2 \times$ (13-16. Perrier de la Bathie 15504; 17-19. Perrier de la Bathie 2232).

47. *S. myrtoides* Gilg et Busse in Engler, Bot. Jahrb. 32: 178. 1902 with fig. (hairs in bristles, not as in C) and 36: 100. 1905; Baker in Fl. Trop. Afr. 4(1): 531. 1903; Bruce & Lewis in Fl. Trop. E. Afr. Loganiaceae 15. 1960.

Fig. 30, p. 198; Map 32, p. 197

Type: Tanzania: Newala District, Mpatila (Makondi) Plateau, near Nyangao, Busse 1108 (holotype not seen, destroyed in B; lectotype: G, other isotype seen: EA).

Much branched densely leafy shrub or small tree, 1–5 m high. Trunk 15 cm in diam. (teste Serv. For. Madag. 38). *Branches* pale brown, not lenticellate, with bark peeling off, not sulcate, often dichotomously branched; branchlets slender, pubescent with ascending brown hairs, pale brown, terete or nearly so, not sulcate when dry. *Leaves*: small or very small, subsessile or shortly petiolate; petiole pubescent with brown ascending hairs, 0.2–1(2) mm long; blade paler beneath, subcoriaceous, very variable in shape and size, ovate, narrowly ovate, elliptic, narrowly elliptic, obovate, or sometimes suborbicular, (1)1.5–4(5) × as long as wide, (4)6–20(27) × 3–8(11) mm in the continent and 12–30(33) × 6–14(19) mm in Madagascar, rounded to acute or broadly and bluntly acuminate at the apex, cuneate or rounded at the base, glabrous or with ranked appressed short hairs on the costa above, beneath sparsely pubescent or with some hairs at the base and often also on the costa, often minutely ciliate above; one pair of not very conspicuous secondary veins from or from above the base curved along the margin and often a faint submarginal pair; margin more or less revolute, especially in old leaves. *Inflorescence* terminal (and occasionally also axillary), lax or rather lax, few (sometimes 1)-flowered, 5 × 3 – 15 × 10 mm (up to 20 × 15 mm in Madagascar), 0–2 × branched. Peduncle and branches pubescent with brown ascending hairs, especially at the base. Pedicels glabrous or nearly so. Lower bracts often leafy, other small, approximately sepal-like, glabrous above, without colleters. *Flowers* (4–)5-merous. *Sepals* connate at the base up to one-third of their length, equal or subequal, broadly ovate to suborbicular, 1–1.2 × as long as wide, 0.8–1.2 × 0.8–1.2 mm, obtuse to acute at the apex, distinctly ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 2.8–3.3 × as long as the calyx, 2.2–4 mm long, and rounded at the apex, white, outside glabrous or minutely papillose-pubescent, inside white-penicillate in the throat; tube campanulate to nearly cylindrical, 1.2–1.9 × as long as the calyx, 0.8–1.4 × as long as the lobes, at the throat 1.2–1.5 mm wide; lobes narrowly triangular, 1.5–2 × as long as wide, 1.2–1.8 × 0.8–1 mm, acute, erect or suberect. *Stamens* included; filaments very short, 0.3–0.5 × as long as the anthers, glabrous, inserted on the middle of the corolla tube; anthers orbicular or oblong, 0.5–0.9 × 0.5–0.7 mm, ciliate at the deeply cordate base or sometimes all around; cells parallel. *Pistil* glabrous, very short, 0.9–1.4 mm long; ovary ovoid, 0.8–1 × 0.6 mm, 2-celled, gradually narrowed towards the apex; style very short, up to 0.6 mm long, or none; stigma capitate. In each cell 2–10 ovules. *Fruit* red or orange, small, soft, globose or laterally compressed (?), about 8–9 mm in diam., 1-seeded, with somewhat granular

skin, slightly shining. Wall thin. Pulp red or orange. Seed ochraceous-brown, flattened, disk-like, elliptic, $8 \times 7 \times 1.5$ mm, rough, with thick very short erect hairs, slightly dented at one side.

Distribution: South-eastern Tanzania, Moçambique, and Madagascar.

Ecology: *Brachystegia*-woodlands or light forests; alt. 0–600 m.

Tanzania: Njonga, Lindi District, Gillman 1388 (EA, K); between Lilo R. and Nkalakatacha (fr. June) Busse 2857 (BM, BR, EA, G, HBG, LY); Mpatila (Makondi) Plateau, near Nyangao, Newala District (Mar.) Busse 1108 (EA, G, type).

Moçambique: Cabo Delgado: Palma, Gomes Pedro 5418 (EA); ibid. (Apr.) Torre & Paiva 12086 (LISC); Tungue, near Palma (fr. Sept.) Barbosa 2147 (LISC); between Palma and Mocimboa da Praia, Gomes Pedro 5436 (EA). Moçambique: Nacala, Barbosa 2421 (LISC). **Zambezia:** Vila Maganja da Costa (fl., fr. Feb.) May) Serv. For. 19113 (P, WAG); Bevazandambo (Feb.) Saboureau 19 (P, WAG); Ambongo (Feb.) Perrier de la Bâthie 6913 (P, WAG); Tsaramandroso Canton, Ambato-Boéni District, Namamonjisa Res. Nat. 1869 (P); Firingalava (fl., fr. Jan.) Perrier de la Bâthie 472 (P, WAG).

Notes. *S. myrtoides* is closely allied to *S. mostueioides* (q.v.).

None of the other *Strychnos* species in continental Africa has as small leaves as *S. myrtoides*.

48. ***S. ndengensis*** Pellegr., Bull. Mus. Hist. Nat. Paris 33: 267. 1927; Mém. Soc. Linn. Norm. n. sér. 1: 37. 1928; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 44. 1963, partly (excl. syn. and specimens cited); Leeuwenberg, Act. Bot. Neerl. 14: 219. 1965.

Fig. 27, p. 185

Type: Gabon: Nyanga R. region, Ndenga, Le Testu 1752 (P, holotype; isotypes: B, IFAN, K, L, P).

Climber. **Branches** lenticellate, pale to dark brown and not or obscurely sulcate when dry; branchlets glabrous, slightly lenticellate, especially at the base, pale to dark brown and often slightly sulcate when dry. Tendrils solitary. **Leaves:** petiole glabrous, 5–10 mm long; blade shining above, somewhat paler and less shining beneath, coriaceous, elliptic or narrowly elliptic, $1.9-3 \times$ as long as wide, $6-12 \times 3-6$ cm, shortly acuminate at the apex, cuneate at the base, glabrous on both sides; one pair of secondary veins from the base curved along the margin, but not reaching the apex, and a faint submarginal pair; costa at the base often slightly impressed, but further like the main secondary veins

prominent above; tertiary venation reticulate, not very conspicuous. *Inflorescences* axillary, several together, lax or rather congested, much shorter than the leaves, $1.5-3 \times 1.5-2$ cm, $1-2 \times$ branched. Peduncle, branches, and pedicels glabrous. Bracts small, approximately sepal-like. *Flowers* 4-merous. *Sepals* connate at the base up to one-quarter of their length, subequal, suborbicular, as long as wide, $1-1.2$ mm long, obtuse or rounded at the apex, minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud $4.5-5.5 \times$ as long as the calyx, $5.2-6$ mm long, and tapering at the apex, white, outside glabrous, inside densely pilose except for the glabrous base of the tube; tube $1.7-2.5 \times$ as long as the calyx, $2-3$ mm long, gradually widened towards the throat, where $1-2$ mm wide; lobes $1-1.6 \times$ as long as the tube, oblong, $2.5-3.3 \times$ as long as wide, $3-3.3 \times 1-1.2$ mm, acute, recurved. *Stamens* well-exserted; filaments glabrous, $1-1.5 \times$ as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, $0.6-1.2 \times 0.25-0.6$ mm, glabrous, often obscurely cordate at the base; cells parallel. *Pistil* glabrous, $4.5-6$ mm long; ovary ovoid, $1 \times 0.6-0.9$ mm, 2-celled; style slender, $3.5-5$ mm long; stigma small, capitate, not thicker than the style. In each cell 5-6 ovules. *Fruit* unknown, supposed to be small and like that of *S. floribunda*.

Distribution: Gabon, Congo (Kinshasa).

Ecology: Rain forests; at low elevations.

Gabon: Ndenga, Nyanga R. region (May) Le Testu 1752 (B, IFAN, K, L, P, type).

Congo (Kinshasa): Léopoldville: Patambalu, Kutu Territory (Apr.) Tailfer 63 (BR, WAG).

Notes. As the flowers of both species resemble each other strikingly, the present author confused *S. ndengensis* and *S. tricalysioides* with each other when he revised the genus for the Flora of W. Tropical Africa. They differ from each other as follows:

Branches lenticellate; leaves shortly acuminate, often much shining when dry; costa and main secondary veins prominent above, only base of costa impressed; seeds unknown *S. ndengensis*
Branches not lenticellate; leaves caudate, dull when dry; costa and main secondary veins impressed above, these veins reaching the leaf-apex; seeds deeply dented and with curved hairs *S. tricalysioides*

The tree *S. elaeocarpa* resembles *S. ndengensis* by the flowers, but differs by the larger and thicker leaves.

Tailfer noted: tree with trunk up to 50 cm in diam. As the specimen agrees in all details with the liana, herb. Le Testu 1752, the present author supposes that he made an error. Moreover, the former collector describes fruits on the label, while the specimen bears only flowers, which are not mentioned.

49. *S. ngouniensis* Pellegr., Bull. Mus. Hist. Nat. Paris 32: 394. 1926; Mém. Soc. Linn. Norm. n. sér. 1: 37, f. 8: 1928 (*as ngouniensis*); Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 43. 1963, partly (excl. both syns. and all specimens cited); Leeuwenberg, Act. Bot. Neerl. 14: 218. 1965.

Fig. 31, p. 203; Map 32, p. 197

Type: Gabon: Ngounié Region, Sindara, Le Testu 2303 (P, lectotype; isotypes: A, B, FHO, IFAN, P, WAG).

Liana at least up to 20 m high climbing in trees and 30 m long. Trunk 3 cm in diam. or more; bark dark brown, lenticellate; wood brownish-creamy. *Branches* not lenticellate, dark when dry, terete; branchlets pubescent or glabrous, often sulcate when dry. Tendrils paired. *Leaves*: petiole short, often sparingly pubescent, 1–2 mm long; blade often slightly shining above, paler and hardly shining beneath, thinly coriaceous or papyraceous when dry, narrowly ovate, elliptic, narrowly elliptic, or oblong, near the base of the branchlets and on the main axis usually ovate, smaller, and comparatively wider, or reduced to small bracts, (1)1.5–3 × as long as wide, (2)3.5–11 × 1.6–5.5 cm, in the shade up to 14 × 5.5 cm, acuminate and apiculate at the apex, rarely obtuse near the base of the branchlets, rounded, subcordate, or sometimes – at the apices of the branchlets – cuneate at the base, glabrous or with some hairs on the costa above, pubescent on the costa and main secondary veins or glabrous beneath; costa impressed above, especially near the base; one pair of secondary veins from the base curved along the margin and also a faint submarginal pair; tertiary venation reticulate, especially beneath. *Inflorescence* axillary, about 0.2–0.3 × as long as the leaves, few- to many-flowered, 2–4 × branched, congested or not, 1–3 cm long and wide. Peduncle, branches, and pedicels short or rather so, sparsely pubescent. Bracts approximately sepal-like, sparsely pubescent. Peduncle up to 1 cm long, mostly shorter. *Flowers* 5-merous. *Sepals* connate at the base up to one-third of their length, orbicular or nearly so, as long as wide, 0.8–1.5 mm long, rounded at the apex or nearly so, minutely ciliate, outside shortly pubescent, inside glabrous and with some dark longitudinal stripes, without colleters. *Corolla* in the mature bud 5–8 × as long as the calyx, 6–7.5 (8.5) mm long, and rounded or nearly so at the apex, white, outside sparsely and often minutely pubescent, especially on the tube, inside with a wide densely pilose ring in the throat, lobes and base of tube glabrous; tube 2–4 × as long as the calyx, 0.6–1 × as long as the lobes, 2.5–4 mm long, gradually widened towards the throat and there about 2.5 mm wide; lobes narrowly triangular, 2–3 × as long as wide, 3.5–4(4.5) × 1.5–1.8 mm, recurved. *Stamens* well-exserted; filaments glabrous, 1.1–1.7 × as long as the anthers, inserted at the mouth of the corolla tube; anthers 1.2–2 × 0.6–1 mm, deeply cordate at the base, ventrally at the base usually with long stiff erect hairs; cells parallel. *Pistil* 6.5–7(9) mm long, hirsuto-pubescent (very base sometimes glabrous, but then on a much shorter portion than in *S. soubrensis*), 1.5–2 × 1 mm, 2-celled, gradually narrowed into the style; style hirsuto-pubescent at the base, glabrous at the apex, 5–5.5(7.5) mm long; stigma capitate. In each cell about 10 ovules. *Fruit*

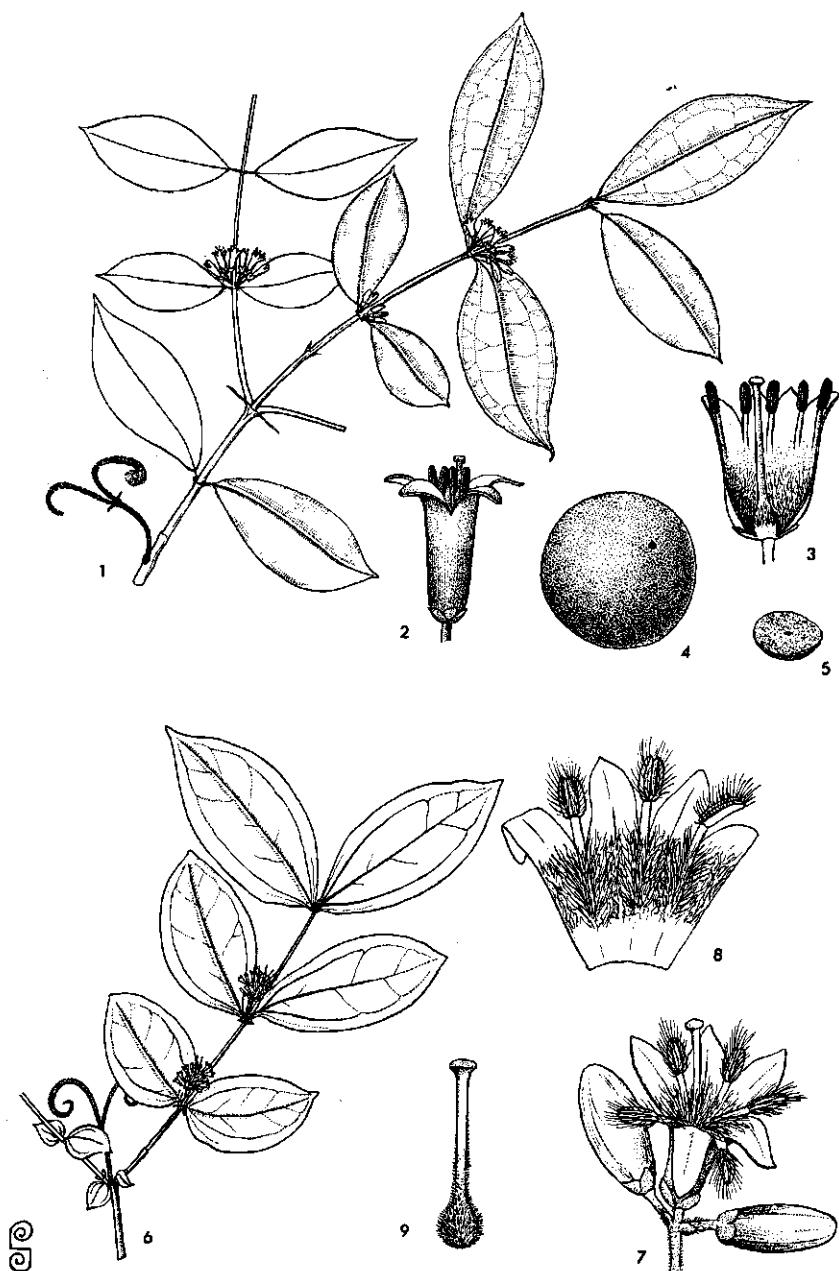

FIG. 31. 1-5. *S. soubrensis*: 1. branch, $\frac{1}{2} \times$; 2. flower, $2 \times$; 3. opened flower, $2 \times$; 4. fruit, $1\frac{1}{2} \times$; 5. seed, $\frac{1}{2} \times$ (1. Leeuwenberg 4146; 2-3. J. de Wilde c.s. 3589; 4-5. Leeuwenberg c.s. 4589); 6-9. *S. ngouniensis*: 6. branch, $\frac{1}{2} \times$; 7. flower and buds, $6 \times$; 8. portion of corolla with stamens, $7 \times$; 9. pistil, $6 \times$ (6. Le Testu 7970; 7-9. Le Testu 2303).

subglobose, about 3 cm in diam., about 10-seeded. Wall about 2 mm thick. Seed flat, ellipsoid, rough.

Distribution: Cameroun, Gabon, Congo (both).

Ecology: Rain forests or secondary forests, often on river banks; alt. about 0–200 m.

Cameroun: Nyoke (July) Schlechter 15792 (BR, PRE, cited as *S. phaeopoda*); 20 km W. of Victoria, Cameroun Mt. base, Leeuwenberg 6921 (WAG); 4 km E. of km 65 of Edéa-Kribi road, Leeuwenberg 5635 (WAG); left bank Kélé R., 29 km N. of Eséka, Leeuwenberg 6028 (WAG).

Gabon: Ngounié R. region, Le Testu 2251 (BR, K, P, WAG, paratype); ibid., Sindara (Jan.) Le Testu 2303 (A, B, FHO, IFAN, P, WAG, lectotype); Lastourville (Mar.) Le Testu 7970 (P, WAG); Lastourville Region (May) Le Testu 7351 (P, WAG); ibid., Koulamotou (Apr.) Le Testu 8747 (P, WAG).

Congo (Brazzaville): Bangou Forest, Kindamba Region (fl., fr. Feb.) Sitha 250 (WAG).

Congo (Kinshasa): Léopoldville: Temvo (Mar.) Vermoesen 1746 (BR); Mvuazi, Ntava R. (Oct.) Devred 813 (BR, PRE).

Notes. *S. ngouniensis* was erroneously united with *S. soubrensis* by the present author in the Flora of W. Tropical Africa. He separated them again in 1965 after having seen more material. These closely allied species can be distinguished as follows:

Leaves often subcordate, rarely cuneate at base; pistil at very base usually not glabrous, hirsute-pubescent; anthers with stiff erect hairs, if hairy *S. ngouniensis*

Leaves cuneate at base, occasionally subcordate; pistil glabrous at base, further pubescent; anthers with pilose hairs, if hairy *S. soubrensis*

The other species related to *S. ngouniensis* have thicker leaves. One of them, *S. scheffleri*, resembles it by the shape of the leaves and flowers. The latter species however, is mostly glabrous in the vegetative parts. The corolla may occasionally bear a single hair outside, but is never pubescent.

50. *S. nigriflora* Bak., Kew Bull. 1895: 97. 1895 and in Fl. Trop. Afr. 4(1): 523. 1903; Hutchinson & Dalziel, Fl. W. Trop. Afr. 2: 24. 1931; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 43. 1963; Leeuwenberg, Act. Bot. Neerl. 14: 219. 1965.

Type: S. Nigeria: Eppah, Barter 3249 (K, lectotype; isotype: P).

Heterotypic synonyms: *S. vogelii* Bak., Kew Bull. l.c. p. 96 and in Fl. Trop. Afr. l.c. p. 523. Type: S. Nigeria: Idah (R. Quorra at Attah), Vogel 49 (K, holotype).

S. cilicalyx Gilg in Schlechter, Westafr. Kautschuk-Exped. 304. 1900, nomen; Gilg & Busse in Engler, Bot. Jahrb. 36: 95. 1905. Type: Ghana: Kwamikrum,

Schlechter 12957 (holotype not seen, destroyed in B; lectotype: Z, other isotype seen: BM).

S. togoensis Gilg et Busse in Engler, Bot. Jahrb. 36: 96. 1905. Type: Togo: Sokodé, Kersting 691 (holotype not seen, destroyed in B, no isotype seen).

Climbing shrub or liana up to at least 30 m long, 5–15 m high climbing in trees. Trunk 4–13 cm in diam. Bark pale grey or pale to dark brown, lenticellate; wood creamy. *Branches* grey-brown, lenticellate, often slightly sulcate when dry; branchlets glabrous, lenticellate or not, green, when dry dark brown. Tendrils paired. *Leaves*: petiole glabrous, 2–7 mm long; blade shining or mat on both sides, medium to dark green above, paler and with dark green veins beneath, in the sun coriaceous, in the shade papyraceous, elliptic or narrowly elliptic, 1.5–3 × as long as wide, (3)6–11(14.5) × (1.6)2.5–7(8.5) cm, apiculate or acuminate at the apex, cuneate or rounded at the base, glabrous on both sides; one pair of secondary veins from or from above the base curved along the margin and mostly a faint submarginal pair; tertiary venation reticulate, when leaves dry prominent on both sides or only beneath; margin revolute, especially in sun-leaves. *Inflorescences* axillary or sometimes terminal, usually several together, lax, usually few-flowered, mostly much shorter than the leaves, 2 × 2 – 8 × 4 cm, 1–3 × branched. Peduncle, branches, and pedicels glabrous. Bracts small, approximately sepal-like, glabrous beneath, above minutely appressed-pubescent at the base, without colleters. *Flowers* 5-merous. *Sepals* pale green, connate at the base, equal or unequal, the inner up to 1.5 × as long as the others, orbicular or ovate, 1–1.25 × as long as wide, 2.5–5 × 2–5 mm, rounded at the apex, outside glabrous, inside minutely appressed-pubescent at the base, without colleters, ciliate. *Corolla* in the mature bud 2.2–4 × as long as the calyx, 7.5–11 mm long, slightly contracted somewhat under the throat, and tapering at the apex, creamy, yellow, or pale green, often with inside purplish-tipped lobes, outside glabrous, inside with a brush-like ring of white lanate hairs in the throat and just on the base of the lobes; tube cylindrical or nearly so, 1.2–2 × as long as the calyx, 1–1.3 × as long as the lobes, 4–6.5 mm long, at the throat 2–4 mm wide; lobes narrowly triangular, 2.2–3 × as long as wide, 4–5 × 1.3–2 mm, thick, especially at the apex, acute, spreading. *Stamens* slightly exserted; filaments very short, about 0.2–0.5 × as long as the anthers, glabrous, inserted at the mouth of the corolla tube; anthers oblong, 2–2.2 × 0.6–0.8 mm, glabrous, deeply cordate at the base; cells often slightly divergent at the base. *Pistil* pilose in the middle, 7–9 mm long; ovary ovoid or oblong, 3–4 × 1.5–2 mm, pilose at the apex, 2-celled, gradually narrowed into the style; style thick, pilose at the very base, 4–6 mm long; stigma capitate. In each cell about 50 ovules. *Fruit* orange or yellow, immature bluish-green, large, hard, globose or nearly so, 4 × 4.8 – 6.5 × 6.7 cm, with 8–45 seeds, with somewhat granular skin, slightly shining. Wall thick, 1.5–3 mm thick, thicker above pedicel, brittle in mature fresh fruits, hard when dry and/or immature. Pulp pale orange. *Seed* ochraceous, flattened, more or less plano-convex, obliquely ovate, elliptic, or trullate, usually irregularly curved, (1)1.2–

$1.5 \times$ as long as wide, $16-25 \times 12-21 \times 5-8$ mm, with thick very short erect hairs, rather rough.

Distribution: West and northern Central Africa.

Ecology: Rain forests or secondary forests, usually on periodically inundated river banks, or in gallery forests; alt. 0–1100 m.

Guinea: Fouta Djalon, near Ditinn, Chevalier 18539 (P); Dalaba Plateau, Diaguissa (fr. Sept.-Oct.) Chevalier 18862 (P).

Ivory Coast: left bank Cavally R., near Troiya, 32 km S. of Taï, J. de Wilde & Leeuwenberg 3554 (WAG); 7 km N. of crossing Hana R. with Taï-Tabou road, J. de Wilde & Leeuwenberg 3527 (K, WAG); left bank Hana R., near ferry in Tai-Tabou road (fl., fr. Mar.) J. de Wilde & Leeuwenberg 3602 (ABI, BR, K, S, WAG); Cavally R. bank, between Prolo and Bliéron, Chevalier 19888 (P, cited as *S. fleuryana*); 10 km W. of Tapéguhé, 50 km NW. of Soubré, right bank Sassandra R., Leeuwenberg 4528 (WAG); 7 km WNW. of Soubré, right bank Sassandra R. (nearly mature fr. Nov.) J. de Wilde 3301 (WAG); 34 km N. of Sassandra, left bank Davo R., Leeuwenberg 4020 (WAG); Ananda-Mbayakro road, Bouquet 5 June 1962 (ABI, WAG); Saint Bernard (Mar.) Herb. I.D.E.R.T. 3832 (ABI); Abouabou Forest, between Abidjan and Grand Bassam, Bouquet Feb. 1958 (ABI, WAG); ibid., J. de Wilde & Leeuwenberg 3448 (ABI, BR, K, WAG), 3450 (BR, K, WAG); ibid. (Dec.) Herb. I.D.E.R.T. 1764 (ABI); Ahinta, Sanvi R. (fl., fr. Mar.) Chevalier 17754 (K, LY, P, WAG, cited as *S. fleuryana*).

Ghana: Kintampo (Mar.) Dalziel 19 (C, E, K); 15 km from Accra, on Old Nsawam Road (May) Irvine 2766 (E, GC); Shiare, Buem-Krachi District, J. B. Hall 1368 (GC, K); Kwamikrum (Mar.) Schlechter 12957 (BM, Z, type of *S. cilicalyx*).

Togo: see cult.

Dahomey: Atacora Mts., between Kouba and Farfa, Chevalier 24039 bis (P).

Nigeria: Lagos, Barter 2232 (K, paratype); ibid. (Apr.) Dalziel 1154 (E, K); Eppah, Barter 3249 (K, P, lectotype); 3 km SSW. of Etemi, Omo R., Jones & Onochie FHI 16629 (FHO); Ijaiye For. Res., Ibadan District (Apr.) Onochie FHI 21957 (FHI, FHO, K); Ondo District, Jones FHI 3542 (FHO); 2 km NE. of Onda, Omo and Shasa For. Res., Jones & Onochie FHI 16969 (FHO); Warri (Mar.) Freeman 319 (BM); Idah, R. Quorra at Attah, Vogel 49 (K, type of *S. vogelii*); Nupe, Barter anno 1859 (K, P); Anara For. Res., Zaria Province (May) Keay FHI 20121 (K), 22909 (FHO, K); Nimbia For. Cameroun: Poli, Aubréville 887 (P); Wakwa, 10 km S. of Ngaoundéré (Jan.) Leeuwenberg 7659 (P, WAG, YA); 7 km N. of Olembe, left bank Sanaga R., 60 km N. of Yaoundé, Leeuwenberg 5479 (WAG); left bank Sanaga R., near Nachtigal, about 20 km N. of Obala (fl., nearly mature fr. June) W. de Wilde 2664 A (WAG, YA), 2664 B (WAG, YA); ibid., Leeuwenberg 6012 (WAG); left bank Sélé R., near bridge in Nanga Eboko-Yaoundé road, Leeuwenberg 5989 (WAG).

Central African Republic: Bozoum (Mar.) Tessmann 2275 (K); Krébedjé, Fort Sibut Chevalier 5660 (P, cited as *S. martrei*); Fort de Possel (fr. Dec.) Chevalier 10551 (P, cited as *S. martrei*), 10629 (cited as *S. martrei*); Bambari Region (Mar.) Tisserant 1039 (IFAN, L, P); Yalinga Region, Le Testu 4562 (P, WAG).

Congo (Kinshasa): Orientale: Lower Uélé R., De Wulf 656 (BR).

Cult.: Bogor, Indonesia, introduced from Africa, Hort. Bot. Bogor 83 (K, cited as *S. imbricata*); Adiopodoumé, 17 km W. of Abidjan, Ivory Coast, Leeuwenberg 4575 (WAG, seedlings of herb. J. de Wilde & Leeuwenberg 3602); Kew, raised from seeds from Little Popo (= Anécho), Togo (fl.) A. Cole 3 July 1901 (K).

Note. *S. nigritana* can be confused with *S. lucens* (q.v.).

51. *S. odorata* A. Chev., Expl. Bot. Afr. Occ. Fr. 1: 443. 1920, nomen; Hutchinson & Dalziel, Fl. W. Trop. Afr. 2: 24. 1931, nomen; Chevalier, Rev. Bot. Appliq. 27: 372, pl. 18 A. 2 and 5–8 (8 is two seeds stucked together). 1947, all three partly (as for Chevalier 15435, the type); Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 44. 1963, partly (as for Chevalier's collections); Leeuwenberg, Act. Bot. Neerl. 14: 219. 1965.

Fig. 32, p. 209; Map 33, p. 211

Type: Ivory Coast: Abidjan, Chevalier 15435 (P, holotype; isotypes: LY, P, WAG; photograph of one P sheet in K, neg. 4479).

Liana. *Branches* not lenticellate; branchlets glabrous, dark brown when dry, not with longitudinal grooves below the stipular line. Tendrils in one or two pairs. *Leaves*: petiole glabrous, 5–7 mm long; blade slightly or hardly shining above, paler and mat beneath, thinly coriaceous or papyraceous, narrowly elliptic, 3–3.6 × as long as wide, 7–12 × 2–4 cm, distinctly acuminate to caudate at the apex (acumen 10–15 mm long, narrow), cuneate at the base, glabrous on both sides; one pair of secondary veins from above the base curved along the margin and a faint submarginal pair. *Inflorescence* axillary, congested, short, 0.1–0.2 × as long as the leaves, 1–1.2 × 1–1.2 cm, many-flowered. Peduncle, branches, and pedicels short, glabrous. Bracts narrowly triangular or sepal-like, glabrous beneath. *Flowers* 4–5-merous. *Sepals* connate at the base, equal, broadly ovate, about as long as wide, 1–1.2 × 1–1.2 mm, obtuse at the apex, minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 2.5–4 × as long as the calyx, 2.8–3 mm long, and rounded at the apex, pale yellow (?), outside glabrous and minutely papillose-pubescent at the margin of the lobes, inside pilose except for the glabrous apices of the lobes and base of the tube; tube short, 1–1.7 × as long as the calyx, about 1.2 mm long; lobes 1.3–1.5 × as long as the tube, oblong, 1.6–1.8 × 0.8 mm, acute, spreading (?). *Stamens* slightly exserted; filaments glabrous, about as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 0.6 × 0.3–0.4 mm, deeply cordate at the base, glabrous; cells parallel. *Pistil* glabrous, 2.4 mm long; ovary broadly ovoid or globose, 0.7 × 0.7 mm, 2-celled; style 1.7 mm long; stigma capitate. In each cell about 5 ovules. *Fruit* small, soft, ellipsoid, 24 × 16 mm, 1–3-seeded. Wall thin, about 1 mm thick. *Seed* flattened, ellipsoid, 16 × 10 × 7 mm, at one side with a deep pit, at the other with a bulge surrounded by a shallow groove, seemingly papillose; false papillae simulated by short curved hairs.

Distribution: only twice collected in eastern Ivory Coast.

Ecology: Moist places in rain forests, often on river banks; at low elevations.

Ivory Coast: Abidjan (fr.) Chevalier 15435 (LY, P, WAG, type); Aboisso, Sanvi R. (Apr.) Chevalier 17824 (P, WAG).

Notes. The branchlets, tendrils, fruits, and seeds of *S. odorata* are exactly like those of *S. barteri*. The flowers on the only flowering specimen of *S. odorata*

available are just opening and therefore perhaps not yet completely developed. The leaves of *S. odorata* resemble very much some shade leaves of *S. barteri* which has a large range of variation in leaf-shapes. It may therefore be that *S. odorata* should be united with *S. barteri*. More collections of both taxa involved are required to be certain about the range of their variation. A fact in favour of uniting them is that the present author never found *S. odorata* in the field, while he collected several vegetative specimens of *S. barteri* in the same area where *S. odorata* was collected.

On the other hand, *S. odorata* also shows resemblance to *S. tricalysioides* by the branchlets, tendrils, seeds, and the thin caudate leaves, but the latter has the main veins impressed above.

52. *S. panganensis* Gilg in Engler, Pflanzenw. Ost-Afr. C: 311. 1895 and in Engler, Bot. Jahrb. 36: 94. 1905; Baker in Fl. Trop. Afr. 4(1): 526. 1903; E. A. Bruce, Kew Bull. 1956: 154. 1956; Bruce & Lewis in Fl. Trop. E. Afr. Loganiaceae 28. 1960.

S. bicirrifera Dunkley, Kew Bull. 1935: 263. 1935; Duvigneaud, l.c. p. 27, f. 8 B. Type: Kenya: Kilifi District, Arabuko, R. M. Graham 2290 (K, holotype; isotypes: EA, FHO, FI, P).

Scandent or scrambling evergreen shrub or liana, 3–20 m high climbing over shrubs and in trees. *Branches* lenticellate, twining (testibus Drummond & Hemsley 3572), terete, pale to dark brown and not sulcate when dry; branchlets hirsuto-pubescent, or only in Madagascar glabrous, not or only at the base lenticellate, terete, ochraceous to dark brown and often slightly sulcate when dry. Tendrils paired. *Leaves* subsessile or shortly petiolate; petiole hirsuto-pubescent, or only in Madagascar glabrous, up to 3 mm long; blade shining and dark green above, paler beneath, coriaceous also when living, variable in shape and size, ovate, narrowly ovate, elliptic, narrowly elliptic, cordate, or suborbicular, comparatively wider on the main axis and at the bases of the branchlets, 0.75–3 × as long as wide, 8–50(67) × 6–30 mm, acute, or shortly acuminate, often apiculate, rarely obtuse at the apex, cordate, rounded, or cuneate at the base, glabrous, except for a few hairs on the costa beneath and sometimes above in continental specimens; one or two pairs of secondary veins from or from just above the base curved along the margin, outer usually fainter; tertiary venation not very conspicuous, prominent on both sides in dry leaves; costa impressed above. *Inflorescence* terminal and at the same time axillary, rather lax, few- to many-flowered, 1.5 × 1.5 – 3 × 3 cm, 2–3 × branched.

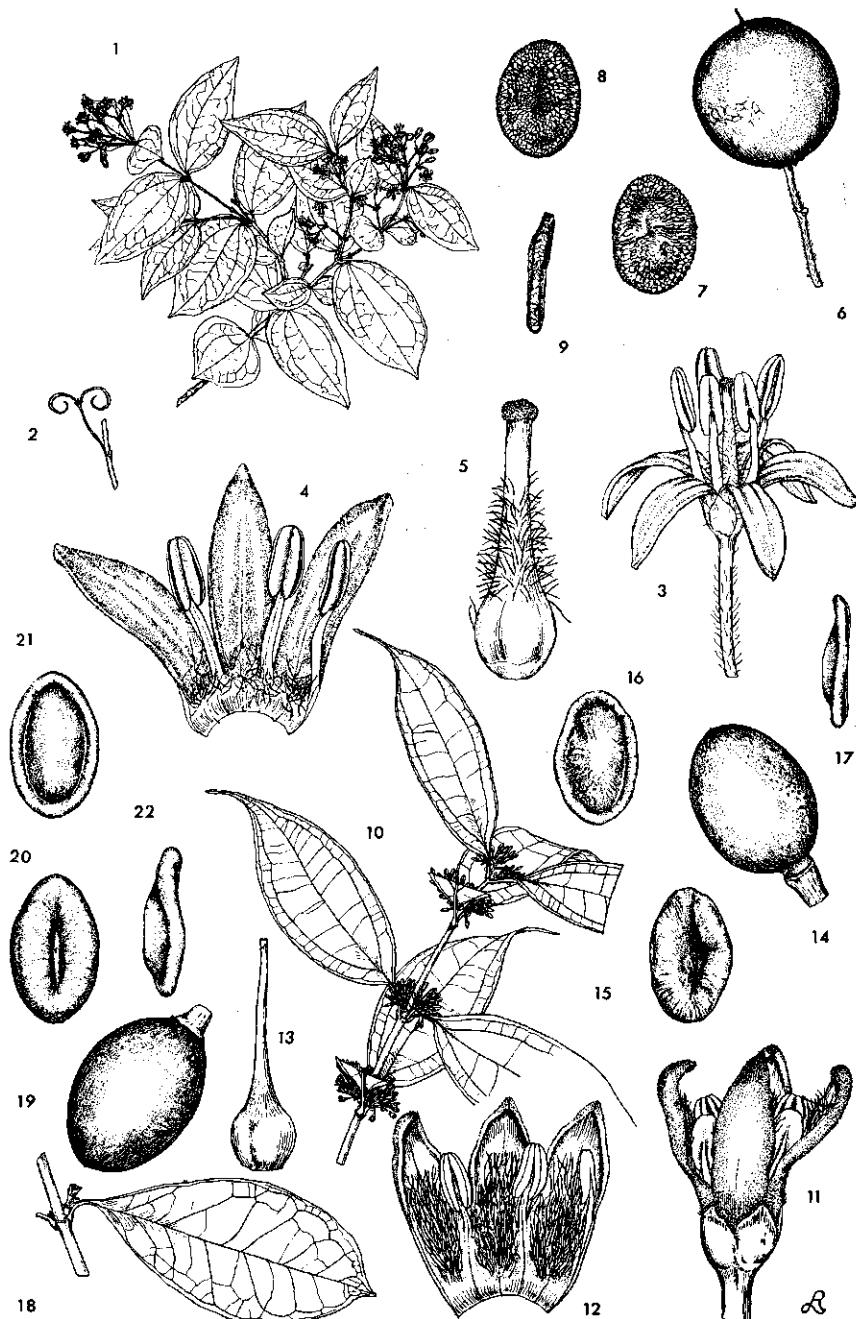

FIG. 32. 1-9. *S. panganensis*: 1. branch, $\frac{1}{2} \times$; 2. tendrils, $\frac{1}{2} \times$; 3. flower, $6 \times$; 4. portion of corolla with stamens, $8 \times$; 5. pistil, $12 \times$; 6. fruit, $1 \times$; 7-9. seed, 3 sides, $2 \times$ (1-5. Verdcourt 1189; 6-9. H. Wild c.s. 5188); 10-17. *S. odorata*: 10. branch, $\frac{1}{2} \times$; 11. flower, $10 \times$; 12. portion of corolla with stamens, $10 \times$; 13. pistil, $12 \times$; 14. fruit, $1 \times$; 15-17. seed, 3 sides, $1 \times$ (10-13. Chevalier 17824; 14-17. Chevalier 15435); 18-22. *S. penninervis*: 18. branch with empty fruit-calyx, $\frac{1}{2} \times$; 19. fruit, $1 \times$; 20-22. seed, 3 sides, $1 \times$ (18-22. Chevalier 27760).

Peduncle, branches, and pedicels slender, hirto-pubescent. Pedicels 2–4 mm long. Lower bracts leafy, other small, narrowly triangular, acute, sparsely hirto-pubescent beneath, glabrous above, without colleters. *Flowers* 5-merous. *Sepals* subequal, connate at the base, ovate or broadly ovate, 1–1.5 × as long as wide, 1–1.5 × (0.6)0.8–1 mm, obtuse at the apex, ciliate, glabrous on both sides (or outside at the base occasionally with a single minute hair), without colleters. *Corolla* in the mature bud 3–4 × as long as the calyx, 3.5–5 mm long, and rounded or subtruncate at the apex, white, greenish, or creamy, outside glabrous, inside pilose in the throat and at the base of the lobes; tube campanulate, short, 0.8–1.2 × as long as the calyx, 1–1.7 mm long; lobes thick, 2–3 × as long as the tube, oblong, 2.3–3 × as long as wide, 2.5–3.5 × 1–1.4 mm, acute, recurved. *Stamens* well-exserted; filaments glabrous, 1–1.3 × as long as the anthers, 1.2–2 mm long, inserted at the mouth of the corolla tube; anthers oblong, 1.2–1.5 × 0.6–0.9 mm, glabrous or bearded with a single pilose hair at the cordate base; cells parallel. *Pistil* pilose in the middle, 3.5–4 mm long; ovary ovoid, pilose at the apex, 1–1.5 × 0.9–1 mm, gradually narrowed into the style, 2-celled; style thick, glabrous at the very apex, 2.3–3 mm long; stigma capitate. In each cell 10–12 ovules. *Fruit* yellow, small, soft, subglobose, 8–18 mm in diam., with (1)3–6 seeds, with a smooth skin, slightly shining, often mucronate by the style. Wall thin. *Seed* pale brown or pale ochraceous, flattened, more or less plano-convex, obliquely elliptic or subtetrahedral, about 1.2 × as long as wide, 7 × 5 × 1.5 – 10 × 7 × 3 mm, rough, with scabrid short hairs. Testa not sticking to the pulp.

Distribution: East Africa and Madagascar.

Ecology: Lowland rain forests, gallery forests, or thickets in coastal evergreen bushland; alt. 0–500 m.

Kenya: Lake Jilori, near Malindi, Kilifi District (Dec.) Verdcourt 1189 (EA, K, MO, PRE); Gede, near Malindi, Swynnerton 288 (K); Arabuko (Mar.) R. M. Graham 374 (FHO), 1854 (EA, FHO, K, paratype of *S. bicirrifera*), 2290 (EA, FHO, FI, K, P, type of *S. bicirrifera*); Arabuko For. Res., Greenway 10825 (EA, K); between Bamba and Sokoke (Dec.) I. R. Vaughan 2528 (BM, EA, K); near Msorwa, Kisarawe District, Semkiwa 116 (EA, K); Matumbi Mts., Busse 3073 (EA); Lindi, Lutamba Lake (Dec.) Schlieben 5696 (B, BM, BR, G, HBG, K, LISC, M, MO, P, PRE, S, WAG, Z,

distributed as *S. corymbifera*); Kwa-Sikumbi, between Muera (= Rondo) and Noto Plateaux, Lindi District, Busse 2909 (BR, EA, LY); sin. loc., Warnecke G 7686 (EA). Tanzania (?): sin. loc. (Nov.) Sacleux 687 (P). Zanzibar; sin. loc., comm. Kirk Apr. 1870 (K).

Moçambique: Cabo Delgado: 10 km from Msalo R., near Mocimboa da Praia, Gomes Pedro 5188 (EA). Zambezia: Gobene Forest, 45 km from Maganja da Costa, Torre & Correia 14626 (LISC). Manica e Sofala: Cheringoma, Durundi Hills, Torre 4200 (LISC); Beira, Dondo, Mendonça 2472 (LISC); Macuti, 6 km from Beira (fr. Mar.) H. Wild & Leech 5188 (K, PRE, SRGH); Madanda Forests, Gazaland (Dec.) Swynnerton 1073 (BM, K). Inhambarane: Panda (fr. Feb.) Exell, Mendonça & H. Wild 610 (BM, LISC, SRGH). Lourenço Marques: Manjacaze (fr. Mar.) Torre 2546 (LISC), 7515 (LISC).

Madagascar: Orangea Forest, E. of Diégo-Suarez (Jan.) Serv. For. 24433 (P, WAG); near Antsoha, W. of Rigny Bay (fr. Jan.) Capuron Serv. For. 24481 (P, WAG).

Notes. *S. panganensis* was known only from East Africa until Capuron discovered it at the northernmost point of Madagascar, as late as in January 1966. The continental specimens are at least partly hairy. Those from Madagascar are entirely glabrous.

The species can be recognized by the slender pedicels and the rather small thin leaves of which usually some are cordate at the base.

MAP 33. ■ *S. odorata*, ● *S. phaeotricha*, ▲ *S. panganensis*.

53. *S. penninervis* A. Chev., Rev. Bot. Appliq. 27: 374, pl. 18 B. 1947.

Type: Congo (Brazzaville): Gompaka (fr. Aug.) Chevalier 27760 (P, holotype; isotype: WAG).

Fig. 32, p. 209

Climber. *Branches* not lenticellate, dark brown and not sulcate when dry; branchlets like branches, glabrous. Tendrils in 1–2 pairs. *Leaves*: petiole glabrous, 3–5 mm long; blade slightly shining above, dull and greyish beneath, elliptic, or narrowly obovate, 1.5–2.7 × as long as wide, 5–7 × 2.5–3.5 cm, apiculate at the apex, cuneate at the base, glabrous on both sides; 4 pairs of secondary veins, basal not longer than the other; tertiary venation reticulate, prominent on both sides. *Inflorescence* axillary, 1–2 × 1–2 cm. Peduncle, branches, and pedicels glabrous. Bracts small, approximately sepal-like. *Flowers* 4-merous. *Sepals* ovate, about 1.5 × 1 mm, acute at the apex, glabrous outside. *Pistil* glabrous, at least 2.5 mm long. *Fruit* orange (?), small, soft, ellipsoid, 25 × 17 – 28 × 20 mm, 1-seeded, slightly shining. Wall thin. Seed 19 × 11.5 × 5.5 mm, further exactly like that of *S. barteri*.

Distribution: Only once collected in Congo (Brazzaville).

Note. *S. penninervis* differs from its nearest relative, *S. barteri*, as follows:
Basal secondary veins curved along the leaf-margin, more conspicuous than the other *S. barteri*
Four subequal pairs of secondary veins *S. penninervis*

On the basis of the only specimen of *S. penninervis* known it is impossible to be certain, if the species should be united with *S. barteri*. It is quite possible that *S. barteri* may turn out to be a widely distributed species with a large range of variation in ecology. In that case it may comprise *S. gossweileri*, *S. odorata*, and *S. penninervis*, or one or two of them.

54. *S. pentantha* Leeuwenberg, sp. nov.

Fig. 33, p. 213; Map 24, p. 152

Liana ramis inermibus lenticellatis cirrhisque solitariis. Folia parva glabra vel fere glabra breviter petiolata. Iaminis subcoriaceis ellipticis vel orbicularibus apice rotundatis vel emarginatis basi cuneatis vel rotundatis nervis infimis curvatis. Inflorescentia terminalis parva laxa 3- vel 5-flora. Flores pentameri parvi. Sepala ovata apice acuta minute ciliata utrinque glabra. Corolla alba extus glabra intus fauce penicillata lobis triangularibus tubum fere aequantibus. Stamina inclusa tubo corollae inserta filamentis glabris antheras oblongas basi cordata barbatas aequantibus. Pistillum glabrum ovario biloculari styloque crasso. Fructus ignotus verisimiliter parvus monospermus.

Type: Madagascar: Analamera Mts., Diégo-Suarez Province, Humbert 19154 (P, holotype; isotype: WAG).

Climber. *Branches* lenticellate, dark brown, often partially greyish, not sulcate

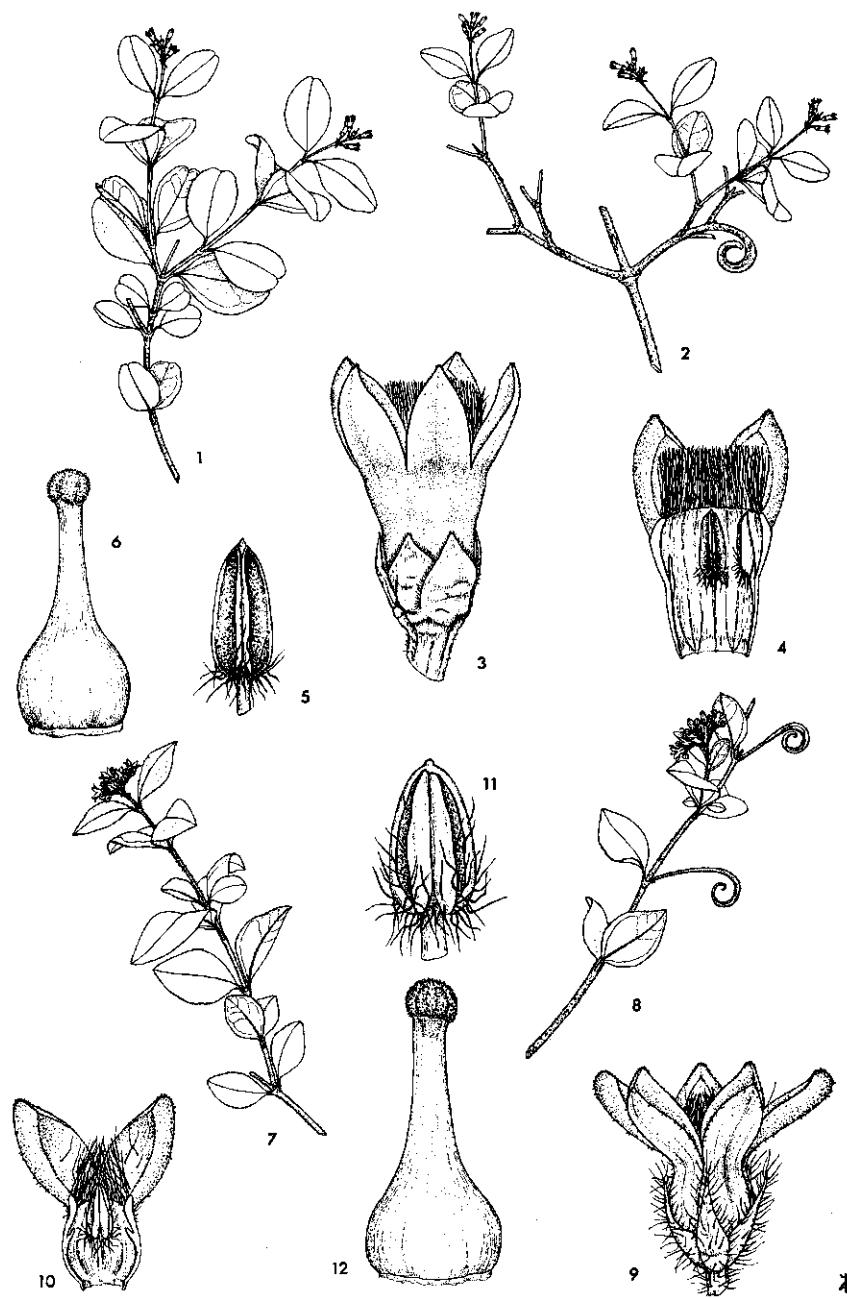

FIG. 33. 1–6. *S. pentantha* (Humbert 19154): 1–2. branches, $\frac{1}{2} \times$; 3. flower, $10 \times$; 4. portion of corolla with stamens, $10 \times$; 5. anther, $20 \times$; 6. pistil, $20 \times$. 7–12. *S. trichoneura* (Perrier de la Bathie 8028): 7–8. branches, $\frac{1}{2} \times$; 9. flower, $7 \times$; 10. portion of corolla with stamen, $7 \times$; 11. anther, $20 \times$; 12. pistil, $20 \times$.

when dry; branchlets with ranked hairs below the stipular line or glabrous, lenticellate or not, pale brown and not sulcate when dry. Tendrils solitary. *Leaves* small, shortly petiolate; petiole glabrous or nearly so, 0.5–2 mm long; blade mat on both sides, pale green, paler beneath, glaucous and thinly coriaceous when dry, elliptic or orbicular, comparatively narrower towards the apices of the branchlets, $1\text{--}2 \times$ as long as wide, $10\text{--}22 \times 5\text{--}17$ mm, rounded or emarginate at the apex, cuneate or rounded at the base, glabrous on both sides or with some hairs at the base beneath; one pair of secondary veins from the base curved along the margin and often a faint submarginal pair; tertiary venation reticulate, not very conspicuous. *Inflorescence* terminal, small, lax, 3- or 5-flowered, $1 \times 0.6 - 1.5 \times 0.8$ cm, 1 × branched. Bracts small, triangular, glabrous on both sides or pubescent above the base, without colleters. *Flowers* 5-merous. *Sepals* connate at the base for one-third of their length, subequal, the inner slightly smaller, ovate, $1.2 \times$ as long as wide, $1\text{--}1.2 \times 0.8\text{--}1$ mm, acute at the apex, minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud $2.7\text{--}3 \times$ as long as the calyx, 3.2–3.5 mm long, and rounded at the apex, white, outside glabrous, inside white-penicillate in the throat; tube $1.5 \times$ as long as the calyx, $1\text{--}1.2 \times$ as long as the lobes, 1.7–1.8 mm long, at the throat 1.2–1.5 mm wide; lobes triangular, $1.5\text{--}1.7 \times 1$ mm, thick, acute, suberect. *Stamens* included; filaments short, $0.5\text{--}1 \times$ as long as the anthers, glabrous, inserted at one-half to two-thirds from the base of the corolla tube; anthers oblong, 0.9×0.4 mm, bearded at the deeply cordate base; cells parallel. *Pistil* glabrous, 1.6–1.8 mm long; ovary depressed-globose to broadly ovoid, $0.7\text{--}0.8 \times 0.8\text{--}0.9$ mm, rather abruptly narrowed into the style, 2-celled; style 0.9–1 mm long; stigma capitate. In each cell about 5–12 ovules. *Fruit* unknown, supposed to be small and 1-seeded.

Distribution: Only twice collected in the same locality in northern Madagascar.

Ecology: Calcareous hills; alt. 50–400 m.

Madagascar: Analamera Hills, Diégo-Suarez Province (Jan.) Humbert 19131 (P, WAG), 19154 (P, WAG, type).

Notes. *S. pentantha* resembles strikingly *S. benthamii* C. B. Clarke var. *parvifolia* (Benth.) A. W. Hill from Ceylon in habit, branches, leaves, inflorescence, and flowers. The only clearcut differential characters are in the indumentum in the corolla and the insertion of the stamens. In *S. benthamii* there is a narrow bristle approximately on the middle of the corolla lobes and the stamens are inserted at the mouth. In *S. pentantha* there is a ring of stiff hairs in the throat and the stamens are inserted in the tube.

55. *S. phaeotricha* Gilg in Engler, Bot. Jahrb. 36: 105, f. 3. 1905; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2: 41. 1963.

Fig. 34, p. 217; Map 33, p. 211

Type: Cameroun: Bipindi, Zenker 2868 (holotype not seen, destroyed in B; lectotype: G; other isotypes seen: BM, BR, E, GOET, GRO, K, L, LY, M, MO, P, S, W, WU, Z).

Heterotypic synonym: *S. thyrsiflora* Gilg in Mildbraed, Wiss. Ergebn. Deutsch. Zentr.-Afr. Exped. 1907-'08. 2: 532, t. 74. 1914. Type: Congo: Orientale, Ituri, between Mawambi and Awakubi, near Njiapanda, Mildbraed 3192 (holotype not seen, destroyed in B; lectotype: UPS).

Liana, at least 35–50 m long, 4–40 m high climbing in trees. Trunk 2–7 cm in diam. or more. Bark (in branches rather thin) pale grey, lenticellate. Branches lenticellate or not, pale grey-brown to dark brown and slightly fissured when dry, paler than the branchlets which are brown-hirsute, often with a double indumentum, and not lenticellate. Tendrils paired. Leaves: petiole short, brown-setose, 2–4 mm long, with some large colleters at the base (at edges); blade shining or mat and dark green above, paler beneath, papyraceous also when living (young membranaceous when dry), narrowly obovate, narrowly elliptic, or sometimes narrowly ovate or on the main axis ovate, comparatively wider on the main axis and at the bases of the branchlets, (1.5)2–3.3 × as long as wide, (2.5) 5–16.5 × (1.4) 2.5–8 cm, in the shade up to 22 × 8 cm and often herbaceous, acuminate at the apex, cordate or subcordate at the base, brown-setose on both sides, especially or only on the costa; one pair of secondary veins from or from above the base curved along the margin and often a faint submarginal pair; tertiary venation forming characteristic mussel shell markings beneath. Inflorescence terminal, partially monochasial near apex of branchings, lax, many-flowered, about as long as the leaves, 5 × 5 – 8 × 8 cm, 3–5 × branched. Peduncle and branches slender, brown-hirsute as the pedicels. Lower bracts leafy, other small, sepal-like, with several large colleters at the edges of the axils. Flowers 5-merous, sessile or subsessile. Calyx often with 1–2 large colleters at the mouth; sepals green, connate at the base, subequal, linear or nearly so, 3–15 × as long as wide, 1.8–3 × 0.2–0.6 mm, subulate, brown-hirsute outside, glabrous inside, not ciliate. Corolla in the mature bud 1.2–2 × as long as the calyx, 2.8–4 mm long, somewhat contracted below the middle (insertion of the glands), and subtruncate at the apex, white, creamy, or yellow, outside brown-hirsute on the lobes or sometimes entirely glabrous, inside with a pubescent gland with thick hairs just above the base of the lobes; tube urceolate, very short, 0.2–0.4 × as long as the calyx, 0.5–0.8 mm long; limb 6.5–7.5 mm in diam.; lobes narrowly oblong, with largest width just above the base, there with the gland, and from that point reflexed, 3.3–5 × as long as the tube, 2.6–4 (in bud 2.3–3.2) × as long as wide, 2.6–4 × 0.7–1 mm (in bud 2.3–3.2 × 0.7–1 mm), acute! Stamens well-exserted; filaments ventrally near the base with a bilobed pubescent gland with the same thick hairs as on the corolla lobes and there curved, glabrous in other parts, 2–2.5 mm long, elongate at anthesis,

widened from above the gland towards the insertion, inserted at the mouth of the corolla tube; anthers suborbicular, $0.4-0.5 \times 0.3-0.5$ mm, glabrous or with some minute stiff hairs at the base, cordate at the base; cells parallel. *Pistil* somewhat pilose in the middle or entirely glabrous, $3(2.8-3.2)$ mm long; ovary ovoid, about $1.5-2 \times$ as long as wide, $1-1.5 \times 0.6-1$ mm, with some minute hairs at the apex, or glabrous, (often with a disk-like base), gradually narrowed into the style; style at anthesis curved at the apex, later straight, $1.5-2$ mm long, with some minute hairs near the base or glabrous; stigma capitate. In each cell 5–6 ovules. *Fruit* orange (?), ellipsoid, rather large, soft, $25 \times 18 \times 18 - 30 \times 27 \times 25$ mm, with about 3–7 seeds, glabrous, immature brown-setose. Wall thin, about 1 mm thick when dry, brittle. *Seeds* ochraceous, flattened, more or less plano-convex, obliquely ovate or elliptic, usually irregularly curved, $15 \times 10 \times 3 - 23 \times 15 \times 6$ mm, smooth. *Testa* very thin, sticking to the pulp.

Distribution: West and Central Africa.

15757 (BR), 16454 (BR); Ituri, between Mawambi and Awakubi, near Njiapanda, Mildbraed 3192 (UPS, type of *S. thyrsiflora*). Kivu: Irangi, near km 110 of Kavumu-Walikale road, Troupin 4404 (BR, K); Shabunda, Kalehe Territory, Pierlot 1103 (BR); Bunyakiri, Kalehe Territory, A. Léonard 2946 (BR, WAG); Tubalaka-Bunyakiri road (Sept.) Gutzwiller 1397 (BR, WAG).

Notes. The size of the flowers in GILG's description of *S. thyrsiflora* does not agree with that of the isotype, Mildbraed 3192, which is here designated lectotype. The latter specimen covers in all other respects both the description and the figure in MILDBRAED's book. This specimen belongs in *S. phaeotricha*, as was concluded after comparison of all the specimens cited. The flowers differ from all other species of the genus by the characteristic glands on the corolla lobes and on the filaments.

The branchlets and leaves may be less hairy to nearly glabrous, as is demon-

strated by three specimens collected in the same locality (Klaine 1695, 1773, 2098). They agree in all other respects exactly with the present delimitation of the species.

Type: Tanzania: Uhehe, Makinde Steppen, between Iringa and Njombe, Goetze 519 (holotype not seen, destroyed in B; lectotype: BM, other isotypes seen: BR, K).

Deciduous much branched small or medium sized tree or sometimes shrub, (2)4–18 m high. Trunk 20–100 cm d.b.h. Bark pale grey or grey-brown, smooth, lenticellate, thin, on section outer green and inner orange or buff; wood pale yellowish-brown, with bark-islets. Branches often several times dichotomously branched, pale to very dark brown, distinctly lenticellate, terete, not or slightly

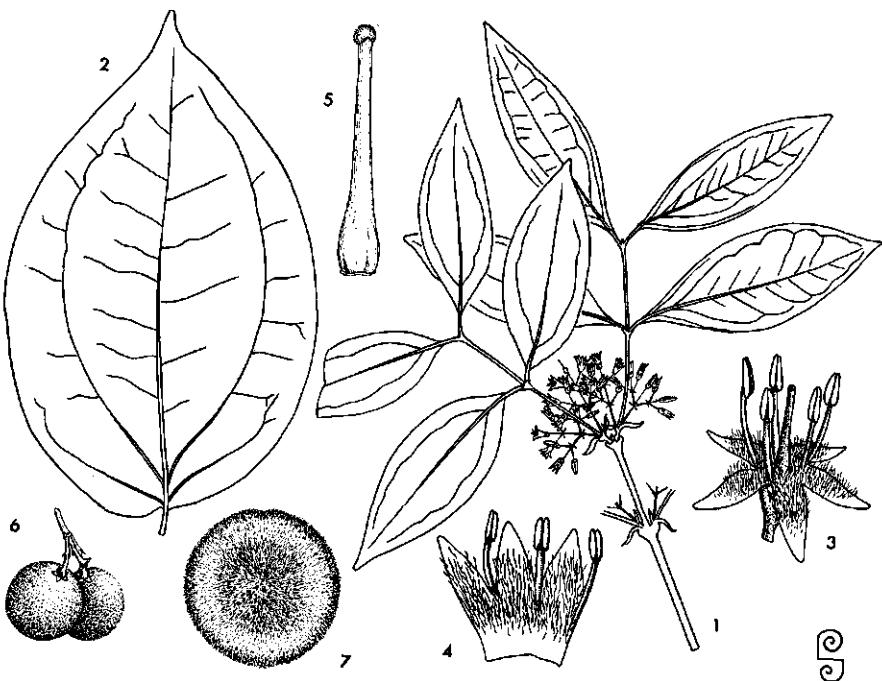

FIG. 35. *S. potatorum*: 1. branch, $\frac{1}{2} \times$; 2. leaf, $\frac{1}{2} \times$; 3. flower, $3 \times$; 4. portion of corolla with stamens, $3 \times$; 5. pistil, $6 \times$; 6. fruits, $\frac{1}{2} \times$; 7. seed, $2 \times$ (1-5. English 3/50; 6-7. Robertson & Elffers 58; 5-7. drawn by Miss H. G. D. Zewald).

sulcate when dry, with protruding persistent cup-like petiole-bases; branchlets glabrous, when leaves mature lenticellate and coloured like the branches, otherwise not lenticellate, pale to dark brown, and often sulcate when dry. Apex of branchlet modified into a spine-like, 1–3 mm long tip. *Leaves*: petiole short, glabrous, 1–7 mm long; blade dark green above, mat or dull and paler beneath, papyraceous or thinly coriaceous, when young membranaceous (in flowering branches), variable in shape and size, elliptic, narrowly elliptic, ovate, or narrowly ovate, 1.5–3(3.5) × as long as wide, 6–15 × 3–9 cm, in the shade up to 19.5 × 11 cm, acute, acuminate, or sometimes apiculate or obtuse at the apex, cuneate, rounded, or sometimes, especially in young shoots, subcordate at the base, glabrous on both sides; two pairs of distinct mostly pale green secondary veins from or from above the base curved along the margin, not reaching the apex; tertiary venation mostly pale green, reticulate. *Inflorescence* in the axils of small scales at the bases of the branchlets, solitary, lax or rather congested, 1.5–2.5 × 1–2 cm, 1–2 × branched. Peduncle, branches, and pedicels slender, glabrous. Bracts small, very narrowly triangular to narrowly triangular, slightly longer than the sepals, glabrous on both sides, at least upper without colleters. *Flowers* (4–)5-merous, variable in shape and size, appearing before or with the young leaves. *Sepals* dark green, connate at the base (up to

halfway in Armitage 181/59), subequal, variable in shape and size, ovate, broadly ovate, or sometimes oblong (1)1.3–2 × as long as wide, 1–2.2(2.5) × 0.7–1.5 mm, acute or less often acuminate at the apex, not ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud (3)3.5–5(6) × as long as the calyx, (4)4.5–7.5 mm long, and tapering at the apex, white, creamy, or yellow, outside glabrous, inside pilose with white hairs on the base of the lobes and often also in the throat; tube very variable in length and width, (0.8)1–2.5 (3.2) × as long as the calyx, 1–3.5 mm long, at the throat 1.5–3 mm wide; lobes 1–3 × as long as the tube, oblong, 2–4.3 × as long as wide, 3–4.5 × (0.8) 1–2.2 mm, acute, spreading. *Stamens* exserted; filaments glabrous, longer in flowers with shorter corolla tube (like in *S. decussata*), 0.5–1.7 × as long as the anthers, 1–2.5 mm long, inserted at the mouth of the corolla tube; anthers oblong, mostly about twice as long as wide, 1.1–2 × (0.3)0.6–1 mm, deeply cordate at the base, glabrous; cells parallel. *Pistil* glabrous, (3.5)4.4–6 mm long; ovary ovoid or conical, 1.2–1.5 × as long as wide, 1–2 × 0.8–1.4 mm, mostly gradually narrowed into the style, 2-celled; style rather thick, (2.5)2.7–4.3 mm long; stigma often small, capitate or occasionally obscurely bilobed. In each cell 5–13 ovules. *Fruit* blue-black, small, cherry-like, soft, globose, (10)15–25 mm in diam., 1-seeded, with smooth skin, shining. Wall thin, dry about 0.3 mm thick. Pulp purplish. *Seed* slightly glossy, pale brown, depressed-globose or ellipsoid, 10 × 9 × 6 – 13 × 12.5 × 9 mm, with an obscurely angular line all around, densely sericeous, smooth.

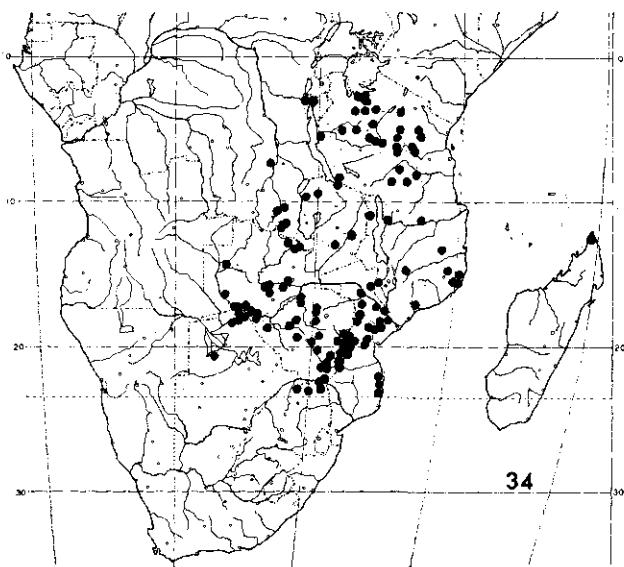

Distribution: East and northern South Africa; and Asia: India, Ceylon, and Burma.

Ecology: In gallery forest, in *Brachystegia*-woodland, semi-evergreen bush-land, often on river banks, on banks of dry riverbeds, or on termitaries; alt. 0–1600 m.

Notes. *S. potatorum* was collected in India by KOENIG, who presented an elaborate description to LINNAEUS f. The latter published it and cited the collector. There are two specimens collected by KOENIG which bear his name and belong to this species, one in the ALSTROEMER herbarium in Stockholm and one in the RETZIUS herbarium in Lund. As ALSTROEMER was a scholar of LINNAEUS, he had met LINNAEUS f. and they knew each other's collections. It is not certain, if LINNAEUS f. saw RETZIUS's herbarium. The present author therefore feels obliged to adopt the specimen in the ALSTROEMER herbarium as the lectotype of the species, although it is less complete than that in the RETZIUS herbarium.

There are two other specimen which were probably also collected by KOENIG, one in the BANKS herbarium in the Linnean Society of London and one in the THUNBERG herbarium in Uppsala. The latter was communicated by SMITH and may therefore originate from the BANKS or the LINNEAN herbarium. As the origin of the specimen in the THUNBERG herbarium is very uncertain and as it is improbable that LINNAEUS f. saw the BANKS herbarium, the excellent specimen in the latter and the less complete in the former cannot be adopted as type.

After comparison of the types of *S. potatorum* and *S. stuhlmannii* and of the other specimens cited, it was evident that they all belong to a single species

which has one character, the blue-black cherry-like fruits by which it is distinguished from all other *Strychnos* species. The species is furthermore easily recognized by the dichotomously branched branches, the leaves, and the arrangement of the inflorescences.

It has been generally assumed that none of the *Strychnos* species occur both in Africa and Asia. It appeared that *S. potatorum* occurs in both continents when the extra-African *Strychnos*-specimens of several herbaria were examined. According to the present author *S. potatorum* is without doubt indigenous in Africa, as it occurs there in the original vegetation and is widely distributed.

The use of the plant in Africa is occasional and not very important. The pounded fruits are sometimes used as fish-poison. The pulp is sometimes eaten. The root bark has medicinal value. None of these uses proves to be so important that the species is planted or cultivated in order to harvest a considerable amount of material to be employed.

In Asia the seeds are used to clear muddy water. For this reason it has often been planted there, especially in India, where it is known to have been in cultivation for a long time. In Burma it may have been introduced fairly recently, according to A. W. HILL (1917).

Taking into account the facts that the species is indigenous in Africa and that it is often planted in Asia the present author presumes that it was introduced in Asia by Arabic traders a long time before the first Europeans arrived in the Indian Ocean. These facts are also known of the useful species *Tamarindus indica* L., which the present author collected in Upper Volta where it is indigenous.

more. Bark grey or brown, rough, closely and shallowly reticulate, not corky, smooth and grey higher up or in young trees; inner bark yellow; wood yellowish, with large bark-islets. *Branches* pale to dark brown, conspicuously and densely lenticellate, not sulcate; branchlets glabrous or occasionally with few hairs, lenticellate or when young not, pale to dark brown when dry, not sulcate. *Leaves*: petiole short, glabrous, 1–4 mm long; blade shining and dark green above, hardly or not paler and less shining beneath, coriaceous, rigid, elliptic, narrowly elliptic, obovate, or occasionally orbicular, (1)2–4(5) × as long as wide, (2)3–8(10) × 1–3.5(4.5) cm, acute or rounded and sharply pointed at the apex, cuneate or rounded at the base, glabrous on both sides or occasionally partly pubescent beneath; one pair of secondary veins from or from above the base curved along the margin and often a faint submarginal pair; costa conspicuously impressed above; tertiary venation reticulate. *Inflorescences* axillary or ramiflorous, mostly several together, usually very short and about 0.25 × as long as the leaves, 1 × 1 – 2 × 2(5 × 4) cm, usually congested and subsessile, rarely lax. Peduncle, branches, and the very short pedicels pubescent. Bracts small, sepal-like, beneath glabrous, above minutely appressed-pubescent at the base or glabrous, sometimes with some large colleters. *Flowers* 5-merous. *Sepals* green, nearly free, subequal, the inner slightly smaller, ovate, broadly ovate, or sometimes orbicular, 1–1.5 × as long as wide, 2–4 × 2–3 mm, acute, obtuse, or rounded at the mostly slightly keeled apex, conspicuously ciliate, glabrous on both sides or inside minutely appressed-pubescent at the base, without colleters. *Corolla* in the mature bud 2.4–3.2 × as long as the calyx, 7–9.5 mm long, and tapering and obtuse at the apex, greenish-creamy, or -yellow, glabrous outside, inside with a brush-like ring of white lanate hairs in the throat and just on the base of the lobes; tube cylindrical or nearly so, 1.4–2 × as long as the calyx, 1–1.7 × as long as the lobes, 4–5.5 mm long, 1.5–3 mm wide at the base, 2–3.5 mm at the throat; lobes thick, narrowly triangular, 2–2.7 × as long as wide, 3–4 × 1.3–2 mm, acute, spreading. *Stamens* slightly exserted; filaments 0.1–0.2 × as long as the anthers, inserted at the mouth of the corolla tube, glabrous; anthers oblong, 1–2 × 0.5–1 mm, glabrous, deeply cordate at the base; cells parallel. *Pistil* pilose in the middle, 5–7.5 mm long; ovary ovoid or oblong, 1–3 × 0.7–2 mm, 2-celled, gradually narrowed into the style, apically pilose, often with a disk-like base; style thick, 2.5–4.5 mm long, at the base hairy like the ovary at the apex; stigma capitate. In each cell 25–60 ovules. *Fruit* orange or yellow, nearly mature bluish-green, large, hard, globose, 5–12(15) cm in diam., with about 20–100 seeds, with somewhat granular skin, slightly shining. Wall thick, (2)4–6 mm thick, thicker above pedicel, woody when dry. Pulp sweet-tasting. *Seeds* ochraceous, flattened, more or less plano-convex, obliquely ovate, elliptic, or trullate, usually irregularly curved, 20–24 × 12–17 × 5–10 mm, with thick very short erect hairs, rather rough.

Distribution: Central, East, and northern South Africa.

Ecology: Woodland, often with *Brachystegia*; alt. 0–2000 m.

MAP 35. *S. pungens*.

Notes. Except for Welwitsch 4778, collected in Angola, all the syntypes of *S. pungens* were collected in East Africa. *S. pungens* and *S. occidentalis* were briefly described by SOLEREDER in his first reference (1892). He reduced the latter name to a synonym of the former in his second reference, the only one in which he cites specimens. Therefore the present author has designated lectotypes for both names using the best specimen available for the name in use for the species *S. pungens*.

The sharp point at the apex of the leaves is a very useful character by which to recognize the species.

58. *S. retinervis* Leeuwenberg, sp. nov.

Fig. 37, p. 229

Planta lignosa glabra verisimiliter arborea. Folia laminis coriaceis ellipticis vel anguste ellipticis apice acuminatis basi cuneatis nervis infimis curvatis ceteris reticulum irregulare formantibus. Inflorescentia axillaris parva congesta multiflora. Flores tetrameri. Sepala suborbicularia apice obtusa minute ciliata utrinque glabra. Corolla longa albastro gracilis extus glabra intus dense pilosa tubo cylindrico lobisque oblongis recurvatis. Stamina longe exserta fauce corollae inserta filamentis antheras oblongas glabras bis superantes. Pistillum glabrum ovario biloculari styloque gracili longe exerto et stigmate parvo. Fructus ignotus verisimiliter parvus et oligospermus.

Type: Gabon: Lastourville Region (fl.) Le Testu 7943 (P, holotype; isotype: WAG).

Tree (?). *Branchlets* glabrous, not lenticellate. *Leaves*: petiole glabrous, 8–11 mm long; blade coriaceous, elliptic or narrowly elliptic, 2–3 × as long as wide, (6.5)12–17.5 × (3)4–6 cm, acuminate at the apex, cuneate at the base, glabrous on both sides; 1–2 pairs of secondary veins from or from above the base curved along the margin, anastomosing with the other secondary veins, which are not less conspicuous; tertiary venation reticulate, prominent on both sides. *Inflorescence* axillary, small, congested, many-flowered, 1.5 × 1.5 – 3 × 3 cm, 1–2 × branched. *Flowers* 4-merous. *Sepals* connate at the base, subequal, suborbicular, 1.2–1.4 × 1 mm, obtuse at the apex, glabrous on both sides, minutely ciliate, without colleters. *Corolla* in the mature bud 5 × as long as the calyx, 7.5 mm long, and tapering at the apex, creamy (?), outside glabrous, inside densely pilose on the base of the lobes and in the throat (only a single hair in the tube); tube cylindrical or nearly so, 3 × as long as the calyx, 1.5 ×

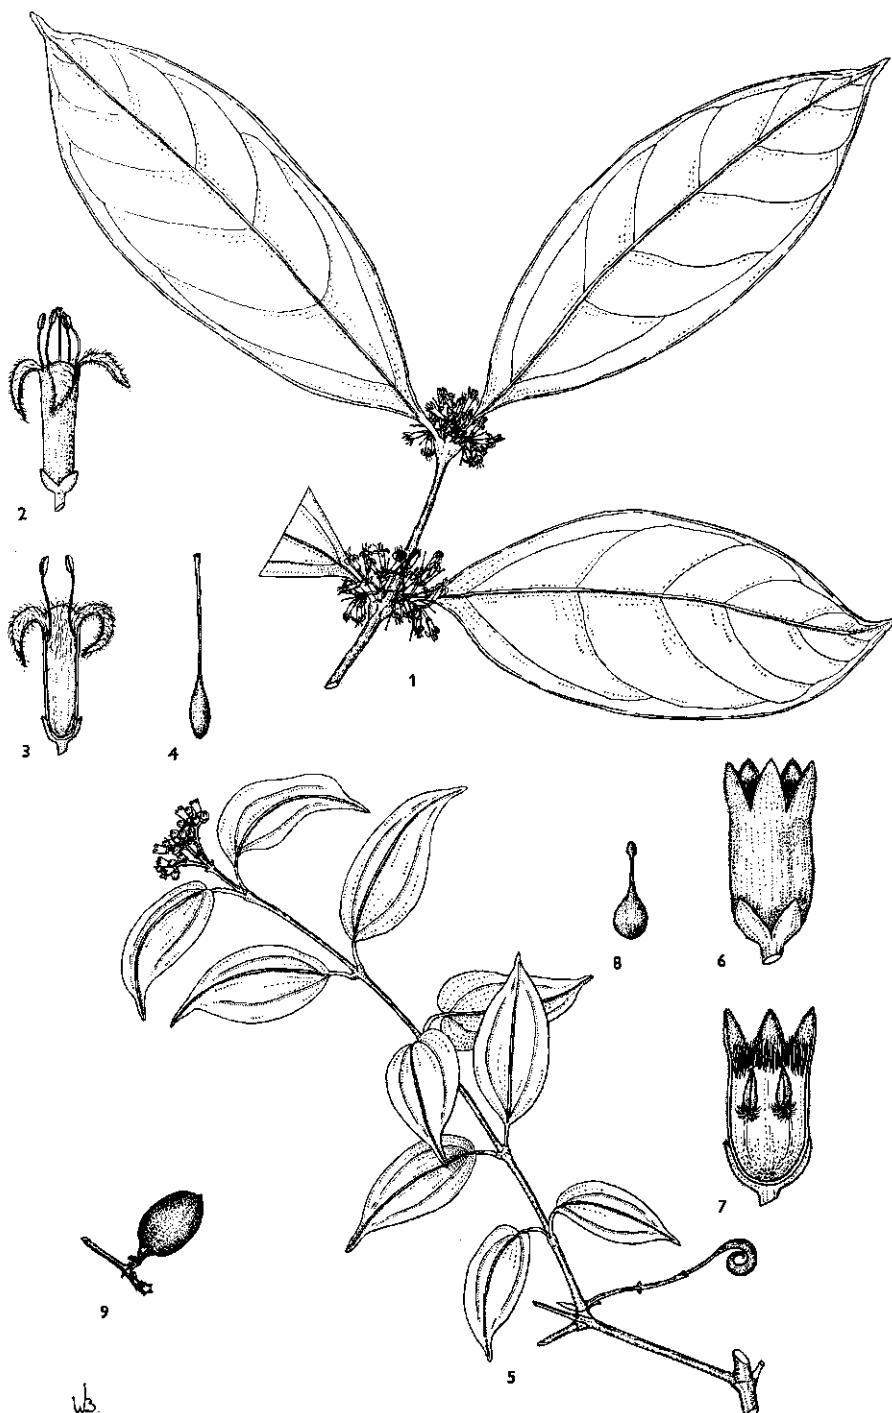

FIG. 37. 1-4. *S. retinervis*: 1. branch, $\frac{1}{2} \times$; 2. flower, $3 \times$; 3. opened flower, $3 \times$; 4. pistil, $3 \times$ (1-4. Le Testu 7943); 5-9. *S. tchibangensis*: 5. branch, $\frac{1}{2} \times$; 6. flower, $5 \times$; 7. opened flower, $5 \times$; 8. pistil, $5 \times$; 9. fruit, $\frac{1}{2} \times$ (6-8. Breteler 1430; 9. Louis 16186).

as long as the lobes, 4.5 mm long, at the throat 1.5 mm wide; lobes oblong, 3×1 mm, recurved. *Stamens* well-exserted; filaments glabrous, at least twice as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 0.9×0.3 mm, glabrous, rounded at the apex, cordate at the base; cells parallel. *Pistil* glabrous, 8.5 mm long; ovary ovoid, 1×0.7 mm, 2-celled; style slender, 7.5 mm long, well-exserted; stigma capitate, small. In each cell about 5 ovules. *Fruit* unknown, supposed to be small and 1-seeded.

Distribution: Only once collected in Gabon.

Ecology: Rain forests, at low elevations.

Note. *S. retinervis* is closely allied to *S. elaeocarpa*. It differs from the latter as follows:

Stamens well-exserted; leaves coriaceous; several pairs of secondary veins as conspicuous as the arcuate; tertiary venation prominent on both sides . . .

S. retinervis

Stamens slightly exserted; leaves thickly coriaceous; secondary veins, except for the arcuate pair, not very conspicuous *S. elaeocarpa*

Type: Congo (Kinshasa): Orientale, Bambesa Region, Brédo 1091 (BR, lectotype).

Liana at least 10 m high climbing in trees and at least 20 m long. Trunk 3–5 cm in diam. or more. Bark medium brown, with few lenticels, thin; wood yellow. *Branches* not lenticellate, green, dry medium brown and not sulcate; branchlets quadrangular, glabrous, green, dry greenish-brown or medium brown and not or slightly sulcate. Tendrils paired. *Leaves*: petiole glabrous, 5–12 mm long; blade slightly shining, dark green, and with often paler veins above, paler beneath, coriaceous in the sun, subcoriaceous in the shade, elliptic or narrowly elliptic, (1)1.5–2.2 × as long as wide, 5–10(17) × 2.5–7(8.5) cm, apiculate or acuminate at the apex, cuneate or rounded at the base, glabrous on both sides; one pair of distinct secondary veins from or from above the base curved along the margin and often a faint submarginal pair; costa and main secondary veins impressed above; tertiary venation reticulate, prominent beneath. *Inflorescence* axillary and terminal, lax or in last branchings congested, few- to many-flowered, very variable in size, 3–10 × 2–5 cm (in fruit up to 15 × 10 cm), 3–4 × branched. Peduncle and branches slender, sparsely pubescent with usually ranked hairs. Pedicels short or very short, glabrous or nearly so. Bracts narrowly triangular or sepal-like, above glabrous or appressed-pubescent, without colleters; when inflorescence terminal lower bracts leafy. *Flowers* 5-merous. *Sepals* pale green, connate at the base up to one-third of

their length, equal or subequal, ovate, $1.2\text{--}1.3 \times$ as long as wide, $0.6\text{--}1 \times 0.5\text{--}0.8$ mm, acute or obtuse at the apex, minutely ciliate, outside glabrous or with a single minute hair, inside glabrous or sometimes appressed-pubescent at the base, without colleters. *Corolla* in the mature bud $2.2\text{--}4 \times$ as long as the calyx, 2.2–2.5 mm long, and rounded at the apex, greenish or pale green, outside glabrous, inside pilose on the lobes, mostly only at the base with creamy hairs; tube short, $1\text{--}1.7 \times$ as long as the calyx, 1 mm long, at the throat 1.5 mm wide; lobes $1.2\text{--}1.5 \times$ as long as the tube, narrowly triangular, $1.5\text{--}2 \times$ as long as wide, $1.2\text{--}1.5 \times 0.8\text{--}1$ mm, acute, suberect or spreading. *Stamens* slightly exserted; filaments glabrous, short, $0.3\text{--}0.5 \times$ as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong or triangular, $0.8\text{--}1 \times 0.4\text{--}0.6$ mm, glabrous, deeply cordate at the base; cells parallel or slightly divergent at the base. *Pistil* glabrous or with a single minute hair in the middle, 1.3–1.7 mm long; ovary ovoid, $1 \times 0.8\text{--}1.2 \times 1$ mm, gradually narrowed into the style, 2-celled; style short 0.3–0.5 mm long; stigma capitate. In each cell 8–9 ovules. *Fruit* pale green, small, soft, globose, 17–20 mm in diam., 1-seeded, with smooth skin, mat when living. *Seed* pale brown, flattened, obliquely ovate, irregularly curved (more or less resembling a saddle of a bike), $14 \times 13 \times 7$ mm, pubescent, smooth.

S. scheffleri var. *expansa* E. A. Bruce, Kew Bull. 1956: 153. 1956; Bruce & Lewis in Fl. Trop. E. Afr. Loganiaceae 31. 1960. Type: Congo (Kinshasa): Orientale: Yangambi, Mbutu R. source, Louis 6204 (K, holotype; isotypes: BR, C, EA, FHO, MO, P, S, U, UC, US).

Climber to large liana, up to 30 m high climbing in trees and 50 m long, twining when young. Trunk 3–15 cm in diam.; bark pale grey-brown or pale to dark brown, with large lenticels; wood pale yellowish. *Branches* lenticellate, pale green to brown, dark brown when dry; branchlets usually striate, also when living, glabrous or sometimes sparsely pubescent, not lenticellate, pale greenish-brown. Tendrils paired. *Leaves*: petiole glabrous or sometimes pubescent, 2–8 mm long; blade shining to mat and medium to dark green above, paler and less shining to mat beneath, coriaceous or subcoriaceous, also when living, thinner in the shade, narrowly ovate, elliptic, narrowly elliptic, or in leaves on the main axis and bases of branches sometimes ovate, 1.5–3.5(4.7) × as long as wide, 4.5–10(14) × 1.7–4(6.5) cm, acuminate to caudate at the apex, cuneate, rounded or – if ovate – sometimes subcordate at the base, glabrous on both sides or sometimes beneath pubescent on the veins; one pair of secondary veins from the base or nearly from the base curved along the margin, and a faint submarginal pair; tertiary venation reticulate, prominent beneath and often above. *Inflorescence* axillary, mostly rather lax, up to 0.7 × as long as the leaves, 1 × 1 – 6 × 4 cm, 2–4 × branched, several- to many-flowered. Peduncle, branches, and pedicels brown-pubescent with sometimes ranked hairs. Bracts small, ovate to triangular, often sparingly pubescent beneath, ciliate (upper without colleters). *Flowers* 5-merous. *Sepals* green, connate at the base for about one-quarter of their length, orbicular or nearly so, 1.3–1.7 mm long, rounded or sometimes obtuse at the apex, ciliate, glabrous or sparsely pubescent outside, glabrous or with few small hairs inside near the base, without colleters.

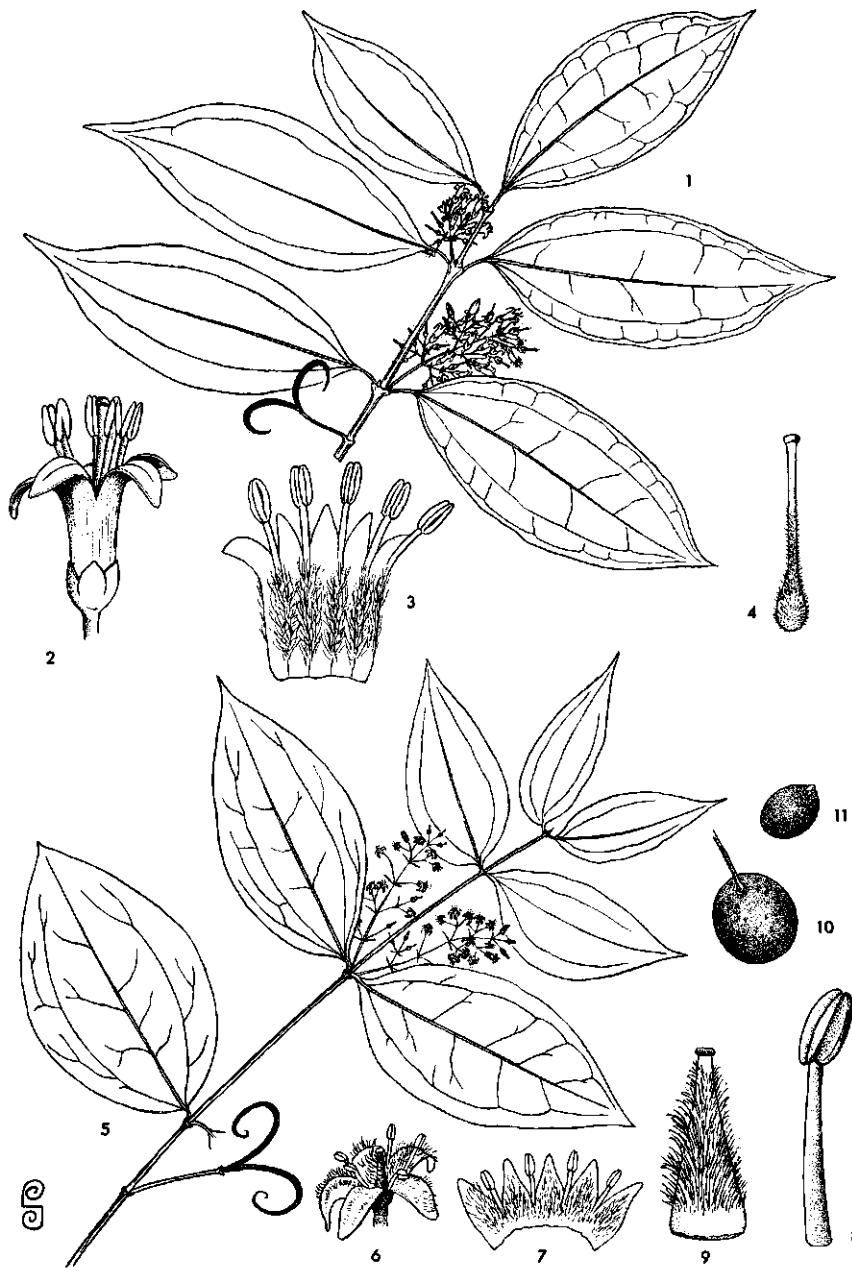

FIG. 38. 1-4. *S. scheffleri*: 1. branch, $\frac{1}{2} \times$; 2. flower, $3\frac{1}{2} \times$; 3. opened corolla with stamens; $3\frac{1}{2} \times$; 4. pistil, $3\frac{1}{2} \times$ (1-4. Louis 6204); 5-11. *S. splendens*: 5. branch, $\frac{1}{2} \times$; 6. flower, $3 \times$; 7. opened corolla with stamens, $3 \times$; 8. stamen, $10 \times$; 9. pistil, $6 \times$; 10. fruit, $\frac{1}{2} \times$; 11. seed, $\frac{1}{2} \times$ (7-9. Leeuwenberg 4566; 10-11. Leeuwenberg 3705).

Corolla in the mature bud 4.7–7 × as long as the calyx, 7–9.5 mm long, and rounded at the apex, white or creamy, widely cylindrical, outside glabrous or occasionally with a single hair, inside densely pilose in the tube except for the glabrous base; tube 1.8–3 × as long as the calyx, 0.6–1.3 × as long as the lobes, 3–4.5 mm long, about 2.5 mm wide, slightly widened towards the throat; lobes oblong, 3–4.5 × as long as wide, acute, recurved (not yet in young flowers). *Stamens* well-exserted; filaments 1–2 × as long as the anthers, 1.5–3 mm long, glabrous, inserted at the mouth of the corolla tube; anthers oblong, 1.2–2.2 × 0.5–0.8 mm, bearded with few pilose hairs at the deeply cordate base or not; cells parallel. *Pistil* hirsute-pilose, 6–9 mm long; ovary ovoid, 2–2.5 × 1–1.5 mm, glabrous at the base, 2-celled, gradually narrowed into the style; style 4–7 mm long, glabrous at the apex; stigma saucer-shaped. In each cell 15–25 ovules. *Fruit* yellow or orange, small, globose, 3–6 cm in diam., about 6–15-seeded. Wall rather thin, about 2 mm thick. Pulp yellow or orange. *Seed* obliquely elliptic, flattened, 15 × 10 × 3 — 18 × 13 × 5 mm, often curved, rough, minutely and densely scabrid. Testa thick.

Distribution: Central and East Africa.

Ecology: Rain forests, secondary forests, often on river banks, or in gallery forests; alt. 0–1100 m.

Cameroun: Bitya, near Dja R., about 60 km ENE. of Sangmélima, Bates 1746 (FHO, K, P, PRE); Dja R., Lomié area (May) Mildbraed 5363 (HBG, cited as *S. excellens*); 43 km NW. of Bertoua, Breteler 1393 (WAG, YA); near Garoua Sambé, 25 km NW. of Batouri, Breteler 2780 (BR, K, P, WAG, YA); Mt. Notes. The variety *expansa* cannot be maintained, according to the present author, as the differential characters are not as constant as was supposed by Miss BRUCE (1956). The corolla lobes are suberect in young flowers and become recurved at anthesis, as can be seen on the B sheet of Drummond & Hemsley 3354, cited as var. *scheffleri*, and Louis 6204, the type of var. *expansa*, and e.g. Germain 4507 and 7316. The East African specimens of *S. scheffleri* studied by Miss BRUCE are in bud and/or bear some young flowers. The style is hairy only at the base in Drummond & Hemsley 3354 and almost to the apex in Graham 2045, both cited as var. *scheffleri*. East African specimens with lax inflorescences in bud are herb. Warnecke 389, paratype of *S. scheffleri*, and Zimmermann G 7688. As is known of many *Strychnos* species, also in *S. scheffleri* the inflorescence axis and branches stretch at anthesis and also after.

Bequaert 4879, the type of *S. dubia*, reduced to a synonym of *S. scheffleri* here, has the congested inflorescence of var. *scheffleri* and the hairy style of var. *expansa*.

S. scheffleri is closely allied to *S. ngouniensis* and *S. soubrensis* by the habit, flowers, fruits, and seeds. The leaves of the former are thicker, while the corolla has outside occasionally a single hair instead of a distinct indumentum.

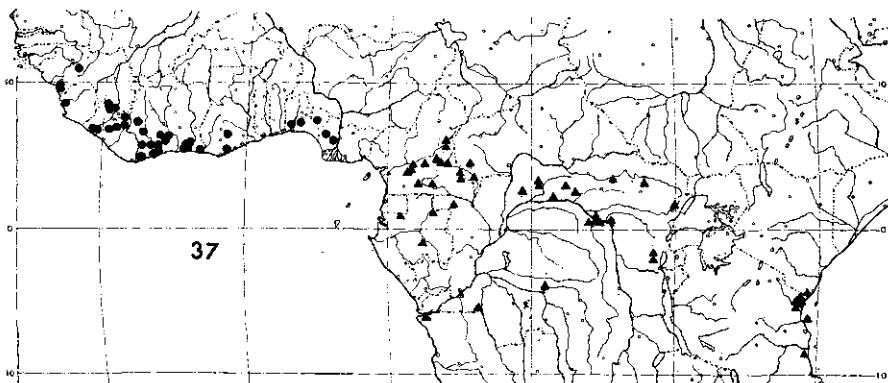

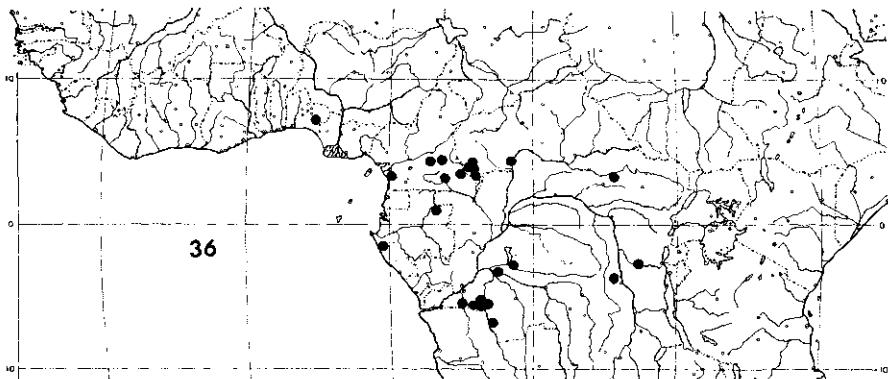

On the other hand, *S. scheffleri* is closely allied to *S. kasengaensis* by the same characters and also by the thickness of the leaves. They differ as follows:

Leaves minutely pubescent on main veins above; branchlets pubescent; corolla outside sparsely pubescent or glabrous, mature bud (4)6–7 mm long

S. kasengaensis

Leaves glabrous above; branchlets mostly glabrous, sometimes sparsely pubescent; corolla outside glabrous or with a single hair, mature bud 7–9.5 mm long

S. scheffleri

MAP 36. *S. samba*; Map 37. ● *S. soubrensis*, ▲ *S. scheffleri*.

Type: Ivory Coast: near Soubré, Sassandra R., Chevalier 17994 (K, holotype; isotypes: LY, P).

Heterotypic synonym: *S. jollyana* Pierre ex A. Chev., Rev. Bot. Appliq. 27: 364, pl. 14. 1947, partly (excl. fruit which is *S. aculeata*), not Chevalier, Expl. Bot. Afr. Occ. Fr. 1: 443. 1920, nomen (specimens cited are *S. aculeata* and *S. barteri*). Type: Ivory Coast: Dabou, Jolly 203 (P, holotype, photograph in K, neg. 4483; isotype: WAG).

Liana or scandent shrub, 10–50 m long, up to 40 m high climbing in trees. Bark pale grey to dark brown, with large lenticels; wood pale ochraceous-

yellow. *Branches* lenticellate or not, dark when dry, terete; branchlets sparsely brown-pubescent, often especially below the stipular line, glabrescent, not lenticellate, often sulcate when dry. Tendrils paired. *Leaves*: petiole short, often sparingly pubescent, 1–3 mm long; blade dark green and often slightly shining above, paler and slightly shining beneath, thinly coriaceous or papyraceous also when living, thinner in the shade, narrowly ovate, elliptic, or narrowly elliptic, near the base of the branchlets and on the main axis usually ovate, smaller and comparatively wider, or reduced to small bracts, 1.5–3 × as long as wide, (1.8)3.5–12 × (0.9)1.6–5.4 cm, acuminate and apiculate at the apex, rarely obtuse near the base of the branchlets, cuneate, rounded, or occasionally subcordate at the base, glabrous or with some hairs on the costa above, sparsely pubescent on the costa and the main secondary veins or glabrous beneath; costa impressed above, especially near the base; one pair of secondary veins from the base curved along the margin, rarely also a faint submarginal pair; tertiary venation reticulate, especially beneath. *Inflorescence* axillary and occasionally at the same time terminal, about 0.2–0.3 × as long as the leaves, few- to many-flowered, 2–4 × branched, congested or not, never lax, 1–2 cm long and wide. Peduncle, branches, and pedicels short, often sparsely pubescent. Bracts approximately sepal-like, sparsely pubescent. *Flowers* 5-merous. *Sepals* very pale green with paler mostly whitish margin, connate at the base up to one-third of their length, orbicular or nearly so, 1.2–2 mm long, rounded or nearly so at the apex, minutely ciliate, outside sparsely shortly pubescent to glabrous, inside glabrous and with some dark longitudinal stripes, without colleters. *Corolla* in the mature bud 4–6.5 × as long as the calyx, 7–8.5 mm long, and rounded or nearly so at the apex, white, outside sparsely and often minutely pubescent, especially on the tube, inside with a wide densely pilose ring in the throat, lobes and one-third to one-half from the base of the tube glabrous; tube 2.2–4 × as long as the calyx, 0.9–1.8 × as long as the lobes, 4–4.8 mm long, gradually widened towards the throat and there (1.5)2–2.5 mm wide; lobes narrowly triangular, 2–3 × as long as wide, 2.5–4 × 1.2–2 mm, often slightly spreading. *Stamens* exserted; filaments glabrous, 1.3–1.7 × as long as the anthers, 2 mm long, inserted at the mouth of the corolla tube; anthers pale yellow or pale green, turning black-brown at anthesis, 2.3–2.5 × as long as wide, 1.2–1.6 × 0.5–0.7 mm, deeply cordate at the base, ventrally at the base usually with some pilose hairs; cells parallel. *Pistil* pubescent in the middle, 7–8 mm long; ovary ovoid, glabrous at the base, 2–3 × 1–1.5 mm, 2-celled, gradually narrowed into the style; style glabrous at the apex, 5–6 mm long; stigma capitate. In each cell about 15–18 ovules. *Fruit* orange, globose, 1.8–3 cm in diam., 2–12 seeded. Wall thin. *Seed* medium brown, obliquely and irregularly elliptic or ovate, flattened, 10 × 8 × 4 – 16 × 11 × 5 mm, rough, very shortly scabrid-pubescent. *Testa* thick.

Distribution: West Africa.

Ecology: Moist places in rain forests or secondary forests, often on river banks; alt. 0–1000 m.

Cult.: Adiopodoumé, Ivory Coast, Leeuwenberg 4571 (WAG, seedlings of herb. Leeuwenberg 3727); Wageningen, seedlings of same mother plant: Leeuwenberg 4991 (WAG), 7815 (WAG), and J. de Bruyn 1792 (WAG, fl. Oct.).

Notes. There has been much confusion around the name *S. jollyana*. CHEVALIER (1920) cited it with some specimens which belong to *S. aculeata* and *S. barteri*. Several years later, in 1947, he describes a species, *S. jollyana*, based on Jolly 203, which should be identified as *S. soubreensis*, according to the present author. The figure which accompanies his description is apparently based on the latter specimen, except for the seeds. These belong doubtlessly to *S. aculeata* and are preserved in the carpological collection of the Paris Herbarium.

S. soubreensis is closely allied to *S. ngouniensis* (see notes there). It is also related to *S. scheffleri*, as is stated there, but less so. The third species, to which it shows resemblance, is *S. splendens*, which has thicker leaves, and a much shorter corolla tube. The shade-leaves of the latter are often undulate at the margin and the plant is often twining.

S. djalonis A. Chev., Expl. Bot. Afr. Occ. Fr. 1: 442. 1920, nomen; Rev. Bot. Appliq. 27: 358, pl. 16 B. 1947. Type: Guinea: Ditinn (Apr.) Chevalier 12179 bis (P, holotype, photograph in K, neg. 2301; isotype: LY).

Deciduous shrub or small tree, (0.30)1–6(10) m high, sometimes flowering on one-year shoots (with small leaves) on old fire-cut stumps. Trunk 4–15 cm in diam., (sometimes fluted), branched from low down; bark pale to dark grey or brown, shallowly fissured, not or sometimes thinly corky, often scaly, sometimes blackened by bush fire, not lenticellate; wood hard, whitish, without bark-islets. Branches sometimes deeply ringed at nodes, grey or brown not lenticellate, often with recurved or straight spines; branchlets glabrous or pubescent, green or yellow-green when living, green or brown and often sulcate when dry, sometimes terminating in a straight spine. Stipules soon deciduous, 4 on each node, at the base of the petioles, narrowly triangular, 1–2 mm long. Leaves on main axis sometimes ternate; petiole 2–10 mm long, glabrous or pubescent; blade shining and pale to medium green above, mat and paler beneath, veins often pale on both sides, coriaceous also when living, young thinner and papyraceous when dry, very variable in shape and size, orbicular, elliptic, narrowly elliptic, ovate, or obovate, 1–2(3) × as long as wide, sometimes comparatively wider or narrower on main axis, usually comparatively wider on flowering branches, 1.4–9.5 × 1.2–7.5 cm, rarely larger, up to 13.5 × 7.5 cm, emarginate, rounded to acute and often apiculate, sometimes acuminate (mostly in trees along water courses), or rarely abruptly acuminate at the apex, cuneate, less often rounded, or sometimes on main axis subcordate at the base, often with hair pockets in the angles of the main veins beneath, glabrous or pubescent on both sides (in sucker shoots and seedlings of plants with few hairs more hairy, smaller and cordate); 1–3 pairs of distinct secondary veins from above the base curved along the margin. Inflorescence terminal, seemingly umbellate, congested or less often not, 1.5 × 1.5 – 5 × 3.5 (6.5 × 7) cm, mostly many-flowered, 3–4 × branched. Peduncle, branches, and pedicels often sparsely pubescent (never glabrous). Bracts linear or nearly so, upper sepal-like, lower larger, sparsely pubescent outside, especially at the base, above mostly with some hairs and occasionally with some colleters at the base. Flowers 5-merous. Sepals pale green, connate at

PHOT. 4. *S. spinosa*: crown of small tree (Leeuwenberg 3288).

the base, narrowly triangular to linear, equal, subequal, or sometimes unequal, $2-6(10) \times$ as long as wide, $1.5-6 \times (0.3)$ 0.5–1.2 mm, elongate at anthesis, acuminate or subulate at the apex, minutely ciliate at the base or not, outside mostly sparsely pubescent at the base and glabrous at the apex or entirely glabrous, never with an even indumentum all over, inside glabrous and usually with some hairs at the base or sometimes minutely pubescent, without colleters. *Corolla* when mature $0.8-2.7 \times$ as long as the calyx, 4–5(3.8–6) mm long, pale green, greenish, or less often white, creamy, or yellow, glabrous or sparsely pubescent outside, inside with a narrow entire white-penicillate corona at the mouth of the tube; tube $1.2-2.7 \times$ as long as the lobes, $2.5-3(2.2-4.4) \times 2-3$ (3.5) mm, urceolate or campanulate, often somewhat contracted in the throat;

lobes triangular, 1.2–1.8 × as long as wide, 1.2–2 × 1–1.5 mm, acute, erect or suberect. *Stamens* included; filaments glabrous, 0.7–1.5 × as long as the anthers, inserted at 0.4–0.8 mm from the base of the corolla; anthers inserted at 0.4–0.8 mm from the base of the corolla; anthers oblong or elliptic, 1.2–1.4 × 0.8–1 mm, deeply cordate at the base, ciliate with villose or sometimes pilose hairs all around by which they are coherent; cells parallel. *Pistil* pubescent, rarely obscurely so, glabrous just below the stigma, 1.8–2.4(3) mm long; ovary ovoid, broadly ovoid, or globose, (1)1.2–1.6(2) × 1–1.3 mm, acuminate at the apex, 1-celled; stigma subsessile, oblong. One large globose basal placenta with about 60–120 ovules. *Fruit* yellow or when nearly mature yellow-green or green, large, hard, resembling an orange or a grape fruit, globose, often slightly shining, with granular skin, 7–11(15) cm in diam., with about 10–100 seeds, immature often slightly pear-shaped. Wall rather thick, hard, 2–5(8) mm thick, thickened inside above the pedicel. Pulp yellow, edible. *Seed* ochraceous in fruit, very pale brown when dried up, darkening in rotten fruits, obliquely ovate or elliptic, flattened, more or less plano-convex, usually irregularly curved, about 1–2 × as long as wide, 11 × 6 × 2 — 23 × 18 × 5 mm, mostly smooth, very shortly pubescent. *Testa* thick.

Distribution: Tropical and South Africa.

Ecology: Woodlands, bushlands, or sometimes gallery forests; alt. 0–2200 m.

About 850 specimens collected throughout the area examined, of which some are cited:

Cult.: Uitenhage, Durban, S. Africa, Brehm s.n. (TCD); Hort. Calcutta, India, Wallich Cat. 1588 (K); Wageningen, Leeuwenberg 3508 (WAG, seedling of herb. Breteler 1167).

Notes. After comparison of about 850 specimens of this species the present author has confirmed Miss VERDOORN's conclusion that it cannot be subdivided as was done by Miss BRUCE, viz. subspp. *lokua*, *spinosa*, and *volkensii*. The species is variable in many characters and in many of these characters throughout its entire area which is the largest of all African *Strychnos* species. The leaves are variously shaped and generally more acute in vegetations along watercourses. Furthermore, the leaves in flowering branches are often comparatively wider and in very young plants or sucker shoots (which might flower) often cordate. In one plant the leaves may vary from orbicular to narrowly elliptic (e.g. herb. Leeuwenberg 4288, Upper Volta). The sepals vary very much in length, from 1.5 to 6 mm; moreover, they are elongate at anthesis. The indumentum of the leaves and branchlets is variable. The corolla, the pistil, and the seeds are relatively constant in most characters: the stamens and pistil are nearly constant in shape and indumentum and vary slightly in size; the ovary is always one-celled; the shape and indumentum of the seeds is also constant.

To illustrate why the species cannot be subdivided the following supporting evidence may be given:

Herb. Espírito Santo 1945 (Portuguese Guinea), Chiovenda 663 (Somalia), Barbosa 2084 (Moçambique), Marais & van der Schijff 1260 (Transvaal), and Mocquerys 136 (Madagascar) have inflorescences and calyces of subsp. *spinosa* and powdery branches as in subsp. *lokua*. Herb. Drummond & Hemsley 3999 (Kenya) and Robinson 3953 (Zambia) have calyces of subsp. *volkensii* and powdery branches like subsp. *lokua*. Herb. Gomes e Sousa 1850 (Moçambique) has long sepals and varnished branches like subsp. *spinosa*, but rather lax inflorescences like subsp. *volkensii*. In herb. Compton 29038 the branches are varnished (subsp. *spinosa*) and powdery (subsp. *lokua*) and the sepals are long as in subsp. *spinosa*. The very long sepals of subsp. *spinosa* were also found in herb. J. D. Martin 321/32 (Zambia) which has powdery branches and pubescent leaves. Herb. Drummond & Hemsley 3612 (Tanzania), which was identified as subsp. *volkensii*, has mottled and powdery branches and pubescent leaves. Herb. Eggeling 6751 (Tanzania) has varnished and mottled branches like subsp. *spinosa* and *volkensii*, but sepals intermediate in length between the two. Herb. Theron 2060 (Transvaal) has varnished branches, pubescence all over, sepals as in subsp. *spinosa*, and inflorescences with few flowers as in subsp. *volkensii*. The variation of the species is well shown in the collections of Marais & van der Schijff (Transvaal) and Leeuwenberg (Ivory Coast, Upper Volta, and Cameroun).

63. *S. splendens* Gilg in Engler, Bot. Jahrb. 17: 571. 1893; Baker in Fl. Trop. Afr. 4(1): 524. 1903; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 41. 1963.

Type: Sierra Leone: Bayabaya, Scarcies R., Scott Elliot 4292, partly (K, lectotype; isotype: BM; the GH sheet is *S. melastomatoides* Gilg).

Heterotypic synonym: *S. chrysocarpa* Bak., Kew Bull. 1895: 98. 1895 and l.c.

p. 529. Type: Sierra Leone: near Wilberforce, H. H. Johnston 98 (K, lectotype; isotype: E).

S. acutissima Gilg in Engler, Bot. Jahrb. 23: 200. 1896; Baker in Fl. Trop. Afr. l.c. p. 524. Type: Sierra Leone: sin. loc., Afzelius s.n. (UPS, lectotype).

Climbing shrub or liana, 8–20 m high climbing over shrubs and in trees, 20–40 m long, often twining. Trunk 2–12 cm in diam. Bark pale grey or pale brown, lenticellate, smooth; wood creamy. *Branches* mostly lenticellate, pale grey or pale brown and not sulcate when dry; branchlets puberulous or glabrous, terete, sometimes obscurely angular when living, not lenticellate, medium to dark brown and often slightly sulcate when dry. Tendrils paired. *Leaves*: petiole puberulous or glabrous, relatively short in shade leaves, 2–8 mm long; blade shining and dark green above, less shining or mat and slightly paler beneath, in the sun coriaceous or subcoriaceous, in the shade papyraceous, also when living, elliptic, narrowly elliptic, or sometimes ovate, usually comparatively narrower towards the apices of the branchlets, 1.3–4 × as long as wide, 4.5–13 × 2–5 cm, up to 17 × 8 cm in the shade, acuminate and often very acute at the apex, cuneate or rounded at the base, slightly undulate in the shade, glabrous on both sides; one or two pairs of secondary veins from the base curved along the margin; tertiary venation reticulate, not very conspicuous, prominent beneath. *Inflorescence* axillary, often also in the axils of the apical leaves and therefore seemingly terminal, solitary, lax, 0.2–1 × as long as the leaves, 2.5–5(6.5) × × 2–2.5 cm, few-flowered, 1–2 × branched. Peduncle, branches, and pedicels slender, pubescent to nearly glabrous. Bracts very narrowly elliptic or very narrowly triangular, about 1–3 × as long as the sepals, beneath hairy as the peduncles, above glabrous and often with colleters at the base. *Flowers* 5-merous. *Sepals* pale green, free or connate at the base, subequal, broadly ovate, 1–1.5 × as long as wide, 0.6–1 × 0.5–0.8 mm, acute or obtuse at the apex, ciliate, often sparingly pubescent outside, glabrous inside, without colleters. *Corolla* in the mature bud 4–6 × as long as the calyx, 3–4 mm long, and rounded at the apex, white, whitish, or pale yellow, in bud at apex often pale bluish, outside glabrous or with some minute hairs, inside pilose on the lobes, especially at the base (glabrous in the tube and at the apices of the lobes); tube very short, mostly shorter than the calyx, 0.4–1 mm long; lobes 3–7 × as long as the tube, oblong, 2–3.5 × as long as wide, 3–3.5 × 1–1.4 mm, acute, recurved. *Stamens* well-exserted; filaments white, glabrous, about 1.5–2 × as long as the anthers, 1.5–2.4 mm long, elongate at anthesis, inserted at the mouth of the corolla tube; anthers oblong, 2–2.5 × as long as wide, 1–1.2 × 0.5–0.6 mm, cordate at the base, glabrous; cells parallel. *Pistil* pilose-pubescent, 3–4 mm long; ovary ovoid-conical, 1–1.5 × 1 mm, only at the very base glabrous, 2-celled, gradually narrowed into the style; style thick, glabrous at the apex, 2.5–3 mm long; stigma capitate. In each cell 7–8 ovules. *Fruit* orange or orange-yellow, immature green and often topped by the hairy base of the style, sub-globose or nearly so, usually depressed, small, soft, 13 × 16 × 13 – 19 × 24 × 21 mm or more (up to about 30 mm in diam.), 1–2 (6)-seeded, with smooth

skin, hardly shining. Wall thin, about 0.3 mm thick. Pulp orange. Seed ochraceous, obliquely elliptic, flattened, often irregularly curved, $12 \times 10 \times 4 - 18 \times 13 \times 6$ mm, slightly plano-convex, rough, with short scabrid hairs. Testa thick.

Distribution: West Africa.

Ecology: River banks and there often near rocks, in rain forests or secondary forests, or in gallery forests; alt. 0–400 m.

Portuguese Guinea: Prabis, Bissau, Espírito Santo 1856 (COI, K, LISC, LISJC); Cumura, Espírito Santo 2230 (COI, K, LISC, WAG); between Cumura and Bár, Bissau, Espírito Santo 1893 A (COI); between Saucunda and Empada, Espírito Santo 7 Apr. 1946 (COI); between Catio and Saucunda (Oct.) Type: Cameroun: Johann-Albrechtshöhe (=Kumba), Staudt 616 (holotype not seen, destroyed in B; lectotype: K, other isotypes seen: COI, G, LE, P, S, Z).

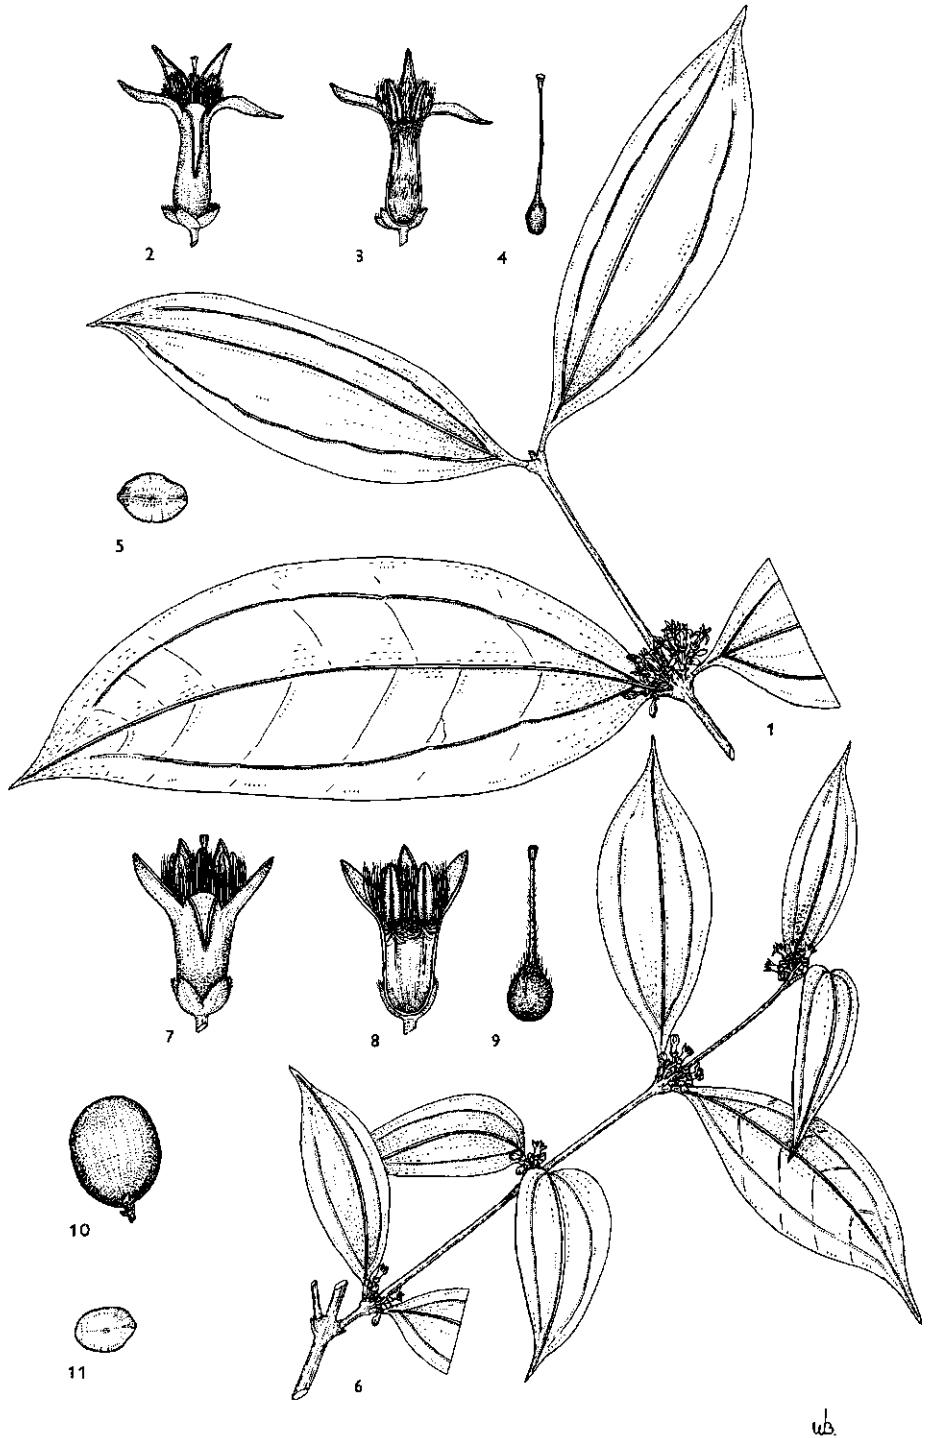

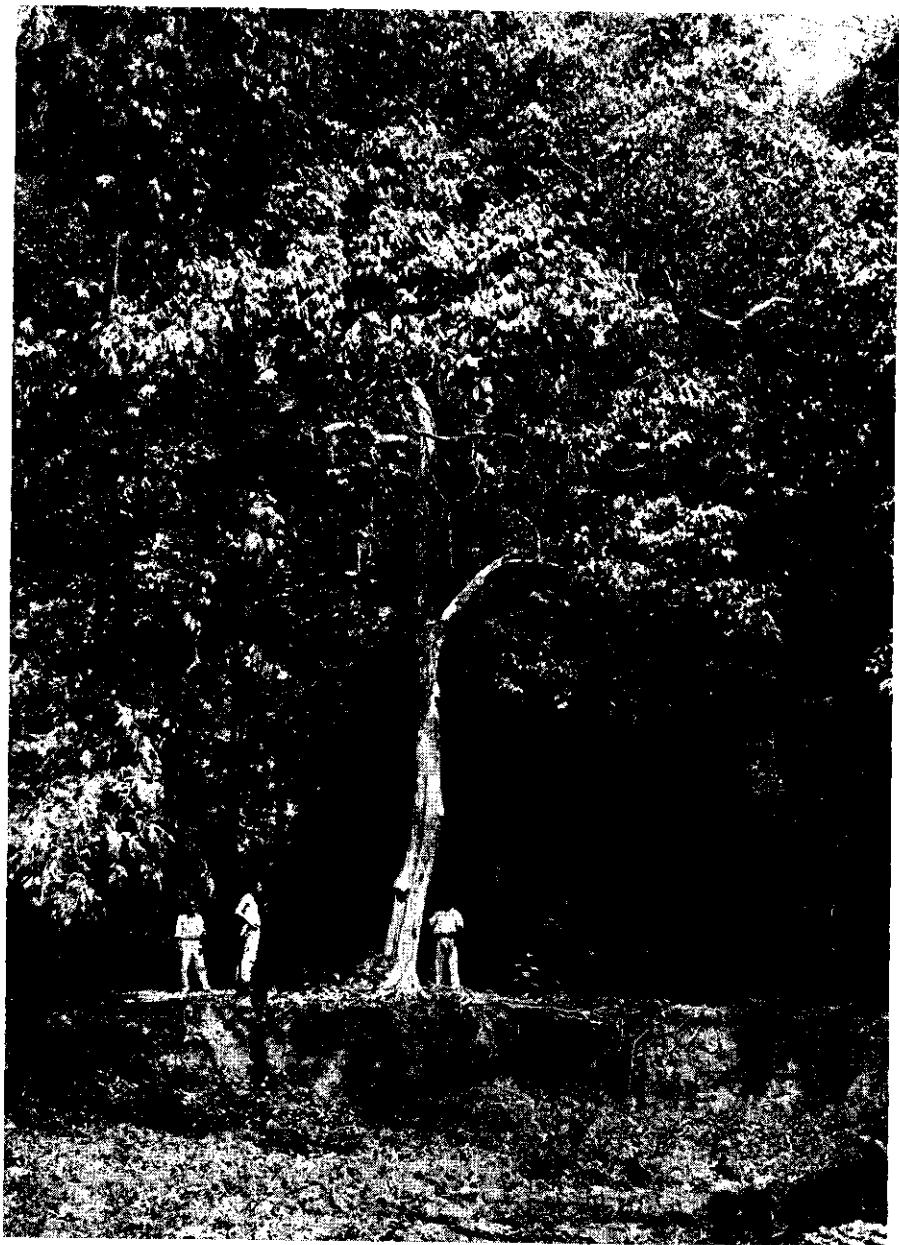

FIG. 41. 1-5. *S. staudtii*: 1. branch, $\frac{1}{2} \times$; 2. flower, $3 \times$; 3. opened flower, $3 \times$; 4. pistil, $3 \times$; 5. seed, $\frac{1}{2} \times$ (1-5. Breteler c.s. 2575); 6-11. *S. zenkeri*: 6. branch, $\frac{1}{2} \times$; 7. flower, $4 \times$; 8. opened flower, $4 \times$; 9. pistil, $4 \times$; 10. fruit, $\frac{1}{2} \times$; 11. seed, $\frac{1}{2} \times$ (6-9. Zenker 2436; 10-11. Pierlot 2373).

Tree, 7.50–20 m high. Trunk somewhat fluted, 40–60 cm in diam., or less. Bark very thin, grey-brown, with large lenticels; wood hard, very pale yellowish-brown. *Branches* pale grey to pale brown, not lenticellate, sometimes umbellately branched; branchlets mostly minutely pubescent below the stipular line, further glabrous, pale to medium brown or pale grey, not lenticellate nor sulcate. *Leaves*: petiole glabrous or with some minute hairs, 3–8 mm long; blade dark green and slightly shining above, somewhat paler beneath, papyraceous when living, coriaceous when dry, elliptic or narrowly elliptic, 2–3.5 × as long as wide, (8)10–20.5 × (3)4–8.5 cm, often shortly acuminate at the apex, cuneate or rounded at the base, glabrous on both sides; one pair of secondary veins from above the base curved along the margin and a faint submarginal pair from the base; costa and main secondary veins impressed above, prominent beneath; tertiary venation not distinctly reticulate. *Inflorescence* axillary, rather congested, few-flowered, much shorter than the leaves, 1.5–3 × 1.5–2.5 cm, 1–3 × branched. Peduncle, branches, and pedicels shortly pubescent all over. Bracts small, approximately sepal-like, beneath shortly pubescent like the peduncle, above glabrous and often (?) with some colleters at the base. *Flowers* (4–)5-merous. *Sepals* greenish-white, connate at the base for one-third of their length, broadly ovate to suborbicular, 1–1.6 × as long as wide, 1.5–3 × 1.5–2.2 mm, obtuse or rounded at the apex, minutely ciliate, minutely puberulous outside, glabrous and with colleters at the base inside. *Corolla* in the mature bud 3.7–5.3 × as long as the calyx, 8–11 mm long, and rounded at the apex, outside greenish-white, inside white, turning pale yellow, outside minutely puberulous, especially on the tube, inside with two rings of white brush-like hairs, one on the middle of the tube and one on a narrow corona in the throat; corona annular, 0.5–1 mm high, entire or with 5 very short broad lobes opposite the corolla lobes; tube somewhat ventricose in the middle or widely cylindrical, 2–2.6 × as long as the calyx, 1–1.4 × as long as the lobes, 4–6.5 mm long, at the throat 2–4 mm wide; lobes narrowly triangular, 2–2.6 × as long as wide, 4–5 × 1.5–2.5 mm, acute, spreading. *Stamens* exserted; filaments glabrous, short, about 0.4–1 × as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 1.5–2 × 0.4–1 mm, deeply cordate to sagittate and mostly shortly bearded at the base; cells parallel. *Pistil* glabrous, pale green, 8.5–10 mm long; ovary ovoid or broadly ovoid, 2–2.5 × 1.5–2 mm, 2-celled, more or less gradually narrowed into the style; style 6–8 mm long, rather thin; stigma white, small, capitate. In each cell 20–30 ovules. *Fruit* white, small, sub-globose, 22 × 20 – 37 × 35 mm, 1- to (probably) several-seeded. Wall thin, dry 1–1.5 mm thick. *Seed* pale brown, nearly elliptic, flattened, 20 × 15 × 7 – 23 × 17 × 7 mm, rather rough, very shortly scabrid-pubescent. Testa thick.

Distribution: Cameroun, Gabon.

Ecology: Rain forests, often on river banks; alt. up to about 400 m.

Cameroun: Johann-Albrechtshöhe (= Kumba) Staudt 616 (COI, G, K, LE, P, S, Z, type), 966 (A, BM, BO, E, G); Koto Barombi, Kumba District, Babute 11 (K); S. of Ebonji, Olorunfemi FHI 30598 (K); between Baimayan and Barombi (Feb.) Binuyo & Daramola FHI

PHOT. 5. *S. staudtii*: tree, with Mr. Breteler and two Camerounese assistants (Breteler c.s. 2575).

35511 (FHO, K, P); left bank Mungo R., near bridge in Kumba-Loum road (fl., fr. Feb.) Breteler, J. de Wilde & Leeuwenberg 2575 (BR, K, P, WAG, YA); ibid., Leeuwenberg 6849 (WAG, seedlings of preceding).

Gabon: Boucimbi, Upper Ngounié R. (Sept.) Le Testu 6093 (P, WAG); Lastourville Region, Le Testu 7563 (P, WAG).

Note. *S. staudtii* is closely allied to *S. zenkeri* by the habit, leaves, inflorescences, outside of flowers, fruits, and seeds. They differ strikingly in the following characters:

Corolla with two rings or hairs inside; pistil glabrous *S. staudtii*
Corolla with one ring of hairs only in the throat; pistil pilose-pubescent

S. zenkeri

65. *S. talbotiae* S. Moore in Cat. Talbot's Nig. Pl. 69. 1913; Onochie & Leeuwenberg in Fl. W. Trop. Afr. 2nd ed. 2: 43. 1963; Leeuwenberg Act. Bot. Neerl. 14: 219. 1965.

Type: Nigeria: Oban, Calabar Province, Talbot 2077 (BM, holotype; isotype: K).

Heterotypic synonym: *S. reygaerti* De Wild., Pl. Bequaert. 2: 99. 1923. Type: Congo (Kinshasa): Equateur, Bumba Territory, Dundusana, Reygaert 225 (BR, holotype).

Liana. *Branches* greenish-brown-spotted, not lenticellate; branchlets glabrous, slightly sulcate and pale to medium brown when dry, more or less terete. Tendrils paired. *Leaves*: petiole glabrous, 4–8 mm long; blade when dry shining and pale brownish-green above, less shining and paler beneath, coriaceous, elliptic or narrowly elliptic, 1.5–3 × as long as wide, 7–12 × 3.5–8.5 cm, acuminate at the apex, cuneate at the base, glabrous on both sides; one or two pairs of secondary veins from above the base curved along the margin and often a faint submarginal pair; tertiary venation reticulate, especially beneath. *Inflorescence* axillary, many-flowered, 2–2.5 × 1.5 cm, 3 × branched, much shorter than the leaves, more or less congested. Peduncle and branches glabrous or nearly so. Bracts sepal-like, but mostly smaller than the sepals, without colleters, appressed-pubescent above at the base. *Flowers* 5-merous. *Sepals* subequal or unequal, connate at the base for about one-quarter of their length, suborbicular, as long as wide, 0.8–1.2 mm long, rounded at the apex, ciliate, glabrous or minutely pubescent outside, inside with a horizontal stripe of pubescence on the level where they are united, that is interrupted in the middle, without colleters. *Corolla* in the mature bud 2–2.5 × as long as the calyx, 2 mm long, rounded at the apex, pale yellow (?), outside pubescent, inside with a ring of villose hairs in the throat; tube shorter than the calyx, 0.7 mm long; lobes triangular to ovate, 1.8 × 1 mm, acute, suberect. *Stamens* exserted; filaments nearly as long as the anthers, glabrous or with a single hair, inserted at the mouth of the corolla tube; anthers cordate, 1 × 0.6–0.8 mm, bearded with villose hairs at the cordate base; cells parallel. *Pistil* pubescent in the upper portion, 2.5 mm

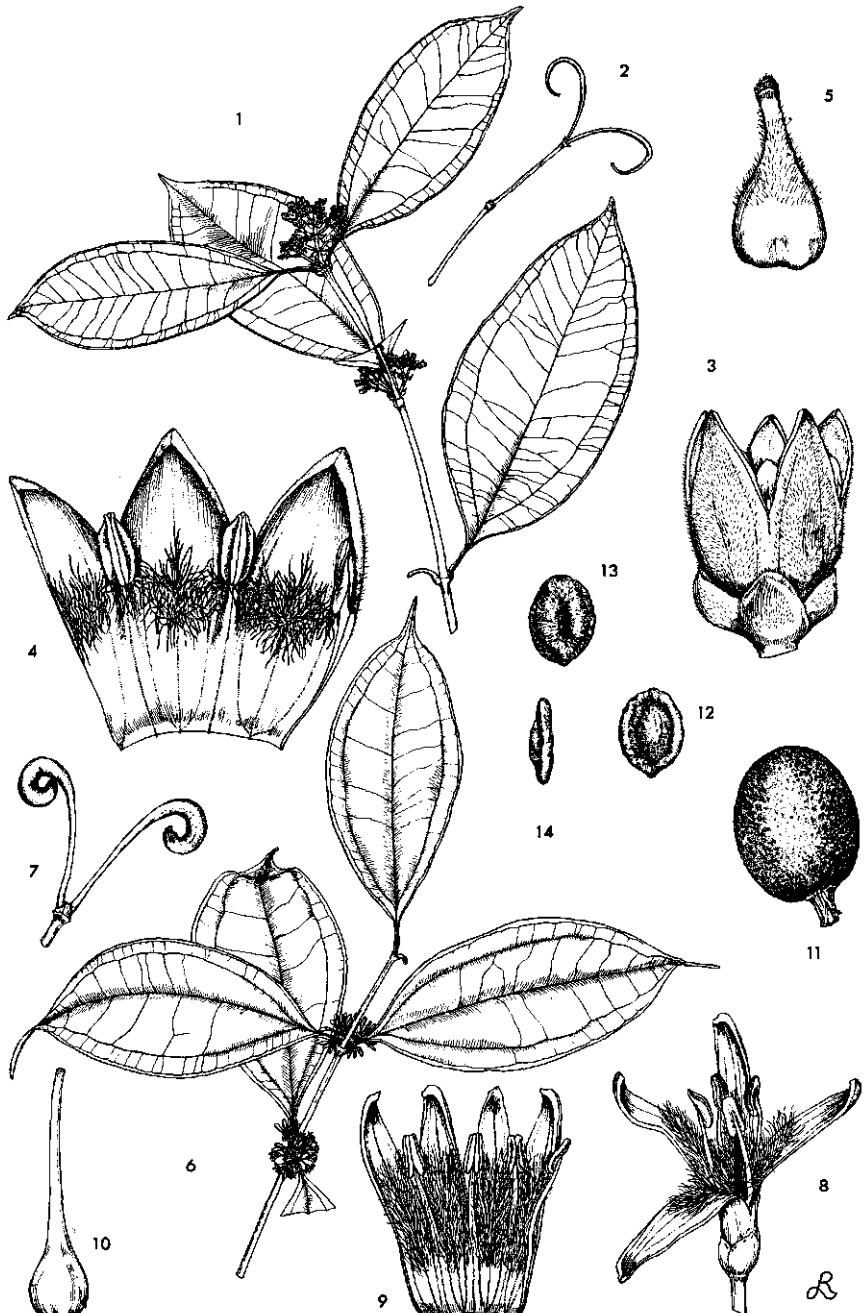

FIG. 42. 1-5. *S. talbotiae*: 1. branch, $\frac{1}{2} \times$; 2. tendrils, $\frac{1}{2} \times$; 3. flower, $7 \times$; 4. portion of corolla with stamens, $10 \times$; 5. pistil, $12 \times$ (1-5. W. de Wilde 2202). 6-14. *S. tricalyptoides*: 6. branch, $\frac{1}{2} \times$; 7. tendrils, $\frac{1}{2} \times$; 8. flower, $5 \times$; 9. opened corolla with stamens, $5 \times$; 10. pistil, $8 \times$; 11. fruit, $\frac{1}{2} \times$; 12-14. seeds, 3 sides, $\frac{1}{2} \times$ (6, 8-10. Mildbraed 10576; 7, 11. Leeuwenberg 5389; 12-14. FHI 18929).

long; ovary ovoid, pubescent at the very apex, further glabrous, $1.5-2 \times 1-1.2$ mm, 2-celled; style short, 1 mm long or less; stigma capitate. In each cell 10-12 ovules. *Fruit* about 3 cm in diam., several-seeded. Wall rather thin. *Seed* flattened, rough (?).

Distribution: Nigeria, Cameroun, Congo (Kinshasa).

Ecology: Rain forests, often on river banks; alt. about 0-500 m.

Nigeria: Oban, Calabar Province, Talbot 2077 (BM, K, type).

Cameroun: bank of small river, N. of Kélé R., about 50 km NNW. of Eséka (Mar.) W. de Wilde 2202 (WAG).

Congo (Kinshasa): Equateur: Gbo-Sassa (Mar.) Evrard 380 (BR); Dundusana, Bumba Territory (Apr.) Reygaert 225 (BR, type of *S. reygaerti*).

Notes. The types of *S. talbotiae* and *S. reygaerti* resemble each other so strikingly that there is no doubt they belong to a single species.

S. talbotiae is distinguished from its nearest relative, *S. chrysophylla* (q.v.).

66. *S. tchibangensis* Pellegr., Bull. Mus. Hist. Nat. Paris 32: 394. 1926; Mém. Soc. Linn. Nor. n. sér. 1: 39, f. 9. 1928; Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 23, f. 7 B. 1952. **Fig. 37, p. 229; Map 41, p. 251**

Type: Gabon: Ganda, Le Testu 1175 (P, lectotype; isotypes: B, IFAN, P).

Climbing shrub or liana. Trunk 5 cm in diam. (or more). Bark dark brown, with large lenticels; wood creamy. *Branches* not lenticellate, terete, medium to dark brown and slightly sulcate when dry; branchlets sparsely pubescent to nearly glabrous (in a single branch), medium to dark brown and slightly sulcate when dry. Tendrils solitary. *Leaves*: petiole sparsely pubescent, 3-7 mm long; blade medium green and slightly shining to mat above, paler and sometimes with dark veins beneath, thinly coriaceous or papyraceous also when living, elliptic, narrowly elliptic, narrowly ovate, or on the main axis or at the bases of the branchlets often ovate, $(1.3)2-3(4) \times$ as long as wide, 3-10(12) \times 1-4(6.5) cm, acuminate to caudate at the apex, cuneate or rounded at the base, glabrous on both sides or sometimes with few hairs at the base beneath; one or two pairs of secondary veins from or from above the base curved along the margin and a faint submarginal pair; tertiary venation reticulate, not very conspicuous. *Inflorescence* terminal, lax at the base, congested in the ultimate branchings, many-flowered, $3 \times 2 - 5.5 \times 4.5$ cm, 3-4 \times branched. Peduncle and branches pubescent as the very short pedicels. Lower bracts often leafy, otherwise narrowly triangular to linear and often pubescent and with colleters at the base above, upper narrowly triangular to linear and often pubescent and with colleters at the base above, or sepal-like and glabrous above and without colleters. *Flowers* 5-merous. *Sepals* pale green, connate at the base for one-quarter to one-third of their length, equal, broadly ovate, about as long as wide,

$1.2-1.5 \times 1.2-1.4$ mm, acute at the apex, ciliate, outside minutely pubescent, especially at the base, inside glabrous, without colleters. *Corolla* in the mature bud $3-3.7 \times$ as long as the calyx, 4.5 mm long, white or greenish, outside shortly pubescent, inside white-penicillate in the throat; tube nearly cylindrical above the contracted base, $2-2.3 \times$ as long as the calyx, 1.6 \times as long as the lobes, 2.8 mm long, at the throat 2.5 mm wide; lobes $1.7 \times 1-1.1$ mm, acute, suberect. *Stamens* included; filaments very short, 0.3 \times as long as the anthers, glabrous, inserted at two-thirds from the base of the corolla tube; anthers narrowly triangular, 1.3×0.6 mm, deeply cordate at the bearded base; cells parallel. *Pistil* glabrous, 2.5–3 mm long; ovary globose, 1 mm long, abruptly narrowed into the style, 2-celled; style 1.5 mm long; stigma capitate, up to 0.5 mm long. In each cell 18–30 ovules. *Fruit* orange, immature pale green or glaucous, small, soft, ellipsoid, $19 \times 13-14$ mm, mucronate, 1(–2)-seeded, with somewhat granular skin. Wall thin. *Seed* not much flattened, ellipsoid, $11 \times 9 \times 7 - 12 \times 10 \times 7$ mm, glabrous, smooth, often slightly dented at one side. *Testa* thin, sticking to the pulp.

Distribution: Cameroun, Gabon, Congo (Kinshasa).

Ecology: River banks in rain forests; alt. 0–600 m.

Cameroun: bank Nyong R., 40 km SE. of Yaoundé, Breteler 1780 (P, WAG, YA); left bank Sanaga R., near Ebaka (May) Breteler 1430 (BR, K, P, WAG, YA); 5 km NE. of Doumé, Breteler 1695 (K, P, WAG, YA); bank Doumé R., near Bimbia, 40 km SW. of Batouri (Apr.) Breteler 2802 (WAG) = Letouzey 4759 bis (P, WAG, YA); bank Dja R., between Edjune and Meu Rs., Letouzey 3773 (P, WAG, YA).

Gabon: Mayombe Bayaka, Tchibanga (Dec.) Le Testu 1909 (A, B, FHO, P, paratype); Tchibanga (Jan.) Le Testu 2131 (IFAN, P, paratype); Ganda (Oct.) Le Testu 1175 (B, IFAN, K, P, lectotype).

Congo (Kinshasa): Equateur: Lukolela, Pynaert 267 (BR). Orientale: Yangambi (fr. Feb., Oct.) Louis 13645 (BR, K, MO, P), 16186 (BR).

Note. *S. tchibangensis* resembles *S. urceolata* when fruiting, as is noted under the description of the latter.

67. ***S. ternata*** Gilg ex Leeuwenberg, Act. Bot. Neerl. 14: 224, f. 2. 7–14. 1965 (Gilg in Mildbraed, Wiss. Ergebn. Deutsch. Zentr.-Afr. Exped. 1910–1911. 2: 62. 1922, nomen).

Fig. 43, p. 253; Phot. 6 p. 261; Phot. 7, p. 263; Map 39, p. 251

Type: Cameroun: Mopwo, km 22 of Yokadouma-Batouri road, Letouzey 5271 (WAG, holotype; isotypes: A, BR, G, K, P, PRE, YA).

Medium sized deciduous forest tree, 12–25 m high. Trunk 70–80 cm in diam., with long narrow buttresses by which it is more or less irregularly fluted; bark thin, pale grey-brown, somewhat scaly; wood hard, yellowish, with paler

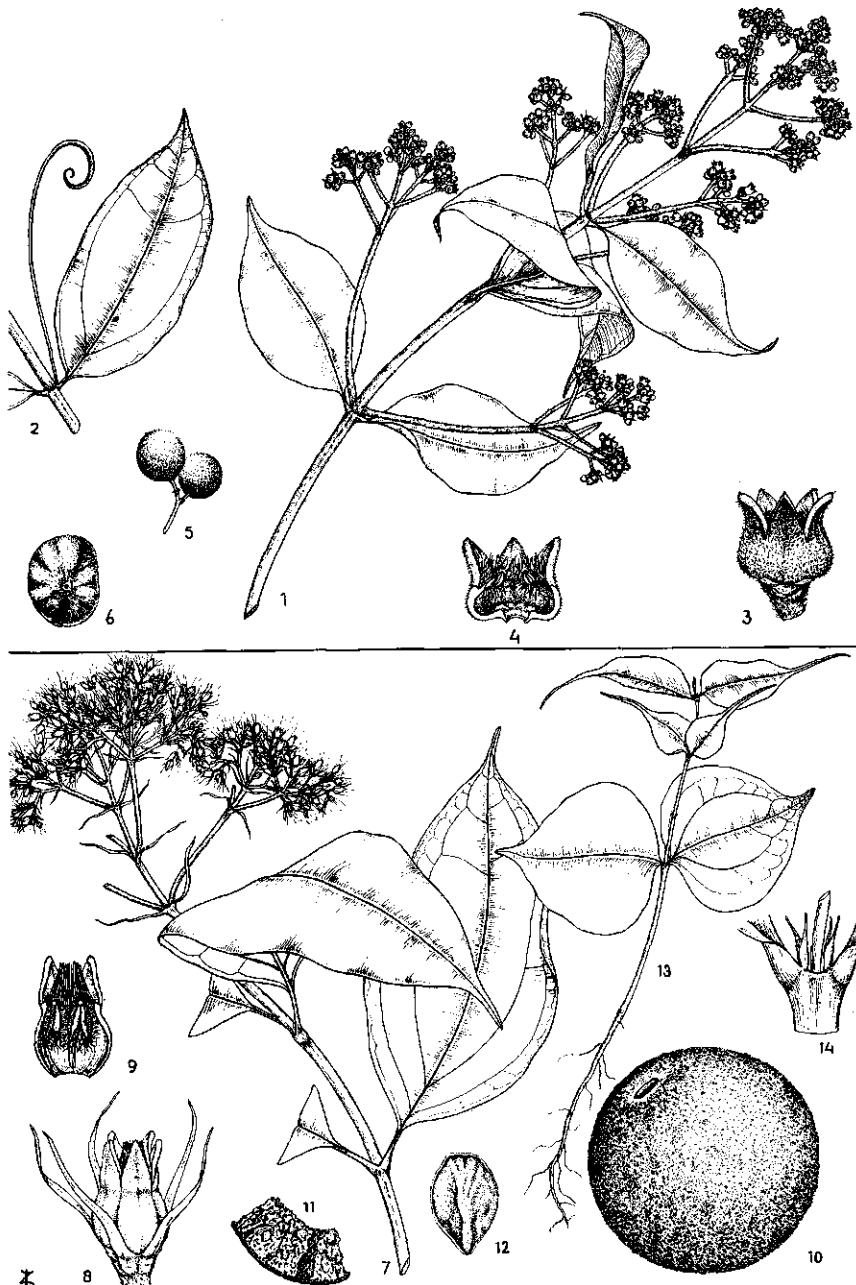

FIG. 43. 1-6. *S. urceolata*: 1. branch, $\frac{1}{2} \times$; 2. portion of branch with tendril, $\frac{1}{2} \times$; 3. flower, $5 \times$; 4. opened corolla, $5 \times$; 5. fruits, $\frac{1}{2} \times$; 6. seed, $1 \times$ (1-4. Breteler 2803; 5-6. Tisserant 1852). 7-14. *S. ternata*: 7. branch, $\frac{1}{2} \times$; 8. flower, $5 \times$; 9. opened corolla, $5 \times$; 10. fruit, $\frac{1}{2} \times$; 11. portion of fruit wall, $\frac{1}{2} \times$; 12. seed, $\frac{1}{2} \times$; 13. seedling, $\frac{1}{2} \times$; 14. node of seedling with stipules, $5 \times$ (7-9. Letouzey 5271; 10-12. Breteler 2196; 13-14. Breteler 2994).

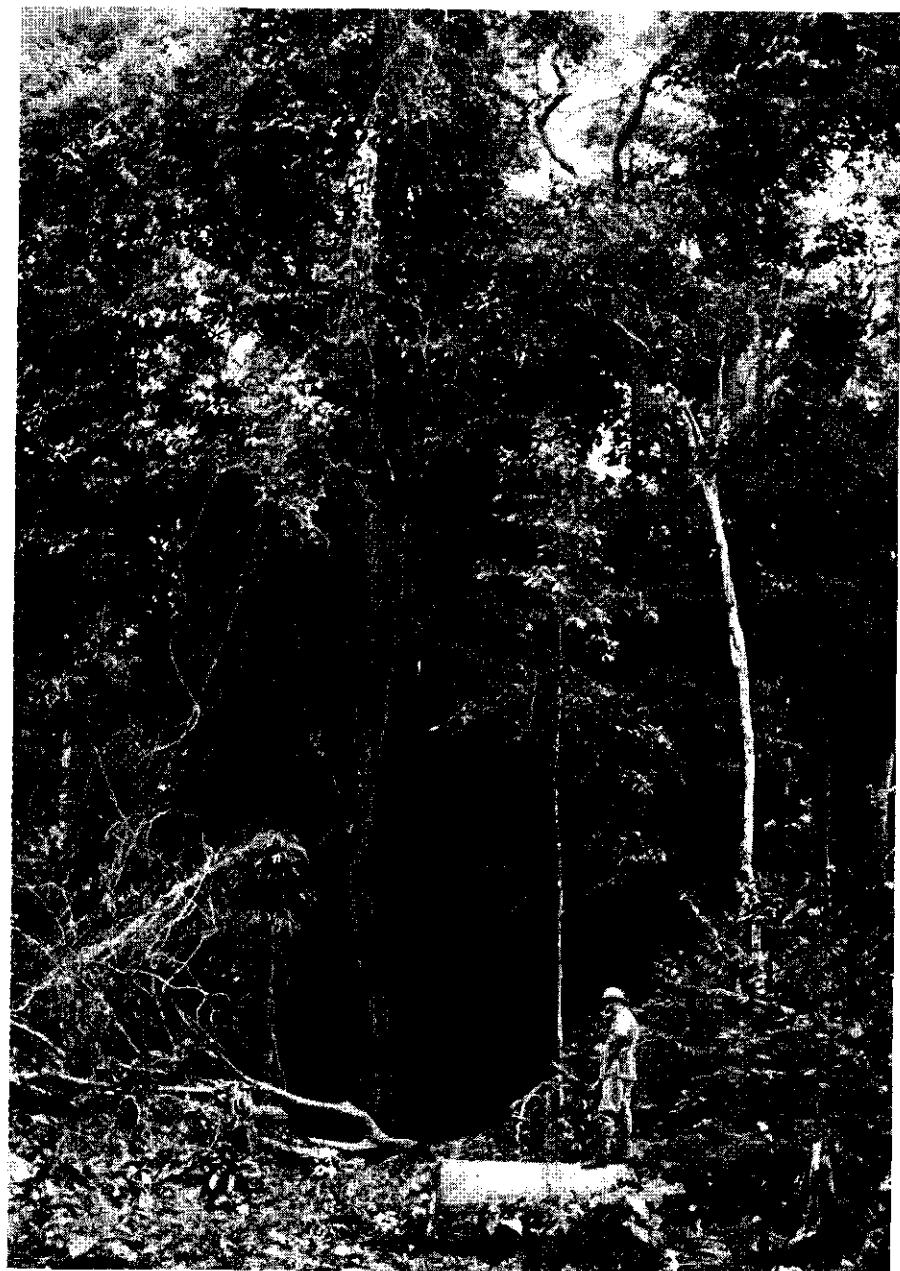

sapwood, without bark-islets. *Branches* unarmed, obscurely lenticellate, pale brown; branchlets often with few hairs when young, soon glabrous, not lenticellate and green when young, like branches when leaves mature. *Stipules* deciduous (only seen in seedling with very young leaves), 4 on each node, at bases of petioles, small, narrowly triangular. *Stipular line* distinct. *Leaves* opposite, never ternate; petiole with some hairs or glabrous, 5–15 mm long; blade shining and dark green above, less shining and paler beneath, papyraceous to coriaceous also when living, elliptic, oblong, or ovate, 1.5–2.7 × as long as wide, 10–20 × 4–10 cm, (or sometimes some smaller), apiculate, acuminate, or nearly caudate at the apex, rounded or cuneate at the base, glabrous above, beneath on main veins partially hirsute; 2–4 pairs of distinct secondary veins curved along the margin which are impressed above and prominent beneath like the costa. *Inflorescence* terminal, seemingly umbellate, not very congested, many-flowered, 5–10 × 6–9 cm, 4–5 × branched. *Peduncle*, *branches*, and *pedicels* pubescent. *Bracts* linear, smaller upwards and then sepal-like, with several distinct colleters in the axils. *Flowers* 5-merous. *Sepals* pale green, connate at the base, unequal, linear, 4–6 × 0.2 mm, subulate at the apex, not ciliate, sparsely pubescent outside, inside often only at the base with some hairs, without colleters. *Corolla* when mature somewhat shorter than the calyx, 4.5 mm long, pale green, thin at the base, thicker towards the apex, glabrous outside, inside with an entire narrow white-penicillate corona at the mouth of the tube; tube urceolate, about half as long as the sepals and twice as long as the lobes, 3 mm long, in the middle 3 mm wide, contracted at the base and at the apex; lobes triangular, 1.5 × 0.8 mm, acute, erect. *Stamens* included; filaments shortly pubescent, twice as long as the anthers, inserted at the base of the corolla tube; anthers cordate, 1.2 × 0.8 mm, deeply cordate at the base, ciliate all around with villose hairs, but less so at the apex; cells parallel. *Pistil* pubescent, 2 mm long; ovary ovoid, 1.8 × 1.2 mm, acuminate at the apex, 2-celled; stigma subsessile. In each cell about 50 ovules. *Fruit* large, hard, dark green, often slightly yellowish, slightly shining, like a bowl, globose, 9.5–15 cm in diam., 10–90-seeded. Wall very thick, hard, ochraceous on section and inside, where it is irregularly knobby by which the thickness varies from 9 to 22 mm, even in a single fruit, thickest above the pedicel. Pulp ochraceous, scented like rotten apples, with thin fibres. *Seeds* ochraceous when in fruit, white when dried up, flattened, more or less plano-convex, obliquely ovate or elliptic, usually irregularly curved, 1.2–2 × as long as wide, 19–30 × 13–21 × 4–7 mm, smooth, shortly pubescent. *Testa* thick.

Distribution: S.E. Cameroun.

Ecology: Rather dry high forests with *Celtis* and *Sterculiaceae* (e.g. *Triplochiton scleroxylon* K. Schum.); alt. 600–800 m.

Uses: The fruit used as mortar (Leeuwenberg 6231).

Cameroun: km 27 of Bertoua-Bétaré Oya road, near Gounté (fr. Dec.) Breteler 2196 (BR, K, P, WAG); of same tree, Leeuwenberg 5977 (WAG); 45 km SW. of Batouri, Breteler 2855

PHOT. 6. *S. ternata*: tree (left), with prof. Finn Sandberg from Stockholm (Leeuwenberg 7324).

(WAG); near Dimako Breteler 1715 (WAG, YA); 15 km E. of Dimako, Leeuwenberg 7324 (WAG); Mopwo, km 22 of Yokadouma-Batouri road (June) Letouzey 5271 (A, BR, G, K, P, PRE, WAG, YA, type); 7 km W. of Yokadouma, along path to Lomié, Leeuwenberg 6231 (WAG); between Yokadouma and Bangé R. mouth, Mildbraed 4598 (HBG, cited by Gilg); 25 km NE. of Bangé, km 75 of Yokadouma-Moloundou road, Letouzey 5154 (P, YA); Bifoum, Nké R. region, Durand 1319 (P).

Cult.: Yaoundé, Breteler 2994 (P, WAG, seedlings of herb. Breteler 2196).

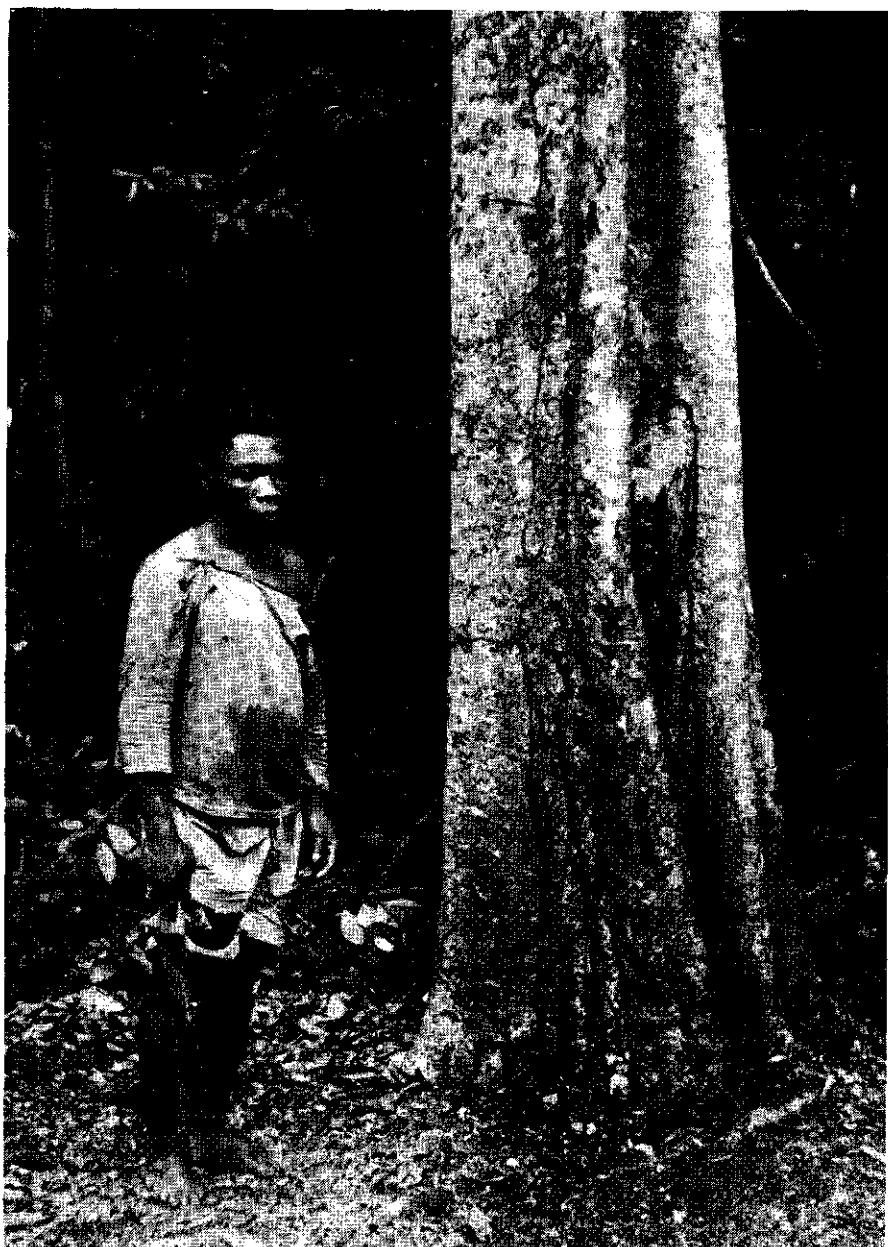

Note. The present author has never seen ternate leaves in this species. In all trees he observed the leaves were opposite.

68. *S. tricalysioides* Hutch. et M. B. Moss in Fl. W. Trop. Afr. 2: 24. 1931 and Kew Bull. 1937: 334. 1937; Leeuwenberg, Act. Bot. Neerl. 14: 219. 1965.

Fig. 42, p. 256; Map 42, p. 251

Type: Cameroun: Likomba, N.E. of Victoria, Mildbraed 10576 (K, holotype; isotype: A).

Climbing shrub or liana, 6–40 m high climbing in trees, up to at least 50 m long. Trunk 3–9 cm in diam.; bark dark brown, with large pustule-like lenticels; wood pale brown. Branches pale greenish-brown or medium brown and not sulcate when dry, terete, not lenticellate; branchlets glabrous, terete, green when living, pale greenish-brown or medium brown and not or slightly sulcate when dry. Tendrils paired. Leaves: petiole glabrous, 5–6 mm long; blade dull, above dark green, beneath somewhat paler, subcoriaceous when dry, elliptic or narrowly elliptic, 2–3 × as long as wide, 7–14 × 2.5–6 cm, caudate at the apex (cauda 10–15 mm long), cuneate at the base, glabrous on both sides; one pair of secondary veins from above the base curved along the margin to the apex and a faint submarginal pair; costa and main secondary veins impressed above (also in living leaves); tertiary venation reticulate, not very conspicuous. Inflorescences axillary, several together, seemingly fasciculate, much shorter than the leaves, 1 × 1 – 1.5 × 1.5 cm, rather congested, few-flowered, 1–2 × branched. Peduncle, branches, and pedicels short, glabrous. Bracts small, approximately sepal-like. Flowers 4-merous. Sepals connate at the base for one-quarter of their length, subequal, suborbicular, as long as wide, 1.2–1.3 mm long, rounded at the apex, minutely ciliate, glabrous on both sides, without colleters. Corolla in the mature bud 5 × as long as the calyx, 6 mm long, and tapering at the apex, creamy, outside glabrous, inside densely pilose except for the glabrous base of the tube and apex of the lobes; tube 1.5 × as long as the calyx, 2 mm long, gradually widened towards the throat, about 1.5 mm wide at the throat; lobes 1.6 × as long as the tube, oblong, 4 × 1.4 mm, acute, recurved. Stamens well-exserted; filaments glabrous, 2.5 × as long as the anthers, 2.2 mm long, inserted at the mouth of the corolla tube; anthers oblong, 0.7–0.9 × 0.4–0.5 mm, glabrous, cordate at the base; cells parallel. Pistil glabrous, 4–4.5 mm long; ovary ovoid, 0.8 × 0.8 – 1.2 × 1 mm, 2-celled; style slender, nearly 3.5 mm long; stigma small, capitate, not thicker than the style. In each cell

PHOT. 7. *S. ternata*: trunk, with Pigmee assistant (Leeuwenberg 7324).

about 10 ovules. *Fruit* orange, rather small, rather hard, subglobose or ellipsoid, $2.5 \times 2 - 4 \times 3.5$ cm, with about 1–10 seeds, with somewhat granular skin, slightly shining. Wall 2 mm thick when dry, brittle in mature fresh fruits, hard when dry. *Seed* pale brown, elliptic, flattened, $21-24 \times 16 \times 6-8$ mm, at one side with a deep pit, at the other with a bulge surrounded by a shallow groove, seemingly papillose; false papillae simulated by short curved hairs.

Distribution: SE. Nigeria, Fernando Po, Cameroun, Gabon, Congo (Brazzaville).

Ecology: Rain forests or secondary forests, mostly on river banks; alt. 0–400 m.

Nigeria: Afi For. Res., Ogoja Prov. (fr. May) Jones & Onochie FHI 18929 (FHI, FHO).

Fernando Po: N. side of Sta. Isabel Peak, Mildbraed 6353 (HBG, cited as *S. isabellina*; aberrant young vegetative specimen).

Cameroun: Likomba, NE. of Victoria (Oct.) Mildbraed 10576 (A, K, type); left bank Mungo R., near bridge in Kumba-Loum road, Breteler, J. de Wilde & Leeuwenberg 2576 (WAG); ibid., Leeuwenberg 6847 (WAG); 19 km W. of Masok, near Ekem R., tributary right bank Sanaga R., Leeuwenberg 5389 (WAG); right bank Kélé R., 30 km N. of Eséka, Leeuwenberg 7468 (WAG); about 30 km ESE. of Kribi (fr. Apr.) Letouzey 9415 (WAG).

Gabon: Cristal Mts., N. Hallé & Villiers 5341 (P); near Libreville (fr. Oct.) Klaine 3152 (BR, K, P, distributed as *S. macrorrhiza*).

Congo (Brazzaville): near Kingami, Bouquet 1870 (P).

Notes. *S. tricalysioides* differs from its nearest relatives *S. barteri* and *S. gossweileri* by the thin and caudate leaves with above impressed costa and main secondary veins. Klaine 3152, which has acuminate leaves with impressed costa, shows a tendency towards *S. barteri* which is not yet known from Gabon.

69. *S. trichoneura* Leeuwenberg, sp. nov.

Fig. 33, p. 213

Liana pubescens vel hirto-pubescentis ramis inermibus lenticellatis cirrhisque solitariis. Folia parva laminis ovatis ellipticis vel obovatis apice acutis mucronatisque vel rotundatis basi cuneatis, rotundatis vel subcordatis nervisque infimis curvatis. Inflorescentia terminalis pedunculo pedicellisque brevibus. Flores pentameri parvi. Sepala anguste triangularia apice acuminata intus glabra. Corolla extus seriebus pilorum pubescentium lobis suberectis alternantibus intus fauce penicillata. Stamina inclusa filamentis brevibus antherisque oblongis basi cordata barbatis. Pistillum glabrum ovario biloculari styloque brevi. Fructus ignotus verisimiliter parvus monospermus.

Type: Madagascar: Upper Bemarivo R., Boina Region (Sept.) Perrier de la Bathie 8028 (P, holotype; isotype: WAG).

Branches not partially greyish; branchlets pubescent. *Leaves:* petiole pubescent, 0.3–2 mm long; blade shining and dark green above, mat and paler beneath, ovate, elliptic, or obovate, 1.2–2.3 × as long as wide, $12-33 \times 8-16$ mm, acute and mucronate or rounded at the apex, cuneate, rounded, or sub-

cordate at the base, sparsely pubescent above, hirto-pubescent beneath, especially on the costa; tertiary venation conspicuous beneath. *Inflorescence* 2 × branched, several-flowered, $0.8 \times 0.6 - 1.5 \times 1$ cm. Bracts sepal-like. *Sepals* connate at the base, narrowly triangular, $2.2 \times$ as long as wide, $1.2-1.3 \times 0.5-0.6$ mm, acuminate at the apex, pubescent outside, glabrous inside, without colleters. *Corolla* in the mature bud $2.5 \times$ as long as the calyx, 3.2 mm long, white (?), outside with one rank of pubescent hairs between the lobes on the tube; tube $1.5 \times$ as long as the calyx, $1.3 \times$ as long as the lobes, 1.8 mm long. *Stamens*: filaments $0.3 \times$ as long as the anthers, inserted on the middle of the corolla tube; anthers 0.9×0.5 mm. *Pistil* 1.8 mm long; ovary ovoid, 1×0.8 mm, gradually narrowed into the style; style 0.8 mm long. In each cell 12 ovules. *Fruit* unknown, supposed to be small and 1-seeded. Other characters see *S. pentantha*.

Distribution: Only once collected in Madagascar.

Ecology: Riverine forest, on rocks; alt. about 400 m.

Notes. *S. trichoneura* resembles the American species *S. parvifolia* A.D.C. and *S. rubiginosa* A.D.C. by the arrangement of the tendrils, and moreover, the former by the habit and the leaves and the latter by the indumentum and the inflorescence. It differs from both essentially by the insertion of the stamens which is in the tube instead of at the mouth. Furthermore, *S. parvifolia* is spiny and *S. rubiginosa* has larger leaves. The hairs in the corolla of these two American species are less stiff than the hairs in the corolla of *S. trichoneura*. They belong in *Breviflorae*. *S. trichoneura* belongs in *Penicillatae*.

70. *S. urceolata* Leeuwenberg, Act. Bot. Neerl. 14: 226, f. 2. 1-6. 1965.

Fig. 43, p. 259; Map 43, p. 251

Type: Cameroun: 40 km SW. of Batouri, Doumé R. bank, near Bimbia, Breteler 2803 (WAG, holotype; isotypes: A, BR, FI, K, M, P; Letouzey 4758 (P, YA) collected on the same day of the same plant).

Large liana, at least up to 80 m long, 10–40 m high climbing in trees. Trunk 3–18 cm in diam. Bark dark brown, with large lenticels; wood pale yellowish. *Branches* not lenticellate, medium brown; branchlets brown-pubescent, medium brown when dry. Tendrils solitary, in the axils of ordinary leaves. *Leaves*: petiole brown-pubescent, 2–4 mm long; blade slightly shining and medium green above, somewhat or much paler beneath, subcoriaceous, elliptic, narrowly elliptic, ovate, or narrowly ovate, comparatively wider on the main axis and at the bases of the branchlets, $(1)1.5-3.5 \times$ as long as wide, $3-7.5(11.5) \times 1.5-3$ (4.5) cm, acuminate at the apex, cuneate, rounded, or on the main axis sometimes subcordate at the base, often sparsely pubescent on the costa on both sides, and on the main secondary veins beneath, furthermore beneath often barbate in the axils of the upper pair of main secondary veins which arise from

about 0.5–1 cm above the base and reach nearly the apex; lower pair less conspicuous, arising from the base; tertiary venation inconspicuous. *Inflorescence* terminal and often at the same time axillary, lax, many-flowered, 8–15 × 5–10 cm, 4–5 × branched. Peduncle, branches, and pedicels brown-pubescent. Lower bracts often leafy; other small, diminishing in size, upper most approximately sepal-like, pubescent beneath. *Flowers* 5-merous, sweet-scented. *Sepals* pale green, about one-third connate, equal, triangular, as long as wide, 0.6–1 mm long, acute, ciliate, pubescent outside, glabrous inside, without colleters. *Corolla* in the mature bud 3 × as long as the calyx, 2–3 × 2 mm, and rounded at the apex, pale grey-green, urceolate, minutely pubescent on both sides and inside pilose on the base of the lobes; tube slightly longer than the calyx, 0.7–1 mm long; lobes narrowly triangular, 1.5–2 × as long as the tube, 1.2–2 × 1–1.2 mm, acute, suberect. *Stamens* slightly exserted; filaments glabrous, about as long as the anthers, inserted at the mouth of the corolla tube; anthers triangular to ovate, 0.6 × 0.5 – 1 × 0.8 mm, cordate at the base, ciliate all around or more often only at the base; cells parallel. *Pistil* glabrous, 1.3–1.6 mm long; ovary depressed-globose, 0.7–0.8 × 1 mm, rather abruptly narrowed into the style, 2-celled; style 0.6–0.7 mm long; stigma capitate. In each cell 8–10 ovules. *Fruit* orange, small, soft, ellipsoid, 12 × 10 – 14 × 12 mm, 1-seeded, mat. Wall thin. *Seed* medium brown, ellipsoid, flattened, 11 × 9 × 3 mm, biconvex, shortly and densely pubescent, rather rough. Testa thick, not sticking to the pulp.

Distribution: Nigeria and northern Central Africa.

Ecology: rain forests or secondary forests, often on river banks; alt. 0–700 m.

Nigeria: Afi For. Res., Ogoja Province, Latilo FHI 31811 (FHI, K, paratype of *S. dolichothysra*).

Cameroun: 2 km E. of km 58 of Edéa-Kribi road (fl. Apr., fr. Oct.) Breteler 2803 (A, BR, FI, K, M, P, WAG) = Letouzey 4758 (P, YA, type); km 6 of Yokadourma-Moloundou road, near Mendoungé, Breteler 1506 (WAG, YA); ibid., Leeuwenberg 6123 (WAG); 15 km from Ngoko R., Mangokélé, Bouquet 1632 (P, WAG).

Central African Republic: Boukoko, N. of Bangui (fl. Apr., Oct., fr. Aug.) Tisserant 391 (P, WAG, paratype), 900 (K, P, WAG, paratype), 1852 (K, P, WAG, paratype).

Congo (Kinshasa): Equateur: Djoa, Bolombo Territory (Oct.) Evrard 5061 (BR, WAG, paratype).

Uganda: Bugala, Sese, Masaka District, A. S. Thomas 21 (K).

Note. *S. dolichothysra* so closely resembles *S. urceolata*, that the authors of *S. dolichothysra* confused them. They designated, however, the holotype of *S. dolichothysra* and this prevented problems of nomenclature. It ought to be noted that the name *S. urceolata* should replace *S. dolichothysra* in the Flora of West Trop. Africa. These species resemble each other so much, that they are

easily confused, even in the field. The differential characters appear clearly in the first key, no. 47, p. 40.

71. *S. usambarensis* Gilg, Abh. Preuss. Akad. Wiss. 1894: 36. 1894 and in Engler, Pflanzenw. Ost-Afr. C: 311. 1895; Baker in Fl. Trop. Afr. 4(1): 526. 1903; E. A. ? *S. distichophylla* Gilg, l.c. p. 310; Baker, l.c. 525; Bruce & Lewis, l.c. p. 35. Type: Tanzania: Biharamulo District, Kimoani (Kimwani) Plateau, Stuhlmann 3397 (holotype not seen, destroyed in B; no isotype seen).

S. micans S. Moore, Journ. Linn. Soc. 40: 146. 1911; Verdoorn, Bothalia 3: 587–588, f. 3. 1939. Type: Rhodesia: Chirinda Forest, Swynnerton 125 (BM, holotype; isotypes: K, Z).

S. cooperi Hutch. et M. B. Moss in Fl. W. Trop. Afr. 2: 24. 1931 and Kew Bull. 1937: 355. 1937; Duvigneaud, Lejeunia 11: 74. 1947, partly (as for the type). Type: Liberia: Dukwia R., Cooper 300 (K, holotype; isotypes: A, BM, F, FHO, GH, NY, US).

Shrub, climbing shrub, large liana, or much branched small tree, as shrub 1.50–5 m high, as liana 2–20 m high or more climbing over shrubs and in trees, and up to 70 m long, as tree 3–10(15) m high. *Liana*: trunk 2–9 cm in diam. (or more ?); bark dark brown, thin, with many lenticels; wood pale yellow. *Tree*: trunk 15–25 cm in diam.; bark pale or dark grey or pale grey-brown with darker patches, smooth, on section orange; wood pale yellow. *Branches* lenticellate, usually very dark brown, often covered with a pale skin which later splits and peels off, not sulcate when dry; branchlets glabrous or shortly pubescent, near the base lenticellate, pale brown and not or slightly sulcate when dry. Tendrils solitary, only present in climbing shrubs or lianas. *Leaves*: petiole glabrous, 2–6 mm long; blade slightly shining and dark green above, less shining to dull and paler beneath, coriaceous or thinly coriaceous in the sun, in the shade thinner and thinly coriaceous or papyraceous, also when living, ovate, narrowly ovate, elliptic, or narrowly elliptic, 1.5–3 × as long as wide, 3–8 × 1.2–3.5 cm, in lianas in the shade up to 16 × 7 cm, distinctly acuminate or in the shade mostly caudate at the apex, usually mucronate at the very apex, cuneate, rounded, or occasionally subcordate at the base, glabrous on both

sides; two pairs of secondary veins from or from above the base curved along the margin, outer usually fainter; tertiary venation reticulate, inconspicuous above, prominent beneath and there not very conspicuous. *Inflorescences* axillary, solitary or several together, lax or congested, usually much shorter than the leaves, $1-2.5 \times 1-1.5$ cm, few-flowered, $1-3 \times$ branched. Peduncle, branches, and pedicels glabrous or shortly pubescent. Bracts approximately sepal-like, above glabrous, upper often with colleters at the base above, lower not. *Flowers* 4–5-merous. *Sepals* pale green, connate at the base, subequal, ovate, broadly ovate, or triangular, $1-1.3 \times$ as long as wide, $0.6-1 \times 0.6-1$ mm, acute or obtuse, very minutely ciliate, glabrous on both sides or shortly pubescent outside, without colleters. *Corolla* in the mature bud $3-4 \times$ as long as the calyx, 2–3.5 mm long, and rounded at the apex, white, yellow, or sometimes orange, glabrous or minutely papillose-pubescent outside, inside with a ring of pilose hairs in the throat and often, when outside so, minutely papillose-pubescent on the lobes; tube short, urceolate, $1-1.4(1.7) \times$ as long as the calyx, 1–1.4 mm long; at the throat 1.4–2.2 mm wide; lobes $1.4-1.6(2.7) \times$ as long as the tube, oblong, $1.3-2.2 \times$ as long as wide, $1.2-2.2 \times 0.8-1.3$ mm, acute, recurved from somewhat below the middle. *Stamens* exserted; filaments glabrous, $0.5-1.2(2) \times$ as long as the anthers, inserted at the mouth of the corolla tube; anthers suborbicular or oblong, $1-2 \times$ as long as wide, $0.6-0.9 \times 0.3-0.7$ mm, glabrous, deeply cordate at the base; cells parallel. *Pistil* glabrous, 1.1–2.5 mm long; ovary ovoid, slightly longer than wide, $0.7-1 \times 0.6-0.8$ mm, rather abruptly narrowed into the style, 2-celled; style short, 0.4–1.5 mm long; stigma capitate or sometimes obscurely bilobed (in a single inflorescence). In each cell 4–7 ovules. *Fruit* orange or orange-yellow, immature pale green and often with a glaucous bloom, or glaucous, small, soft, globose or subglobose, often laterally compressed, sometimes shortly stipitate within the calyx, $11-18 \times 10-18 \times 10-18$ mm, with smooth skin, 1-seeded, mat, mostly obliquely pedicellate. Wall thin, about 0.3 mm thick. Pulp orange. *Seed* pale brown, depressed-globose or ellipsoid, $9 \times 7 \times 5 - 12 \times 11 \times 8$ mm, shortly and densely pubescent, smooth, with a central hilum at one side. Testa thin.

Distribution: Tropical and northern South Africa.

Ecology: Upland and lowland rain forests and secondary forests, especially on river banks, gallery forests, semi-evergreen, and coastal evergreen bushlands; alt. 0–2000 m.

Notes. The West African, the Congolese, and several of the East African specimens of *S. usambarensis* are climbers, while the other East and the South African are small trees.

The following specimens may belong to *S. usambarensis*:

Zambia: Chingola (fl. Mar., fr. Nov.) Fanshawe 2813 (BR, K, LISC), 5262 (K); near Mufulira (veg.) Schmitz 2299 (BR, PRE); Kitwe (veg.) Fanshawe Kitwe 9 (WAG).

The leaves are like those of *S. usambarensis*, but they have distinctly prominent veins above like those of *S. dale*. The flower-buds and pistils of herb. Fanshawe 2818 are 4 mm long as in *S. dale*, while the fruit of herb. Fanshawe 5262 is like that of *S. usambarensis*. They resemble also *S. floribunda*. As the three species all are variable the present author referred the four above cited specimens to '*S. usambarensis* (?)'.

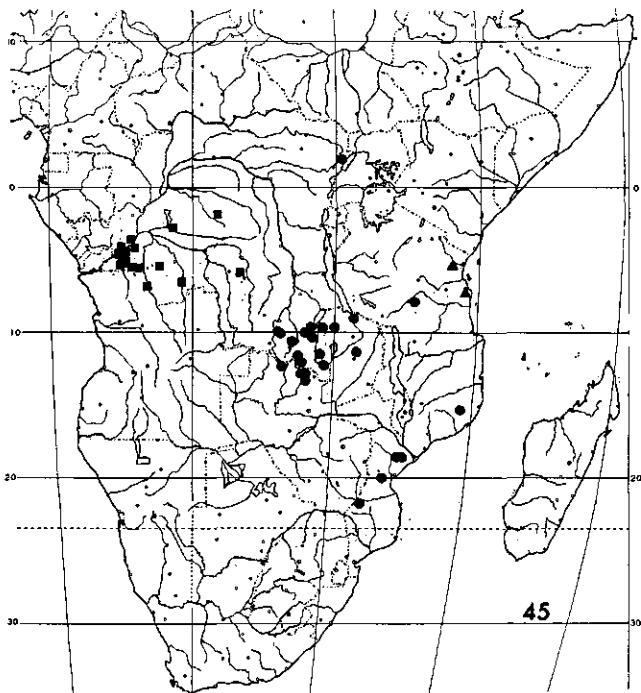

72. *S. variabilis* De Wild., Ann. Mus. Congo Sér. 5. 1: 178. 1904; Baker in Fl. Trop. Afr. 4(1): 623. 1904; Duvigneaud, Bull. Soc. Roy. Bot. Belg. 85: 19, f. 5. 1952.

Type: Congo (Kinshasa): Léopoldville Province, Kimuenza, Gillet 2081 (BR, lectotype).

Fig. 44, p. 269; Map 45, p. 273

Small deciduous tree, 3–12(25) m high. Trunk 10(–50) cm in diam.; wood very hard, yellow-orange. Branches pale brown or ochraceous, distinctly lenticellate; branchlets densely hirsuto-pubescent with appressed and often also erect hairs, not lenticellate, or when leaves mature lenticellate and coloured like branches. Leaves: petiole short, hirsuto-pubescent, 1–2 mm long; blade shining and dark green above, mat and paler beneath, subcoriaceous, thinner and dull when dry and young, elliptic, oblong, ovate, or narrowly ovate, usually larger and comparatively narrower towards the apices of the branchlets, 1.5–3 × as long as wide, 3–9 × 1–3.5 cm or sometimes smaller, acute, acuminate, or in leaves at the base of the branchlets obtuse, subcordate or sometimes rounded at the base, sparsely appressed-pubescent, especially on the costa on both sides or sometimes only above; one pair of secondary veins from or from above the base curved along the margin and mostly a faint submarginal pair; venation reticulate, but not very distinct, prominent on both sides. Inflorescence terminal, congested, often seemingly capitate, 1.5 × 1.5 – 3.5 × 3 cm, 3–4 × branched, many-flowered. Peduncle, branches, and pedicels hirsuto-pubescent.

Bracts sepal-like, hirto-pubescent beneath, glabrous or with few hairs at the base above, without colleters. *Flowers* 5-merous. *Sepals* connate at the base, subequal or sometimes very unequal and then largest up to twice as long as smallests, narrowly triangular, 3–7 × as long as wide, (2)3–4(5) × 0.5–1 mm, acuminate or subulate at the apex, ciliate, hirto-pubescent outside, glabrous inside, without colleters. *Corolla* in the mature bud cylindrical, 1.4–2 × as long as the calyx, 4.5–6.5 mm long, white or greenish-white, glabrous outside, inside densely villose except for the glabrous base, tips of lobes sometimes also glabrous; tube 0.5–1 × as long as the calyx, slightly widened towards the throat; lobes oblong, 1–2.7 × as long as the tube, 2.7–4.4 × as long as wide, 2.7–4 × 0.8–1.2 mm, acute, spreading. *Stamens* exserted; filaments glabrous, 1–1.2 × as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 2.4–4.5 × as long as wide, 1–1.2 × 0.25–0.5 mm, cordate at the base, glabrous; cells parallel. *Pistil* pubescent, often glabrous at the base, 4.4–5.5 mm long; ovary pubescent, glabrous, or only apically pubescent, ovoid, 1–1.2 × 0.8–0.9 mm, 2-celled; style 3.4–4.5 mm long, thick, about 0.2 mm in diam., persistent on the immature fruit; stigma capitate. In each cell 6–8 ovules. *Fruit* orange (?), green when immature, ellipsoid, about 1.5 × 1.2 – 2.5 × 2 cm, 1–2-seeded. Wall thin. *Seeds* pale ochraceous, ellipsoid, flattened, 15 × 11 × 4 mm, very minutely papillose (not hairy), smooth. Colleters in the axils of the leaves.

MAP 45. ■ *S. variabilis*, ● *S. xantha*, ▲ *S. xylophylla*.

Distribution: Congo (both).

Ecology: Woodland or gallery forest; alt. about 300–500 m.

Note. According to the notes of most collectors *S. variabilis* is a small tree, 3–12 m high, with a trunk of 10 cm diam. Only Liben, who collected the only specimen known from Kasai, noted: large tree, 20–25 m high; trunk 50 cm in diam.

73. *S. xantha* Leeuwenberg, sp. nov.

Fig. 45, p. 277; Map 45, p. 273

Frutex scandens, liana vel arbor ramis lianescensibus cirrhis per paria dispositis. Folia glabra laminis in sicco flavis coriaceis ellipticis, anguste ellipticis, ovatis vel anguste ovatis apice acuminatis basi cuneatis vel rontundatis nervisque infimis curvatis. Inflorescentia axillaris et nonnunquam etiam terminalis subcongesta pauciflora pedunculo pedicellisque glabris tenuibus. Flores tetrameri. Sepala suborbicularia apice rotundata minute ciliata utrinque glabra. Corolla alba extus glabra vel minute papilloso-pubescentia intus fauce et lobis dense pilosa tubo cylindrico lobis oblongis recurvatis. Stamina exserta glabra corollae fauce inserta filamentis antheras oblongas subaequantibus vel superantibus. Pistillum glabrum ovario biloculari styloque gracili et stigmate parvo. Fructus aurantiacus vel luteus parvus ellipsoideus mono- vel bispermus. Semen ellipsoideum applanatum latere profunde excavato, latere altero protuberatione fossa parva circumdata ut videtur papillosa. Papillae falsae pilis curvatis compositis.

Type: Zambia: Kitwe District, Fanshawe 3185 (K, holotype; isotypes: BR, EA, PRE, SRGH, WAG).

Climbing shrub or *liana* at least 6–10 m high climbing over shrubs or in trees, not climbing shrub or small *tree* with short thick trunk and often liana-like branches, 2–12 m high. Trunk short (in trees), 50 cm in diam. Bark slightly

rough, grey or black, on section faded yellow; sapwood white; wood faded yellow. *Branches* ochraceous or black-brown, often spotted, not lenticellate, terete, not or hardly sulcate when dry; branchlets glabrous, green, terete, ochraceous and often sulcate when dry. Tendrils – if present – paired. *Leaves*: petiole glabrous, 5–8 mm long; blade hardly shining and pale green, not or slightly paler beneath, usually yellow when dry, often stiffly coriaceous also when living, elliptic, narrowly elliptic, ovate, or narrowly ovate, (1.5)2–3 × as long as wide, 4–9(11.5) × 1.5–4.5(7) cm, acuminate at the apex, cuneate or rounded at the base, glabrous on both sides; one or two pairs of secondary veins from or from above the base curved along the margin and often a faint submarginal pair; costa impressed above; tertiary venation reticulate, conspicuous, in dry leaves prominent on both sides, in living beneath only. *Inflorescence* axillary and occasionally also terminal, rather congested, few-flowered, much shorter than the leaves, 1.5 × 1 – 2.5 × 1.5 cm, 1–2 × branched. *Peduncle*, branched, and pedicels short, thin, glabrous. Bracts ovate or sepal-like, lower approximately shovel-shaped and about 3 × as long as the sepals, beneath glabrous, above often with colleters at the base. *Flowers* 4-merous. *Sepals* connate at the base, equal or subequal, suborbicular, 1–1.4 × as long as wide, 1.2–1.5 × 0.9–1.4 mm, obtuse or rounded at the apex, minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 3.5–5 × as long as the calyx, 4.5–6.5 mm long and rounded at the apex, white, outside glabrous or minutely papillose-pubescent, inside densely pilose on the lobes and in the throat, less pilose in the tube, glabrous at the base; tube cylindrical or nearly so, 1.7–3 × as long as the calyx, 1–1.3 × as long as the lobes, 2.4–3.5 mm long, at the throat 1.8–2.2 mm wide; lobes oblong, 1.7–2.5 × as long as wide, 2.4–3.3 × 1.2–1.5 mm, acute, recurved. *Stamens* exserted; filaments glabrous, 0.8–1.5 × as long as the anthers, elongate at anthesis, inserted at the mouth of the corolla tube; anthers oblong, 0.7–1 × 0.4–0.6 mm, glabrous, cordate at the base; cells parallel. *Pistil* glabrous, 4–5.5 mm long; ovary ovoid or nearly so, 1–1.5 × 0.8–1 mm, more or less abruptly narrowed into the style, 2-celled; style slender, 2.8–4.2 mm long; stigma obscurely bilobed or less often capitate. In each cell 6–8 ovules. *Fruit* orange or yellow, nearly mature pale green, with paler dots, small, soft, ellipsoid, 15 × 10 – 20 × 18 mm, often mucronate, often obliquely pedicellate, with a smooth skin, 1–2-seeded. Wall thin, when dry 0.3–0.5 mm thick. Pulp orange or yellow. *Seed* ochraceous, often obliquely ellipsoid, flattened, 10 × 8 × 3 – 14 × 11 × 4 mm, at one side with a deep pit, at the other with a bulge surrounded by a shallow groove; seemingly papillose; false papillae simulated by short curved hairs.

Distribution: Eastern Congo (Kinshasa), Tanzania, Zambia, Moçambique.

Ecology: Gallery forests or riverine thickets; alt. 0–1800 m.

Congo (Kinshasa): Orientale: Nioka-Djugu road, Mahagi Territory, Taton 727 (BR, WAG). Katanga: 54 km S. of Mukulakulu, Schmitz 6193 (BR); between Guba and Mokabé-Kasari, Schmitz 4016 (BR); km 16 of Kashiobwe-Mukupa road, Schmitz 6241 (BR); Luapulu

Notes. *S. xantha* belongs to the section *Dolichanthae* and is closely allied to *S. barteri* and *S. melastomatooides* by the flowers and seeds. It differs strikingly from these and the other species of the section by the mostly yellow-drying leaves.

It shows a strikingly resemblance to *S. floribunda* by the flowers and the shape of the leaves. It differs from the latter by the paired instead of solitary tendrils, the mostly yellow-drying leaves which have a more prominent venation, and the typical dented seeds. The latter seeds are only known for the section *Dolichanthae*.

74. *S. xylophylla* Gilg in Engler, Bot. Jahrb. 28: 122. 1899; Baker in Fl. Trop. Afr. 4(1): 526. 1903; E. A. Bruce, Kew Bull. 1956: 155. 1956; Bruce & Lewis in Fl. Trop. E. Afr. Loganiaceae 32. 1960. **Fig. 45, p. 277; Map 45, p. 273**

Types: Tanzania: Uzaramo District, Kikulu, Stuhlmann 6853 (holotype not seen, destroyed in B, no isotype seen) and 16 km S. of Dar es Salaam, Vaughan 2763 (BM, neotype, photograph in K, neg. 2517; iso-neotype: EA, designated by BRUCE & LEWIS).

Shrub or tree. *Branches* not lenticellate, pale greenish-brown to dark brown, not sulcate when dry; branchlets glabrous, pale greenish-brown to dark brown and usually slightly sulcate when dry, often subquadrangular. *Leaves*: petiole short, glabrous, 2–5 mm long; blade shining and dark green above, paler beneath, drying pale greenish-brown often with dark brown, paler and mat beneath, thickly coriaceous, elliptic, 1.3–2.2 × as long as wide, 4.5–10.5 × 2.5–6 cm, apiculate at the apex, cuneate or rounded at the base, glabrous on both sides; one or two pairs of secondary veins from or from above the base curved along the margin, and often a faint submarginal pair; tertiary venation

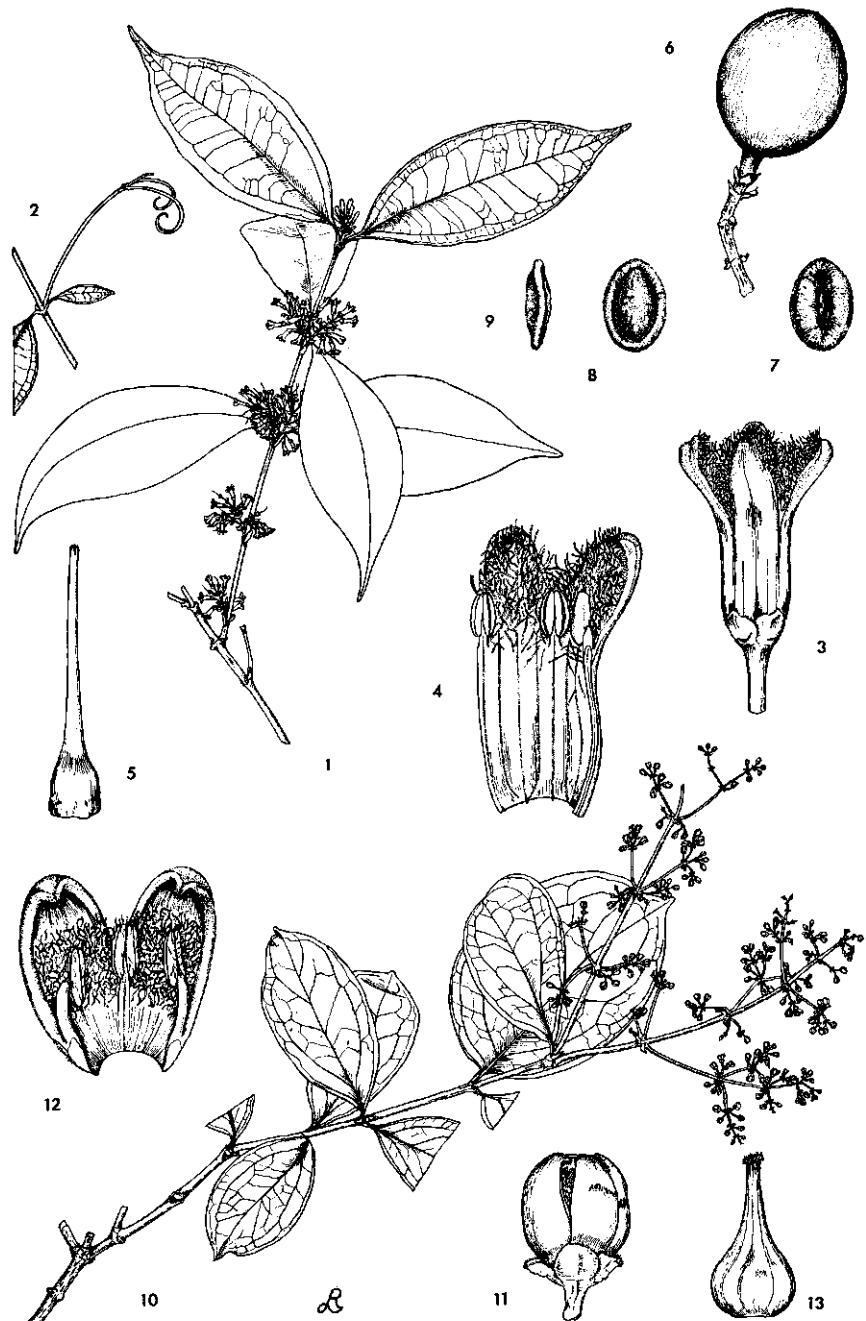

FIG. 45. 1-9. *S. xantha*: 1. branch, $\frac{1}{2} \times$; 2. tendrils, $\frac{1}{2} \times$; 3. flower, $5 \times$; 4. portion of corolla with stamens, $7 \times$; 5. pistil, $7 \times$; 6. fruit, $1 \times$; 7-9. seed, 3 sides, $1 \times$ (1, 3-5. Fanshawe 3185; 2. Richards 15196; 6. Torre & Paiva 11594; 7-9. Schmitz 1362); 10-13. *S. xylophylla*: 10. branch, $\frac{1}{2} \times$; 11. flower, $5 \times$; 12. portion of corolla with stamens, $14 \times$; 13. pistil, $14 \times$ (10-13. Vaughan 2937).

reticulate, prominent on both sides. *Inflorescence* axillary, usually also in the axils of the apical leaves and therefore seemingly terminal, lax, many-flowered, longer than the leaves, $5 \times 4 - 11 \times 8$ cm, 3-4× branched. Peduncle, branches, and pedicels slender or rather slender, glabrous. Bracts small, narrowly triangular or sepal-like, at least upper glabrous above and without colleters. *Flowers* 4-merous. *Sepals* free, equal, broadly ovate, 0.8×0.8 mm, rounded at the apex, minutely ciliate, glabrous on both sides, without colleters. *Corolla* in the mature bud 3× as long as the calyx, 2.5 mm long, and rounded at the apex, white (?), outside glabrous, inside densely pilose on the lobes of which the apices glabrous; tube very short, slightly shorter than the calyx, 0.7 mm long; lobes oblong, 2.5× as long as the tube, 1.8×1.2 mm, acute, spreading. *Stamens* slightly exserted; filaments very short, inserted at the mouth of the corolla tube; anthers oblong, 0.8×0.4 mm, cordate at the base, glabrous; cells parallel. *Pistil* glabrous, 1.5 mm long; ovary globose, 0.7 mm long, 1-celled, rather abruptly narrowed into the style; style short, 0.8 mm long; stigma capitate. One basal placenta with 6 ovules. *Fruit* orange, small, globose, about 15 mm in diam., 3-seeded. Wall thin. *Seed* subtetragonal, slightly compressed, about $10 \times 8 \times 4$ mm, smooth, glabrous. *Testa* thin.

Distribution: Tanzania, near the coast.

Ecology: River banks, in forests(?); at low elevations.

Tanzania: Sinden Hill, Handeni District (very young bud Dec.) Burtt 5419 (BM, BR, FHO, K); 16 km S. of Dar es Salaam (fr. Feb.) Vaughan 2763 (BM, EA, neotype), (Jan.) Vaughan 2937 (BM, EA).

Notes. *S. xylophylla* is closely allied to *S. mellodora* by the habit and flowers. Both species differ as follows:

Branchlets mostly dark, terete (always?); leaves coriaceous; main secondary veins not much longer than the other; veins often paler beneath; inflorescence axis and branches rather thick, pubescent *S. mellodora*
Branchlets often (?) paler, subquadrangular; leaves thickly coriaceous, mostly broader; main secondary veins much longer than the other, nearly reaching the leaf apex; inflorescence axis and branches rather thin, glabrous
S. xylophylla

75. *S. zenkeri* Gilg ex Bak. in Fl. Trop. Afr. 4 (1): 529. 1903.

Fig. 41, p. 252

Type: Cameroun: Bipindi, Zenker 2436 (K, holotype; isotypes: A, BM, BR, COI, E, G, GOET, GRO, HBG, L, LY, M, MO, P, PR, PRE, S, W, WAG, WRSL, WU, Z).

Shrub or small tree up to 15 m high. *Branches* pale grey-brown, not lenticellate, sometimes umbellately branched; branchlets apically often with two

lines of minute pubescence below the stipular lines. *Leaves*: petiole short, glabrous, 2–3 mm long; blade shining above, paler beneath, coriaceous, elliptic or narrowly elliptic, 2–3.5 × as long as wide, 4–14 × 1.5–5 cm, distinctly acuminate at the apex, cuneate at the base, glabrous on both sides; two pairs of secondary veins from the base to the apex of which the lower fainter; tertiary venation conspicuously reticulate beneath. *Inflorescences* axillary, several together, congested, much shorter than the leaves, about 1 cm long. Peduncle, branches, and pedicels very short, somewhat pubescent. Bracts approximately sepal-like. *Flowers* subfasciculate, 5-merous. *Sepals* connate at the base for about one-third of their length, subequal, broadly ovate to suborbicular, 2 × 2–2.2 mm, obtuse or rounded at the apex, ciliate, practically glabrous outside, inside minutely pubescent and without colleters at the base. *Corolla* in the mature bud about 3 × as long as the calyx, 6.5 mm long, and rounded or slightly tapering at the apex, white (?), outside glabrous, inside with a ring of white brush-like hairs on the very base of the lobes only; tube approximately cylindrical, 1.7 × as long as the calyx, about as long as the lobes, 3.3 mm long, 1.5–2 mm wide at the throat, lobes narrowly triangular, 3.2 × 1.5 mm, acute, spreading. *Stamens* slightly exserted; filaments glabrous, about half as long as the anthers, inserted at the mouth of the corolla tube; anthers oblong, 1.8 × 0.6 mm, cordate at the base, glabrous; cells parallel. *Pistil* pilose-pubescent in the middle, 5.6 mm long, ovary broadly ovoid, 1.6 × 1.5 mm, glabrous, 2-celled; style 4 mm long; stigma capitate. In each cell 14 ovules. *Fruit* nearly globose, white (?), about 2 cm in diam., 2-seeded. Wall thin, about 1 mm thick. *Seed* pale ochraceous, obliquely elliptic, flattened, plano-convex, 15 × 13 × 5 mm, with a raised hilum in the middle of the convex side, rather rough.

Distribution: only three times collected, once in Cameroun, and twice in Congo (Kivu).

Ecology: Rain forests, often on mountains; alt. 0–1800 m.

Cameroun: (fl.) type, see above.

Congo (Kinshasa): Kivu: km 48 of Kavumu-Walikale road (fr. Aug.) Pierlot 2373 (BR, K, WAG); Ndolere, Kabare Territory, A. Léonard 3685 (BR, WAG).

Notes. Zenker, who collected an excellent flowering specimen with many duplicates, unfortunately did not describe the ecology and habit. Both specimens from Congo were collected in montane rain forest. The fruiting specimen has still the hairy pistil-base on the fruit.

S. zenkeri is closely allied to *S. staudtii* by the habit and leaves, although the leaves of *S. staudtii* are generally larger. They differ mainly as follows:

Pistil glabrous; corolla with two rings of hairs inside *S. staudtii*
Pistil pilose-pubescent; corolla with one ring of hairs inside *S. zenkeri*

HYBRIDS

There are a few specimens which are almost perfect intermediates between well-defined and often collected species. The present author supposes that they may be hybrids.

Two vegetative specimens have the corky bark, branchlets, spines, and leaves of *S. coccoides*. The leaves, however, are slightly thicker than is usual in this species and they bear the sharp apex of those of *S. pungens*:

South West Africa: Garu, 90 km S. of Runtu, Maguire 1584 (NBG); Karakowida, Dinter 7298 (B).

Five specimens of which two are flowering and the other vegetative have branches and leaves of *S. innocua*. The leaves here again have the sharp apex of those of *S. pungens*. The flowers of both species are not distinctly different:

Tanzania: Ngulu District, Peter 34795 (B).

Zambia: Luanshya District (July) Fanshawe 1402 (BR, FHO, K, SRGH, WAG).

Rhodesia: Urungwe District (Dec.) R. Goodier 468 (BR, K, LISC, PRE, SRGH); ibid., Chipani, Whellan 668 (MO, PRE, SRGH); Lomagundi District, Herb. Dept. Agric. 1200 (K).

One specimen is intermediate between *S. innocua* and *S. lucens* by the branches, leaves, inflorescences, and flowers, while it has the small fruit which may occur in *S. lucens*:

Congo (Kinshasa): Katanga: near Lubumbashi (fl., fr. Oct.) Quarré 1927 (A, BR).

One specimen is exactly *S. scheffleri* in branchlets, leaves, lax inflorescences, and flowers, but it is hairy as *S. kasengaensis*:

Tanzania: Malagarasi ferry, Kibondo District (Feb.) Proctor 385 (EA, FHO, K).

wenzelii Merrill, Philip. Journ. Sc. 11: Bot. 202. 1916. = *S. axillaris* Colebr.

yapurensis G. Planch., Journ. de Pharm. 5. 1: 492. 1880, doubtful. – Am.

This list is compiled after the publications cited after the genus diagnosis.
Mme. C. TIREL will reduce several names of Asiatic species to synonyms in
Adansonia 1969 (ined.). The Asiatic species described after 1917 are also in-
cluded in this list.

ACKNOWLEDGEMENTS

The present author is greatly indebted to the directors and curators of the herbaria cited in the introduction for putting their material at his disposal. He is also very grateful to prof. dr. H. C. D. DE WIT, through who's intermediary possibilities were found for travel in Africa. He gave also noteworthy critical remarks. Furthermore he acknowledges in particular the drawings of Miss H. G. D. ZEWALD, and further the additional drawings of Miss W. BRAND, Miss L. TH. M. E. VAN DER RIET, and Mr. W. SCHEEPMAKER. These drawings are an indispensable contribution to this revision. He wants also to express his gratitude to dr. P. W. LEENHOUTS for his critical remarks, especially on the Asiatic species, and dr. N. G. BISSET for tracing obscure names, especially in pharmaceutical publications.

The author received a grant of the Netherlands Organization for the Advancement of Pure Research (Z.W.O.) for the last visit to the herbaria of Kew, London, and Oxford.

INDEX OF EXSICCATAE

The number in parentheses corresponds with the species-number of the revision. Only numbered collections have been listed.

If a collector gathered a portion of his collection together with others using a single number series, only his name is cited in this list: e.g. Humbert & Swingle is cited as Humbert, and Torre & Correia as Torre.

 var. *longiflora* Hassler 288
pseudo-tieuté A. W. Hill 288
psilosperma F. v. Muell. 23, 288
pubescens C. B. Clarke 288
 var. *scortechinii* King et Gamble 288
pubiflora Krukoff 21
pungens Gagnep. 288
pungens Solered. 10, 11, 14, 18, 22, 31, 38,
 44, 86, 126, 224, 225, 228, 280, 281
pusilliflora S. Moore 134, 136
pynchoneura Gilg et Bened. 288
quadrangularis Gilg 281
quadrangularis A. W. Hill 29
quaqua Gilg 160, 166
quintuplinervis A. W. Hill 288
radiosperma Gilg et Busse 242
ramentifera Ducke 21
ramonensis Pierre ex Sauvan 288

- ranconensis* Pierre ex A. W. Hill 288
randiaeformis Baill. 160, 167
reticulata Burtt-Davy et Honoré 127, 131
retinervis Leeuwenberg 11, 23, 40, 41, 43, 45,
 228, 229, 230
reyaerti De Wild., syn. nov. 255, 257
rheedii C. B. Clarke 288
rhexioides Klotzsch ex Rich. Schomb. 288
rhombifolia Gilg et Busse 242
ridleyi King et Gamble 26
rivularia Barb. Rodr. 288
robinsonii A. W. Hill 288
robورans A. W. Hill 288
rondeletioides Spruce ex Benth. 21
rouhamon Benth. 288
rubiginosa A. D.C. 24, 25, 265, 285
rufa C. B. Clarke 30, 31
 var. *candollei* C. B. Clarke 288
ruizii Sprague et Sandw. 288
rupicola Pierre ex Dop 21
rutenbergii Klein et Herndlhofer 282
samba Duvign. 10, 12, 15, 28, 29, 37, 38, 42,
 45, 47, 147, 149, 150, 230, 231, 236
sansibariensis Gilg 240
sapini De Wild. 224
scaberrima Gilg ex Duvign. 216, 281
scandens Schum. et Thonn. 282
scheffleri Gilg 10, 13, 14, 30, 31, 33, 39, 44,
 48, 153, 156, 204, 232, 233, 235, 236, 238,
 250, 280, 281, 282
 var. *expansa* E. A. Bruce, syn. nov. 232,
 234, 235
 var. *scheffleri* 235
schmidtii Gilg 288
schomburgkiana Klotzsch ex Rich. Schomb.
 288
schultesiana Krukoff 24, 25, 82
schumanniana Gilg 86, 90, 239
schweinfurthii Gilg 240
scortechinii A. W. Hill 27, 288
sellowiana Gilg 288
sennensis Bak. 127, 131
septemnervia C. B. Clarke 288
 var. *imberbis* A. W. Hill 289
silvicola A. W. Hill 289
simiarum (Hochst.) Gilg ex A. Chev., in syn.
 138
similis A. W. Hill 289
smilacina Benth. 289
smithiana Krukoff 21
solerederi Gilg 289
solimoesana Krukoff 21
soubreensis Hutch. et Dalz. 10, 13, 14, 30, 39,
 202, 203, 204, 235, 236, 238, 250
spinosa Lam. 9, 10, 11, 12, 13, 14, 17, 18, 20,
 27, 28, 36, 87, 126, 170, 239, 241, 243, 245,
 247, 281
 subsp. *lokua* (A. Rich.) E. A. Bruce 239,
 248
 var. *pubescens* Bak. 240, 246
 subsp. *spinosa* 248
 var. *suberifera* (Gilg et Busse) Aubrév. 87
 subsp. *volkensii* (Gilg) E. A. Bruce, syn.
 nov. 240, 248
spireana Dop 21
splendens Gilg 10, 13, 14, 30, 31, 39, 48, 233,
 238, 248, 250, 251
staudtii Gilg 11, 12, 13, 14, 31, 32, 35, 41, 47,
 251, 252, 254, 255, 279
stenoneura Gilg et Busse 161, 165
stenura Duvign. ex Denoël c.s. 270, 282
stuhlmannii Gilg, syn. nov. 9, 22, 218, 223
stylosa Pierre ex Sauvan 289
suaveolens Gilg 104, 108
subaquatica De Wild. 32, 33, 232, 234
subcordata Spruce ex Benth. 23, 283, 284,
 287
suberifera Gilg et Busse 87, 91
suberosa De Wild. 86, 89
suberosa T. R. Sim 87, 91
subscandes Bak. 15, 120, 123
sumbensis Good 32, 232, 235
syntoxica Sprague et Sandw. 289
syringiflora A. Chev., syn. nov. (1963) 32,
 179
tabascana Sprague et Sandw. 21, 285, 287
talbotiae S. Moore 10, 11, 30, 39, 46, 48, 76,
 86, 182, 251, 255, 256, 257
tarapotensis Sprague et Sandw. 24, 25, 286
tchibangensis Pellegr. 10, 12, 26, 37, 45, 113,
 118, 229, 251, 257, 258
telankotta J. F. Gmel. 218
tenuiflora Froes et Ducke 289
tepicensis Standley 289
ternata Gilg ex Leeuwenberg 10, 11, 18, 27,
 28, 36, 251, 258, 259, 261, 263
tesseroidea A. W. Hill 289
tetragona A. W. Hill 29
tetankotta Retz. 218, 223
thomsiana Gilg et Busse 87
 var. *elegans* Gilg et Busse 87, 90
thomningii Solered. 289
thorelii Pierre ex Dop 30, 31
thwaitesii Solered. 289
thyrsiflora Gilg, syn. nov. (1963) 215, 217
ticate Lechen. ex Steud. 289
tieute Lesch. 289
titou-cote Gaertn. 218
togoensis Gilg et Busse 120, 205
tomentosa Benth. 21, 288

- tonantinensis* Barb. Rodr. 289
tonga Gilg 240
torresiana Krukoff et Monachino 24, 25, 26
toxifera Rob. Schomb. ex Benth. 21, 289
 var. *acuminata* Klotzsch ex Rich. Schomb. 289
 var. *latifolia* Klotzsch ex Rich. Schomb. 289
 var. *obliqua* Klotzsch ex Rich. Schomb. 289
transiens Gilg 95, 282
tricalysioides Hutch. et M. B. Moss 33, 43, 44, 48, 80, 143, 201, 208, 251, 256, **262**, 264, 281
trichocalyx A. W. Hill 26, 27, 284, 286
trichoneura Leeuwenberg 11, 26, 36, 43, 45, 213, **264**, 265
trichostyla Ducke 289
triclisiodes Bak. 138
trillesiana Pierre ex A. Chev. 100, 282
trinervis (Vell.) Mart. 21, 283, 285, 289
trinitensis Griseb. 289
triplinervia Mart. 289
tubiflora A. W. Hill 20, 21
tuvungasala Duvign. 57, 62
ulei Gilg ex Ule 289
umbellata (Lour.) Merr. 29, 289
ungascha A. Rich. ex Schinz 160
unguacha A. Rich. 138, 144, 282
 var. *dschurica* Gilg 138, 144
 var. *dysophylla* (Benth.) Gilg 160
 var. *grandifolia* Gilg 15, 140, 144
 var. *micrantha* Gilg 160
 var. *microcarpa* Gilg 140, 144
 var. *obovata* De Wild. 140, 145
 var. *polyantha* Gilg 140, 146
 var. *pubescens* (Solered.) Gilg 138
 var. *retusa* Chiov. 138, 242, 245
 var. *steudneri* Gilg 140, 144
 var. *typica* Gilg 138
urari-iiua Mart. ex Prog., in syn. 289
urbaniana Gilg 289
urbanii Barb. Rodr. 289
urceolata Leeuwenberg 9, 10, 12, 14, 24, 25, 40, 47, 156, 251, 258, 259, **265**, 266
