

H+N+S landscape architects presents...

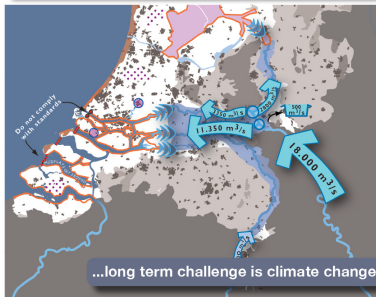

A vision on dealing with peak discharge and rising sea levels in the **Southwestern Delta**

...an attractive area to live in...

...the Delta is divided into a number of separate parts...

...long term challenge is climate change...

...harmful algal blooms are nowadays a problem...

The step-by-step restoration of water exchange and tidal dynamics of the Delta will lead to an upgrade of the Delta for various functions in the interconnected basins with new characteristics.

River water is temporarily stored in the northern arms of the Delta in times of storm and high discharge...

... and interconnections are restored to improve water quality.
