# Our research information infrastructure uncovered

Wageningen UR's windows of opportunity

- **Staff Publications** provides the gateway to all Wageningen UR's output which was registered in our Research Information System. This interface provides sophisticated search possibilities, allowing users to generate (annual) reports and overviews for every researcher, department and all kinds of queries. Wageningen UR library provides special output formats like the SEP-format which suits the requirements in the Standard Evaluation Protocol. http://library.wur.nl/WebQuery/wurpubs/show

- **NARCIS** provides access to the (Open Access) publications from the repositories of all Dutch universities, KNAW, NWO and a number of scientific institutions. The Wageningen UR publications are harvested from our research information infrastructure. Not all registered research output continues to Narcis. Publications are harvested, but output like media appearances isn't. http://www.narcis.nl

- Part of the research output registered in our Research Information System is passed on to the databases of the **FAO** (Food and Agriculture Organization of the United Nations - http://www.fao.org/statistics/databases/en/) and may be harvested by **EU-portals** like DART-Europe E-thesis portal (http://www.dart-europe.eu/basic-search.php) and OpenAIRE (https://www.openaire.eu/)

- **KennisOnline** is the platform that shows the results of research Wageningen UR performs on behalf of the Ministry of Economic Affairs (EZ). The entire database of WUR publications is filtered for publications which have an EZ projectcode. These results are passed on to KennisOnline. http://www.wageningenur.nl/nl/Onderzoek-Resultaten/Projecten-EZ.htm

- **Personal pages.** When you or people from outside Wageningen UR search for you, your chair group or graduate school they end up on your personal page or section pages. The corresponding publications which were fed to our Research Informaton System are visible on these pages. Via http://www.wageningenur.nl

- **We@Wur** shows the contact and expertise details of Wageningen UR employees. In We@Wur your publication list can be shown as an URL which links to Staff Publications. Staff can change this URL in WBA. http://www.wewur.wur.nl/

11.000 - 13.000 records a year

Yearly import

BAPS (EZ) projectcodes

BAPS

Web of science

* not for PhDs; these are fed to RIS through Promis

Below the surface

In **WBA** (Wageningen Basis Administration) you can access and modify your contact data. The person information is derived from **Pview**, the staff administration system. The data in WBA are automatically transferred into Outlook and are shown in We@Wur.

PROMIS is the project accounting and personnel system for PhD students.

BAPS (Budget Allocation and Projects System) is designed for projects funded by the ministry of Economic Affairs (EZ). By linking research output in our Research Information System (RIS) to a BAPS project code, publications are also visible on the website KennisOnline. The projectcodes begin with the letter BO, KB or WOT followed by three sets of numbers with a hyphen in between. The code to which records should be linked, looks something like BO-11-001-010. If records are entered into RIS with the wrong projectcode, these records will not be shown in KennisOnline.

In our **E-depot** (persistent links to) open access, full-text files are saved.

Our **RIS** (Research Information System) is at the heart of our research information infrastructure. Records are **entered manually** by a network of 300 record feeders as well as by a yearly import from the Web of Science. The record feeder's network takes care of coupling authors and publications to the department where the authors worked at the time of publication (the so called 'work relationships'). An author may have multiple work relationships.

The records imported into RIS are converted to an .xml format. This format allows for data exchange with other information systems. The records enter the **WURpubs** database, where they are merged with earlier data as well as with catalogue data and publications records from before 2003. A search index is made, allowing our windows to be searched.

The **organization table** is created and maintained by the library. This table keeps track of name changes of organizational units and links organizational units to any of its predecessors. In this way the history of name changes is 'remembered' (coupled), preventing a loss of publications when searching for the new/old name of the department.
