PREFACE

This report is one of a series of evaluation reports, consisting of ten reports in total, reflecting the results of the jointly-organised MFS II evaluation:
- eight country reports (India, Bangladesh, Ethiopia, Uganda, Indonesia, DR Congo, Liberia, Pakistan);
- a synthesis report (covering the eight country studies); and
- a report with the results of the international lobbying and advocacy programmes.

This series of reports assessed the 2011-2015 contribution of the Dutch Co-Financing System (MFS II) towards achieving the Millennium Development Goals, strengthening international civil society, setting the international agenda and changing decision-makers' policy and practice, with the ultimate goal of reducing structural poverty. On July 2nd, 2015, the reports were approved by the independent steering committee (see below), which concluded that they meet the quality standards of validity, reliability and usefulness set by the Ministry of Foreign Affairs.

MFS II has been the 2011-2015 grant framework for Co-Financing Agencies (CFAs). A total of 20 alliances of Dutch CFAs were awarded € 1.9 billion in MFS II grants by the Ministry of Foreign Affairs. CFAs receiving MFS II funding work through partnerships with Southern partner organisations supporting a wide range of development activities in over 70 countries and at the global policy level.

The MFS II framework required each alliance to carry out independent external evaluations of the effective use of the available funding. These evaluations had to meet quality standards in terms of validity, reliability and usefulness. The evaluations had to focus on four categories of priority result areas, as defined by the Ministry of Foreign Affairs, and comprise baseline assessments serving as a basis for measuring subsequent progress.

Out of the 20 alliances receiving MFS II funding, 19 decided to have their MFS II-funded activities evaluated jointly. These 19 alliances formed the *Stichting Gezamenlijke Evaluaties (SGE)*[1], which acted on their behalf in relation to the joint MFS II evaluation. The SGE was assisted by an 'Internal Reference Group', consisting of seven evaluation experts of the participating CFAs.

The Netherlands Organisation for Scientific Research (NWO/WOTRO) managed the evaluation and selected ten research teams to carry out the joint MFS II evaluation: eight teams responsible for carrying out studies at country level, one team responsible for the synthesis of these country studies, and one team responsible for the study of international lobbying and advocacy. Each study comprises a baseline assessment (2012) and a final assessment (2014). Research teams were required to analyse the effectiveness, efficiency and relevance of development interventions funded by MFS II. An independent steering committee was appointed to verify whether the studies met with the required quality standards. In its appraisal, the steering committee drew on assessments by two separate advisory committees.

[1] *Stichting Gezamenlijke Evaluaties can be translated as Joint Evaluation Trust.*

The evaluation has been implemented independently. The influence of the CFAs was limited to giving feedback on the first draft reports, in particular to correct inaccuracies. The contents and presentation of information in this report, including annexes and attachments, are therefore entirely the responsibility of the research team and/or NWO/WOTRO.
However, as SGE we are responsible for adding this preface, the list with parties involved and a table of contents, in the cases that the report is a compilation of several reports.
In addition we would like to note that when reference is made to individual case studies, this should be seen as illustrative examples, rather than as representative of a CFA's entire partner portfolio.

The Dutch CFAs participating in this unique joint evaluation are pleased that the evaluation process has been successfully completed, and thank all the parties involved for their contribution (see the next pages for all the parties involved). We hope that the enormous richness of the report will serve not only accountability but also learning.

Bart Romijn

## Acknowledgement

We are grateful to all the people that have contributed to this report. We particularly would like to thank the staff and the leaders of all Southern Partner Organisations that assisted us in collecting information about the projects and the organisation itself for the baseline. We also thank the Co-Funding Agencies and the representatives of the Dutch Consortia for making available background documentation.

In addition, we would like to give credit to Paula Bilinsky for her contribution in the development of the Capacity Development evaluation tool and training of the Indonesian researchers in the baseline phase. At the baseline period, Débora de Oliveira Martins, Marente Vlekke and other research assistants at AIID have also contributed to the report. We are also grateful for the staff at Survey Meter for implementing the baseline surveys. Finally, we would like to thank Erwin Bulte of Wageningen University and Robert Lensink of Rijksuniversiteit Groningen for collaborating in setting up the evaluation designs.

We hope that this baseline report will provide useful insights and that it is a good basis for making final conclusions about the MFS II funding to Southern Partner Organisations.

# Executive summary

## 1. Introduction

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant frameworks for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion for the period 2011-2015 in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA). The overall aim of the MFS is to contribute to structural poverty reduction in the south by supporting Dutch private non-governmental organisations that share this aim. These Dutch CFAs usually collaborate with local Southern partner organisations (SPOs) that are based in the south.

The overall purpose of the joint MFS II evaluations at the country level is to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern partners and to contribute to the improvement of future development interventions. The specific aims of the evaluations of development interventions at country level are threefold: (1) to assess the effectiveness, efficiency and relevance of development interventions funded by MFS II; (2) to develop and apply innovative methodologies for the evaluations of development interventions; and (3) to provide justified recommendations that enable Dutch CFAs and/or their Southern partners to draw lessons for future development interventions.

To this end, the country evaluations comprised a baseline assessment in 2012 and a follow-up assessment in 2014, and were arranged according to three categories of priority result areas as defined by MoFA:

- Achievement of Millennium Development Goals (MDGs) & themes;
- Capacity development of Southern partner organisations (SPO);
- Efforts to strengthen civil society.

The MFS II evaluation in Indonesia was carried out in the framework of a collaboration of the Amsterdam Institute for International Development (AIID), Centre for Development Innovation (CDI) in Wageningen, and Survey Meter in Yogyakarta, Indonesia. AIID was responsible for the overall management of the evaluation and the design and evaluation of the MDG component; CDI led the designing and evaluation of the capacity development and civil society strengthening components; while Survey Meter oversaw and implemented the data collection.

This narrative report provides an overview of the findings of the evaluation components in Indonesia for the 12 projects selected for the MDG evaluation at the final beneficiary level; 12 SPOs evaluated on capacity development; and 10 SPOs assessed with respect to civil society strengthening. The SPOs for the MDG and capacity development components were pre-selected by NWO-WOTRO, while they were sampled by the evaluation team for the civil society component. In the sample, 5 SPOs were included in both the MDG and capacity development components and 2 SPOs were common in the MDG and civil society components. However, the report does not address the synergies between the different

components as in practice the sampled beneficiaries of SPOs in the MDG evaluation are only minimally affected by the changes in the SPOs' capacity and links to civil society between 2012 and 2014 because they benefitted from the SPOs activities mostly prior to these changes were realised (i.e. before the baseline period). Nonetheless, available data was shared between the evaluation teams responsible for the different components for these SPOs.

In the following sections, the main findings for the three evaluation components are summarized starting with the MDG component, capacity development component and, finally, the civil society component.

## 2. Achievement of Millennium Development Goals and Themes

### 2.1. Introduction

The MDG component of the MFS II evaluation addresses five pre-determined evaluation questions:

1. What are the changes under each MDG or theme at community/household level during the 2012–2014 period?
2. To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3. What is the relevance of these changes?
4. Were the development interventions of the Southern partner organisations efficient?
5. What factors explain the findings drawn from the questions above?

These questions are assessed for the 12 selected projects working on different MDGs and themes. Among the projects, 7 of them (partially) aim at poverty alleviation[1] (MDG 1), and 6 (partially) work on sustainable living environment, forests and biodiversity[2] (MDG 7 a and b). These two topics cover 9 of the 12 selected projects in Indonesia, while the remaining 3 projects are related to the MDGs on gender[3] (MDG 3) and health[4] (MDGs 4, 5 and 6).

We discuss the evaluation findings for these projects according to their final objectives or topics, which do not always coincide with the MDG categories. The following sections present our findings for the following topics:

1. Projects on reforestation: WIIP
2. Projects on poverty alleviation: FIELD, SC GREEN, KSP-QT, SC LED-NTT/FSPP and partially WIIP
3. Projects on empowering indigenous communities: Pt.PPMA, NTFP-EP, YRBI and HuMa
4. Projects on sexual education: YPI
5. Projects assisting victims of gender based violence (GBV): LRC-KJHAM and Rifka Annisa

[1] The following SPOs (projects) are evaluated under MDG 1: FIELD, SC GREEN, KSP-QT, SC LED-NTT and partially WIIP. SPOs Pt.PPMA and NTFP-EP are also partially related to MDG 1, however, these projects were not evaluated with respect to their impacts on poverty alleviation.

[2] The following SPOs (projects) are evaluated under MDG 7ab: WIIP, Pt.PPMA, NTFP-EP, and partially YRBI and HuMa. In addition, FIELD is also partially works on the MDG on sustainable living environment.

[3] The following SPOs (projects) are evaluated under MGD 3: LRC-KJHAM, Rifka Annisa and YPI.

[4] Only Rifka Annisa is selected to be evaluated on the MDG on health.

Before we outline the evaluation methodology and delve into discussing the results, it is important to point out that all of the projects started already before the baseline period of the MFS II evaluation. 3 of 12 contracts already stopped at end 2012 (KSP-QT, LRC-KJHAM and Rifka Annisa). Another 3 contracts were extended (FIELD and SC GREEN) or a new project has been set up serving the same beneficiaries (SC LED-NTT/FSPP). The contract period for the remaining 6 projects was better aligned with the project activities. Nonetheless, except for one project (SC GREEN), in all sampled projects the project beneficiaries have been reached already before the baseline survey. This had important implications for the evaluation methodology and the results of the evaluation.

Finally, it is important to mention that some projects contained multiple sub-projects (NTFP-EP, HuMa, SC LED-NTT). In these cases, we have selected only one of these sub-projects. Therefore, the results of the evaluation are not necessarily generalizable over the whole project.

## 2.2. Methodological approach

### *Change in outcomes between 2012 and 2014*

The evaluation of the selected MDG projects was based on the project logic or result chain of the evaluated projects.[5] For each project, we identified specific evaluation questions and (intermediate) outcome indicators that were linked to the outputs and outcomes of the interventions (see Annex B). This approach, on the one hand, guided us in measuring outcome indicators were the project is mostly likely to have an effect, and on the other hand, it can help us determine whether the changes in outcomes can be attributed to the evaluated intervention following the logic of the result chain. We only collected information on relevant and measureable outcome indicators,[6] which we tried to link to uniform indicators if possible. We report on the changes in these outcome indicators for the surveyed beneficiaries between 2012 and 2014.

### *Attribution of changes to MFS II interventions*

The WOTRO call puts particular emphasis on impact evaluation. Impact evaluation compares the situation as it was realized with the projects to the hypothetical situation of no intervention (counterfactual). This allows one to isolate the contribution of the Dutch MFS II on the outcomes to be studied. Wherever possible, we aimed to use a comparison group in the evaluation design to estimate the counterfactual. In this case, we used the difference-in-difference methodology[7] to estimate the impact of the intervention.

[5] The *result chain* links the project activities to outputs achieved through these activities, and outcomes realised through the outputs. Whereas project outputs can be affected by the project implementers to a large extent, the materialisation of outcomes depends mostly on external factors from the perspective of the project implementers, such as the decisions of local governments, weather conditions or market prices.

[6] Hence, we did not collect information on the uniform indicators that were irrelevant for the project or not measureable using the surveys.

[7] This method compares the changes in outcomes between a treatment and comparison group over the period of time when the intervention takes place.

Unfortunately, all of the sampled projects were already on-going at the time of the baseline survey. Therefore, the difference-in-difference estimate does not capture impacts that were realised before the baseline. In order to assess the early effect of the projects (before the baseline), we compared the baseline outcomes between the treatment and comparison households controlling for household characteristics like age, gender and education of the household head, household size and other observable characteristics that were independent of the intervention.

For four of these projects (partially) related to poverty alleviation, it was possible to use difference-in-difference methodology complemented with cross-sectional analysis at the baseline to evaluate the impact of the project activities both during the evaluation period and before the baseline ('early treatment effect'). For two projects with planned comparison groups, we only used cross-sectional analysis due to unexpected circumstances related to the project implementation.

For the remaining six projects which focused on natural resource management (4 projects), good governance (2 projects) and counselling of victims of GBV (2 projects), we relied on before-after comparison complemented with qualitative data collection to find out the causal channels that have led to the changes in outcomes, including the intervention supported by MFS.[8]

In addition, for one project on reforestation, we also conducted an ecological survey of the forest condition and biodiversity both at the baseline and endline.

All data collected are based on self-reporting of the respondents, except for the ecological survey.

### *Relevance of changes*

To investigate the relevance of the observed changes, we assessed the size of the impact and whether the project addressed an important issue for the beneficiaries. In addition, we compare project impacts to existing literature.

### *Efficiency*

We planned to address this evaluation question through a cost-benefit analysis for each project and compare the results to similar projects. In order to obtain information regarding project costs, we focused on the SPOs as the primary source of information because we assumed the SPOs to be the most knowledgeable about the costs of activities. However, for some projects costs did not include all the costs related to delivering the intervention to the beneficiaries, while some project had different funding sources and several different project activities, which made it difficult to calculate project costs.

In addition, for some projects the cost information was only available in Indonesian rupiahs (IDR). For these projects, we used average annual exchange rates[9] to calculate the amounts in euros, while for the other projects the reported cost information in euros was used. The information on total project costs

[8] The resulting qualitative reports are included as annexes to the project reports.

[9] The annual average exchange rates used are 12,264 IDR/EUR in 2011, 12,087 IDR/EUR in 2012, 13,923 IDR/EUR in 2013 and 16,040 IDR/EUR in 2014. Source: http://www.oanda.com/currency/historical-rates/.

(in euros) does not take into account the inflation rate. Therefore, we used International dollars[10] adjusted for inflation (2011 prices) and purchasing power parity when calculating the unit costs of projects. This ensures that the costs are comparable across countries and time, and allows us to easily calculate the overall costs per beneficiary over multiple years at constant prices.

The main difficulty appeared in identifying the unit for which to calculate the unit costs: we only managed to do so for 5 projects (WIIP, FIELD, SC GREEN, SC LED-NTT and YPI). For these projects, we compare the projects' unit costs to the costs of similar interventions based on the findings of the Synthesis team.

### *Limitations*

A number of methodological issues made these evaluation challenging. First of all, at the time of the baseline, most projects had already started. All but one project had received MFS funding for over a year by the time of the baseline. In some cases, the MFS funding dried up during the evaluation period. Four projects ended their contracts with the CFA shortly after the baseline.

We focused the evaluation on the impact of local organizations supported by the SPO under MFS on ultimate beneficiaries, irrespective of whether these organizations were still receiving funds support from the SPO. The rationale behind this decision is that the support provided by the SPO was often in the form of capacity building or rotating funds, the benefits of these investments should be long lasting.

The fact that some SPOs did not directly engage with ultimate beneficiaries, but rather supported local organizations in doing so more effectively, was also unexpected. In our opinion, some of these projects could have been classified as capacity building or civil society evaluations. This explains our reliance on similar methodologies as used in these evaluations.

Finally, we often encountered that the available sample size was small as a result limited scope of the intervention that could be traced back to MFS, or because the project had regionally based objectives, such as forestry management. This also resulted in greater reliance on qualitative methods and process tracing.

## 2.3. Changes in outcomes and attribution (evaluation questions 1, 2 and 5)

We discuss the findings under 5 themes: reforestation, poverty alleviation, empowering indigenous communities, sexual education and gender based violence.

### *Reforestation*

The climate risk reduction project (WIIP) provided 7 communities in Flores (East Indonesia) with (conditional) grants and training to restore mangrove forests, reduce disaster risks and engage in

[10] The following exchange rates were used based on PPP conversion factor using the World Development Indicators: 3,606.57 IDR/Int$ in 2011, 3,636.38 IDR/Int$ in 2012, 3,682.25 IDR/Int$ in 2013 and 4,530.90 IDR/Int$ in 2014. Source: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#

sustainable livelihood activities. The project also aimed to raise awareness on the importance of mangrove forests for protection against tsunamis. Project participants received compensation for reforestation (grant) and a loan for sustainable livelihood activities, which was converted to a grant if 80 percent of the agreed number of trees were alive after 3 years. Community groups were formed to take charge of the management of the project.

We found that the project was successfully implemented. Over half of the surveyed villagers participated in mangrove planting, 119 hectares of additional forest was attributed to the project and the planting resulted in additional income for villagers. Hazard-prone areas were identified and awareness raising campaigns were conducted in 6 of 7 project villages; while alert teams were set up in every project village; and village regulations on natural resource extraction and land use now take into account natural hazards. Except for reforestation, the project's effects on the direct beneficiaries are muted due to improvements occurring also in the comparison areas.

### *Poverty alleviation*

The poverty alleviation projects assisted farmers to breed seeds that are less reliant on fertilizers and pesticides and improve access to markets (FIELD), promoted organic farming practices and certification (SC LED-NTT/FSPP), provided business development services to groups of female entrepreneurs, usually working in the textile sector (SC GREEN) and provided capacity building and seed funding to savings and credit cooperatives to improve the financial and social performance (KSP-QT).

All projects were implemented according to plan except of SC GREEN, which changed course midway from supporting local organizations to providing training directly to female entrepreneurs. The result was that few project activities were implemented over the evaluation period with a handful of beneficiaries. For the farming projects, around 40 percent of the sampled farmers in the treatment groups participated in any of the trainings provided by the project. For the seed capital project, the only activity which directly affected beneficiaries and could be traced back to MFS was trainings on financial literacy, which were attended by about 25 percent of the sampled treatment group.

Poverty impacts, if any, were only found at baseline. The sampled treatment groups for FIELD, SC LED-NTT/FSPP, and the 2 cooperatives supported under the Seed Capital project of KSP-QT had, respectively, about 40 and 20 percent higher consumption and the same level of income as the comparison group at baseline controlling for observed characteristics. The difference in difference results, providing an estimate of the gain over the evaluation period, show no positive impacts on poverty anywhere. For SC LED-NTT/FSPP, the results even point to a fall in incomes of about 30 percent as a result of the project, caused by regional unfavorable conditions for cashews which were a more important source of income for farmers in the treatment group.

### *Empowering indigenous communities*

Four projects supported communities to improve their awareness and management of natural resources and reduce conflicts over natural resources, in particular forest land. Pt.PPMA implemented a participatory forestry mapping project in Papua, while NTFP-EP in Kalimantan. In both cases, communities did not have formal claims on community forest land, which resulted in lack of forest

management and conflicts over forest land with other communities or palm oil companies (Kalimantan). YBRI, operating in North Sumatra, and HuMa, shared these objectives but had a greater focus on strengthening local institutions that could manage forests and potential conflicts.

At the community level, almost all projects were implemented as planned. The exception is the Pt.PPMA project, where almost no project activities were realized during the contract period (2012-2014) and the contract was terminated.[11] Generally, forestry mapping activities were finalized rather quickly but legalizing the maps took a very long time because of boundary disputes with other villages and a slow response rate of local Government. HuMa also provided training on access to justice for the potential threat of natural resource extraction. The projects' activities mostly involved the local leaders in the community, and women were rarely involved.

We find very little evidence of impact in all four quantitative surveys. Most villages already had regulations on the use of forest, and we find no evidence of those being more effectively applied at endline. We observe small positive improvements in the attitude of villagers towards forest land. There is no increase in the sense of control villagers feel with regards to land. On the positive side, qualitative work indicated an increased support to traditional institutions over the past years, in part as result of the project. There is also evidence from the qualitative work that the participatory mapping had managed to resolve or prevent potential conflicts over land.

### *Sexual education*

The DAKU and Dance for Life (D4L) programmes of YPI aim to increase the capacity of young people to make safe and informed sexual and reproductive health decisions, and are implemented at high schools in Jakarta as extracurricular programmes. DAKU is a computer-based Comprehensive Sexual Education (CSE) programme covering issues like HIV prevention, sexual abuse and other risky behaviour issues like drug prevention. D4L on the other hand is an international programme. It employs dance, music and performing acts and focuses mainly on HIV/AIDS issues.

We find positive effect of the DAKU program in combination with the D4L program on knowledge and attitudes, while we do not find effects for the Dance for Life program alone. This is most likely due to the stronger focus of the DAKU programme, while in the D4L program dance was prioritized over the educational objectives.

### *Assistance to victims of GBV*

Both the Legal Resources Centre for Gender Justice and Human Rights (LRC-KJHAM) and Rifka Annisa are NGOs providing services to female and child victims of violence in the form of psychological counselling and legal aid services. Both NGOs have been providing these services for a long time and MFS support was used to fund part of this ongoing work.

Regarding the beneficiaries, we observed that several beneficiaries visited the service centres only once, particularly in the case of Rifka Annisa. Most respondents who visited the organisations multiple times have turned to the organisations for help in a litigation procedure (legal aid). This is also true for Rifka

[11] This is due to the sudden decease of Pt.PPMA's director in 2011, which led to an organisational crisis.

Annisa. The number of women who experienced either physical, psychological or sexual violence (or a combination of those) in the past 12 months (LRC-KJHAM) or 3 months (Rifka Annisa) decreased for both projects while indicators of psychological health improved somewhat. The women from both projects show satisfaction in the sense that they feel more emotional stable and less stressed due to the services. However, only a small part of the changes can be attributed to the projects. Respondents' family and friends played the most important role in overcoming the burden of domestic abuse, albeit respondents still found it difficult to cope with emotional problems at the endline.

## 2.4. Relevance of changes

### *Reforestation*

Tsunamis have proven to be devastating and the area is tsunami prone. In that sense the WIIP project addresses an important issue for beneficiaries. Regarding the reforestation efforts of WIIP, the survival rate of seedlings was 66% of the total planted trees and 83% of the agreed planting (with replanting) at the end of 2013. Comparing these results to existing studies, we find that the bio-rights approach of WIIP to use residents living close to mangroves to maintain the plants is well-designed. The resulting survival rates are also in the upper range of reforestation projects.

### *Poverty alleviation*

We find very little evidence that the projects improved the livelihoods of the beneficiary households. The developments in household wealth among the beneficiary households are usually matched by improvements in the comparison groups. In the case of the SC LED-NTT project, we even found that due to better diversification of income sources, the comparison households could better cope with a bad cashew nut harvest in the area. Data from the agriculture oriented projects (FIELD and SC LED-NTT) show that households move from investing into farming tools to rather investing in new non-farm businesses, which may be a sign of more diversification of household income.

Access to financial services in the form of saving and borrowing are important tools for better aligning household income and expenditure, and facilitating investments into businesses or farming tools. Many rural households face constraints in accessing formal financial services. The cooperatives participating in the KSP-QT project offer financial services from poor (KSP-QT and KSU-GTGS) to middle income (KSU-GTGS) rural households that are designed to match the needs of their membership. In this respect, the KSP-QT project addresses a relevant issue for the beneficiaries. However, our finding suggest that after the repayment of loans, many households decide to stop saving and leave the cooperative. Hence, the project savings and credit cooperatives serve only a temporary purpose for some households.

We observe similar findings also for the FIELD and SC GREEN projects: some cooperative members have also quit by the endline survey; and in the SC GREEN project, a large share of the 50 participants of the first introductory training on *kanzashi* did not adopt the new skills in their livelihood activities. In addition, all SC GREEN project participants already had a livelihood activity prior to the project that they kept as their main activity also after the project.

Regarding the project beneficiaries, for the SC GREEN and FIELD projects, they were richer than the average Indonesian household in terms of asset ownership, while the beneficiaries of the LED-NTT and KSP-QT cooperative are poorer than the average. Hence, the projects are more needed for these households who live in more remote areas.

### *Empowering indigenous communities*

We do not observe a significant change in the outcome variables. However, the issues addressed by the 4 projects (Pt.PPMA, NTFP-EP, YRBI and HuMa) are very important for the communities: the prospect of recognition of the indigenous communities' sovereignty over the natural resources located in their territory by the local government. Nonetheless, at the individual level respondents are most concerned by more urgent matters like education, health care, access to clean water and the road conditions/access of the village. Almost none of the respondents thought that 'exploitation of natural resources' was an urgent issue. This may indicate a lack of understanding about the likely causes for water scarcity (i.e. environmental destruction due to mining activities and conversion of lands to plantations), or a reluctance to admit to it due to financial interests in the mining activities.

### *Sexual education*

In general, SRHR information addresses an important issue for the targeted beneficiaries. To assess the actual satisfaction of the beneficiaries with the project, students were asked about the effect of the programmes on their life. Mostly an increase of knowledge in certain areas like reproductive health, HIV/AIDS and safe behaviour were mentioned. Some students also mentioned positive changes in their behaviour and attitude towards others, i.e. being more careful and understanding.

### *Assistance to victims of GBV*

A first indication that LRC-KJHAM indeed addresses an important issue for the beneficiaries is that 85% of the respondents visited LRC-KJHAM more than once. Given that respondents visit the SPOs voluntarily, their continued use of Rifka Annisa's and LRC-KJHAM's services signals the value to the respondents. Also, most women agree that the support group activities were or would be very helpful for them. However, most women cannot participate in the support group (only 5 of 20 women were a member of the support group all through the evaluation period) due to the distance to the meeting and the time of the meeting (during working hours).

In addition, the existence of organisations that provide free counselling and legal aid services to victims of SGBV is essential for creating a society that is free of SGBV. They not only provide services but stand as proof for the rights of women, children and other marginalised groups. The more these organisations are known, for example through media coverage or through information from friends, police and health care providers, the more likely it is that abused women will break their silence and seek help to improve their situation either through mediation or divorce.

## 2.5. Efficiency

As discussed above, unit costs were calculated for 5 of the projects (WIIP, FIELD, SC GREEN, SC LED-NTT and YPI). Based on the benchmarks costs identified by the Synthesis team, none of these projects are cost effective, i.e. they operate with higher costs than similar projects. However, it has to be kept in mind that most of the projects are relatively small and in case of the WIIP and LED-NTT/FSPP projects also quite intensive, which contribute to higher costs.

Looking at the benefits of the projects, we also found that costs were higher than the observed benefits in terms of livelihood improvements (no significant effects were found) for the 4 projects working on poverty alleviation. In addition, not all project results can be measured by livelihood improvements. A good example would be increased skills in handcrafts or sustainable farming practices. The only positive cost-benefit estimate was found in terms of the estimated benefits of mangroves and the costs of the WIIP project, both of which were quite high. For the sexual education programme of YPI, no cost-benefit analysis was done.

## 2.6. Overall conclusions

First, project impacts in the uniform indicators were often minimal, if any, because (1) often the project did not explicitly target the uniform indicators; (2) the project interventions were not substantial enough or reached a small fraction of the intended beneficiaries; (3) projects were not successful in reaching their final objectives in terms of outcomes at the final beneficiary level. In addition, the difficulties mentioned in the first bullet made it difficult to draw strong conclusions regarding impact.

Second, looking at the interventions themselves, we mostly found professional and committed local NGOs and CSOs implementing the projects, which is reflected in the high scores on the design and implementation of the projects (Table 6). Projects were often funded from multiple sources. The interventions which could be traced back to MFS sometimes turned out to be very small (for example, for Rifka Annisa). Many projects did not spend the whole budget (for example, NTFP-EP, FIELD and SC LED-NTT), and the project period was also often extended (for example, NTFP-EP and FIELD). Most projects were implemented according to plans except for a few: in the case of the Pt.PPMA project the contract was stopped due to non-performance, and the implementation of the GREEN project of SC was adjusted. However, especially the project aimed empowering indigenous communities using participatory mapping methods (Pt.PPMA, NTPF-EP, YRBI and HuMa/Wallacea) struggled to deliver the planned outcomes due to the limited timeframe for the projects. In the latter case, a long term commitment from the CFAs is important to be able to deliver the desired project outcomes.

Third, we observe that most projects involve a capacity development component (for example, NTFP-EP and HuMa), and some of them even have capacity development of NGOs and CSOs as their primary objective (for example, SC GREEN and KSP-QT). Others provide trainings to community groups or households (for example, WIIP, FIELD and SC LED-NTT/FSPP). In fact, all selected projects focus on one of the following: providing trainings, participatory workshops, counselling and legal aid, SRHR education and linking producers to markets. Regarding the trainings, we often found that their effectiveness could

be increased.[12] Only one project actually disbursed performance-based compensation for project activities (tree planting) to the beneficiaries (WIIP), and another one provided capital for borrowing (KSP-QT). Most projects were designed to have sustainable effects after the project period.

Fourth, for most SPOs, we observe a long working relation between the SPO and CFA. For example, the FIELD and LED-NTT/FSPP projects ran for about 10 years. Hence, the good performance of the SPOs in terms of designing and implementing the projects could be a result of careful partner selection of the CFAs. On the other hand, during the evaluation period some of these working relations have (temporarily) ended due to changing strategies of the CFAs (YRBI, FIELD, KSP-QT).

Fifth, we observe that while some projects worked closely with the beneficiaries (for example, WIIP, YRBI, SC LED-NTT/FSPP), other SPOs were operating at a larger distance from the beneficiaries and more oriented towards civil society and policy influencing and worked with local partner organisations (for example, HuMa, NTFP-EP, FIELD and YPI).[13] Overall, we observe that projects that interacted more intensively with beneficiaries were also more effective (for example, WIIP and YRBI). However, these projects also had the highest costs. Unfortunately, based on the available data, we are not able to assess the efficiency of the two approaches.

Sixth, regarding the relevance of the projects to beneficiaries, most projects addressed relevant issues for the beneficiaries. This is particularly the case for projects on sexual education, services for victims of domestic violence and coastal reforestation. The mapping and natural resource awareness raising projects address important community concerns and are supported by the communities, however, they are not deemed as urgent issues despite the long-term implications of natural resource extraction and the loss of cultural resources. Hence, these projects have an essential role in protecting ecological and cultural resources for future generations. Among the sampled project areas, the projects on poverty alleviation seem to be the least relevant relatively speaking, especially, as only one of the 4 projects is implemented in an underdeveloped area of Indonesia (SC LED-NTT/FSPP).

Overall, we find that the selected project were well-designed and implemented by committed SPOs, albeit the evaluation found limited quantitative impacts of the interventions during the evaluation period and we often found the interventions to be not cost-effective compared to benchmarks provided by the Synthesis team. The latter result may be explained by the small scale of the implemented projects.

Finally, we do not recommend the replication of this evaluation design in the future. However, we encourage carefully designed impact evaluation of development projects that reach a sizeable group of beneficiaries and offer measureable outcome indicators at the final beneficiary level. For small scale projects with outcomes that are difficult to quantify, we recommend the use of more qualitative evaluation methods like process evaluation or process tracing. Regarding the size of the project, it is important to consider whether the outcomes and primary sampling units are at the household or the community level, and the complexity of the project.[14] Most importantly, for all future evaluations we

[12] For example, more effort should be taken by YPI to train teachers on how to effectively deliver the material of the DAKU programme.

[13] Or teachers in the case of YPI.

[14] For projects that involve many different treatments/activities, the beneficiaries should be stratified or separated by the different combination of treatment 'packages'. Evaluating complex projects requires a larger sample size

strongly recommend the development of the evaluation design in cooperation with the SPOs prior to the start of the interventions in order to allow for a true baseline measurement (and possibly the randomisation of beneficiaries) before the project is rolled out.

# 3. Capacity development of Southern Partner Organisations

## 3.1. Methodological approach

The overall evaluation approach for evaluating capacity development of the SPOs is a participatory, theory-based approach using theories of change, impact pathways and process tracing[15,16], in a before-after comparison. Mainly qualitative methods have been used as organisational capacity is characterised by complexity and uncertainty.

The overall evaluation design is centred around the four evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described in more detail in Annex F.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

**Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see Annex G) and changes between the baseline, and the endline situation have been described. For data collection, a mix of data collection methods were used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided. The scores were developed by the evaluation team, after thorough analysis and description of the situation during endline and how this changes since the baseline. These scores are based on mainly proportional differences. Whilst the information provided by staff may have provided socially desirable answers, the information provided has been cross-checked using different sources of information

due to this stratification. One option to reduce the sample size would be to only evaluate some of the project activities, as was also done for some of the selected MFS II projects.

[15] In Stern et al, 2012: Evaluation and IE in particular, is an opportunity to test a programme's theory through the links in the causal chain. In terms of method, this tendency is close to 'process tracing' (George and McKeown, 1985, Collier 2011), defined by Aminzade (1993) as: 'theoretically explicit narratives that carefully trace and compare the sequences of events constituting the process…'. These causal chains are represented graphically as causal maps or neural networks.

[16] Stern et all (2012) say there are 'three main designs that show promise to reinforce existing IE practice when dealing with complex programmes – theory-based; case-based and participatory'.

(different staff groups based on functions; self-assessments in interviews; interviews with CFA and other externals).

**Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described. This general causal map was developed to also get the SPO perspective on what they considered as important capacity development changes since the baseline. For this reason, and since the indicators by themselves could not provide this overall SPO story and perspectives on what they considered important changes, only the SPO perspective has been included. This was an additional activity that wasn't planned for during the baseline. The analysis in terms of organisational capacity changes has however mainly focused on changes in the 5c indicators.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to only 5 of 12 SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This was also confirmed during the 5c endline study. Theory-based evaluation can help to understand why a program works or fails to work and they attend to not only what programs do but also to how participants respond[17]. The theory based approach also allows space for the evaluation to reflect the complex nature of the development process, particularly when focusing on changes in organisational capacity. To deal with the attribution question (2), the theory-based approach '(outcome explaining) process tracing' is used.

A detailed explanation of the methodological approach and reflection on this is provided in Annex F.

## 3.2. Changes in partner organisation's capacity and reasons for change (evaluation question 1 and 4)

**Changes in terms of the five core capabilities**

All in all, changes took place in all the five capabilities, for most of the SPOs, and most of these changes were slight improvements. There were a few exceptions. For Institut Dayakologi no change took place in terms of the average for four of the capabilities. For GSS, Yadupa, and Yayasan Kelola no changes took place in two of these average capabilities. The picture for YRBI is very different from the others, since no changes took place in two capabilities, and a slight deterioration took place in two other capabilities. The main reason for this is that the organisation is in a poor financial situation since ICCO has stopped the contract with YRBI and since then, the organisation has been unable to perform its activities. For 6 (50%) of the SPOs (slight) improvements took place in all of the capabilities: ASB, ECPAT, Lembaga Kita, Rifka Annisa, WIIP, and YPI. WIIP has seen most progress, since in all of the capabilities changes of more than 0.5 have taken place. For ASB and ECPAT also did well, since in three capabilities the progress was 0.5 or more. It must be noted that within these capabilities, and related to the specific indicators, mainly improvements but also some deteriorations have taken place. This is very much specific to the organisation. For specific details about each SPO, we refer to the specific 5C reports.

[17] Carol H. Weiss (2007).

**Key organisational capacity changes as perceived by the SPO - general causal map**

On the whole, according to SPOs for which a 'general causal map' was developed based on what they perceived as key organisational capacity changes since the baseline, MFS II funded capacity development interventions were mentioned as playing a role in bringing about these changes, especially in terms of enhancing staff capacity, mainly in terms of (planning), and M&E (5 SPOs): GSS, ID, Rifka Annisa, Yadupa, YPI, whilst for ASB the strategic planning workshop has sparked of many changes, since it resulted in a leadership change and a strategic plan. Internal factors have also been perceived as very important, whilst external factors have also played a role, particularly in the case of WIIP, with the change of vision and mission at WI-HQ.

## 3.3. Attribution of changes in partner organisation's capacity and reasons for change (evaluation question 2 and 4)

On the whole, it can be concluded that for 3 of the 5 SPOs (for which 'process tracing' was carried out), selected key organisational capacity changes can to a large extent be attributed to MFS II funded capacity development interventions: ASB (1 out of 2 changes); YPI (2 out of 3 changes); and YRBI (1 out of 2 changes). Internal factors have also played an important role in many of these changes. These include changes in leadership (PT.PPMA; YPI) and leadership style (ASB); enhancing staff competencies (ASB, ECPAT, YRBI) and other internal changes. For many of the selected organisational capacity changes, internal changes have played an extremely important role: ASB (2 out of 2); ECPAT (1 out of 2); PT.PPMA (2 out of 2); YPI (1 out of 3); YRBI (1 out of 2). It must be noted that some of the important internal changes were very closely related to MFS II funded capacity development interventions such as the change in leadership style and a strategic document at ASB as a result of the Hivos supported strategic planning workshop which sparked off many internal changes. Only in one case external factors have been mentioned: for YRBI the contract with ICCO expired due to a change in ICCO policy, which was the result of the renewal of the MoU between ICCO and the government of Indonesia. For 4 out of the 5 SPOs (all except PT.PPMA), MFS II capacity development interventions have played a role in enhancing staff competencies. The poor funding situation was a negative change, and has been an issue for two of the SPOs (YPI and YRBI). It is interesting to see that YPI experienced the 5C baseline in 2012 as a capacity development intervention that sparked of many changes in the organisation. For PT.PPMA, there have been no capacity development interventions, even though the CFA has asked the SPO many times for a capacity development plan. For more details please see the separate 5C reports for the SPOs.

## 3.4. Reflections

We recommend for future capacity development evaluations to be more utilisation focused, engaging stakeholders in a learning process so that they can also take up the lessons learned in order to further improve upon their organisations. Now, the evaluation was too much accountability driven. Furthermore, it is important that sufficient time is taken into account for the evaluation process in order to provide useful insights for all involved. The time period of two years was too short to see remarkable changes in terms of capacity development.

Organisational capacity contains many different aspects that are constantly changing. Therefore, it is important to see these as part of a whole rather than separate issues, unlike it had to be done for this evaluation in terms of standard indicators. The different aspects relate to each other and need to be seen more from a whole systems perspective. Furthermore, organisational capacity is complex, methodologies for evaluation need to be tuned to the specific situation of each organisation.

Overall, process tracing has proven to be a useful exercise that provided a lot of insight into how changes in terms of capacity development have taken place. Many SPOs and CFAs valued this insightful learning process and indicated that they would work with the results to further improve the organisational capacity of the SPO. Furthermore, in case of staff turnover, this may have seriously affected institutional memory, which is an important factor, next to the difficulty of recall when describing a chain of events, in qualitative information.

None of the CFAs and SPOs had a clear and explicit Theory of Change for the organisational capacity development of the SPO and this made it difficult to compare and test this theory of change with the final narrative after the process tracing. For future purposes, we recommend that SPO and CFA do a proper analysis of the organisational capacities that the SPO needs to further enhance and make this explicit in the theory of change for the organisational capacity strengthening of the SPO. This would also strengthen theory-based evaluation.

# 4. Efforts to strengthen Civil Society

## 4.1. Introduction

The Civil Society evaluation component of the MFS II evaluation addresses four pre-determined evaluation questions:

1. What are the changes in civil society in the 2012–2014 period, with particular focus on the relevant MDGs & themes in the selected country?
2. To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3. What is the relevance of these changes?
4. What factors explain the findings drawn from the questions above?

To address these evaluation questions, the evaluators were asked to select a sample for the Civil Society evaluation component, unlike for the MDG and Capacity Development evaluation components. A sampling procedure was set up by the evaluators that resulted in the evaluation of five SPOs that address issues related to MDG 7, and five others that work on governance issues. These two themes were selected because most SPOs in Indonesia that receive MFS II funding work on these topics. Within MDG 7, we randomly sampled three SPOs supported by Hivos that are creating cooperatives to improve market access and engage in policy influencing, and two SPOs that address natural resource governance and sustainable livelihoods of forest dependent people supported by IUCN-NL. Within the governance theme; two Hivos' supported organisations are creating space for alternative artist expressions; two

organisations supported by Hivos and Free Press Unlimited that use social and conventional media to engage citizens and youth in online discussions and if necessary in citizen action, and; one organisation supported by Hivos that addresses human rights violations through evidence based advocacy.

### 4.2. Methodology

The evaluation questions aimed at identifying changes occurred in line with the CIVICUS dimensions in the 2012 – 2014 period, the extent to which these changes are to be attributed to the Indonesian SPOs and to MFS II, the relevance of these changes and factors explaining the changes.

*Change* in civil society was documented in relation to the interventions of the SPO, as perceived by the SPO, and expressed in documents, a workshop and follow-up interviews with the SPO, and interviews with external resources persons. To assess whether these changes can be *attributed* to the interventions of the SPO, a theory based methodology was used for five of the ten SPOs while for the others a less extensive contribution analysis was done. The selection of the five SPOs was based upon an estimation of the MFS II budget for that NGO that is related to CIVICUS dimensions, ensuring that both SPOs working on MDG 7 and on governance were amongst the selected as well as a variety of Dutch partners were included. The *relevance question* was assessed through interviews with the SPO and its Dutch partner and context information. Relevance was assessed against the Theory of Change constructed with the SPO during the baseline assessment in 2012, the context in which the SPO is operating and the civil society policies of the Dutch MFS II alliance. The *explaining factors question* assessed organisational factors of the SPO, its external context and the relation between the Dutch and the Indonesian NGO that explained the civil society changes achieved or not. No additional information was collected for this question.

### 4.3. Changes in civil society in relation to SPO interventions

***Governance theme***

*Common Room (CRI) and RUANGRUPA* have contributed to the emergence of new expressions of contemporary arts resulting in an increased exposure of people to alternative expressions of arts. KBR temporarily offered the space for children and teenagers to exchange about issues of their concern, but its Teen Voice radio programme discontinued when KBR failed to mainstream the programme into other networks. CRI has created the space for sharing grassroots information amongst bloggers, community radios and other citizen journalists to voice the day-to-day issues of citizens but failed to mobilise these voices for collaborative action. ELSAM has further positioned itself in the human rights sector as a resource centre on human right atrocities and has used this information for evidence-based advocacy together with its network of both national and local SPOs-CSOs. Its work has resulted in compensations for those affected by natural resource conflicts.

***MDG 7***

The most significant contributions of FIELD, KWLM and LPPSLH in the past two years consist of the expansion of the number of cooperative structures and/or the improvement of their organisational performance. Members improved their bargaining position vis-à-vis middlemen because the cooperatives either help them access premium markets (KWLM and LPPSLH) or provide them access to

credits (FIELD). Cooperative members (and members of FIELD's farmer field schools) have strengthened their personal network and as representatives they have developed relations with local government officials. Whereas FIELD involves small scale farmers in lobby activities with national coalitions, LPPSLH better positioned itself in networks that promote organic farming and food sovereignty. FIELD's most important success since 2012 has been the amendment of the 1992 Crop Production and Protection Act. However, no changes were observed with regards to farmers being able to legalise the intellectual property rights they have when they breed new seed varieties.

WARSI's community based forest management groups increasingly are being endorsed by the authorities, enabling them to manage their village forests for the next 35 years. CBFM groups have started to share experiences, increasingly engage with local governments and are about to form an umbrella organisation. Other SPOs have started replicating the creation of those groups in other districts. Concerns raised are the representativeness of those CBFM groups and how to overcome financial burdens attached to the village forests. WARSI successfully lobbied in Jambi province to create one-stop-shop services to accelerate the implementation of the CBFM scheme. At the same time the government designated 500,000 hectares of forests to be managed by CBFM groups. In West Sumatra the CBFM scheme has been mainstreamed into the provincial forest policy. Together with the other partners of the Ecosystem Alliance WARSI managed to simplify the procedures to obtain a village forest licence in 2014.

***Impact upon the civil society arena, household level, public sector, and private sector***

Overlooking all the changes, most of these occurred in the civil society arena through the creation of community based organisations, cooperatives and the like, followed by changes at household level. Indicators that relate to these two categories already had high scores during the baseline. Changes in the relation with the public sector and in particular influencing policies and practices was less frequently occurring, and impact upon the private sector was negligible. In fact, baseline scores for these two categories were lower than those for civil society and household. Apart from one exception, all changes that occurred since the baseline are minor changes scored with a 1.

## 4.4. Attribution/contribution

***Governance theme***

Out of seven changes, one of the outcomes *cannot* be explained by the SPO: this is CRI's claim that it contributed to the Ministry of Health granting more beneficiaries access to the health insurance scheme through the online platform. Its online platform did not exert public pressure upon the Ministry of Health to change its regulations.

Multiple factors explain the second outcome of CRI; increased participation on the online platform. Each of these factors separately, including CRI's contribution to the increased participation to the platform, forms a *sufficient but not necessary* explanation for the observed change.

RUANGRUPA's and KBR68H' interventions *sufficiently and necessarily* explain their noted changes. RUANGRUPA created the necessary infrastructure and demand for contemporary visual art in Jakarta. Its reputation and role were key in achieving this outcome. KBR68H's interventions also explain the engagement of teenagers and children in the Teen Voice Program. The most valid explanation for the

increased quality of participation of the target group in Teen Voice since the baseline is the shift towards a web-based platform for Teen Voice, in combination with the use of radio and television broadcasts.

Three outcomes are the result of a *causal package*, in which the SPO played a substantial role. ELSAM has an enormous network in which its particular role is to mobilise local information that it uses to draft position papers used by the network for lobby and advocacy. This causal package explained two lobby outcomes. Common Room's innovation to combine traditional Sundanese instruments with heavy metal music and its collaboration with a popular band explain the revival of Sundanese traditions and the integration of heavy metal groups in society.

***MDG 7ab***

With regards to MDG 7ab, nine changes achieved were explained, of which six were assessed with in-depth process tracing; those of LPPSLH, WARSI and NTFP-EP.

Three changes can be explained by a *causal package* of actors and factors that cannot be disentangled and in which the SPO showed to be indispensable. This was the case with FIELD's work in the coalition to push the government for a review of the 1992 Crop Production and Protection Act; WARSI's work to obtain the endorsement of CBFG which required also the support of local authorities at district, provincial and national level, and; WARSI, other SPOs and the provincial government to mainstream CBFM in the West Sumatra forest policies.

The realisation of four other outcomes can be 'attributed' to the SPOs, with local government playing a constructive role. FIELD's, KWLM's and LPPSLH's interventions were a *sufficient and necessary* cause for the creation of cooperatives, and districts provided the enabling environment to do so. The same applies for the second outcome achieved by LPPSLH which consists of the bargaining position of small holders being improved vis-à-vis middlemen because it provided these small holders with alternative and promising value chains through the cooperative.

NTFP-EP's support to the Crafts network and its business unit to market NTFP products is one of the explaining actors for the increased incomes of 17 women weaving baskets. NTFP-EP provides a *sufficient but not necessary* explanation, because other buyers more often buy these products.

NTFP-EP's claim that communities are able to claim their rights to manage natural resources and land in four villages in the first place was only partially true. NTFP-EP's support in mapping the resources and previous work done by other SPOs to organise communities in groups both are a *necessary but not sufficient* cause to explain the outcome; more lobby efforts are needed to integrate the participatory maps into the spatial plans of the district.

**The role of MFS II in the contribution/attribution**

In total, 10 of 16 outcomes were realised with only MFS II funding. MFS II funding was not at all effective with one outcome (CRI), whereas five outcomes materialised during the MFS II period whilst interventions were made during MFS I. Three of these five outcomes where co-funded by other donor organisations.

**Achievement of planned objectives**

When analysing the effectiveness of the SPOs in terms of the achievement of planned objectives, we observe that seven out of the ten are quite effective, having realised 60 % of all their objectives entirely or partially. We also observe, however, that five of the ten SPOs provided insufficient data to assess progress being made against one or several objectives.

**Conclusion**

The overall effectiveness of MFS II with regards to Civil Society is estimated between 60 and 80 percent, based upon the process-tracing exercise and the analysis of the achievement of planned objectives.

### 4.5. Relevance

Most changes explained and other changes in civil society are relevant in the light of the Theory of Change constructed in 2012 during the baseline. All changes are relevant with regards to the context in which they were realised. With few exceptions, changes in civil society are generally speaking relevant in relation to the MFS II policies.

### 4.6. Explaining factors

Most SPOs avail of the *capabilities* to introduce change in civil society. However, Common Room's high staff turnover, decline in staff members and the gap between its ambitions and realisations make this organisation one of the weakest.

CRI, having faced high staff turnover rates (but is growing) and still repositioning itself in society, may also have influenced its outcomes related to the online platform.

Based upon the progress reports made available by the SPOs, we observe that the monitoring systems in place do not allow drawing lessons at outcome level in terms of what works, what does not work and why. Reporting mostly takes place at activity and output level but not at outcome level. Important issues to look at from a civil society perspective are, for instance, the performance of organisations created, a more systematic gathering of information on client satisfaction or impact at household level and governments becoming accountable to citizens.

External factors that provide a conducive environment for the SPOs are Indonesia's connection to the internet; contemporary arts becoming the latest trends; anti-corruption being on the agenda of the government; regulations in favour for community based forest management and the creation of cooperatives, and; growing demands for certified timber and crystal sugar.

Not so conducive factors are the broadcasting law that creates unfair advantages to large media conglomerates and risks to decrease the diversity of expression (CRI and KBR); free expression on the internet (ELSAM and KBR); unfavourable markets for NTFP-EP products in Indonesia because middle class consumers do not buy these products (NTFP-EP), and; NTFP-EP missing the political commitments of district governments for the management of natural resources by communities themselves rather than giving these as concessions to agribusiness and extractive industries.

Relations between the Co-Funding Agencies and the SPOs were overall constructive and supportive.

### 4.7. Design of the interventions

In addition to the mandatory evaluation questions, the synthesis committee added a question about the 'replicability' of the interventions. The evaluation team looked at the extent to which the design could lead to the same outcomes when implemented by a different organisation or in another context, as well as assessing if the design was suitable for a project mode and short term interventions or required a long term and socially embedded process. We categorised the intervention models into those that are replicable, those that are not replicable because they do not fit into a project mode of development and those that need to be redesigned.

Interventions *that are replicable* but with adaptations are those of Combine Resources Institution, KBR68H, FIELD, KWLM, LPPSLH and WARSI:

1. The intervention model of Combine Resource Institution requires more capacity building activities that learn citizen journalists, members of the online platform to jointly exercise pressure upon local and national governments either through social media or by direct engagement.
2. The more or less fixed project format of Free Press Unlimited will become stronger if a more in-depth assessment is made that explores the relations between civic engagement and media usage

among youth, factoring in specific age groups, types of media used, and identifying information gaps.

3. FIELD's impact at household level can improve if more attention is being paid to improve the market access for organic products of the cooperative members and those participating in the Farmers' Field Schools.
4. KWLM's cooperative model is already being replicated by others, but would gain in household impact if less privileged categories in society, including women can become member and if KWLM's shortage of financial liquidity is being addressed.
5. Also LPPSLH's cooperatives for palm sugar farmers is replicable, but more attention is required with regards to gender dimensions at household level and the traceability of products, in particular when organic products are being marketed.
6. WARSI's design and success depends to a large extent to favourable political contexts and to the presence of third-party assistance to support CBFM groups to deal with bureaucracies. The SPO however needs to rethink its strategies to improve the livelihoods of forest dependant people.

Interventions that are *not replicable* because they do not fit into a 'project mode of development' are those of ELSAM and RUANGRUPA:

1. ELSAM's intervention design does not fit into a 'project mode' of development, because its outcomes are partially the result of 20 years of consistent attention on human rights issues, the reputation it has acquired, its huge network with other human rights organisations and its capacity to engage with decision makers within the government and national parliament. RUANGRUPA's outcomes are to be considered as emerging features in an urban context that cannot be planned as an intervention. Therefore its strategy is not replicable in other contexts.
2. Interventions that *need to be redesigned* are Common Room and NTFP-EP.
3. There is a considerable gap in Common Room's Theory of Change to influence the Bandung creative industries and its economy and their realisations in the 2012 – 2014 period. The most important reason for this is to be attributed to its weak organisational capacity, but also strategic thinking is required to harmonise its interventions with its vision and mission.
4. Also NTFP-EP needs to rethink the relations between the interventions it undertakes and the outcomes to be achieved. This is in particular the case for its policy influencing work at district level and strategies to increase the share of household incomes generated by the marketing of NTFP products in the total incomes, as well as strategies to rethink the sharing of benefits in the value chains created.

# 1. Introduction

## 1.1. Terms of Reference for the MFS II Evaluation

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant frameworks for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion for the period 2011-2015 in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA). The overall aim of the MFS is to contribute to structural poverty reduction in the south by supporting Dutch private non-governmental organisations that share this aim. These Dutch CFA usually collaborate with local Southern partner organisations (SPOs) that are based in the south.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued calls for proposals, on a country by country level basis. This report is part of the joint MFS II evaluations of development interventions for Indonesia.

The overall purpose of the joint MFS II evaluations at the country level is to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern partners and to contribute to the improvement of future development interventions.

The specific aims of the evaluations of development interventions at country level are threefold: (1) to assess the effectiveness, efficiency and relevance of development interventions funded by MFS II; (2) to develop and apply innovative methodologies for the evaluations of development interventions; and (3) to provide justified recommendations that enable Dutch CFAs and/or their Southern partners to draw lessons for future development interventions.

To this end, the country evaluations comprised a baseline assessment in 2012 and a follow-up assessment in 2014, and were arranged according to three categories of priority result areas as defined by MoFA:

- Achievement of Millennium Development Goals (MDGs) & themes;
- Capacity development of Southern partner organisations (SPO);
- Efforts to strengthen civil society.

For each priority result areas, pre-determined research questions are specified. For the priority result areas related to MDGs and themes these are:

- What are the changes under each MDG or theme at community/household level during the 2012–2014 period?
- To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

- What is the relevance of these changes?
- Were the development interventions of the Southern partner organisations efficient?
- What factors explain the findings drawn from the questions above?

The research questions for the priority result areas related to capacity development of Southern partner organisation are:

- What are the changes in partner organisations' capacity during the 2012–2014 period?
- To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
- Were the efforts of the MFS II consortia efficient?
- What factors explain the findings drawn from the questions above?

The research questions for the priority result areas related to civil society are:

- What are the changes in civil society in the 2012–2014 period, with particular focus on the relevant MDGs & themes in the selected country?
- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- Were the development interventions of the MFS II consortia efficient?
- What factors explain the findings drawn from the questions above?

These research questions were addressed in the 2012-2014 period. This country narrative report summarizes the main findings of the evaluation activities in Indonesia.

## 1.2. The Evaluation Team and Organisation of the Evaluation

The core of the project team was centered around a collaboration of the Amsterdam Institute for International Development (AIID), Centre for Development Innovation (CDI) in Wageningen, and Survey Meter in Yogyakarta, Indonesia. AIID was responsible for the overall management of the evaluation and the design and evaluation of the MDG component; CDI led the designing and evaluation of the capacity development and civil society strengthening components; while Survey Meter oversaw and implemented the data collection. The team was part of a consortium that included Wageningen University and Groningen University, which took primary responsibility for other country studies. The aim was to harmonize of approaches and tools across country studies that were carried out by the consortium.

The gravity of the research was in Indonesia. Two scientific coordinators, one from Survey Meter and one from AIID, spent most of their time together in Indonesia to prepare and implement the various studies. In addition, qualified senior and junior local researchers were contracted for the development of the MDG survey design and the implementation of the capacity development and civil society evaluations. All local researchers have relevant experience in the topic areas. Two research coordinators based in Indonesia were also contracted for the implementation and preliminary analysis of the capacity development and civil society studies.

Following field work, the analysis of the collected MDG data has been carried out by AIID with the lead of the scientific coordinator for the MDG component in Amsterdam.

The data for the capacity development and civil society studies were collected in Indonesian. Therefore, the local researchers have done the preliminary data analysis and report writing in English with the lead of the local research coordinators. These served as inputs for the final reports, which were jointly written by CDI and the Indonesian research coordinators.

## 1.3. Organisation of the narrative report

This narrative report provides an overview of the findings of the evaluation components in Indonesia. Chapter 2 presents the description, findings and conclusions drawn from the evaluation of the 12 projects selected for the MDG component; Chapter 3 continues with discussing the evaluation findings for the 12 SPOs selected for the capacity development component; while Chapter 4 summarizes the evaluation findings for the 10 SPOs selected for the civil society strengthening component.

It is important to note that, there are 5 SPOs that overlap between the MDG and capacity development sample and 2 SPOs that are common in the MDG and civil society components. However, the report does not address the synergies between the different components as in practice the sampled beneficiaries of SPOs in the MDG evaluation are only minimally affected by the changes in the SPOs' capacity and links to civil society between 2012 and 2014 because they benefitted from the SPOs activities mostly prior to these changes were realised (i.e. before the baseline period). Nonetheless, available data was shared between the evaluation teams responsible for the different components for these SPOs.

A number of annexes provide additional information about the evaluation at the end of the report. For the MDG component, Annex A summarizes key details of the evaluated projects, Annex B shows stylized result chains for the projects, Annex C summarizes all outcome indicators measured for the projects, while Annex D displays changes in selected outcome indicators for the beneficiary population and Annex E reports the regression results regarding the attribution of these changes to the projects.

For the Capacity Development component, Annex F discusses the methodological approach, while Annex G provides background information on the five core capabilities framework (5C) and Annex H gives an overview of the elements of these five capabilities.

For the Civil Society component, Annex I discusses CIVICUS and the Civil Society Index, Annex J provides the details of the methodological approach of the evaluation, while Annex K discusses the changes in the civil society context between 2010 and 2014, and Annex L elaborates on policy changes in Indonesia between 2011 and 2014.

# 2. Achievement of MDGs and Themes

## 2.1. Sample for the MDG evaluation

The sample of projects were pre-selected for the MDG component. The evaluation sample resulted from a stratified random sampling among projects that satisfied the following eligibility conditions:

- The project could be categorised in at least one of the MDGs and themes;
- The project budget exceeded EUR 50,000;
- The project contract was in effect on 1 January 2012.

Based on these conditions, 12 projects were selected for the MDGs and themes evaluation in Indonesia. In case the projects were active in multiple MDGs and/or themes, one of these has been randomly selected for the purpose of the evaluation. Further, in the original sample, one project has been terminated prior to 2012 (E5. KSP-ASD). To replace this project, a new project (E5. SC GREEN) has been randomly drawn by the Synthesis team based on the above criteria. The final sample for the MDGs and themes evaluation is presented in Table 1.

In addition, Figure 1 shows the location of the projects, Figure 2 graphs the contracting periods of the projects (see also Table 14 in Annex A), while Figure 3 shows the actual implementation period of the evaluated project components along with the timing of the evaluation activities.

A number of observations can be made based on these tables. First, regarding the topics of the projects (Table 1), 7 of the 12 projects (partially) aim at poverty alleviation[18] (MDG 1), and 6 (partially) work on sustainable living environment, forests and biodiversity[19] (MDG 7 a and b). These two topics cover 9 of the 12 selected projects in Indonesia, while the remaining 3 projects are related to the MDGs on gender[20] (MDG 3) and health[21] (MDGs 4, 5 and 6).

Second, regarding the location of the selected projects (Figure 1), 6 of the 12 projects work in West or Central Java: half of the projects work on gender related issues (counselling for victims of gender based violence – LRC-KJHAM, Rifka Annisa - or sexual education – YPI) and the other half are aimed at improving the livelihood of households (through saving and credit cooperatives – FIELD, KSP-QT –, and trainings on handicrafts – SC GREEN – and sustainable agricultural practices – FIELD). Two other projects that we evaluate on poverty alleviation are located in East Nusa Tenggara province: one focuses on organic certification and sustainable farming practices (SC LED-NTT), while the other combines economic incentives (sustainable livelihood) with reforestation as an effort at coastal disaster risk reduction (WIIP). The remaining four projects (Pt.PPMA, NTFP-EP, YRBI and HuMa) are spread out in remote areas over

[18] The following SPOs (projects) are evaluated under MDG 1: FIELD, SC GREEN, KSP-QT, SC LED-NTT and partially WIIP. SPOs Pt.PPMA and NTFP-EP are also partially related to MDG 1, however, these projects were not evaluated with respect to their impacts on poverty alleviation.

[19] The following SPOs (projects) are evaluated under MDG 7ab: WIIP, Pt.PPMA, NTFP-EP, and partially YRBI and HuMa. In addition, FIELD is also partially works on the MDG on sustainable living environment.

[20] The following SPOs (projects) are evaluated under MGD 3: LRC-KJHAM , Rifka Annisa and YPI.

[21] Only Rifka Annisa is selected to be evaluated on the MDG on health.

four islands (Sumatra, Kalimantan/Borneo, Sulawesi/Celebes and Papua): they are all aimed at empowering indigenous communities' in their rights to their land and in their decisions on natural resource use. In addition, in all four projects the evaluated project activities rely on participatory mapping methods.[22]

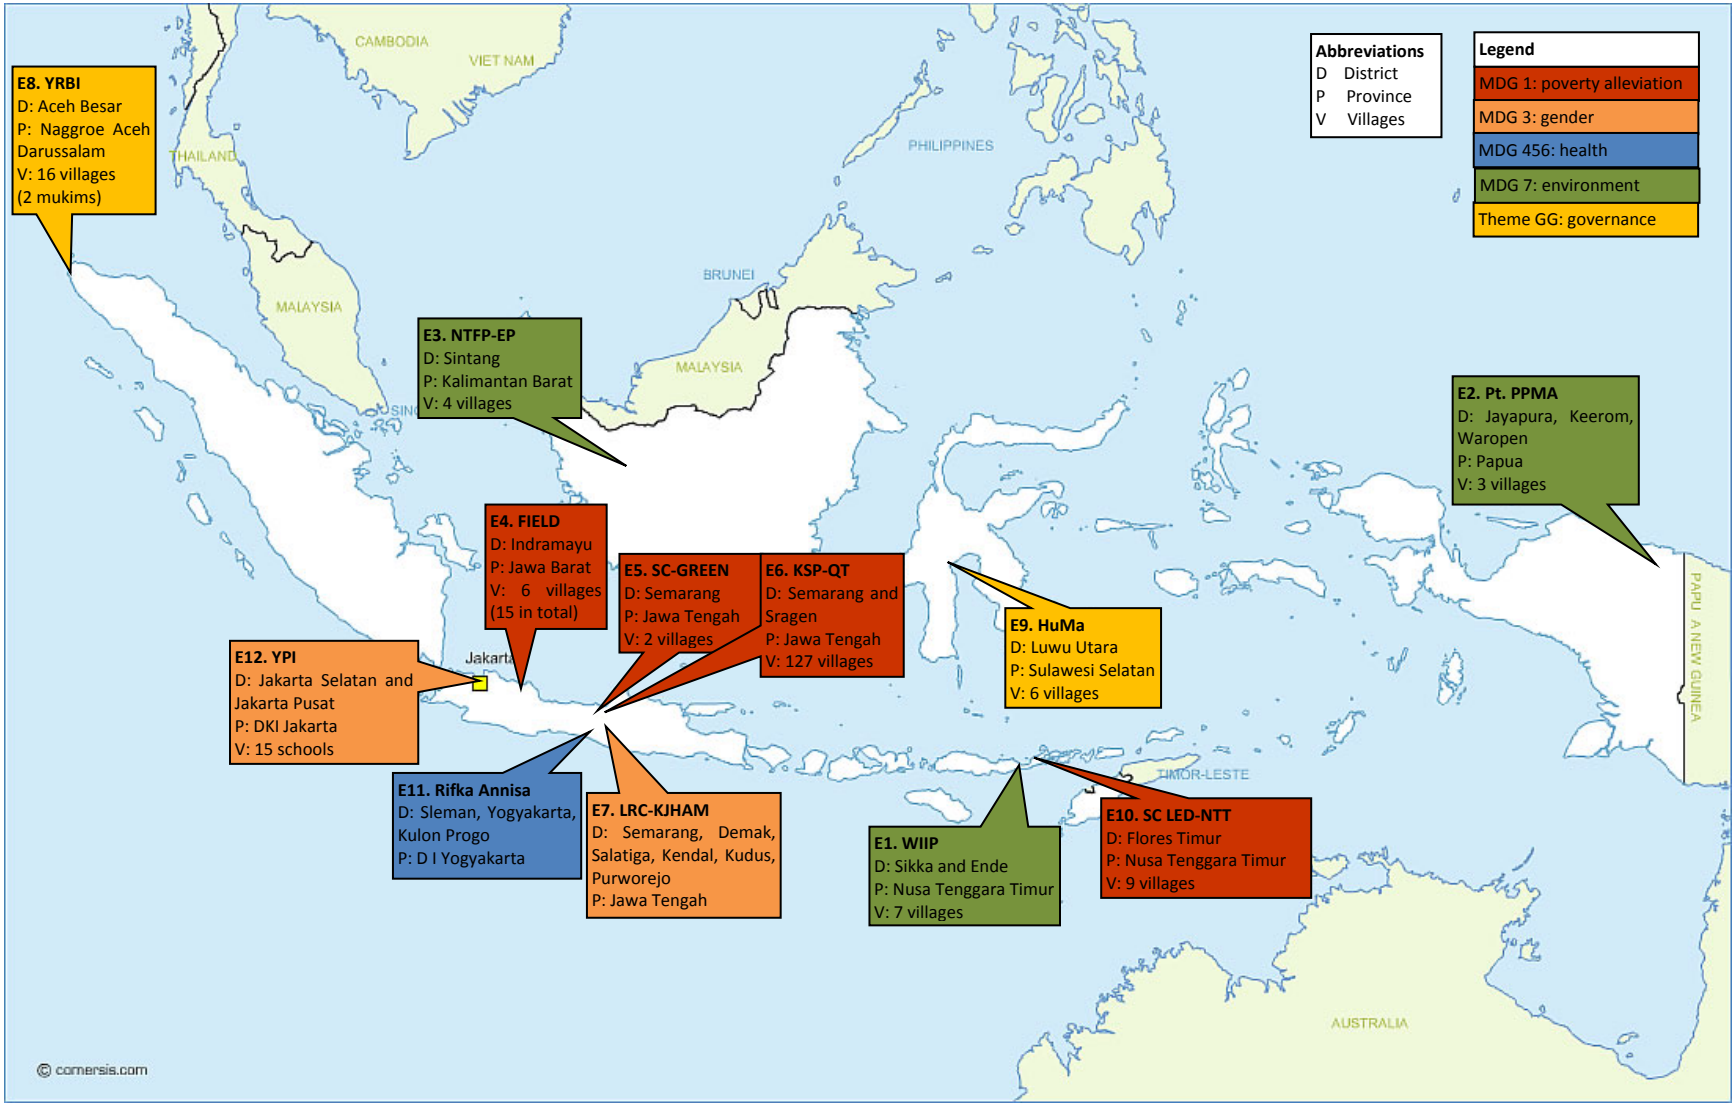
Third, regarding the contract periods of the projects (Figure 2), all projects started already before the baseline period of the MFS II evaluation. However, 3 of 12 contracts already stopped at end 2012 (KSP-QT, LRC-KJHAM and Rifka Annisa). Another 3 contracts were extended (FIELD and SC GREEN) or a new project has been set up serving the same beneficiaries (SC LED-NTT). The contract period for the remaining 6 projects was better aligned with the project activities. Nonetheless, Figure 3 shows that except for one project (SC GREEN), in all sampled projects the project beneficiaries have been reached already before the baseline survey. This had important implications for the evaluation methodology and the results of the evaluation. We return to this issue when discussing the projects.

Fourth, the project budget differs among the projects (Table 1), ranging from the minimum amount of EUR 50,000 to EUR 1,000,000. In addition, for one project (YPI) we found that the project budget was less than the eligibility criteria. The differences in budgets could be due to the size of the population served or the type of activities implemented. Therefore, we postpone the discussion of the project costs to the discussion of similar projects in detail.

Finally, the above discussion already hinted at possible groupings of the projects for the discussion of the evaluation findings. One option would be to discuss the projects based on the MDG categories. However, we decided for a more pragmatic approach based on the final objectives of the projects. For some projects these topics coincide with the selected MDG categories, while in some other cases we split or merged the MDG categories. The following sections present our findings for the following topics:

6. Projects on reforestation: WIIP
7. Projects on poverty alleviation: FIELD, SC GREEN, KSP-QT, SC LED-NTT and partially WIIP
8. Projects on empowering indigenous communities: Pt.PPMA, NTFP-EP, YRBI and HuMa
9. Projects on sexual education: YPI
10. Projects assisting victims of gender based violence: LRC-KJHAM and Rifka Annisa

For these topics, we introduce the context in Indonesia, provide an overview of the planned and actual implementation of the projects, discuss the evaluation design and present our findings for the evaluation questions. We conclude the sections with the main findings and our recommendations. All tables related to the evaluation design and findings are presented in Annexes at the end of the report. These can be consulted for further information about the results. Namely, Annex A contains project information about the contracting period, costs, number of beneficiaries and (if applicable) the project costs per beneficiary for the projects; Annex B presents stylized result chains for the projects to provide further insight into project logic; Annex C shows the outcome indicators used for the evaluation; Annex D reports the changes in selected outcome indicators; and Annex E displays the results regarding the attribution of the projects to the observed changes.



[22] For NTFP-EP and HuMa we only evaluated part of their project activities. At other locations, these projects did not necessarily use participatory mapping but their objectives were similar.

**Table 1: Selected projects for the MDGs and themes evaluation**

| Project | Partner | Consortium | Selected MDG/theme | Other MDGs/themes[a] | Total budget[b] (EUR) | % funded by MFS II |
|---|---|---|---|---|---|---|
| E1. Climate-Proof Disaster Risk Reduction | Wetlands International – Indonesia Programme (WIIP) | Partners for Resilience | MDGs 7ab | MDG 1 | 1,001,000 | 100% |
| E2.Empowerment of Papua Customary People for Sustainable Natural Resources Management | Association for Study and Empowerment of Papuan Indigenous People (Pt.PPMA) | Ecosystem Alliance | MDGs 7ab | MDG 1 | 130,328 | 100% |
| E3. Up-Scaling Sustainable , Community-Based Forest Livelihoods in Kalimantan | Non-Timber Forest Product Exchange Programme (NTFP-EP) | Ecosystem Alliance | MDGs 7ab | MDG 1 and Good Governance | 135,217 | 100% |
| E4. Local Economic Development and Promotion of Local Seed System to Indonesian National Policy | Farmer Initiatives for Ecological Livelihoods and Democracy (FIELD) | People Unlimited 4.1 | MDG 1 | MDGs 7ab | 182,975 | 62.2% |
| E5. Implementation of Garment for Economic Empowerment (GREEN) | SwissContact - Regional Office SE Asia (SC) | People Unlimited 4.1 | MDG 1 | (MDG 3) | 141,263 | 76% |
| E6. Seed Capital Programme for Koperasi Mentari Qaryah Thayyibah | Koperasi Simpan Pinjam – Qaryah Thayyibah (KSP-QT) | People Unlimited 4.1 | MDG 1 | | 201,370 | 95.1% |
| E7. Strengthening Marginalized Women's Access and Control to Legal Resources and Human Rights in Central Java 2010-2012 | Legal Resources Centre for Gender Justice and Human Rights (LRC-KJHAM) | People Unlimited 4.1 | MDG 3 | | 95,000 | 100% |
| E8. Empowerment of Mukim and Gampong Capacity in Spatial Management Phase II | Yayasan Rumpun Bambu Indonesia (YRBI) | ICCO Alliance | Good Governance | (MDGs 7ab) | 315,130 | 60.3% |
| E9. The Security of Strengthening Communities Rights and Justice | The Association for Community and Ecologic-Based Law Reform (HuMa) | ICCO Alliance | Good Governance | MDGs 7ab | 615,142 | 29.3% |
| E10. Local Economic Development in Nusa Tenggara Timur (LED-NTT) | SwissContact - Regional Office SE Asia (SC) | Communities of Change | MDG 1 | | 897,794 | 34.0% |
| E11. Rifka Annisa project | Rifka Annisa | SRHR Alliance | MDGs 4 5 6 | MDG 3 | 52,290 | 100% |
| E12. YPI project | Yayasan Pelita Ilmu (YPI) | SRHR Alliance | MDG 3 | MDGs 4 5 6 | 42,864 | 100% |

## 2.1. Methodological approach

Before turning to the evaluation findings, this section discusses the methodological approach used for the evaluation in general. First, the selection of outcome indicators is described, which is followed by the discussion of attribution analysis and the sample sizes. In turn, the approaches used to assess the relevance of changes and the efficiency of the projects is discussed. Further specificities of the evaluation methodology are discussed per topic in sections 2.2 through 2.6.

### 2.1.1. Outcome indicators

The evaluation of the selected MDG projects was based on the project logic or result chain of the evaluated projects.[23] For each project, we identified specific evaluation questions and (intermediate) outcome indicators that were linked to the outputs and outcomes of the interventions (see Annex B). This approach, on the one hand, guided us in measuring outcome indicators were the project is mostly likely to have an effect, and on the other hand, it can help us determine whether the changes in outcomes can be attributed to the evaluated intervention as discussed later in section 2.1.2.

The outcome indicators identified through the result chain were not always aligned with the uniform indicators selected by the Synthesis team at the baseline period for each MDGs and Themes. As much as uniform indicators are useful for the overall assessment of the projects per MDGs and Themes, in practice, measuring uniform indicators that are not directly related to the objectives and result chain of the evaluated projects would have led to misleading results regarding the effectiveness of the projects, and would have increased the costs of data collection if they were added to the specific indicators that we deemed relevant. However, in some cases when uniform indicators seemed relevant, it was also not possible to obtain appropriate data and link it to the intervention. For example, projects on counselling and legal aid for victims of gender-based violence (LRC-KJHAM and Rifka Annisa) will not affect the 'enrolment rates in post-primary education for girls' (a uniform indicator for MDG 3 on gender), and even though they are aimed at reducing the exposure of their clients to repeated instances of violence it would be almost impossible to obtain data on the 'incidents of gender-based violence per 100 adult women' (another uniform indicator for MDG 3) for the general population.[24]

Hence, we only collected information on relevant and measureable outcome indicators,[25] which we tried to link to uniform indicators if possible. Annex C lists the outcome indicators used in each project per topic. In Annex D, the change in the beneficiary population is reported for selected outcome indicators, again by topic.[26] These will be discussed in sections 2.2 through 2.6.

[23] The *result chain* links the project activities to outputs achieved through these activities, and outcomes realised through the outputs. Whereas project outputs can be affected by the project implementers to a large extent, the materialisation of outcomes depends mostly on external factors from the perspective of the project implementers, such as the decisions of local governments, weather conditions or market prices.

[24] We collected information about the exposure to GBV only for the survey respondents.

[25] Hence, we did not collect information on the uniform indicators that were irrelevant for the project or not measureable using the surveys.

[26] The project reports also report on the changes in outcome indicators for the comparison groups (if applicable).

### 2.1.2. Attribution analysis

The WOTRO call puts particular emphasis on impact evaluation. Impact evaluation compares the situation as it was realized with the projects to the hypothetical situation of no intervention (counterfactual). This allows one to isolate the contribution of the Dutch MFS II on the outcomes to be studied. Wherever possible, we aimed to use a comparison group in the evaluation design to estimate the counterfactual. In this case, we used the difference-in-difference methodology[27] to estimate the impact of the intervention (WIIP, FIELD, KSP-QT and SC LED-NTT). This method compares the changes in outcomes between a treatment and comparison group over the period of time when the intervention takes place. Normally, the baseline is taken before the start of the intervention. Then, the impact is estimated by subtracting the endline difference in outcome from the baseline difference in outcomes.

Unfortunately, all of the sampled projects were already on-going at the time of the baseline survey. Therefore, the difference-in-difference estimate does not capture impacts that were realised before the baseline. In order to assess the early effect of the projects (before the baseline), we compared the baseline outcomes between the treatment and comparison households controlling for household characteristics like age, gender and education of the household head, household size and other observable characteristics that showed a different distribution between the treatment and comparison households and were independent of the intervention. In fact, we had to use such cross-sectional regression approach to evaluate two projects that we planned to evaluate using difference-in-difference methodology: in one case, this was due to the limited project activities during the evaluation period (YPI), and in the other case, we only observed the outcomes for project beneficiaries at the endline (SC GREEN).

In the remaining half of the projects, we deemed the sampling of comparison groups impractical because either the project outcomes were defined at the community level with only handful of participating villages (Pt.PPMA, NTFP-EP) or no comparable sampling units (villages or people) could be identified (Pt.PPMA, NTFP-EP, YRBI, HuMa, LRC-KJHAM and Rifka Annisa). For instance, the project that supported local NGOs in participatory mapping of 4 villages for the protection of eco-cultural sites (NTFP-EP) is basically one case study with 4 observations. It would not have been possible to isolate the impact through statistical methods like difference in differences. In addition, in this case as well as in many other projects, the beneficiaries themselves had decided to participate in the project. This self-selection further complicates the identification of a valid comparison group. For example, not all villages are willing to participate in a participatory mapping project due to conflicts of interests as we also observed in the project in Papua (Pt.PPMA).[28] Therefore, in such cases, we relied on before-after comparisons of outcomes among the project beneficiaries, which were complemented with qualitative data collection to find out the causal channels that have led to the changes in outcomes, including the intervention supported by MFS.[29]

[27] In our proposal we had listed our order of preference for evaluation methods, starting from a randomized experiment, which provides the most creditable method. However, as all projects had already started at the time of the baseline this approach was not feasible.

[28] In this case, a planned beneficiary village (Ampas) decided to withdraw from the project due to the conflicting interests of immediate high returns of illegal logging and the long-term sustainable income from eco-forestry.

[29] The resulting qualitative reports are included as annexes to the project reports.

In addition, for all projects, working through the result chain helped us determine whether the changes in outcomes can be attributed to the evaluated intervention. For example, in a project that aims to improve the livelihood of households through trainings on good farming practices (partially SC LED-NTT and FIELD), the output of the project would be that households participated in these trainings, started using the farming practices learned, which led to an increase in their productivity and resulted in increased incomes. Following this link is important, as the productivity and income of households could also change due to other factors such as weather conditions, which could be thought of as an alternative pathway. However, the analysis focuses on assessing whether the pathway proposed by the projects (see Annex B for these result chains) can explain the observed changes and not on finding out what alternative pathways lay behind the changes.

Table 2 summarises the methods used in the evaluation of the 12 MDG projects. In the case of 6 projects it was possible to find valid comparison groups (WIIP, FIELD, SC GREEN, KSP-QT, SC LED-NTT and YPI), and for two additional projects we found comparison groups due to differences in the evaluation design and the project implementation (Pt.PPMA, NTFP-EP). As mentioned above, for four of these projects (partially) related to poverty alleviation (WIIP, FIELD, KSP-QT and SC LED-NTT), it was possible to use difference-in-difference methodology complemented with cross-sectional analysis at the baseline to evaluate the impact of the project activities both during the evaluation period and before the baseline ('early treatment effect'). For the remaining two projects with planned comparison groups, we only used cross-sectional analysis as explained above (SC GREEN, YPI).

**Table 2: Methods and comparison groups used**

| Project ID | SPO name / Project name | Comparison group | Diff-in-Diff method | Cross sectional analysis | Before/after comparison | Qualitative surveys |
|---|---|---|---|---|---|---|
| **E1** | WIIP | X | X | X[b] | | |

Notes:
a. Due to different project implementation compared to evaluation design.
b. Early treatment effect is estimated.

For the remaining six projects which focused on natural resource management (Pt.PPMA, NTFP-EP, YRBI and HuMa), good governance (YRBI, HuMa) and counselling of victims of GBV (LRC-KJHAM, Rifka Annisa), we relied on before-after comparison complemented with qualitative data collection to assess the impact of the intervention. Qualitative data was collected for the SC GREEN and YPI projects as well. In-depth interviews and focus group discussions were usually conducted with beneficiaries that did not participate in the quantitative surveys (Pt.PPMA, NTFP-EP, LRC-KJHAM, YRBI and HuMa), and additional in-depth interviews were conducted with other project stakeholders such as project facilitators or local government officials (Pt.PPMA, NTFP-EP, LRC-KJHAM, YRBI and HuMa). However, in order to assess the impact of sexual education (YPI) and of counselling for victims of GBV (LRC-KJHAM, Rifka Annisa), we also conducted in-depth interviews with the respondents of the quantitative surveys. In the latter case, alternative pathways were also explored.

In addition, for the project on reforestation (WIIP), we also conducted an ecological survey of the forest condition and biodiversity both at the baseline and endline. These measurements were carried out by forest surveyors at the same GPS coordinates at baseline and endline, which were then linked to a recent satellite image of the area (Google earth). Based on the information from these two sources a quantitative model was built, which can be used to extrapolate the indicators of forest condition over the total project area.

All data collected are based on self-reporting of the respondents, except for the ecological survey.

### 2.1.3. Sample size

For all projects we used structured interviews with individual respondents at the household and for some projects also community level (WIIP, Pt.PPMA, NTFP-EP, YRBI and HuMa). Table 3 summarises the number of villages visited and the number of household interviews conducted for each of the 12 MDG projects. These data are based on the actual classification of the data used.[30]

The projects on mangrove reforestation using bio-rights approach (WIIP), saving and credit services (KSP-Q) and sexual education in high schools (YPI) had the largest sample sizes with around 300 respondents in total. In general, projects that were evaluated under MDG 1 had the largest sample sizes (FIELD, SC GREEN, KSP-QT, SC LED-NTT and partially WIIP) between 100 and 320. For these projects it was also always possible to find comparison groups and use the diff-in-diff methodology for evaluation, except for SC GREEN. On the other hand, FIELD, KSP-QT and SC LED-NTT are also the projects that have been going on for the longest time prior to the baseline.

The projects on assisting victims of GBV had the smallest sample size at around 20 respondents, while the projects on indigenous empowerment had a sample size between 40 and 160.

Comparing these figures to the actual number of beneficiaries (Table 4) puts the sample sizes into perspective. For most projects we sampled a substantial share of the project beneficiaries, especially in terms of location: we sampled all project villages for 2 projects (WIIP, Pt.PPMA), around half of the villages for the two agricultural projects (FIELD, SC LED-NTT), and a selection of project locations for 3

[30] For some projects, the assignment status of villages (schools) and/or households had to be adjusted based on project information (Pt.PPMA, NTFP-EP, FIELD, SC GREEN and YPI).

projects on indigenous land rights and natural resource management (NTFP-EP, YRBI and HuMa). For the sexual education project (YPI), we also sampled almost all known participating high schools known to us at the time of the baseline.[31] Regarding the beneficiaries, for some project we interviewed a substantial share: 77% for LRC-KJHAM, about 50% for WIIP and 20% for FIELD. For other projects this share was lower, while in other cases the project was aimed at the community level and not household level (Pt.PPMA, NTFP-EP, YRBI and HuMa). Further, for one of the gender projects (Rikfa Annisa), the number of survey respondents was limited by the SPO.

Finally, it is important to mention that some projects contained multiple sub-projects (NTFP-EP, HuMa and SC LED-NTT). In these cases, we have selected only one of these sub-projects. Therefore, the results of the evaluation are not necessarily generalizable over the whole project, especially in the case of HuMa where we have selected one of approximately 60 small interventions.

**Table 3: Sample size for structured surveys**

| Project ID | SPO name / Project name | Nr. of treatment villages | Nr. comparison villages | Nr. treatment HHs | | Nr. comparison HHs | |
|---|---|---|---|---|---|---|---|
| | | | | Base | Panel | Base | Panel |

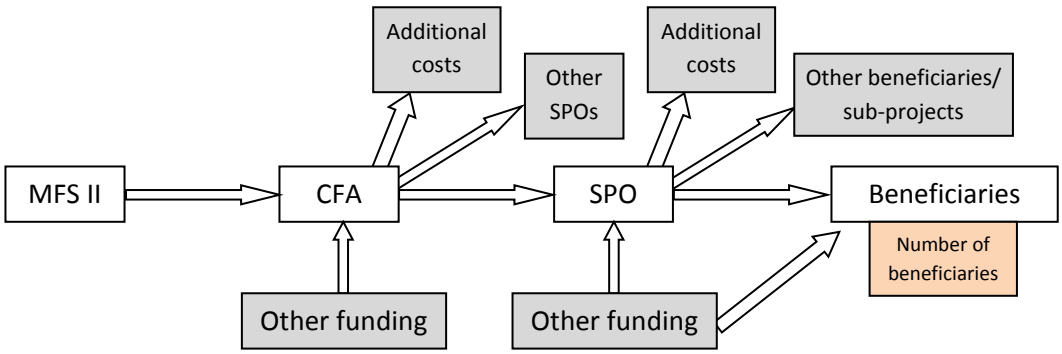
[1] Per year.
[2] *Mukim* is a traditional institution in Aceh encompassing around 3-12 *gampongs* or villages.
[3] PHR stands for people participating in community law facilitator (PHR) trainings.
[4] Numbers are only for the cashew sector. In total 4500 planned and 4633 realized beneficiaries (hh) in 3 sectors.

### 2.1.4. Relevance of changes



To investigate the relevance of the observed changes, we assessed the size of the impact and whether the project addressed an important issue for the beneficiaries. For some projects, we also reported on the satisfaction and self-reported impact of beneficiaries (LRC-KJHAM, Rifka Annisa and YPI), and the representativeness of the sample (Rifka Annisa and YPI). In addition, we compare project impacts to existing literature.

### 2.1.5. Efficiency

Assessing the evaluation question 'Were the development interventions of the Southern partner organisations efficient?' proved to be the most challenging part of the MDG component of the evaluation. We initially planned to address this evaluation question through a cost-benefit analysis for each project and compare the results to similar projects, which relies on the calculation of unit costs and benefits per the same unit. We aimed to calculate the project costs that can be linked to the evaluated project activities reaching the beneficiaries. In addition to the direct project costs, these include project management costs both at the CFA and the SPO.

However, already calculating the project costs proved to be challenging due to different funding sources and several different project activities (that did not reach the sampled beneficiaries). To highlight these difficulties, Figure 4 visualizes the flow of MFS II and other funds to the beneficiaries with arrows showing the direction of expenditure flows.

**Figure 4: Budget flow from MFS II to SPOs**

In order to obtain information regarding project costs, we focused on the SPOs as the primary source of information because we assumed the SPOs to be the most knowledgeable about the costs of activities. We conducted a budget survey with each SPO regarding the project costs, activities and beneficiaries between 2013 and 2014. This information was then complemented with the financial reports of the SPOs for the years between 2010 and 2014, and also verified by the CFAs. However, these costs sometimes do not include all the costs related to delivering the intervention to the beneficiaries. For example, in the case of the YPI project, the costs of schools in implementing the DAKU and D4L sexual educational programmes are not taken into account.

Regarding the calculation of total project costs in euros (EUR), we found out that many SPOs only reported their costs only in Indonesian rupiahs (IDR), for example NTFP-EP, YRBI, FIELD, KSP-QT and others. This was particularly the case for projects with CFAs operating in Indonesia, such as Hivos and ICCO. In these cases, we used the annual average exchange rate to calculate the amounts in euros. This is an important consideration given that there has been a 33% change in the IDR/EUR exchange rate

between 2012 and 2014.[32] When available, the reported cost information in euros was used. The information on total project costs (in euros) does not take into account the inflation rate. Therefore, we used International dollars[33] adjusted for inflation (2011 prices) and purchasing power parity when calculating the unit costs of projects. This ensures that the costs are comparable across countries and time. This is especially useful for projects that have worked with beneficiaries for a longer time period (for example, the projects of WIIP, FIELD and SC LED-NTT), as it allows us to easily calculate the overall costs per beneficiary at constant prices.

Cost per beneficiaries or other unit costs were calculated based on the reported project costs in IDR. For projects with multiple sub-projects such as the projects of NTFP-EP, SC LED-NTT, FIELD and HuMa, we calculated the direct project costs for the evaluated sub-project. The project management costs were accounted for this sub-project proportionally to the share of its direct costs from all direct costs.

The main difficulty appeared in identifying the unit for which to calculate the unit costs: we only managed to do so for 5 projects (WIIP, FIELD, SC GREEN, SC LED-NTT and YPI). In the other cases, we could not identify the unit of beneficiaries either because the project output has not been finalized (Pt.PPMA, HuMa, YRBI, NTFP-EP); because we had difficulty identifying the main output unit (communities, people or land; in all of the above mentioned); or because the intervention was about service delivery which we deemed unsuitable for the calculation of unit costs (Rifka Annisa, LRC-KJHAM and KSP-QT).

Finally, for the 5 projects where we provide information on project costs, we often struggled to compare these costs to the benefits (impacts) of the projects as these manifested themselves in multiple indicators. Instead, we compare the projects' unit costs to the costs of similar interventions based on the findings of the Synthesis team.

Table 5 reports the available information regarding the project costs. These figures will be discussed later in the report per topic.

In general, we find that evaluating the efficiency of the projects was beyond the reach of the evaluation team due to the complex nature of the interventions and because of the limitations posed by not closely working with the SPOs in designing and executing the evaluation due to limited resources.

[32] The annual average exchange rates used are 12,264 IDR/EUR in 2011, 12,087 IDR/EUR in 2012, 13,923 IDR/EUR in 2013 and 16,040 IDR/EUR in 2014. Source: http://www.oanda.com/currency/historical-rates/.

[33] The following exchange rates were used based on PPP conversion factor using the World Development Indicators: 3,606.57 IDR/Int$ in 2011, 3,636.38 IDR/Int$ in 2012, 3,682.25 IDR/Int$ in 2013 and 4,530.90 IDR/Int$ in 2014. Notes:

N.A. = not applicable. Not possible to determine the cost per beneficiary for this project.

N.K. = not known.

1. For 2011 till 2014. For 2014, the total costs are based on the approved budget from 1 December 2013 – 30 November 2014 minus the actual costs in 2013.
2. Indirect and direct cost per direct beneficiary households between 2011-2013. Additional costs were incurred in the project after the evaluation period.
3. Only for 2013.
4. In total, 65% of ICCO's budget has been spent and 47% of the total budget including activities funded by the communities.
5. Only for 2012.
6. The total costs of the project are actually higher than the budget, but that is financed with unspent parts of the budget from previous periods.
7. Funded by MFS II but not through the selected project.

a. % funded by MFS II is based on the budget and not the actual costs.

### 2.1.6. Reporting structure

The results of all five evaluation questions will be discussed by project groups. The last evaluation question on explanations is integrated into the discussion of the preceding questions on change, attribution, relevance and efficiency.

## 2.2. Projects on reforestation

### 2.2.1. Country context

Earthquakes, floods, volcanic eruptions, drought, landslides and tsunamis are natural hazards that occur in Indonesia almost every day, causing a large number of casualties every year. This situation is particularly true for the relatively poor province of Nusa Tenggara Timur (NTT), where the Wetlands International Indonesia Programme (WIIP) project operates. The tsunami event in 1992 has created a traumatic experience where thousands of islanders have lost their lives and some more thousands have lost their shelter and livelihood. However, communities that live in the surroundings of relatively dense mangrove forests have been spared from substantial damage. This is an indication that mangroves have a vital function in the protection from heavy waves of tsunamis. Through disaster risk management measures, such as mangrove reforestation, it is possible to reduce the environmental risk and economic burden of natural hazards on society. As a results, the Government of Indonesia (GoI) has declared its determination to fight the risks from natural hazards by introducing pro-active measures (e.g. early warning systems, mangrove forestation) to enhance the resilience of society. This development increases the effectiveness of rehabilitation efforts that cooperate with local governments. In fact, the district governments at the WIIP project locations (Ende and Sikka districts in NTT) passed regulations that put a moratorium on destroying mangrove forests with the aim to protect the remaining mangrove forests in the district.

The restoration and rehabilitation of wetlands provides not only protection of the vital environment and its resources but also a source of livelihood for locals if managed sustainably. Mangrove forests are rich in crab and fish, the fruit of certain types is edible, but also honey can be harvested. In addition, the timber is a valuable building and construction material. Hence, mangrove forests contribute to the resilience of local communities both by mitigating the effects of natural disasters and by providing sustainable livelihoods.

### 2.2.2. Description of projects

The Climate-Proof Risk Reduction project of WIIP aims to sustain and restore wetlands, their resources and biodiversity through research, information exchange and conservation activities.

In January 2012, WIIP selected 7 project villages in Flores based on a rapid project site assessment and integrated ecosystem mapping. After the socialisation of the project at the village level, community groups responsible for the implementation of the planting and sustainable livelihood activities were formed in each village. In total, the community groups contain 185 members of which 71 (38%) are women.

The bio-rights approach of WIIP encourages community groups (with 20-30 members) to restore coastal ecosystems through awareness raising on Disaster Risk Reduction (DRR), Climate Change Adaption (CCA) and Ecosystem Management and Restoration (EMR) and signing a contract with community members to commit to reforestation of community areas in exchange for a substantial conditional grant. If after 3 years more than 80% of the agreed number of plants are alive (a dead plant is defined as having no green live leaves – although in reality, some are still able to grow subject to the proper treatment)

and/or community groups participated on the related policy initiatives (such as development of village regulation, development of village contingency plan, and establishment of village level disaster response team), the communities can keep the grant. Otherwise it has to be repaid in proportion with the survival rate of trees. However, enrichment and new planting are possible during the 3 year period.

The result chain for this project can be found in Figure 23 in Annex B. It focusses on the project components that have a direct impact on the surveyed beneficiary population.

### 2.2.3. Evaluation design

The evaluation focused on the impact of the WIIP project in the bio-right community group members (direct beneficiaries) and other community members (indirect beneficiaries) in the 7 treatment villages in Flores. All seven villages that participated in the bio-rights project in Flores were included in the sample. These villages were selected by WIIP based on ecosystem, disaster and climate risk mapping of the area and the strong commitment of the village on environmental actions. Seven comparison villages were selected based on disaster risk mapping and geographical location information. We sampled two treatment and one comparison groups for the household survey: (i) Households directly involved in the bio-rights project: these households are involved in planting the seedlings for which they receive a (conditional) grant from WIIP (112 in total), (ii) Other households living in the project villages who benefit from spillover effects (103 in total); and (iii) Households from comparison villages (105 in total). Hence, the treatment group was separated into the 'bio-rights' households and the 'spillover' households.[34] For all these villages we collected two types of data: quantitative (household, community and bio-rights community group leader surveys) and ecological.

Using the data, we wanted to answer questions like: How did the number of households applying sustainable forest management change (i.e. participating in reforestation efforts)? How did the communities' and households' disaster risk preparedness change? Table 15 and Table 16 in Annex C give an overview of the outcome indicators on reforestation that were measured.

We analyse the effects of the WIIP programme on beneficiaries using regression analysis. The primary analysis uses difference-in-difference methodology: we compare the changes in outcome indicators between the treatment groups (bio-right and spillover groups) and the comparison group. However, because the WIIP project started already before the baseline survey, we also analyse the early results of the project using cross-sectional analysis on the baseline data. The total impact of the WIIP project is the sum of the early effects (at the baseline) and the effects found between the baseline and endline survey period (at the endline).

### 2.2.4. Implementation of projects

The implementation of the WIIP project was according to plan. All planned project activities have been implemented in a timely manner so far. In fact, the project has enjoyed substantial support in the project area, and communities have exceeded their commitment in planting mangroves.

[34] Note that the so-called 'spillover' households also benefit from the village wide project activities, therefore they are not only benefiting from spillover effects.

Table 4 in section 2.1.3 shows the number of project beneficiaries per project. As mentioned already, the number of direct beneficiaries is as proposed: 185 households.[35] The number of indirect beneficiaries is calculated to be 19,653 people, the population of the 7 villages. The overall costs of the project as well as the costs per beneficiary can be found in Table 5 in Annex A. This table gives a summary of the collected information and the estimates of the costs per year. While the overall costs amount to 929,491 EUR, the costs per direct beneficiary households over the entire period were calculated to be 1,604 Int$ (2011 prices).[36]

### 2.2.5. Changes in selected outcome indicators and attribution to MFS II

Table 20, Table 21 and Table 23 in Annex D give the changes of the (selected) outcome indicators between baseline and endline, both at household and community level, while Table 34 and Table 37 in Annex E shows the attribution of these changes to the WIIP project at the household level. First, the changes and then the regression results (attribution) are discussed below for the outcome indicator categories.

#### *Reforestation indicators*

**Changes in outcomes between 2012 and 2014**

At the community level, Table 21 shows no change in the number of villages with efforts at forest protection: both at baseline and endline 4 of 6 project villages had efforts at mangrove forest protection and 3 of 7 villages had efforts at non-mangrove forest protection. This is in line with the fact that the project already started before the baseline.

At the household level, Table 20 shows that, as expected, almost all households in the bio-rights group (around 97%) participated in reforestation, both at baseline and endline. In the spillover group only 35% of the households at baseline and 54% at endline participated in reforestation. The survey also asked respondents who participated in reforestation to estimate the total number of seedlings planted. In the bio-rights group, we observe a sharp increase in this indicator from 398 seedlings per household to 1677 at endline. In the spillover group, this number increased from only 66 to 270 seedlings per households.

**Attribution of changes to MFS II interventions (project effects)**

Table 34 shows that the WIIP project had a strong effect on the percentage of households involved in reforestation efforts (54 percentage point at the baseline), and the number of seedlings planted by the bio rights group: 1,187 of the planted seedlings per household can be attributed to the project (controlling for household characteristics). We also find a positive (245 seedlings/household) effect on the number of seedlings planted by the spillover group. However, this later effect is not statistically significant from zero.

[35] Including the 9 members of the community group in Banten Bay, the total number of bio-right community members (direct beneficiary households) is 194, as indicated in the Yearly reports of WIIP.

[36] International dollars at 2011 prices25 are used for the cost per unit calculation because it takes both purchasing power parity and inflation into account that would not be the case if we reported the unit costs in euros. Hence, using Int$, the costs can easily be compared across time and countries.

### *Forest management indicators (community level)*

In terms of managing the forest, we observe a positive trend in treatment communities. Over the course of the evaluation period, there has been a clear increase in the number of treatment villages that adopted forest management structures for mangrove forests (from 4 to 6 villages) but also for non-mangrove forests (from 3 to 6 villages). Also the number of villages with regulations on natural resources has increased clearly in the treatment area. For mangrove forests, this number increased from 2 to 4 villages, for non-mangrove forests the increase is even bigger (from 1 to 5 villages).

### *Condition of forest indicators (community level)*

On a scale from one to six, the condition the mangrove forests remain constant at around 4.1 in treatment villages. In addition, the ecological survey of mangroves shows that the mangrove forests were in a health condition at the time of the endline survey (August 2014). However, the number of (young) trees has decreased substantially during the evaluation period independently of the project.[37] Note that these figures refer to forests that already existed before the WIIP project started.

### *Indicators on the knowledge and awareness of mangroves*

**Changes in outcomes between 2012 and 2014**

We find no clear patterns here that could indicate that the project increased knowledge. A test showing 4 cards with forests, of which two depicted a mangrove forest, did not show any change between baseline and endline. Another variable, whether households could give a correct description of mangrove forests, was similar between bio-rights and spillover: in both groups around 97% of the households gave corrects descriptions at endline. To test awareness of benefits, households were asked to name benefits of the mangrove forests. Here we see a significant but small increase in the number of benefits in both bio-rights (from 1.3 to 1.8) and spillover groups (from 0.7 to 1.5).

**Attribution of changes to MFS II interventions (project effects)**

Regarding the knowledge and awareness of mangroves, we find that the WIIP project contributed to the correct recognition of the mangroves: respondents in both the bio-rights and spillover groups were more likely (10 and 16 percentage points, respectively) to correctly recognise mangroves at the endline (controlling for household characteristics). Somewhat surprisingly, this effect is larger than we would have expected based on the changes reported for this indicator.

In addition, participants in the bio rights group mentioned on average 0.3 more benefits at baseline than the comparison group (controlling for background characteristics) but this effect disappears by the endline as comparison households also become more aware of the benefits of mangroves.

[37] We observe the same pattern in both treatment and comparison villages.

### *Disaster risk preparedness action indicators*

**Changes in outcomes between 2012 and 2014**

The mangrove forests provide protection against natural disasters, particularly tsunamis. The project aimed to increase disaster preparedness in other ways. To assess whether households are better prepared, we counted the number of disaster preparedness measures they took. There are 4 information related preparedness measures (which focus on whether households know how to act in case of a disaster), 7 personal preparation measures (which focus on whether households have taken measures to protect their family and personal assets) and 3 community volunteering measures (which measure whether households have participated in any community led efforts). We find generally low levels of preparedness, with a small positive trend in terms of information preparedness (on average an additional 0.4-0.5 measures). The levels and trends are comparable for bio-rights and spillover groups. The number of community volunteering measures was higher in bio-rights communities (2.6 against 2.4 in the spillover group) and further increased in this group by 0.3 additional measures on average.

**Attribution of changes to MFS II interventions (project effects)**

Regarding disaster risk preparedness, we find that the WIIP project positively impacted the number of personal preparation and community volunteering measures taken by the bio-rights group (by 0.5 and 0.4, respectively) at the baseline. No further effects at the household level are found as a result of the project activities during the evaluation period, despite the fact that the project achieved results at the community level.[38]

### *Income and livelihood indicators*

**Changes in outcomes between 2012 and 2014**

The project could influence household income and consumption in two ways. First, the (conditional) grant distributed to the households participating in reforestation could result in an income effect. In addition, the project included several livelihood activities on livestock farming, and also related to sustainable use of mangroves, such as shrimp and honey farming. These also could have changed incomes.

Table 20 shows that almost all households obtain at least some income/benefit either from the forest[39] (10-20% at baseline and 20-22% at endline), livestock raising (56-62% at baseline and 57-66% at endline) or fishing (82-92% at baseline and 74-84% at endline). Per capita incomes/benefits per months from these sources have increased in real terms over the evaluation period for forestry and fishing but these changes are not significant. In addition, the income from forestry is marginal on average (7.2-18.9 thousand rupiahs).

[38] Village disaster risk assessment including identification of hazard-prone areas and awareness raising campaigns was carried out in 6 out of 7 project villages, alert teams were set up in every project village, and village regulations on natural resource extraction and land use now take into account natural hazards.

[39] Income from selling of wood, honey and fruits picked in the forest is included under income from forests. We used median prices reported by the households to calculate the value of these products.

In general, the per capita real food and non-food expenditure changed little over the evaluation period. We find some small improvements in asset ownership and housing facilities, and the changes in the self-assessed happiness and current wealth status are also in line with the other wealth indicators (Table 23).

**Attribution of changes to MFS II interventions (project effects)**

The WIIP project did not affect household income from forestry, livestock and fishing (Table 34). The early project results show a small effect on food consumption (10% higher food consumption) due to the disbursements of grants just before the baseline survey, but not on the other livelihood indicators. At the endline, we do not find any livelihood effect of the WIIP project (Table 37).

### 2.2.6. Relevance of changes

The size of the impact in terms of seedlings planted is substantial. Adding up the early impacts and the impacts achieved over the project period, the bio-rights group members in treatment villages report almost 1,700 seedlings planted per household. Otherwise, the project has had little impact at the household level. The few impacts that are recorded are only found for the bio-rights group, which is a small group. Tsunamis have proven to be devastating and the area is tsunami prone. In that sense the project addresses an important issue for beneficiaries. However, we find very few impacts on the general population in terms of preparing themselves for an eventual disaster. This could indicate the project does not reach the population. It could also indicate that disaster risk management is not on the top list of priorities of villagers.

Regarding the reforestation efforts of WIIP, the survival rate of seedlings was 66% of the total planted trees and 83% of the agreed planting (with replanting) at the end of 2013. Comparing these results to existing studies, we find that reported survival rates vary considerably ranging from 17% to 90% (IFRC, 2011; Primavera and Esteban, 2008). The literature shows that the projects with the highest survival rates have in common that there is regular maintenance by residents who live right next to the plantations and have co-management with local governments. Low survival rates are usually the result of a lack of technical knowledge. Survival rates on mangrove reforestation projects in Vietnam (1994-2010) averaged around 60% after receiving technical training (IFRC, 2011). Hence, the bio-rights approach of WIIP to use residents living close to mangroves to maintain the plants is well-designed. The resulting survival rates are also in the upper range of reforestation projects.

### 2.2.7. Efficiency

Table 5 in section 2.1.5 gives an overview of the costs per project, which are estimated at 1,604 Int$ (2011 prices) per direct beneficiary household or 1,266 Int$ per hectare over the entire project period. The benefits of the project are in two areas: the benefits from the additional (mangrove) forests and benefits from livelihood activities. Because the attribution analysis did not show any significant income effects of the project, here we focus on the benefits provided by the additional forests (136.26 hectares, of which 119.6 hectares is attributable to the WIIP project). We compare the project costs (1,266 Int$ per ha) to the benefits provided by the mangrove forests, which Brander et al. (2012) estimated around USD 748-1,353 ha/year in Indonesia. We conclude that the project is cost effective because the benefits from mangroves exceed the costs of the project. However, comparing the unit

costs of reforestation to other projects (399-939 Int$/ha, Primavera and Esteban, 2008), we observe that the WIIP project is on the expensive side.

### 2.2.8. Conclusion

The analysis indicates that the project was rather successful in achieving its objectives. The benefits are in the area of mangrove forest that was realized, and in disaster risk preparedness measures at the community level. The program had less of an effect on the disaster preparedness and awareness of the general population in the project communities. We find very small effects in these areas, limited to the bio-rights groups that directly participated in the project. In addition, despite that the reforestation resulted in additional income for villagers, we do not find evidence that the disbursed project funds and the trainings on sustainable livelihood activities resulted in a lasting livelihood impact on the villagers.

## 2.3. Projects on poverty alleviation

### 2.3.1. Country context

Despite an average of 6 percent annual economic growth in the past decade, Indonesia's most recent (March 2014) poverty statistics[40] estimate that 11 percent of the population still live under the poverty line, while this figure was 13.3 percent in 2010. In 2014, the poverty rate in Central Java is above national average at 13.6 percent. In West Java the situation is better than the national average with 9.2 percent poverty rate in the population. Meanwhile, in Jakarta, the capital of Indonesia, the poverty rate is 4.1 percent. However, one of the poorest provinces of Indonesia is the archipelago of Nusa Tenggara Timur (NTT) province, of which Flores is one of the islands, with a poverty rate of 19.6 percent.

Indonesia is characterised by small farming households. The average landholdings are around 0.8 hectare per farming households to the 2003[41] agricultural census. According to Kuswara et al. (2009), over the past decades the farmers have become dependent on agricultural companies for agricultural inputs like fertilisers, pesticides and seeds. The government is also encouraging the use of chemical inputs to increase productivity as also indicated above. However, Kuswara et al. notes, many of the existing commercial seeds are not suitable to the local conditions and farmers' needs. In addition, the reliance on industrial inputs has resulted in the loss of farmers' knowledge about plant breeding and high genetic erosion of agro-diversity. PEDIGREA (Participatory Enhancement of Diversity of Genetic Resources in Asia) programme started in 2002 to reverse this situation.

In NTT and other areas in Indonesia, many small-holder farmers produce cash crops like coconut, cashew nut or cocoa. In East Flores, cashew nut is one of the main cash crops, and around 80% of the farmers grow cashews. Most of these cashew farmers deliver the unprocessed cashew nuts to traders that export it to Java. From there the cashews are shipped to countries like India and Vietnam for further processing. The processed cashews are then sold to Western markets. However, cashew nut farming is seasonal activity, providing a stream of income only for 3-6 months per year. Farmers, who

[40] Source: http://www.bps.go.id/tab_sub/view.php?kat=1&tabel=1&daftar=1&id_subyek=23&notab=1. Accessed on 2015-02-20.
[41] World Bank (2006) "Making the new Indonesian work for the poor", Figure 2.1

are not able to save enough during this period, often have to rely on borrowing at high interest rates to overcome the lean periods. Therefore, it is greatly beneficial for the farming households if they can increase their share of profits in the cashew value chain, for example by getting involved in cashew nut processing or in the organic cashew market. By responding to the increasing demand for organic foods in developed countries,[42] farmers following organic farming practices can obtain a premium price, increasing their profits. For example, in a public consultation, FairTrade proposed a 15% premium for organic cashew nut, which was widely accepted by the consulted stakeholders[43].

As in many other places, in Indonesia poverty rates are also higher in rural (13.8 percent) compared to urban (8.2 percent) areas. Many of the poor live in rural areas with limited access to financial institutions despite the fact that Indonesia has quite an advanced banking and financial system. In more remote areas, communities have to rely on informal money lenders, if they need to borrow money to cover their living costs. Most affected are uneducated people who have illiquid assets (in the form of land) but whose land tenure is not registered. Therefore, they are not able to apply for credit at the banks even when banks are present in the villages. In the absence of formal financial institutions, informal arrangements in saving and credit groups provide a way for people to commit to accumulate savings that they can use when it is their turn to receive the payments. This mechanism is useful for small scale savings and expenditures. However, formal institutions are needed to help smooth consumption and income patterns of farming or seasonal employment, and to borrow larger amounts.

Turning from farming households to non-farm businesses, we find that Micro, Small and Medium Enterprises[44] represent the largest part of the Indonesian business community, and contributed 55.6% to the total national GDP in 2011.[45] Therefore, one of the main cluster strategies in alleviating poverty in Indonesia is the empowerment of micro and small enterprises with the goal to increase the saving and to maintain sustainability of micro and small businesses, for example through the micro finance program *Kredit Usaha Rakyat* and other technical assistance programmes.[46] Especially in the provinces of Central Java and Jakarta, there are large numbers of Small and Medium Enterprises focusing on garment products. The textile and garment apparel industry is a labour intensive industry, and it is expected to remain a major contributor to Indonesia's economy.

[46] Other strategies are social aid and protection with the goal to reduce the expenditure burden of poor families, and people's empowerment with the goal to improve income and prosperity of poor people.

### 2.3.2. Description of projects

As the above overview suggests, the projects selected with a specific aim on poverty alleviation (MDG 1) work in different settings and address different needs of the beneficiary population. Below we shortly summarize the project logic of each of the selected projects.

FIELD has assisted farmers in breeding local seed varieties that are less reliant on fertilisers and pesticides. The Local Economic Development and Promotion of Local Seed System project of FIELD aims at facilitating farmers to get their local varieties certified through community seed registration system once it is approved by the local government. To improve the market position of the farmers, FIELD gave trainings to the farmers' cooperative on how to set up a credit cooperative, which is used to mobilise capital to be able to set up an enterprise necessary to sell the products of the members collectively. The aim is to strengthen the market power of farmers producing local seed varieties. The seed breeding program has already started in 2002 and it works in 15 villages in Indramayu district of West Java province. FIELD selected 6 participating villages for the project on cooperatives based on the criteria that the villages having developed local seed varieties; farmers are dependent on income from agriculture; farmer group is well-organised; and the farmers in group have high commitment during seed breeding. In 2012, these cooperatives had 161 members in total, which has increased to 456 by 2014 (Table 4). The result chain for this project can be found in Figure 26 in Annex B.

The GREEN project of SwissContact has the final objective to improve the livelihoods of female micro-entrepreneurs in selected project areas. In the project, SwissContact provides technical assistance for two Hivos partner organisations: PPSW in Jakarta and ASSPUK in Central Java province. Both of these organisations are a network of Non-Governmental Organisations (NGOs) focusing on the empowerment of female entrepreneurs. The project involves the development of these organisations into business development services provider centres. The capacity building is implemented using the garment industry as the theme of the project. The first step in becoming a BDS provider is to identify stakeholders and jointly develop and implement a joint vision for growth. That is followed by implementing promotional measures related to purchasing, production and marketing with groups of entrepreneurs. These are located in four regions: in Surakarta region the focus of the project is on batik making and the beneficiaries are members of JARPUK; in Sukohardjo region the focus is also on batik making and beneficiaries are members of Yayasan Krida Paramita; in Semarang region (Pringapus sub-district) the focus is on doormat/rug making and the beneficiaries are members of the Melati cooperative. The project activities in the above regions are supported by ASSPUK. Finally, in Jakarta region (Tambora sub-district) the focus is on laundry ventures specialised in jeans attire and the beneficiaries are SMSEs that are members of PPSW. In total, 125 craftswomen at the four project locations benefitted from the trainings organised by SC GREEN (Table 4). The result chain for this project can be found in Figure 27 in Annex B.

The Seed Capital project of KSP-QT has the objective to improve the financial and social performance of three primary saving and credit cooperatives: KSP-QT, KSP-MDM and KSU-GTGS, so that they become self-sufficient. The cooperatives operate in Central Java province and have the same mission to provide financial services to the small-scale farmers and entrepreneurs to open their opportunities to improve livelihood by developing small-trading, livestock farming and home industries. The project supported the

establishment of a secondary cooperative, KSM-QTha, that serves as an umbrella organisation for the primary cooperatives by providing guarantee for inter-lending among the cooperatives. Half of the project budget was given to KSM-QTha as seed money used to lend to the cooperatives that need more funding to provide loans to their members. The other half was used to conduct capacity building trainings for the cooperatives' staff from clerical to managerial level. The focus of the training for the field staff was on basic knowledge about cooperative, financial planning for family (financial literacy), and simple business plan. The field staff is in touch with the clients on a daily/weekly basis, as their main task is to collect the daily/weekly savings from members of the cooperatives. All prospective cooperative members participate in an hour-long individual or group training/discussion on family finances, which is followed up by a daily/weekly collection service of the members' savings as part of a continuous education. By saving in the cooperatives, members become eligible to borrow from the cooperatives. At the end of 2012, the three cooperatives had 13,372 members jointly (Table 4). The result chain for this project can be found in Figure 28 in Annex B.

Last, the LED-NTT and FSPP project of SwissContact on local economic development in Nusa Tenggara Timur focused on promoting organic farming practices, supporting the implementation of national and international organic certification for the project villages and supporting the development of local processing. The main objective of the project was to increase income and create jobs by improving the competitiveness of farmers and processing enterprises. The LED-NTT project worked with cacao, cashew and seaweed farmers, while the FSPP project only continued project activities in the cashew sector and started new activities in the wild honey sector. The evaluation focused on the cashew sector, where the project worked with 1,541 cashew farming households in 2012 (Table 4). The result chain for this project can be found in Figure 32 in Annex B.

### 2.3.3. Evaluation design

For all four projects, the evaluation focused on a subsample of the project beneficiaries and locations. Specifically, for the SC GREEN project survey data was only collected for the beneficiaries at the Melati cooperative (Pringapus sub-district); for the Seed capital project of KSP-QT, we sampled from the members of the KSP-QT and KSU-GTGS cooperatives in 5 and 3 villages, respectively; while for the SC LED-NTT and FSPP projects, the evaluation focused on the cashew sector exclusively, collecting data in 6 of 9 project villages. Finally, for FIELD's project, we sampled survey respondents from 8 of 19 project farming groups involved in rice breeding and from 4 of 6 savings and credit cooperatives (in the same villages) established with the assistance of the project.

For all four projects, we interviewed both beneficiary and comparison households[47] in order to allow us to use difference-in-difference methodology in estimating the projects' impacts (attribution). For the FIELD project, we also sampled households living in project villages but not directly benefitting from the project in order to measure potential spillover effects (similarly to the WIIP project). For the sample

[47] Comparison villages were usually selected by matching population and agricultural characteristics of potential comparison villages to the treatment villages. Households were then randomly selected from a farming group similar to the beneficiary households in the case of FIELD and SC LED-NTT, and randomly selected in the case of KSP-QT. In SC GREEN, the potential treatment and comparison households came from the same two villages, had the same livelihood activity but were not member of the project cooperative.

sizes see Table 3 in section 2.1.3. In addition to structured household surveys, for the FIELD project we also collected data using farming group and cooperative surveys, and farming group surveys were also used for the SC LED-NTT project.

Using the collected data, we want to answer the evaluation question related to poverty alleviation (MDG 1): How did the livelihood of households change during the evaluation period? In addition, in each case we also analyse whether the intermediate results in the project logic have been realised.[48] Hence, for all projects there are common outcome indicators (in accordance with the uniform indicators of the synthesis team), while a number of specific outcome indicators were also identified based on the result chain of each project. Table 16 in Annex C gives an overview of the indicators used for each projects.

For the selected outcome indicators, we analyse the effects of the projects on the beneficiary households using regression analysis. For three projects (FIELD, KSP-QT and SC LED-NTT), the primary analysis uses difference-in-difference methodology: we compare the changes in outcome indicators between the treatment groups and the comparison group. However, because the all these projects have already started before the baseline survey (see Figure 2), we also analyse the early results of the project using cross-sectional analysis on the baseline data. Then, the total impact of the projects can be estimated as the sum of the early effects (at the baseline) and the effects found between the baseline and endline survey period (at the endline).

In the MDG evaluation, the SC GREEN project is an exception because the project activity actually started only after the baseline survey. However, unfortunately, the project participants were not yet identified at the time of the baseline survey, and at the endline survey we found out that only 1 of 50 potential beneficiary respondents from the baseline sample participated in the training organised by the project (there were 14 participants in total). Therefore, at the endline, we interviewed 5 additional beneficiaries. As a result of this situation, we had to adjust our initial plan to use difference-in-difference methodology, to working with a cross-sectional regression, like we used for the other projects in estimating the early effects of the projects.

### 2.3.4. Implementation of projects

As discussed before, all four projects had been already running for some time before the evaluation period. The FIELD project already started almost a decade ago, while the SC LED-NTT project started actively working with the project villages at least since 2010. The KSP-QT project also already started in 2009, and some of the sampled beneficiaries became member of the savings and credit cooperatives already in 2010.

This fact, however, only lead to some complication for the evaluation design, but did not influence the implementation of the projects. Indeed, all projects, except for the SC GREEN project, were implemented mostly according to the plans. However, for some of the farming groups sampled as beneficiaries of the FIELD project we found no evidence that they have received any assistance from FIELD in terms of seed breeding, good farming practices and management trainings. Therefore, we moved the households sampled from these farming groups to the comparison group.

[48] For a complete set of specific evaluation questions and outcome indicators, please consult the individual reports.

In the case of SC GREEN, the project period proved to be too short to change the mind-set of the project's two NGOs (ASPPUK and PPSW) to the business world according to SwissContact. As a consequence, half-way through the project, the stakeholders decided to change the strategy of the project: SwissContact shifted the focus directly to the female entrepreneurs, and looked for a market opportunity to link them to a buyer. As a result, three women groups received trainings on batik and *kanzashi* techniques between February-July 2013. Hence, instead of being cases studies, the trainings for direct beneficiaries became core activities of the project.[49] In addition, changes in the SwissContact staff and differences in perspectives between SwissContact and the project NGOs lead to delays in the project implementation.[50]

Regarding the project beneficiaries, it is important to keep in mind that in all projects the beneficiaries were selected based on characteristics such as having an organised farming group and being interested in the project for the FIELD and SC LED-NTT projects. The criteria for the FIELD project were discussed above. FIELD usually works with one farming group (out of several) per village because spreading out the project locations in Indramayu district is useful in the multiple location testing of the newly bred seed varieties. On the other hand, the SC LED-NTT project works with the whole village because organic certification is organised at the village level. Therefore, SwissContact selected the 9 project villages with the additional criteria that the main income source in the village was from cashew nuts, and that there was already a village level farming group with a group leader. In addition, due to the orientation of the organic certified products at the premium markets, having the highest quality cashew nuts (taste and size) and not using chemical inputs were also essential criteria of being involved in the project. Self-selection into the projects played also an important role in the KSP-QT and SC GREEN projects. In the case of KSP-QT and KSU-GTGS, members voluntarily decided to join the savings and credit cooperatives. We also observed that some of the characteristics of the members were different from the population average, for example members were on average higher educated. In the case of the SC GREEN project, the training participants also voluntarily decided to participate in the project. However, in the latter case the beneficiaries and comparison group were quite similar.

Looking at whether the sampled beneficiaries actually participated in similar activities as the ones organised by the projects,[51] we found moderate participation rates among the beneficiaries: less than 40% of the treatment households in both the SC LED-NTT and the FIELD projects reported to have participated in any trainings on good (sustainable) farming practices in the two (three) years preceding the surveys. Also, less than 40% of the KSP-QT members and less than 10% of KSU-GTGS members remembered to have participated in any family finance meetings despite this being an integral part of the services of the cooperatives. In addition, we observed that during the evaluation period some households quit their farming groups (38 percentage points in the SC LED-NTT project and 8 percentage points in the FIELD project) or their savings and credit cooperatives (14 percentage points in the FIELD project, 32 percentage points for KSP-QT members and 27 percentage points for KSU-GTGS members).

[49] The trainings were organised by SwissContact instead of the NGOs (ASPPUK and PPSW) that were to become business development service providers.

[50] A qualitative study of the implementation and benefits of the SC GREEN project can be found in Annex VI of the project report.

[51] We asked about participation in different types of trainings relevant for the project, in order to also be able to measure participation of similar activities in the comparison group.

### 2.3.5. Changes in selected outcome indicators and attribution to MFS II

The evaluation findings for the selected outcome indicators are discussed by group below. For each group, first, the change in the indicators during the evaluation period is discussed based on the tables reported from Table 22 to Table 28 in Annex D. Then, we elaborate to what extent the changes can be linked to the interventions based on the regression tables reported from Table 35 to Table 41 in Annex E.

#### *Indicators on the use of financial instrument*

**Changes in outcomes between 2012 and 2014**

These indicators were measured for the FIELD and KSP-QT projects. For the FIELD project, we do not see any significant change in the use of financial instruments or the percentage of households involved in a financial institution. This suggests a stable membership during baseline and endline. However, we observe a sharp reduction in the use of financial instruments that are directly related to the intervention of the members of KSP-QT (34 percentage points in savings) and KSU-GTGS (12 percentage points in savings). This is due to the fact that they were members at baseline with a high use of services. Also, we observe a positive trend in the use of financial products which are not directly related to savings and credit cooperatives. KSP-QT (KSU-GTGS) members increased their use of savings accounts in regular banks from 14 (33) percent at baseline to 29 (37) percent at endline.

**Attribution of changes to MFS II interventions (project effects)**

Conditional on observed characteristics, savings and cooperative members were about 70 percent point more likely to be involved in a financial institution, and about 87 percent points more likely to have savings in a savings and credit cooperative. Notable is the drop for the latter for KSP-QT from baseline to endline (in comparison with the comparison group). For KSU-GTGS, the effect is much less and insignificant from zero. The reverse occurred for the households holding savings in a bank. This indicates that KSP-QT members tend to make use of the regular financial system after they have paid back their loan, while KSU-GTGS members continue to use the financial services of the cooperative.

#### *Financial knowledge indicators*

**Changes in outcomes between 2012 and 2014**

This indicator has only been measured for the KSP-QT project. While there has been a large increase in financial planning (by around 40 percentage points) for both cooperatives, we find no substantial change in financial numeracy.

**Attribution of changes to MFS II interventions (project effects)**

According to the difference-in-difference results, the increase in financial plans is still large but no significant effect can be found for either group. Only for KSU-GTGS members, we find that the increase in financial numeracy skills is slightly significant. The effects are not significantly different between the two types of cooperatives.

### *Income and livelihood indicators*

**Project differences**

Comparing wealth levels between the people in the projects we find clear differences at the baseline (Table 23 and Table 24). Monthly per capita non-food consumption is only around 70,000 Rp. (less than 6 EUR) on average among the beneficiaries of the SC LED-NTT project compared to 250,000 (525,000) Rp. among the KSP-QT (KSU-GTGS) members and 370,000 Rp. among the beneficiaries of the FIELD project. The difference is driven by the more remote location of the SC LED-NTT project (Flores, NTT) compared to the FIELD and KSP-QT projects (West and Central Java, respectively), as we also find a lower level of non-food consumption (170,000 Rp.) among the beneficiaries of the WIIP project, which is working on a different (less remote) part of Flores. The asset index[52] confirms the finding that the beneficiaries of the WIIP and SC LED-NTT projects are less wealthy than those of the FIELD, SC GREEN and KSP-QT projects. In particular, the negatives values (-1.0 and -1.3, baseline) of the indices for the projects in Flores (WIIP, SC LED-NTT) show that these households were at least one standard deviation poorer compared to the average Indonesian household in 2012. KSP-QT members were also slightly poorer than average (-0.2, baseline), while KSU-GTGS members were somewhat richer (0.3, baseline) and the beneficiaries of the FIELD and SC GREEN projects were more than half a standard deviations richer than the average Indonesian household (0.6, baseline).

However, people in Flores (WIIP, SC LED-NTT) seem to be slightly happier (2.1-2.3) than in the Central and West Java (2.0 for FIELD, SC GREEN and KSP-QT). However, in terms of subjective wealth status they are aware that they are poorer by about 0.5 points (on a scale from 1 to 6).

**Changes in outcomes between 2012 and 2014**

Looking at the changes in the indicators, we observe an overall modest increase in wealth throughout the projects, and also in the comparison groups. Changes in household income are very small between baseline and endline for the FIELD project. However, in the SC LED-NTT project, we actually observe a reduction of income due to the decrease in overall cashew nut harvest. We also observe the same pattern of harvest reduction in the comparison group.

**Attribution of changes to MFS II interventions (project effects)**

Based on the results in Table 36 and Table 37, no significant project effects are found on the livelihood of households between the baseline and endline periods for any of the projects. Significant improvements (attributable to the project) are only found for the housing facilities index and overall happiness of the FIELD farming group households, and the per capita monthly income for the KSU-GTGS members. However, the latter is not supported by improvements in other wealth indicators.

For the FIELD and KSP-QT projects we observe some early project results (controlling for household characteristics), which in the case of the KSP-QT project are often counterbalanced by negative effects for the difference-in-difference estimates. This suggests that in the case of KSP-QT and KSU-GTGS the initial improvements could be part of a loan cycle: savings and credit cooperative member households

[52] The asset index is normalized to have zero value for the average Indonesian household in 2012 based on the DHS survey. In addition, the variance of the index was also normalized to 1. Hence, negative (positive) values of the index show lower (higher) than average wealth status compared to the Indonesian average.

developed earlier, while the comparison households caught up with the cooperative members during the evaluation period due to general developments in Indonesia.

### *Yield and volume of traded goods indicators*

**Changes in outcomes between 2012 and 2014**

In Table 25, we observe different developments in the yield of the selected crops between the FIELD (rice) and SC LED-NTT (cashew nuts) projects: while the yield of rice per hectare increased (from 5.6 to 6.7 t/ha), the yield of cashew nuts decreased (by more than 100 kg/ha and almost 2 kg/tree). These yields are largely influenced by weather and pests, and we observe a similar pattern for the comparison group.

The volume of the traded goods in the FIELD project did not change significantly, but since the project had been in the field for many years already, this is not surprising. However, for the SC LED-NTT project, in line with the findings for the cashew nut yield, we also observe a decline in the amount of cashew nuts sold. Hence, the decrease is driven by supply rather than demand factors.

**Attribution of changes to MFS II interventions (project effects)**

For the FIELD project, we found a positive early project effect on the yield of rice for the farming group members (but a negative effect on the cooperative members). However, no additional effects are found between the baseline and endline periods. The project also did not have a significant effect on the volume of rice marketed.

For the SC LED-NTT project, between the baseline and endline, the yield of cashew nuts in the project villages decreased, which is captured by the negative albeit insignificant coefficient estimate of the intervention. Nonetheless, the overall effect of the project on the cashew nut yields appears to be substantial and significant (42% higher per tree and 46% higher per hectare compared to the comparison group at baseline). The regression results on the volume of cashew nuts sold do not support the hypothesis that the project contributes to increasing the amount of cashews sold. However, as a result of the SC LED-NTT project, households marketed 38 percentage point more of their products at (inter)national markets.

### *Food security and vulnerability indicators*

**Changes in outcomes between 2012 and 2014**

Even though the households' wealth has moderately increased, they seem to feel more often that they cannot cover their living costs. The percentage of households that felt they could not cover their living costs in the past 12 months increased by 20 percentage points for the beneficiaries of the WIIP project, by 6 percentage points for the SC LED-NTT project and by almost 20 percentage points for the FIELD project, see Table 26 and Table 27. This change could signal that households' expectations have increased.

On the other hand, we observe that the emergency savings of both KSP-QT and KSU-GTGS members have increased.

**Attribution of changes to MFS II interventions (project effects)**

Possibly due to the increased savings of the households, the KSP-QT project had a positive impact on the percentage of households with emergency savings covering the living costs for at least one month.

No other effects of the projects were found on the food security of households (Table 39 and Table 40).

### *Indicators on organic farming practices*

**Changes in outcomes between 2012 and 2014**

For the FIELD project, there has been no change in the indicators on organic farming practices (Table 28). On the other hand, in the SC LED-NTT project, the use of organic pesticides/insecticides and fertilizers increased between baseline and endline (by around 25 and 18 percentage points, respectively).

**Attribution of changes to MFS II interventions (project effects)**

Interestingly, the regression results convey different project effects regarding the use of organic practices (Table 41): both projects (FIELD, SC LED-NTT) had a significant early treatment effect on the project farming group members (42 and 18 percentage point higher use of organic fertilizers, respectively). However, between the baseline and endline, these effects were tempered by negative difference-in-difference effects due to the increased use of organic farming practices in the comparison group. The overall effect is still positive in the case of FIELD but it is nullified for in the case of the SC LED-NTT project. The latter result may be, however, somewhat misleading as the effects in the comparison areas could also be partly driven by indirect effects of the SC LED-NTT project as the project also works with the local extension service network.[53]

#### 2.3.6. Relevance of changes

Unfortunately, we find very little evidence that the projects improved the livelihoods of the beneficiary households. The developments in household wealth among the beneficiary households are usually matched by improvements in the comparison groups. In the case of the SC LED-NTT project, we even found that due to better diversification of income sources, the comparison households could better cope with a bad cashew nut harvest in the area. Data from the agriculture oriented projects (FIELD, SC LED-NTT) show that households move from investing into farming tools to rather investing in new non-farm businesses (Table 23 and Table 24), which may be a sign of more diversification of household income.

Access to financial services in the form of saving and borrowing are important tools for better aligning household income and expenditure, and facilitating investments into businesses or farming tools. Many rural households face constraints in accessing formal financial services. The cooperatives participating in the KSP-QT project offer financial services from poor (KSP-QT and KSU-GTGS) to middle income (KSU-GTGS) rural households that are designed to match the needs of their membership. In this respect, the KSP-QT project addresses a relevant issue for the beneficiaries. However, our finding suggest that after

[53] District Education Centre (BPK) or Agricultural Extension Centre (BPP).

the repayment of loans, many households decide to stop saving and leave the cooperative. Hence, the project savings and credit cooperatives serve only a temporary purpose for some households.

We observe similar findings also for the FIELD and SC GREEN projects: some cooperative members have also quit by the endline survey; and in the SC GREEN project, a large share of the 50 participants of the first introductory training on *kanzashi* did not adopt the new skills in their livelihood activities. In addition, all SC GREEN project participants already had a livelihood activity prior to the project that they kept as their main activity also after the project.

Regarding the project beneficiaries, in the case of the SC GREEN and FIELD projects they were richer than the average Indonesian household in terms of asset ownership, while the beneficiaries of the SC LED-NTT and KSP-QT cooperative are poorer than the average. Hence, the projects are more needed for these households who live in more remote areas.

Finally, we compare these results to other evaluation studies. Regarding the FIELD project, the literature shows that seed breeding projects can improve poverty status, at least in the short run. Reported impacts on net income range from 25% to almost 200% (Beye and Margiotta, 2008; Poudel et al., 2003; Singh et al., 2013). However, the sustainability of the impact is a problem. In the FIELD project seed breeding has started already prior to the MFS II period, hence we cannot report on short run impacts but we observe that during the evaluation period the number of seed breeders declined by 26 percentage points, which may indicate sustainability problems.[54]

Related to the SC GREEN project, early evidence is found that vocational trainings and entrepreneurship trainings can also improve someone's poverty status in the developing world. Though, the impact varies with the components and the length of the trainings (Attanasio et al., 2011; Card et al., 2011; Glaub & Frese, 2011; Hirshleifer et al., 2014; Maitra & Mani, 2012; McKenzie, 2012; Patel, 2014). However, these trainings were mostly more intensive (up to 6 months) than that of the SC GREEN project.

Turning to micro-finance such as the credit cooperatives of the KSP-QT and FIELD projects, the existing evidence suggests that most micro-finance projects do not improve the livelihood of household in terms of savings and income, even if it increases sales or employment rates (IPA, 2015; Khandker et al., 1998; Takahashi et al., 2010; Yang and Stanly, 2012). Concerning financial literacy, no evidence is found for a substantial effect of financial literacy training on financial knowledge or saving behaviour (Cole et al., 2011; Eskes, 2011). Hence, the limited impact found in the MFS II projects is in line with existing literature.

With respect to the fourth method of alleviating poverty in the MDG studies, organic farming projects (SC LED-NTT/FSPP, FIELD), the literature shows that organic certification projects have a positive impact on the yield, prices and revenue of farming households if the projects are coupled with trainings on best organic farming practices and the projects target farmers that have not used agro-chemical inputs prior to the project (Agro Eco/Grolink, 2008; Beuchelt and Zeller, 2011; Bolwig et al., 2009; Leijdens, 2007).[55] The one reported increase in yields equals almost 100% increase per cashew tree in Tanzania (Leijdens, 2007). Reported price increases range from 8% in Nicaragua (coffee; Beuchelt and Zeller, 2011) to 200%

[54] The establishment of credit cooperatives was meant to ensure the sustainability of enterprising seed breeding initiatives in the communities.

[55] However, organic farming yields are usually lower compared to yields obtained using agro-chemical inputs.

per kilo in Tanzania (cashew nut, Agro Eco/Grolink, 2008). Reported increases in revenue range from 10% to 20% in Tanzania (cashew nut, Leijdens, 2007) to 75% in Uganda (coffee; Bolwig et al., 2009). However, there are no indications that these effects translate into higher income, especially compared to conventional farming methods using agro-chemical inputs (Beuchelt and Zeller, 2011). In the case of the SC LED-NTT/FSPP projects we observe a higher yield in the treatment communities but we are not able to assess whether this is due to the project or to soil conditions.

### 2.3.7. Efficiency

The four projects on MDG 1 worked with varying budgets (Table 5 in section 2.1.5) and numbers of direct beneficiaries (Table 4 in section 2.1.3). The SC LED-NTT and FSPP projects had the largest project costs (1,040,028 EUR[56] of which 22% or 229,220 EUR was spent on the cashew sector), while FIELD had the smallest (103,015 EUR). However, the type, intensity and number of direct beneficiaries of the project activities were also very different: while the SC LED-NTT project served up to 1,841 farming households and regularly visited the project locations, the FIELD project worked less intensely with direct beneficiaries (161 cooperative members) and focused more on policy advocacy for the community seed registry system.

In the case of KSP-QT, the project did not fund direct project activities with beneficiaries (around 13,000 members); the project costs (156,514 EUR) rather funded the cooperatives' capacity development in terms of financial knowledge, technology and seed money for borrowing. Hence, for this project it is not possible to calculate unit costs.

Most of the project costs of the SC GREEN project also covered the consultancy of SwissContact to project stakeholders. Only 17% of the total project costs (116,412 EUR) were used for providing trainings to direct beneficiaries (125 craftswomen).

Hence, when calculating the unit costs of the projects, we calculated these over the project costs directly attributable to the evaluated project activity. We found that the unit costs were 562.8 Int$ (2011 prices) per training participant for the SC GREEN project for a 2-4 day training; in total 762.43 Int$ per cashew nut farming household for the SC LED-NTT/FSPP projects for the period of 2010-2013; and in total 60.45 Int$ per cooperative member for the FIELD project.

Based on the benchmarks costs identified by the Synthesis team, none of these projects are cost effective, i.e. they operate with higher costs than similar projects. However, it has to be kept in mind that most of the projects are relatively small and in case of the SC LED-NTT/FSPP projects also quite intensive, which contribute to higher costs.

Looking at the benefits of the projects, we also find that costs are higher than the observed benefits in terms of livelihood improvements. In the case of the SC LED-NTT/FSPP project, a regional poor cashew nut harvest contributed to these findings.[57] In addition, not all project results can be measured by livelihood improvements. A good example would be increased skills in handcrafts or sustainable farming practices.

[56] For the LED-NTT (2010-2012) and FSPP (2013-2014) projects together.

[57] Project households were less likely to diversify their income sources into other (non-farm) activities, therefore they were more affected by regional conditions resulting in a poor harvest.

### 2.3.8. Conclusion

All evaluated projects (FIELD, SC GREEN, KSP-QT, SC LED-NTT and WIIP) provided trainings as one of the strategies to improve the skills and welfare of their beneficiaries. In addition, improving access to market was another common strategy used by the projects (FIELD, SC GREEN, KSP-QT and SC LED-NTT): the SC LED-NTT and SC GREEN projects of SwissContact (through different CFAs) also assisted the beneficiaries in marketing their products, while FIELD worked on enabling seed breeding farmers to legally market their products, and KSP-QT (and FIELD to some extent) provided access to financing.

The WIIP project was the only project that directly created new 'jobs' (in reforestation) and provided monetary compensation for households working on the project.

In addition, all of the projects aimed at developing the capacity of partner organisations (ASPPUK and PPSW for SC GREEN and KSP-QT, KSU-GTGS and KSP-MDM for the KSP-QT project), farming groups and cooperatives (FIELD, SC LED-NTT) or the village apparatus (WIIP – not related to poverty alleviation).

Finally, during the evaluation period we observe a general shift from agriculture towards off-farm businesses as a source of diversification of income sources. Projects focusing on agricultural production (SC LED-NTT/FSPP and FIELD) may slow down this adaptation and diversification, which is a necessary development as harvests can be volatile due to environmental conditions. In addition, the last bad harvest in the case of SC LED-NTT/FSPP may explain why households are less keen on exerting extra effort into organic farming practices.

## 2.4. Projects on empowering indigenous communities

### 2.4.1. Country context

Community empowerment programmes for indigenous communities are very important in a country like Indonesia where an estimated 48 million indigenous people still depend on the forest for their livelihood, but where mining, logging and oil palm industry are destroying more than 1 million hectares of rainforest territory each year[58] (Telapak & Gekko Studio 2011). Most often participatory mapping methods are used to agree and map the boundaries of the community, but also to document important ecological, cultural and economic sites within the village.

Even though, in recent years, laws and policies have been implemented (both on federal and local level) by the government to facilitate the indigenous people's access to their lands and resources, in reality it turns out that the implementation of these new policies is problematic, as it is very difficult for the indigenous people to effectively prove their claims to ancestral lands on their own. As a result, central government and outside companies are still able to keep extorting their natural resources.

The general aim of participatory mapping projects is to help indigenous communities to make a map that depicts the boundaries of –and important cultural and natural landmarks and areas within- their community lands, and to help them use the map as a tool to claim the legal rights to their ancestral

[58] Making Indonesia the fastest forest clearing nation in the world since 2012, and also the world's third largest emitter of carbon dioxide emissions, behind China and the United States (Telapak & Gekko Studio 2011).

lands and manage their forests and resources in a sustainable way. Thereby preventing further environmental damage and saving indigenous cultures from extinction.

These projects are very relevant to the project locations we have evaluated, because almost all of the communities are heavily reliant on the forest and its resources for their livelihoods, economy, and culture. All locations cope with their own specific problems: In Jayapura-District in Papua (location of the Pt.PPMA project) the forests are being exploited by timber companies, as well as outside communities that steal valuable natural resources such as birds of paradise, black orchids, and wood from their forests. In Sintang in Kalimantan (location of the NTFP-EP evaluation) conversion of forest land into oil palm plantation has already led to water scarcity and a decrease in forest animals and plants, some of which are used for their traditional weaving crafts. Their remaining forest lands are also under serious threat of being converted to oil palm plantations, as they are located in the APL[59] area of giant oil palm companies. Likewise, the residents of Rampi, Sulawesi (location of the HuMa evaluation), worry about the potential damaging effects of gold mining activities on their still relatively healthy eco-systems, and fear government's plans to convert their community forest into protected forest. Also in Aceh in Sumatera (location of the YRBI project), new natural resource exploitation projects that are taking place without their consent in some areas. In light of these activities, it is increasingly important to settle existing boundary disputes between *Gampongs* and *Mukims.* The communities are also experiencing an increasing water scarcity, and a decline in important forest products, such as honey and timber, as a result of plantation building and the ongoing illegal logging activities (often supported by the local apparatus) in their industrial forests.

### 2.4.2. Description of projects

The main goal of the participatory mapping activities differs per project. Whereas the Pt.PPMA and NTFP-EP projects are mainly trying to secure the livelihood of the communities, YRBI and HuMa are mostly focused on strengthening indigenous political organisations and institutions. By extension, not all participatory mapping projects are evaluated on the same Millennium Development Goals and Themes. On the one hand, the evaluation of Pt.PPMA and NTFP-EP projects is mostly focused on the MDG on 'living environment, forests and biodiversity' (MDG 7a and 7b), and partially on the MDG on 'poverty alleviation' (MDG 1). In addition, the NFTP-EP project is also partially evaluated on the theme of 'good governance and civil society building'. On the other hand, the YRBI and HuMa projects are mainly evaluated on the theme of 'good governance and civil society building', and partially on the Millennium Development Goal on 'sustainable living environments, forests and biodiversity'.

The two main activities that were conducted by the Association for Study and Empowerment of Papuan Indigenous People (Pt.PPMA) in Jayapura-District in Jayapura-District are participatory mapping and eco-forestry. The purpose of these activities was to enhance the communities' ability to properly and sustainably manage their forests. The result chain for this project can be found in Figure 24 in Annex B.

The main activities of NTFP-EP in Sintang in Kalimantan were participatory mapping and training. The objectives of the project were to develop and improve the community's livelihood by making sure that

[59] APL means *Area Peruntukan Lain*, or 'area for other allocation'. Land with an APL indication is government owned land that is allocated for non-forestry business.

they are empowered and organised to manage and benefit from their eco-systems and to claim their rights on the utilization of natural resources (in particular the raw materials used to produce woven cloth and natural dye), and to provide alternative sources of livelihood for the community to improve their income and welfare. The result chain for this project can be found in Figure 25 in Annex B.

YRBI carried out participatory mapping activities as well as trainings, workshops, and discussions on participatory mapping and the strengthening of traditional institutions in Aceh in Sumatra. The final objectives were to strengthen traditional institutions, and letting them regain the rights and authority they once held in Aceh's society in terms of conflict management and the management of natural resources, as well as to increase people's awareness and capacity to manage and control natural resources and sources of water, and to ensure a fair and just management and distribution of natural resources in an ecological and social way. The result chain for this project can be found in Figure 30 in Annex B.

HuMa/Wallacea's main activities in Rampi in Sulawesi, were participatory mapping and organising 'PHR' (community law facilitation) trainings in the form of village discussions for the general community, and special workshops for village leaders about natural resource management and preservation. Their aim is to train communities to manage and maintain their forests, and to fight for their rights over their lands. HuMa's final objective is to influence law and policy with regard to indigenous land rights, by building a social movement that pushes for law reform based on social and ecological justice. The result chain for this project can be found in Figure 31 in Annex B.

### 2.4.3. Evaluation design

For the evaluation of all four projects on the empowerment of indigenous communities, we sampled from project communities. In the case of the Pt.PPMA we sampled all project villages, while for the NTFP-EP and HuMa projects we first selected one of the project areas, and then sampled all project villages in that project component (4 villages for NTFP-EP) or just a subsample (3 of 6 villages for HuMa). YRBI also implements its programme in multiple locations, from which we selected 2 *Mukims* (traditional institution consisting of a group of villages) and sampled 3 of 8 villages in each.

Hence, the evaluation relies on a before-after comparison design.[60] We interviewed community leaders in each sampled village, and 20[61] randomly chosen villagers[62] knowledgeable about village affairs. In order to validate the data from the quantitative surveys and to deepen our understanding of the project context and results, we collected additional qualitative information at the project locations in the form of in-depth interviews with project stakeholders and community leaders, and using focus group discussions with men and women participating in project activities. The findings of the qualitative studies are included as annexes in the project reports.

[60] For Pt.PPMA and NTFP-EP we actually also ended up collecting data on non-project villages due to misunderstandings regarding the project locations (Pt.PPMA,NTFP-EP) and changes in the project implementation (Pt.PPMA). However, due to the small sample size (2-4 villages per treatment group) we are not able to use these locations as true comparison areas.

[61] Due to the small size of the villages in Rampi sub-district (HuMa), in 2 of the villages we only interviewed 10 respondents. Hence, the total sample size for this project was only 40.

[62] We tried to interview a gender-balanced sample.

Both the quantitative and qualitative surveys focused on the evaluation questions like: How did the management structure of community forest areas change? How did the attitude and awareness of the people towards natural resources change? Are there local wisdom documentations about natural resource management produced? Table 17 in Annex C give an overview of the outcome indicators measured for the participatory mapping projects both related to MDG 7 and Good governance.

### 2.4.4. Implementation of projects

At the community level, almost all projects were implemented as planned. The exception is the Pt.PPMA project, where almost no project activities were realized during the contract period (2012-2014) due to the sudden decease of Pt.PPMA's director in 2011, which led to an organisational crisis. This has led the CFA (IUCN) to terminate the project one year earlier than planned (in April 2014).[63]

In general, the implementation of the projects crucially depends on the cooperation of the SPOs with the communities due to the participatory nature of the projects. It usually takes years to complete the mapping of village boundaries due to the necessity to discuss and resolve boundary disputes with other villages and land owners, as we observed in the case of the YRBI project that has been working with the surveyed locations since 2009/2010. NTFP-EP and HuMa only started working with the surveyed project locations in 2012, however, already before the baseline survey. In the case of the NTFP-EP project, the boundary mapping has been finalized rather quickly (March-September 2012). However, lobbying at the local government for the approval of the maps proved to be a challenge due to political dynamics (the frequent turnover of persons in charge of in the local government).

Instead of working closely with communities, HuMa is specialized in providing trainings on community law facilitation to CBOs and NGOs that are confronted with a potential threat of natural resource extraction. Therefore, HuMa's activities are usually short at one location and spread out over many locations over time. The evaluation focuses on the evaluation of HuMa's assistance in Rampi, where HuMa assisted a local NGO (Wallacea) in mapping the village boundaries and other sites and conducting trainings/meetings on community law facilitation to strengthen the indigenous communities' claims to their natural resources. However, the activities in Rampi were not finalized after HuMa's training, and Wallacea continued the project activities from other funds.

Regarding the implementation of the project activities in the communities, our data show that the projects' activities mostly involve the local leaders in the community, and women are rarely involved (due to the heavy work of mapping). For example, less than 30% of the surveyed villagers participated in YRBI's participatory mapping activities.

### 2.4.5. Changes in selected outcome indicators and attribution to MFS II

Looking at the changes in the outcome indicators of the household and community surveys between the baseline and endline (from Table 29 to Table 31 in Annex D), not many significant changes can be found that indicate that the projects have been successful. However, this does not necessarily mean that the

[63] The evaluation of the Pt.PPMA project, therefore, focuses mostly on the impact of Pt.PPMA's project activities in the previous contract period (2009-2010).

projects entirely failed their purpose, or that their beneficiaries did not benefit at all from the projects. Because all the 4 participatory mapping projects had to be evaluated on the same outcome indicators, it was not possible to make the outcome indicators specific enough to encompass all the different objectives of the specific projects. Also, none of the maps that were made during the different projects have yet been legally recognized by the (local) government and therefore cannot yet be used at their full potential. Furthermore, it may take quite some time before changes in natural resource management, land ownership, etc. lead to results that are actually felt and noticed by the larger society. It is, therefore, very possible that not all of the impacts were already measurable at the time of the endline study, and that (more) project impacts will manifest themselves in the future.

In order to bridge part of this gap, information from the qualitative study is used to show how the projects were received by the beneficiaries, and what specific benefits (that are not captured in the quantitative study) the people felt from – and attributed to – the project, or expected to feel from the project in the future. With regard to the outcome indicators, the results from the qualitative study sometimes contradict the results from the quantitative study. However, due to time restrictions it is not possible to further investigate these issues.

Below, the general project results from both the quantitative and qualitative study are discussed per outcome indicator group.

### *Management of natural resources indicators*

Only 1 out of 5 villages[64] that did not yet undertake efforts to protect their forest at the time of the baseline study had started to do this by the time of the endline study. No increase in forest size was found for any of the villages. On the contrary, 4 out of 6 forests were reported to have decreased in size.

At the time of the baseline, regulations about the use and protection of the community forests were already present in 10 out of 14 project villages. This number increased to 12 villages at the endline study (with 1 additional village in Aceh (YRBI) and 1 in Jayapura-district (Pt.PPMA)) according to the community survey. However, at the endline study less respondents (from Jayapura-district (Pt.PPMA), Sintang (NTFP-EP), and Rampi (HuMa) reported that there were regulations than at the baseline study.

With regard to those regulations being communicated to all villagers (including women and children), there was an increase of 1 village in Aceh (YRBI), but a decrease of 2 villages in Sintang (NTFP-EP) compared to the baseline study.

A slight increase in satisfaction with the regulations was only seen among the household respondents of Sintang (NTFP-EP). The respondents of the rest of the projects showed a slight decrease in satisfaction.

The results from the qualitative study more or less mirror those of the quantitative study, as both measure no real significant improvement on forest preservation and natural resource management at the moment of the endline study. However, results from the qualitative study showed that some mapping projects did cause some promising developments that could lead to actual positive impacts on sustainable resource management in the future. For example, in Jayapura-District (Pt.PPMA)

[64] This outcome indicator was only applicable for Pt.PPMA and NTFP-EP, of which the sample size was 6 villages in total. The village that started to undertake efforts to protect their forest was from Sintang (NTFP-EP).

respondents claimed that the map that was created during the project was already being used by the community to make ecologically-responsible landscaping decisions. Additionally, a general workplan for sustainable forest management was created by Pt.PPMA. They also helped the community found the KSU Lwagubin Srem joint venture business cooperative for sustainable timber production' and another cooperative that manages the results of the cacao production in Jayapura-district (NTFP-EP). However, both cooperatives have not been running for the past 2 years, and as such no real result have yet been achieved. In Aceh (YRBI) respondents stated that the project had helped the Mukim governments to restore some of the traditional institutions responsible for natural resource management (the Panglima Glie and Keujreun Blang). However, due to a lack of government support these institutions weren't yet able to operate at their full potential, and as such real results were not yet noticeable in the *Mukims*.

### *Attitude towards forests/plantations indicators*

Compared to the baseline study, a slight increase in dependency on the forest was visible from the household survey, for all but one project location (Mukim Siem in Aceh (YRBI)).

The results from the community endline survey indicate that the attitude of the people of Sintang (NTFP-EP) and Jayapura-District (Pt.PPMA) towards sustainable forest use had grown slightly (for Jayapura-District) and significantly (for Sintang) more positive over the course of the projects. However, the respondents of the household surveys of Sintang and Jayapura-District reported no change in attitude. Results from the qualitative study in Sintang (NTFP-EP) confirmed that the project has actually made people more aware of their dependency on their forests, plants, and animals, and the danger of conversion of forest lands.

In the household surveys of Aceh (YRBI) and Rampi (HuMa) a very slight increase in positive attitude was visible in the quantitative study. This increase was not found in the results of the qualitative study in Aceh (YBRI), where respondents from one of the project locations had actually grown more apathetic towards their forests' sustainability, possibly (partly) due to the fact that they had grown less dependent on their forests over the course of the project. In Rampi (HuMA) both the local leaders and the community members interviewed for the qualitative study were already very much aware of the importance of their natural resources and willing to fight to protect them before the start of the project[65] and continued to do so over the course of the project. However, at the same time, a contradictory increase in gold mining activities was visible in one of the project villages, supported by the local apparatus[66] and also local residents of Rampi who were making money from the mining activities.

### *People involved in traditional crafts*

Since the baseline study, the number of household respondents involved in traditional crafts has significantly decreased. In Sintang (NTFP-EP) the number nearly halved. In Jayapura-District (Pt.PPMA)

[65] e.g. by organising meetings to discuss gold mining activities, actively preventing mining companies from entering their territory, making regulations against gold mining, and visiting local gold mine factories to complain about the environmental damage they are causing and even threatening them with a law suit.

[66] For example: the customary leader of one of the project villages (Onondowa) currently holds a high position in a gold mining business.

there were none left at all. This was also reflected in the qualitative study where respondents reported to have trouble finding the necessary resources.

### *Sense of control of villagers*

We find little evidence that the projects increased the sense of control of villagers in terms of their lives and over land. We observe some improvements in the indicators in Aceh (YRBI) and Rampi (HuMa), but these are only significant in one of the project locations in Aceh. On the other hand, in Sintang (NTFP-EP) and Papua (Pt.PPMA) the indicators deteriorated or stayed the same during the evaluation period (not significant). The data is suggestive of a weak association between the intensity of the projects and the effectiveness of the projects in increasing the security and sense of control of the villagers.

### *Access to information on (local) governance, satisfaction with local governance and the role of traditional institutions*

For the projects in Aceh (YRBI) and Rampi (HuMa) -that were focused on the strengthening of traditional institutions- no significant improvements were found with regard to the household respondents' attitudes towards traditional laws and culture, their satisfaction with local government, and their access to information on local governance. The respondents of the household surveys even reported slightly more corruption and the respondents of Mukim Siem in Aceh (YRBI) had grown slightly less satisfied with the local government. Also, In Mukim Lamteuba (YRBI) the respondents were less satisfied with the local governance's information provision than at the time of the baseline.

Contradictory to these results, the qualitative study shows evidence that the communities of Aceh (YRBI) have grown more and more supportive of the Mukim institution over the past years. It is also important to note that results from the qualitative study show that, with the help of the project, the Mukim institution has increased its role in society over the past 2 years. For example in conflict resolution, education, the preservation of traditional culture, and reviving the traditional institutions for natural resource management.

Likewise, all 4 projects succeeded in enthusing the local communities to take a (greater) interest in their traditional culture and customs, and making them recognize that the map can play a role in preserving their customs and traditions. For example, in Jayapura-district (Pt.PPMA) Informants claimed that they had become enthusiastic about the historical and cultural places (such as ancestral graves, ancient places for ritual, etc.) they encountered in the forests during pioneering, and the stories the elders of the community told them during the sketching of the map. In Rampi (HuMa), some respondents mentioned that the project activities had made them realize even more how beautiful their traditional culture and traditions were, and how important it was to preserve them.

### *Resolution of land related conflicts*

An important (possible) goal of participatory mapping, which is not directly captured in the uniform outcome indicators is conflict resolution. Some projects have managed to solve, reduce, or prevent border conflicts within the project communities themselves. In Aceh (YRBI), the mapping activities have already helped the communities to solve many internal boundary conflicts, making people feel safer on

their land, especially those living in the border areas between villages. In Rampi (HuMa), respondents said that the mapping of the village boundaries between 2 of the project villages -which was done as part of the project in an amicable way- has prevented a serious conflict over land boundaries that was likely to take place in the future. In Sintang (NTFP-EP), where over the past year village borders had often changed due to the openings and expansions of oil palm plantations, respondents mentioned that the mapping had made them more aware of the size and location of their forest areas, and said they were planning to use the forest borders captured on the map as a reference point to monitor trespasses on their territory.

### 2.4.6. Relevance of changes

Unfortunately, we do not observe a significant change in the outcome variables. However, the issues addressed by the 4 projects (Pt.PPMA, NTFP-EP, YRBI and HuMa) are very important for the communities: the prospect of recognition of the indigenous communities' sovereignty over the natural resources located in their territory by the local government. Nonetheless, at the individual level respondents are most concerned by more urgent matters like education, health care, access to clean water and the road conditions/access of the village. Almost none of the respondents thought that 'exploitation of natural resources' was an urgent issue. This may indicate a lack of understanding about the likely causes for water scarcity (i.e. environmental destruction due to mining activities and conversion of lands to plantations), or a reluctance to admit to it due to financial interests in the mining activities.

Comparing the findings to existing literature, in general, studies have noted the positive impacts of participatory mapping on the community. Participatory mapping is not only recognized as a practical tool (e.g. get legal recognition of land rights or control natural resources); the participatory approach is also noted to have impacted group communication and awareness, cultural identity and empowerment (i.e. it empowers indigenous peoples in land and resource use rights against potential encroachers) (Fox et al., 2003, as cited in Wright et al., 2009; Reyes-Garcia et al. ca. 2012a: 2-3). The literature also reports on negative consequences of participatory mapping, for example on the increased privatization of land, loss of indigenous conceptions of space, the greater exposure of valuable natural resources, and the increased taxation by the state. Increase of conflicts - either within the village, with neighbouring villages, or with other external actors such as companies or governmental authorities - is one of the most frequently reported drawbacks of participatory mapping (Reyes-Garcia *et al*. 2012b). However, this finding might have been subject to selection bias[67]. Using an experimental research design in 32 native Amazonian villages, Reyes-Garcia *et al*. (2012b) showed no statistically significant differences in the measured variables (i.e. number of conflicts, negative opinion, neutral attitude, and negative attitudes towards outsiders) between treatment and comparison villages.

The findings for the 4 MFS II projects are partly comparable to the findings in the literature. All projects raised the awareness of communities on important issues. However, not all projects were able to take

[67] Because the villages participating in participatory mapping projects are generally the ones that are chosen or volunteering to participate in participatory mapping due to the fact that they are expected to experience – or are already experiencing – conflicts over land rights and resources.

the improved awareness to the next level where communities take actions. Sometimes this was due to external conditions, for example when higher levels of governments did not legalise the map, in other projects this was due to the approach of the project itself, for example NTFP-EP, where the project was implemented very fast. Only one of the four projects seemed to have impacted the community as a whole. This was the YRBI project which increased the local traditions and customs by strengthening the local institutions. With respect to the increase in land conflicts, some projects show an increase in land conflicts due to greater awareness and the presence of extractive industry (HuMa/Wallacea project), other show a decrease due to solving existing disputes (YRBI project). The findings are partly in line with the literature, as we expect the increase to be the result of the selection bias.

### 2.4.7. Efficiency

The project costs are displayed in Table 5 in section 2.1.5. We did not calculate the unit costs for the participatory mapping projects (Pt.PPMA, NTFP-EP, YRBI and HuMa) partially because lack of accurate information regarding the costs and beneficiaries of the projects. However, a more important reason is that the projects have usually not yet been finalized (have not yet reached the desired outputs, like finalizing the village map or obtaining legal approval of it). The differences in the project costs can be explained by the number of locations covered and the intensity of the project activities funded by MFS II.

### 2.4.8. Conclusion

Our conclusions based on the evaluation findings for the 4 projects are summarized below.

1. The long-term success of participatory mappings projects depends on their capability to empower the beneficiary communities to independently undertake mapping activities, maintain and update their maps, and develop their own map-use strategies. With this respect, we observe different strategies from the evaluated SPOs: for example, NTFP-EP was more concerned with the outcome of the project (the map) than the process of teaching the community members how to independently produce and use the resulting maps. As a result, even though in most projects community members were made part of the mapping team (conducting GPS data collection), they did not know what to do with the maps or what steps to take to get their land rights recognized, and thought it necessary that the SPO would continue to help them in the future (Pt.PPMA, NTFP-EP). On the other hand, YRBI worked closely with the communities as its mandate included the empowerment and revival of traditional institutions. As a result, YRBI communities were able to productively use the resulting maps even before they have been finalized.[68] If the SPOs are to continue their programs in the future, or implement them elsewhere in the world, we recommend that they improve their activities by more strongly aiming them towards achieving community empowerment, i.e.: increasing residents' knowledge, collective awareness, willingness, and capacity to make smart choices and independently manage their natural and cultural resources, and secure the rights to their lands so that they can protect it against damage and threats by outsiders in the future.

[68] In the YRBI project the maps have not been finalized due to yet unsolved boundary disputes.

2. The general aim of the participatory mapping projects is to create a map of a community's village and lands, and to get that map legitimized by the (local) government, in order to ensure the legitimate rights of the community over their indigenous territory and the natural resources in it. Even though all of the 4 SPOs have map legitimization efforts on their agenda, as of yet, none of them have managed to get the map officially recognized. This is not surprising as the process of legitimization is generally very lengthy and strenuous. Our recommendation is therefore that the SPOs keep investing in the project communities, and persist in their efforts until the mapping process is entirely finished, so that the communities can gain maximum and lasting benefits from the projects.
3. The qualitative work indicates that there is a lack of awareness also from the side of the villagers for the need for forest protections. Logging (Pt.PPMA), killing animals (such as bears, monkeys and squirrels) that damage crops (NTFP-EP) and local mining activities (HuMA/Wallacea) are conducted by villagers and contribute to the decline of fauna in their forest. Participatory forest projects could put even greater emphasis on awareness raising, so that these practices are reduced.

## 2.5. Projects on sexual education

### 2.5.1. Country context

Knowledge of Sexual Reproductive Health and Rights (SRHR) among Indonesian youth (15-24 years) is low. At the school level, SRHR education is only included as informal subjects in the school curriculum. The subjects are normative in essence, relying on morality and deemed to bear social stigma related to sexuality, gender and HIV/AIDS issues. Teachers feel uncomfortable and may choose not to address some subjects, reducing the quality of the education.

Two opposite trends influence the attitude and social taboo on SRHR services and education: Islamisation versus liberalisation. On the one hand, due to the greater emphasis on religion in Indonesia, including part of the youth population, the social taboo on SRHR issues has grown in recent years. On the other hand, the liberalisation trend causes many young people in urban regions to become more open and liberal with respect to expressing themselves and their sexual activities.

When SRHR knowledge level is low, the perceived risk of sexual activities is low, which may increase risky sexual behaviour[69] that may lead to undesirable outcomes like HIV, unintended pregnancies and illegal abortions (Amnesty International, 2010; Harding, 2008). These trends suggest an increase in risky sexual behaviour among Indonesian youth, which is most probably caused by their little knowledge of SRHR. This underlines the importance of SRHR education in schools. To tackle the stigmatization of SRHR issues and increase the awareness of youth aged 12-18 years about risky sexual behaviour, the NGO Yayasan Pelita Ilmu (YPI) carries out two SRHR programmes: DAKU and Dance4Life (D4L).

[69] Risky sexual behavior is commonly defined as behavior that increases one's risk of contracting sexually transmitted infections and experiencing unintended pregnancies. They include having sex at an early age, having multiple sexual partners, having sex while under the influence of alcohol or drugs, and unprotected sexual behaviors (Centers for Disease Control and Prevention, 2010).

### 2.5.2. Description of projects

Both programmes, DAKU and D4L, aim at increasing the capacity of young people to make safe and informed SRHR decisions and are implemented at schools as extracurricular programmes. DAKU ('Dunia remajaku seru' or 'Lively Youth World') is a computer-based[70] Comprehensive Sexual Education (CSE) programme with 15 modules covering SRHR knowledge issues like HIV prevention, sexual abuse and other risky behaviour issues like drug prevention. D4L on the other hand is an international programme. It employs dance, music and performing acts and focuses mainly on HIV/AIDS issues.

The result chain of both DAKU and D4L is displayed in Figure 34. As mentioned, the ultimate aim of both programmes is to encourage safe SRHR behaviour. They aim at changing the attitude and social opinion about SRHR issues directly, but also indirectly via a knowledge increase.

The target groups for DAKU are students from 15-19 years old. The target group for D4L is broader than DAKU as it covers students from 12-19 years old.

### 2.5.3. Evaluation design

The evaluation focusses on the following research questions: did DAKU and D4L enable students to make more informed decisions about their Sexual and Reproductive Health (SRH) activities? In particular, how did the knowledge, attitude and behaviour of students change as a result of the DAKU and D4L programmes?

To answer these questions we identified specific outcome indicators. The outcome indicators are split up into three sub-categories: knowledge, attitude, and behaviour. Additionally we look at possible unintended effects by investigating whether the programme altered actual sexual behaviour. Table 18 in Annex C displays the outcome indicators of the main analysis and the scale of these variables. For all outcome variables (Panel A to C) 'the higher, the better' rule applies.

The evaluation focuses on vocational senior high schools. A total of 15 schools were selected for the evaluation. In each senior high school 20 students were randomly selected among first and second grade students[71]. In treatment schools we stratified our sample based on CSE participation: we interviewed 10 participants (treatment group) and 10 non-participants who were expected to indirectly benefit from the programme through social contacts with their participating classmates (spillover group).

In total, almost 300 students in 10 treatment and 4 control schools in Jakarta are followed. In treatment schools both participants and non-participants in the programmes were selected. The programmes are implemented at schools as extracurricular programmes.

To analyse the impact of DAKU and D4L, two surveys have been conducted to collect quantitative data: a computer-based student survey and a school survey for a staff member. In addition, in order to gain more insight into the impact of the programmes, a qualitative study was also conducted: 8 participating

[70] In 2013, also a paper-based version of DAKU has been launched by Rutgers WPF and YPI is one of the implementing organisations of this programme.

[71] Senior high consists of 3 years of schooling. If a student dropped out or graduated between the base- and endline survey, the student was tracked at home to complete the endline survey.

students in DAKU and D4L were individually interviewed on the same topics covered in the quantitative survey.

### 2.5.4. Implementation of projects

Our data shows that in the intervention schools the implementation of the DAKU and D4L programmes had already started before the baseline survey. Also, most students participating in these programmes have indicated their involvement already at the baseline phase. DAKU and D4L reached few additional participants between the baseline and endline surveys in our sample.

This had implications for the evaluation design as well: it was no longer meaningful to evaluate the YPI project using difference-in-difference methodology as originally planned. Instead, we opted for multiple cross-sectional analysis. The actual implementation at the schools differs from the original sampling design. Although we sampled 3 DAKU schools, 4 D4L schools, and 2 DAKU&D4L schools, according to the school survey all schools that implemented DAKU also implemented D4L. Hence, we focus on the actual treatment status based on the school survey. Table 4 shows the number of students benefitting from DAKU (315 high school students) and D4L (2,930 junior and senior high school students) in 2012.

### 2.5.5. Changes in selected outcome indicators and attribution to MFS II

Table 32 in Annex D gives the changes of the (selected) outcome variables between baseline and endline. These are shortly discussed below separately for the 4 sub-categories knowledge, attitude, behaviour and unintended effects. Table 42 in Annex E shows the attribution of each of these changes. This is also discussed below.

#### *Knowledge indicators*

**Changes in outcomes between 2012 and 2014**

On average, knowledge levels are moderate for HIV/AIDS issues (8 out of 17) as well as students' awareness about their rights to receive SRHR information. The latter is slightly higher for the DAKU&D4L students (85%) than for the D4L only students (around 79%). Looking at changes over time within each type of schools, we see that the knowledge level decreased slightly (by 1) for the DAKU&D4L group while awareness about their rights to receive SRHR information increased by almost 4 percentage points. For the D4L the change is exactly the other way around that knowledge increased slightly and awareness decreased.

**Attribution of changes to MFS II interventions (project effects)**

Students from the D4L-only schools have not seen a significant improvement in their SRHR knowledge compared to the comparison school for any knowledge indicator except for their HIV/AIDS knowledge. Due to the more comprehensive nature of DAKU and the fact that students can follow both programmes in DAKU&D4L schools, almost all knowledge and awareness indicators show a significant impact of the intervention for these students and schools.

### *Attitude indicators*

**Changes in outcomes between 2012 and 2014**

On average, about half of the statements on relationships were correctly indicated as good/bad at the time of the baseline (4 out of 8). Most statements on Gender Based Violence (GBV) are agreed upon by students to be an incorrect attitude or behaviour. On average, 55-70% of the students at D4L-only and DAKU&D4L schools agreed that HIV/AIDS patients have the same rights as other persons. The acceptance of homosexuality was significantly lower for both treatment groups at the endline compared to the baseline, namely 7-11 percentage points.

**Attribution of changes to MFS II interventions (project effects)**

For the D4L schools, we did not find any significant impact of D4L on any of the attitude indicators. The effects of the programmes on attitude are larger in schools implementing both DAKU and D4L. Especially rights of HIV/AIDS patients and acceptance of homosexuality are significantly higher.

### *Behaviour indicators*

**Changes in outcomes between 2012 and 2014**

Around 30-40% of the students discussed intimate relationships with their friends. This percentage increased in the DAKU&D4L schools from 39 to 41% while it decreased from 35 to 30% for the D4L-only schools. On average, 15-18% of the students consulted a health centre/clinic for SRHR related matters in the past year at time of the baseline.

**Attribution of changes to MFS II interventions (project effects)**

In the D4L-only schools no effect was found on the two behaviour indicators. We found mixed results for the schools implementing both DAKU and D4L. On school level, discussions on intimate relationships increased significantly.

### *Unintended effects*

**Changes in outcomes between 2012 and 2014**

We observe that in both at the base- and endline, none of the students agreed with the statement 'I believe there is nothing wrong with unmarried boys and girls having sexual intercourse if they love each other'. Hence, the SRHR interventions do not alter the opinion of students about premarital sex.

**Attribution of changes to MFS II interventions (project effects)**

With respect to the unintended effects of the SRHR programmes, the results indicate that more students in treatment schools engaged in sexual activities (e.g. holding hands, kissing and hugging) compared to students in comparison schools controlling for age and gender of the students. This is a controversial finding. It is important to emphasize that this finding in itself does not imply that DAKU and D4L encourage sexual activity. There could be a number of other possible explanations for this finding.

### 2.5.6. Relevance of changes

In general, SRHR information addresses an important issue for the targeted beneficiaries. As one student mentions "*It is better to explain [about sexual activities] rather than hide that from young people, so that they will not try it out*". To assess the actual satisfaction of the beneficiaries with the project, students were asked about the effect of the programmes on their life. Mostly an increase of knowledge in certain areas like reproductive health, HIV/AIDS and safe behaviour were mentioned. Some students also mentioned positive changes in their behaviour and attitude towards others, i.e. being more careful and understanding.

Comparing the findings with existing literature, several meta-analyses have been done to study the impact of school sexual education programs, usually focussing on HIV education. In both the developed and the developing world, the results show that these programmes are an effective way to increase SRHR knowledge and attitude of the youth (Fonner et al., 2014; Michielsen et al., 2010; Paul-Ebhohimhen et al., 2008; Song et al., 2000). Hence, our findings for the DAKU programme are in line with the findings of other studies. As a result of the short education component of D4L, this programme only had an effect on HIV/AIDS knowledge of participating students except when jointly implemented with DAKU.

### 2.5.7. Efficiency

Table 5 in section 2.1.5 gives an overview of the costs per project. Since it is difficult to monetize the benefit of increased SRHR knowledge, instead of directly comparing costs with benefits, we resort to indicating the achievements that we have attained using 1 Int$. This method gives the following results: 1 international $ spent on DAKU has contributed to 0.64% increase in STI knowledge and 0.13% increase in the knowledge of rights to information on SRHR. Spending 1 international $ on implementing both DAKU and D4L results in the combination of 0.19% increase in HIV/AIDS knowledge, 0.49% increase in STI knowledge, 0.27% increase in contraceptive knowledge, 0.08% increase in the knowledge of rights to information on SRHR and 0.16% increase in acknowledging the rights of HIV/AIDS patients to equal treatment.

Kivela et al (2011) report on the unit cost of comprehensive sexual education programmes. In Indonesia, they report that the project costs were 17.06 Int$ per learning hour or 518.00 Int$ per year per student during the pilot phase of the project. These benchmark costs are about double the costs reported for DAKU (202.02 Int$ in 2012). Assuming 30 learning hours for the 15 chapters of DAKU, the costs of DAKU were 6.73 Int$ per learning hour per student. However, this calculation may be misleading as it only accounts for the costs of YPI but not the costs incurred by the schools. Nonetheless, we can conclude that the implementation of DAKU is cost effective in terms of output units. Regarding D4L, if we assume a 2 hour session for each stage of D4L (four in total), D4L operates with a unit cost of 4.17 Int$ per learning hour. This is lower than the unit cost of DAKU. However, D4L addresses a large group of students at the same time, while DAKU works with smaller groups.

### 2.5.8. Conclusion

Our findings are in line with the literature on sexual education programmes in the sense that we also find that the DAKU and D4L programmes were effective in educating students about SRHR knowledge. However, students participating in DAKU and D4L still did not perform very well on the SRHR knowledge test. For example, they only answered on average about 9 of 17 (53%) HIV/AIDS related questions correctly. This is nonetheless better than the score in the comparison schools (38-39%). However, we can conclude that DAKU and D4L could improve on the delivery of the SRHR information to students.

Regarding the delivery of the project material, we have to note that YPI only trains the teachers at the participating schools on teaching the DAKU programme. These teachers at the school are responsible for implementing DAKU for the students. Therefore, based on the data, we believe that more effort should be taken by YPI to train teachers on how to effectively deliver the material of the DAKU programme. With regard to D4L, our data suggest that the programme could also improve on its effectiveness, for example by a longer education component.

## 2.6. Projects assisting victims of GBV

### 2.6.1. Country context

Gender based violence (GBV) is a human rights violation and the social and economic costs are high. The UN Declaration on the Elimination of Violence against Women (1993) offered the first official definition of the term GBV, defining it as "any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or suffering to women, including threats of such acts, coercion or arbitrary deprivations of liberty, whether occurring in public or in private life."[72] Millennium Development Goal 3 calls for the promotion of gender equality and women's empowerment.[73]

In Indonesia, law no. 23/2004 (the PKDRT law) on the Elimination of Domestic Violence was the first regulation that finally legally entitled female victims of domestic violence to report any violence they experienced at the hands of their husband. In addition, as a result of the implementation of this law, institutions providing services to female and child victims of GBV started to be established. In Central Java Province,[74] the government issued by-law no. 3/2009 to assure better enforcement of the PKDRT law. This by-law governs, among others, the rights of female victims and the obligations of the local government with respect to prevention, protection and reintegration of victims. As a result, local governments are authorized to form integrated services centres (PPTKs) and commissions for the protection of female and child victims of domestic and/or gender based violence. However, despite these efforts, the actual implementation and enforcement of the legislation, especially by local governments, is slow. In Indonesia's multicultural society, GBV is often tolerated and permitted due to patriarchy that manifests in cultural and religious beliefs and practices.

[72] Source: http://www.hhri.org/thematic/gender_based_violence.html.
[73] Source: http://www.un.org/millenniumgoals/gender.shtml
[74] The location of the project.

Domestic violence is by far the largest reported subcategory of GBV. Hakimi et al. (2001) found that 41% of women from Central Java had suffered physical or sexual violence at least once in their lives, mostly from their husbands. The roots of domestic violence in Indonesia can -at least in part- be found in gender inequality, particularly within marital relations. For example, the husband's culturally-instilled superior position as head and provider[75] has grave implications for women's willingness and ability to report domestic violence and/or file for divorce. In addition, many victims attest that their husbands tell them during fights that "he is not bound by his oath to treat her well or stay faithful, because he hasn't sworn the marital oath directly to her [but to her father]". Even though divorce is common in Indonesia, it is rarely instigated by the wife since she needs the income of her husband to take care of the children (Venning, 2010). Moreover, women that report their husband to the police face the threat of being stigmatized by her family and environment. Nonetheless, the National Commission for Women found that 95% of the divorce cases approved by the Religious High Court in 2011 were due to domestic violence against the wife, of which the most common reported form in Indonesia is psychological abuse.

In general, the lack of autonomy and assertiveness among many Indonesian women, particularly of those who live in rural areas, hinders them to report the case to state apparatuses or bringing the case into public.[76] Women also often experience difficulties in accessing the legal system, for example due to the prohibitive cost and distance. Moreover, domestic violence is often regarded as a private matter, not belonging in the public domain. The taboo and stigma on domestic violence prohibits not only collecting accurate data (Utami, 2013), but more importantly hinders women to become aware of the problem and possible solutions. Therefore, institutions providing services to female and child victims of violence play an important role in raising awareness to these problems and in assisting victims in finding personal solutions to become survivors.

### 2.6.2. Description of projects

Both the Legal Resources Centre for Gender Justice and Human Rights (LRC-KJHAM) and Rifka Annisa are NGOs providing services to female and child victims of violence. In both cases, the evaluation focuses on psychological counselling and legal aid services provided for victims of domestic violence.[77]

LRC-KJHAM is a pro-women's rights legal resource centre, which is committed to strengthening the access of marginalized and poor women victims of gender based violence to legal resources. As such, LRC-KJHAM provides legal aid services to women victims, empowers women victims with education and training, and provides survivor-based support groups to improve their ability to reach victims of GBV. Next to activities with women victims, LRC-KJHAM has community and political activities as well, such as holding campaigns for women rights and promotes legal and policy reform and conducting (documentation) research. The project of Hivos provides funding for activities like continuous victim support (legal aid and strengthening support group); training of paralegals; developing a database of

[75] Within Indonesian law and culture, the husband is always regarded as the head of the household and expected to be the breadwinner. The notion of the husband as the head of household is also stated in the marriage law no. 1, dating from 1974.
76 ACNielsen (2005) finds that only 27% of victims would report domestic violence to the police.
77 Rifka Annisa and KJHAM also provide support to victims of violence related to dating, rape and transgender issues. However, these are a minority of cases. Therefore, we focus on the more common support to victims of domestic violence in this study.

cases of GBV; and policy advocacy activities. The result chain for this project can be found in Figure 29 in Annex B.

On the other hand, Rifka Annisa, meaning "Friends of Women", has a focus on victims of Sexual and Gender Based Violence (such as rape, sexual harassment, domestic violence etc.). The main objective of Rifka Annisa is providing counselling and legal assistances to victims of Sexual and Gender Based Violence. The aim of Rifka Annisa is to empower female survivors and in doing that contribute to the development or creation of a gender-just society. Rifka Annisa works together with other community institutions to help the women and promote a gender-just society. In addition, Rifka Annisa also carries out a programme for male perpetrators of SGBV. The project of Rutgers WPF provides funding for activities such as organising training session on paralegal counselling; providing SRH counselling and legal aid services to female victims of SGBV; providing shelter to female victims of SGBV; providing counselling service for changing behaviour of men perpetrators; and developing monitoring and evaluation tools for quality services for victims and perpetrators of SGBV. The result chain for this project can be found in Figure 33 in Annex B.

LRC-KJHAM and Rifka Annisa use rather different approaches to reduce domestic violence and related stress problems. Rifka Annisa works from the premise that many women will stay with their husband. Their theory of change relies on psychological counselling, which starts by building awareness of the problem with the victim of domestic violence, and moves on to increasing self-confidence to address the problem. LRC-KJHAM is more focused on providing free of charge legal assistance to victims of domestic violence supported by psychological counselling. By facilitating the divorce,[78] the women will be able to distance themselves from their former husbands and be less confronted with domestic violence. Both organisations assist women to file complaints with police in order to obtain external help to reduce the domestic violence, and they also offer support groups for women to discuss their problems with other victims of domestic violence.

Both projects operate in Central Java. LRC-KJHAM is located is Semarang, while Rifka Annisa has its base in Yogyakarta. Both SPOs draw their clients from surrounding communities, including rural areas, who usually present themselves to the offices of the SPOs for help. However, the size of the organisations differs in terms of the number of cases handled: whereas LRC-KJHAM assisted 114 clients (49 cases of domestic violence) in 2012, Rifka Annisa handled 270 cases (200 cases of domestic violence).

### 2.6.3. Evaluation design

This evaluation poses two particular challenges. First, beneficiaries contact the SPO, and are always provided with support. It is thus impossible to form a comparison group of victims of domestic violence that are not supported. The evaluation therefore uses a before-after design, that is, it assesses whether the situation of clients of the SPOs improves, and tries to assess whether this change can be attributed to the project. The second challenge is that the topic of domestic violence is sensitive to discuss, especially, with women who are in distress and worried about revealing that they receive support to their husbands. As a result, we relied more on qualitative studies (with support group members, LRC-KJHAM) and interviews with women when they were somewhat advanced in their contact with the SPOS.

[78] LRC-KJHAM never explicitly suggests divorce as a solution. It is the decision of the clients to file for divorce.

For Rifka Anissa, the initial plan was to interview women who already received support from Rika Annisa. We stratified over four brackets: those who had their first contact with Rifka Annisa 0-3, 3-6, 7-9 and 10-12 months ago. However Rifka Annisa insisted on being present at the interviews and to arrange the interviews. In the end, only 18 out of the sampled 80 women could be interviewed in this way. We interviewed these women twice. It is important to note here that 15 of 18 respondents visited Rifka Annisa already more than 9 month before the baseline survey (up to 15 months) for the first time, while the remaining 3 visited 3-9 months before the baseline.

In addition, we also implemented a short self-administered survey (provided by the counsellor) for first time visitors to Rifka Annisa in order to assess the reasons for contacting the SPO and service satisfaction. The clients were asked to fill out another survey focusing on their psychological health and support received from Rifka Annisa upon their third and sixth visit to Rifka Annisa. This worked rather well. However, most women only came for one visit only. During the six month interval of the study, 51 women filled out the questionnaire on their first visit, 3 returned for a third visit, and none returned for the sixth visit.

For LRC-KJHAM, we sampled 20 of 26 women who visited the SPO between January and July 2012 with a case of domestic violence. These respondents were interviewed three times: in September 2012 , November 2013 and September 2014. In addition, we conducted a qualitative survey with support group members using in-depth interviews in July 2013.

Table 19 in Annex C lists the main outcome indicators we obtained from the structured interviews. The outcome indicators are grouped in five groups: number of women free of domestic violence; physical and psychological health of women; women's empowerment/attitude towards themselves; attitude/empowerment in marriage; and satisfaction and self-reported impact. In Table 19 we only listed the main outcome indicators. For a complete list of the indicators collected we refer the reader to project level reports. The table also indicates which indicators correspond to the uniform outcome indicators identified by the synthesis team. The variables grouped under Attitude/empowerment in marriage relate to the attitude of women and men related to GBV.

### 2.6.4. Implementation of projects

The LRC-KJHAM project was implemented as planned. However, the Rifka Annisa project ended already in December 2012 (instead of 2015) because Rutgers WPF allocated funding from another source to finance the project. Hence, only a small part of the planned MFS II budget has been spent (around 12,000 EUR). However, the project objectives and activities remained the same despite the change in funding source.

Regarding the beneficiaries, we observed that many beneficiaries only visited Rifka Annisa once (self-administered survey). Most respondents who visited the organisations multiple times have turned to the organisations for help in a litigation procedure (legal aid). Surprisingly, this appeared to be the case most often for Rifka Annisa, while for LRC-KJHAM we observed that some survey participants who visited LRC-KJHAM more than once did not start or cancelled the litigation procedure.

In addition, between the baseline and endline surveys, only 7 of 20 women used the services of LRC-KJHAM, and this number is 6 of 18 women for Rifka Annisa. Note, however, that we were more likely to sample respondents who had more interaction with the SPOs.

### 2.6.5. Changes in selected outcome indicators and attribution to MFS II

Table 33 in Annex D gives the changes of the (selected) outcome variables between baseline and endline. The results are presented by group of outcome indicator. First, the change in the indicators is discussed, then we elaborate to what extent the changes can be linked to the interventions.

**Changes in outcomes between 2012 and 2014**

#### *Number of women free of domestic violence*

The number of women who experienced either physical, psychological or sexual violence (or a combination of those) in the past 12 months (LRC-KJHAM) or 3 months (Rifka Annisa) decreased for both projects. For LRC-KJHAM, the number of abused women decreased by 10 (from 15 to 5), while for Rifka Annisa, this number decreased by 4 (from 9 to 4). The data also show that while only 1 Rifka Annisa respondent was physically or sexually abused (in the last 3 months) at the time of the baseline, this number was 10 for LRC-KJHAM (in the past 12 months). This is reflected in the indicator for the average number of types of abuse that the respondents experienced.[79] Both programmes see a decrease in this indicator, but it is only significant for LRC-KJHAM (by 1.15), which is explained by the observation that the absolute value of the variable was much higher at the baseline for LRC-KJHAM (1.45) compared to Rifka Annisa (0.56), while this value did not differ much at the endline (around 0.30-0.40).

The difference in the respondents' exposure to domestic abuse between two SPOs (at the baseline and during the evaluation period) can be explained by the fact that most of the Rifka Annisa respondents were already divorced at the baseline (11 out of 18) and sought help at the SPO over a year ago, while over half of the LRC-KJHAM respondents visited the SPO less than 9 month ago and only 5 of 20 were divorced at the time of the baseline.[80]

#### *Indicators of psychological health*

For the psychological health of the women the psychological distress index is reported on, which consists of the social dysfunction index, the anxiety index and the losing confidence index. Again, only LRC-KJHAM saw a significant decrease (by -2.10), which is a positive development for the women. Also the three components of the psychological distress index significantly decreased (by -0.60-0.80). The Rifka Annisa respondents did experience a significant decrease in the social dysfunction index (by -0.50) but at the endline they were doing somewhat worse in terms of symptoms of social dysfunction (0.61 vs 0.40) and anxiety (2.17 vs. 1.60) compared to the LRC-KJHAM respondents. Most women still struggled to overcome emotional problems in both projects.

[79] These types are physical, psychological and sexual violence.
[80] In addition, the recall period may have also played a role in the reported exposure to domestic abuse.

### *Indicators of women's empowerment/attitude towards themselves*

There are smaller changes seen in these indicators. The only significant effect is found in the self-esteem index for the women of LRC-KJHAM, which shows a positive development (it increased by 0.46). Also, the women do not feel disempowered on average, since the level of all the indices is above 0. However, the negative changes in the self-efficacy index, self-esteem index and support for Rifka Annisa are concerning, although not significant.

### *Indicators of women's attitude/empowerment in marriage*

For both projects, no significant changes were found in the indicators. The rights of wife index decreased for LRC-KJHAM (by -0.45), although not significant. There are still women who can think of good reasons for a husband to hit his wife (around 4/5 women for both projects at endline), but on average, they cannot think of a lot of reasons (0.35-0.61 for both projects at endline). Almost all of the women agree with at least one occasion in which a woman can refuse sex. The women from LRC-KJHAM agree with somewhat more occasions than the women from Rifka Annisa (20 compared to 17 at endline).

### *Satisfaction and self-reported impact*

The women from both projects show satisfaction in the sense that they feel more emotional stable and less stressed due to the services. Their feelings about LRC-KJHAM between the baseline and the endline did not really change, while it did decrease for Rifka Annisa (by 0.22).

**Attribution of changes to MFS II interventions (project effects)**

Most respondents first confessed their marital problems to their friends after they could not endure anymore. Friends motivated and encouraged them to seek help. Support from family also played an important role in the resolution of respondents to divorce their husbands, while children were the most often mentioned reason to stay with and endure their husband.

Friends and relatives were the most important sources to refer respondents to Rifka Annisa and LRC-KJHAM. Rifka Annisa provided psychological counselling to all respondents, and legal advice to most of them. Some respondents also joined the support group. Based on the respondents' testimonies, the respondents who turned to LRC-KJHAM not only received legal assistance but also moral support and counselling from survivors at LRC-KJHAM who have experience with their situations. This contributed to improving the respondents' self-esteem and confidence, especially for women who were members of the support group.

Through assisting in the divorce, LRC-KJHAM and Rifka Annisa directly contributed to breaking the cycle of abuse when the women were ready to make this step.[81] Hence, both SPOs assisted women in carrying out their resolution and informed them about their options and the procedure. Most changes in the outcome indicators (less dependency on husband, less exposure to abuse, better relationship with

[81] Rifka Annisa assisted in 6 out of 12 litigation cases, while LRC-KJHAM assisted in 10 of 15 litigation cases (not all ended in a divorce).

husband and improvements in the psychological well-being and social functioning of respondents) can be attributed to the fact that women divorced and broke free from their abuse husbands. Despite the stigma of divorced women in Indonesian culture, respondents who got divorced felt more relieved and relaxed, and managed to find new friends and companions.

However, the SPOs were not the only (or most important) source of help. Respondents also confided in their close friends and looked to them for moral support. Support and advice from parents and siblings was also an important factor in dealing with their household problems. Some LRC-KJHAM respondents also got engaged in religious activities to ease their mind. Overall, respondents' main motivation to look positively into the future is their children and to be able to provide for them.

Nonetheless, the everyday life of respondents has been governed by work and earning a living to provide for themselves and their children, especially after a divorce. Several respondents achieved successes in obtaining a better job or starting their own business. Family support is also an important factor in the observed improvements. Respondents who have parents and siblings that can help them financially and by looking after the children managed to have a good grip on their lives after the divorce, and to find a better job or finish their studies; while some respondents who have no such support still struggle to make ends meet while staying at home with their young children.

Overall, we find that LRC-KJHAM and Rifka Annisa were an important source of help for escaping the abusive situation, especially for women who cannot lean on support from their family and who have the time to go to the SPOs. Respondents felt that LRC-KJHAM really supported victims of domestic violence. However, it was the close friends and family that send most of the respondents to LRC-KJHAM and provided continuous support for the women through their everyday life.

### 2.6.6. Relevance of changes

We observe more improvement in the women's situation for the LRC-KJHAM project than for Rifka Annisa. On the one hand, we could think that this is due to the fact that respondents have been actively seeking help to resolve their marital problems already for some time before the baseline survey (for example, empowerment). On the other hand, the results often show smaller effects for respondents who have been assisted by Rifka Annisa during the evaluation period, suggesting that it takes longer for respondents to recover (for example, psychological distress).

It is also important to mention that while the results are representative for LRC-KJHAM; in the case of Rifka Annisa, the additional self-administered client survey suggests most women only visit the SPO only once (only 3 of 35 respondents visited Rifka Annisa at least 3 times over a 3-6 month survey period) whereas most of the survey respondents visited multiple times. It is mostly women who seek assistance in litigation who visit Rifka Annisa multiple times as also suggested by our sample.

A first indication that LRC-KJHAM indeed addresses an important issue for the beneficiaries is that 85% of the respondents visited LRC-KJHAM more than once. Given that respondents visit the SPOs voluntarily, their continued use of Rifka Annisa's and LRC-KJHAM's services signals the value to the respondents. Also, most women agree that the support group activities were or would be very helpful for them. However, most women cannot participate in the support group (only 5 of 20 women were a member of the support group all through the evaluation period) due to the distance to the meeting and the time of

the meeting (during working hours). In the case of Rifka Annisa, most respondents were not aware of the existence of the support group but those who were mentioned similar concerns (4 out of 18 women were members of the support group).

From the interviews it became clear that woman do need LRC-KJHAM services when filing for a divorce. They indicate the need to receive help and guidance before and during court since most women do not have any experience at all in this area. In addition, LRC-KJHAM is very valuable for respondents who cannot afford to hire a lawyer to handle their case. LRC-KJHAM offers free of charge services both for counselling and legal assistance until the case is closed.

In addition, the existence of organisations that provide free counselling and legal aid services to victims of SGBV is essential for creating a society that is free of SGBV. They not only provide services but stand as proof for the rights of women, children and other marginalised groups. The more these organisations are known, for example through media coverage or through information from friends, police and health care providers, the more likely it is that abused women will break their silence and seek help to improve their situation either through mediation or divorce.

Finally, comparing our findings to existing literature on the effectiveness of counselling programmes, the literature suggests that counselling and support group activities for battered women can improve a number of skills and characteristics, like self-esteem, assertiveness and coping abilities (Bennett et al., 2004 and Tutty et al., 1993). Hence, counselling and support groups can help to emotionally strengthen survivors, but it is not clear yet whether it actually results in changing the abusive situation. The findings for the LRC-KJHAM project are in line with these findings in the literature, while in the case of Rifka Annisa, we found less positive effects of counselling and support group activities, which could be due to the limited number of respondents engaging in Rifka Annisa's counselling and support group activities during the evaluation period.

### 2.6.7. Efficiency

The project costs are displayed in Table 5 in section 2.1.5. In 2012, the project costs of LRC-KJHAM were 42,527 EUR compared to 11,897 EUR for Rifka Annisa. However, the MFS II project only contributed 2.3% of the total costs of Rifka Annisa.[82]

We did not calculate the unit costs for the LRC-KJHAM and Rifka Annisa projects because the SPOs operate with mostly fixed costs, while the number of clients is external to the organisations. In addition, we believe that the availability of the counselling and legal advice and aid services is valuable in itself. Further, calculating the cost per client would be misleading in case of a large turnover of clients.

### 2.6.8. Conclusion

Despite that we find only small effects of the projects on the wellbeing and empowerment of the abused women, the work of LRC-KJHAM and Rifka Annisa, both as service centres and in policy advocacy, are indispensable in creating a gender just society free of sexual and gender based violence. The

[82] We do not have information about the total costs of LRC-KJHAM.

existence of such organisations may raise the awareness of victims of sexual and gender based violence to step outside of the cycle of abuse.

It was interesting to observe that while both Rifka Annisa and LRC-KJHAM provide similar services, the results were more prominent for LRC-KJHAM both in the quantitative and qualitative data. There could be several explanations for this finding. We explore a few possibilities. Firstly, LRC-KJHAM is a smaller organisation (based on the number of clients served) and it works with survivors who are trained as paralegals. Respondents felt that the knowledge and moral support received from these survivor paralegals provided strength for them in solving their problems at court or in the household. There is also a close connection between LRC-KJHAM and the support group and every client is invited to join the support group. On the other hand, the larger size of Rifka Annisa and its focus on multiple activities (perpetrator counselling, shelter, psychological counselling and legal assistance) has resulted in capacity problems. Finally, the respondents of LRC-KJHAM and Rifka Annisa were different. While almost all of them worked, most of the Rifka Annisa respondents received support from their family both financially and by taking care of their children, this was less often the case for LRC-KJHAM. Also, while only 3 of 18 Rifka Annisa respondents remained with their (abusive) husband at the endline, this number was 6 of 20 for LRC-KJHAM.

We conclude this section with some additional observations and recommendations.

1. The risk of being stigmatized by the community, and the fear of not being able to support themselves and their children, is what usually keeps women from filing for divorce or reporting the abusive behaviour of their husbands to the police. Changing this patriarchal culture requires continuous advocacy of policy change with regard to gender equality.
2. Most of our informants had initially tried to cope with the abuse on their own and had waited a long time before confiding to a friend or relative about the abuse. In the end, none of them had made the step to contact the SPOs on their own but were motivated by a friend, relative, neighbour, acquaintance or public officer. It is, therefore, of utmost importance to conduct active outreach not only to clients but also to communities, the victims' social circle and the relevant public institutions (police, health care, court) through multiple media channels.
3. LRC-KJHAM's strategy to change victims of gender based violence into survivors and active agents that are able to change their own situation as well as those of others is well chosen. By empowering victims and giving them the courage, skills, and will to actively speak up in court and actively commit their own knowledge and experiences to inspire and help other victims, the victims themselves become advocates for the fight against gender based violence. By changing shame and disgrace into power, they are able to gradually change the negative connotations that are traditionally associated with 'divorce' and 'assertiveness' in women, and inspire and encourage other victims to fight for their own rights, and ultimately those of others.
4. Our data shows that victims of domestic violence preferred to file for divorce immediately, without first reporting the abuse and going through the full legal process. This is problematic because any abuse that is reported after the divorce is granted will legally not be sentenced as 'domestic violence', but rather as 'violence against women' for which lighter punishment applies.

The fact that many women still decide to directly file for divorce supports the idea that victims know too little about legal procedures.

5. It is often difficult for divorced women with small children and without additional family support to manage to work and to take care of the children at the same time. One respondent found a solution by starting an online business. However, more women would benefit from trainings on entrepreneurship and economic activities that they can do from home (an example would be the *kanzashi* brooches made by beneficiaries of the SC GREEN project).
6. Many respondents stopped using the services of Rifka Annisa because they did not have the time and the organisation was far away from their home. Given the busy schedule of the respondents and the fact that many of them still struggle to overcome the emotional burden of the experiences of abuse, we encourage the SPOs to develop and extend counselling tools that can be used remotely, such as counselling by phone, message based counselling (SMS or chat) and booklets.

## 2.7. Overall conclusions

First, most projects selected for the evaluation were difficult to properly evaluate because

- Often projects were already underway by the time of the baseline. This made it more difficult to estimate impacts by analysing trends from baseline to endline.
- Projects were small, often reaching only a handful of villages or beneficiaries. This made it difficult to rely on statistical analysis to estimate impacts.
- New beneficiaries were not identified by the time of the baseline. This made it difficult to construct a treatment and comparison to follow over the course of the evaluation.
- Even though the projects were selected under the MDG component, they often focused on building capacity building of organisations and influencing civil society (especially, participatory mapping projects, and disaster risk reduction). In these cases we often relied on a combination of qualitative and quantitative work to understand the impacts.

Second, project impacts in the uniform indicators were often minimal, if any, because (1) often the project did not explicitly target the uniform indicators; (2) the project interventions were not substantial enough or reached a small fraction of the intended beneficiaries; (3) projects were not successful in reaching their final objectives in terms of outcomes at the final beneficiary level. In addition, the difficulties mentioned in the first bullet made it difficult to draw strong conclusions regarding impact.

Third, looking at the interventions themselves, we mostly found professional and committed local NGOs and CSOs implementing the projects, which is reflected in the high scores on the design and implementation of the projects (Table 6). Projects were often funded from multiple sources. The interventions which could be traced back to MFS sometimes turned out to be very small (for example, for Rifka Annisa). Many projects did not spend the whole budget (for example, NTFP-EP, FIELD and SC

LED-NTT), and the project period was also often extended (for example, NTFP-EP and FIELD). Most projects were implemented according to plans except for a few: in the case of the Pt.PPMA project the contract was stopped due to non-performance, and the implementation of the SC GREEN project was adjusted. However, especially the project aimed empowering indigenous communities using participatory mapping methods (Pt.PPMA, NTPF-EP, YRBI and HuMa/Wallacea) struggled to deliver the planned outcomes due to the limited timeframe for the projects. In the latter case, a long term commitment from the CFAs is important to be able to deliver the desired project outcomes.

Fourth, we observe that most projects involve a capacity development component (for example, NTFP-EP and HuMa), and some of them even have capacity development of NGOs and CSOs as their primary objective (for example, SC GREEN and KSP-QT). Others provide trainings to community groups or households (for example, WIIP, FIELD and SC LED-NTT/FSPP). In fact, all selected projects focus on one of the following: providing trainings, participatory workshops, counselling and legal aid, SRHR education and linking producers to markets. Regarding the trainings, we often found that their effectiveness could be increased.[83] Only one project actually disbursed performance-based compensation for project activities (tree planting) to the beneficiaries (WIIP), and another one provided capital for borrowing (KSP-QT). Most projects were designed to have sustainable effects after the project period.

Firth, for most SPOs, we observe a long working relation between the SPO and CFA. For example, the FIELD and SC LED-NTT/FSPP projects ran for about 10 years. Hence, the good performance of the SPOs in terms of designing and implementing the projects could be a result of careful partner selection of the CFAs. On the other hand, during the evaluation period some of these working relations have (temporarily) ended due to changing strategies of the CFAs (YRBI, FIELD, KSP-QT).

Sixth, we observe that while some projects worked closely with the beneficiaries (for example, WIIP, YRBI, SC LED-NTT/FSPP), other SPOs were operating at a larger distance from the beneficiaries and more oriented towards civil society and policy influencing and worked with local partner organisations (for example, HuMa, NTFP-EP, FIELD and YPI).[84] Overall, we observe that projects that interacted more intensively with beneficiaries were also more effective (for example, WIIP and YRBI). However, these projects also had the highest costs. Unfortunately, based on the available data, we are not able to assess the efficiency of the two approaches.

Seventh, regarding the relevance of the projects to beneficiaries, most projects addressed relevant issues for the beneficiaries. This is particularly the case for projects on sexual education, services for victims of domestic violence and coastal reforestation. The mapping and natural resource awareness raising projects address important community concerns and are supported by the communities,

[83] For example, more effort should be taken by YPI to train teachers on how to effectively deliver the material of the DAKU programme.
[84] Or teachers in the case of YPI.

however, they are not deemed as urgent issues despite the long-term implications of natural resource extraction and the loss of cultural resources. Hence, these projects have an essential role in protecting ecological and cultural resources for future generations. Among the sampled project areas, the projects on poverty alleviation seem to be the least relevant relatively speaking, especially, as only one of the 4 projects is implemented in an underdeveloped area of Indonesia (SC LED-NTT/FSPP).

Overall, we find that the selected project were well-designed and implemented by committed SPOs, albeit the evaluation found limited quantitative impacts of the interventions during the evaluation period and we often found the interventions to be not cost-effective compared to benchmarks provided by the Synthesis team. The latter result may be explained by the small scale of the implemented projects.

Finally, we do not recommend the replication of this evaluation design in the future. However, we encourage carefully designed impact evaluation of development projects that reach a sizeable group of beneficiaries and offer measureable outcome indicators at the final beneficiary level. For small scale projects with outcomes that are difficult to quantify, we recommend the use of more qualitative evaluation methods like process evaluation or process tracing. Regarding the size of the project, it is important to consider whether the outcomes and primary sampling units are at the household or the community level, and the complexity of the project.[85] Most importantly, for all future evaluations we strongly recommend the development of the evaluation design in cooperation with the SPOs prior to the start of the interventions in order to allow for a true baseline measurement (and possibly the randomisation of beneficiaries) before the project is rolled out.

[85] For projects that involve many different treatments/activities, the beneficiaries should be stratified or separated by the different combination of treatment 'packages'. Evaluating complex projects requires a larger sample size due to this stratification. One option to reduce the sample size would be to only evaluate some of the project activities, as was also done for some of the selected MFS II projects.

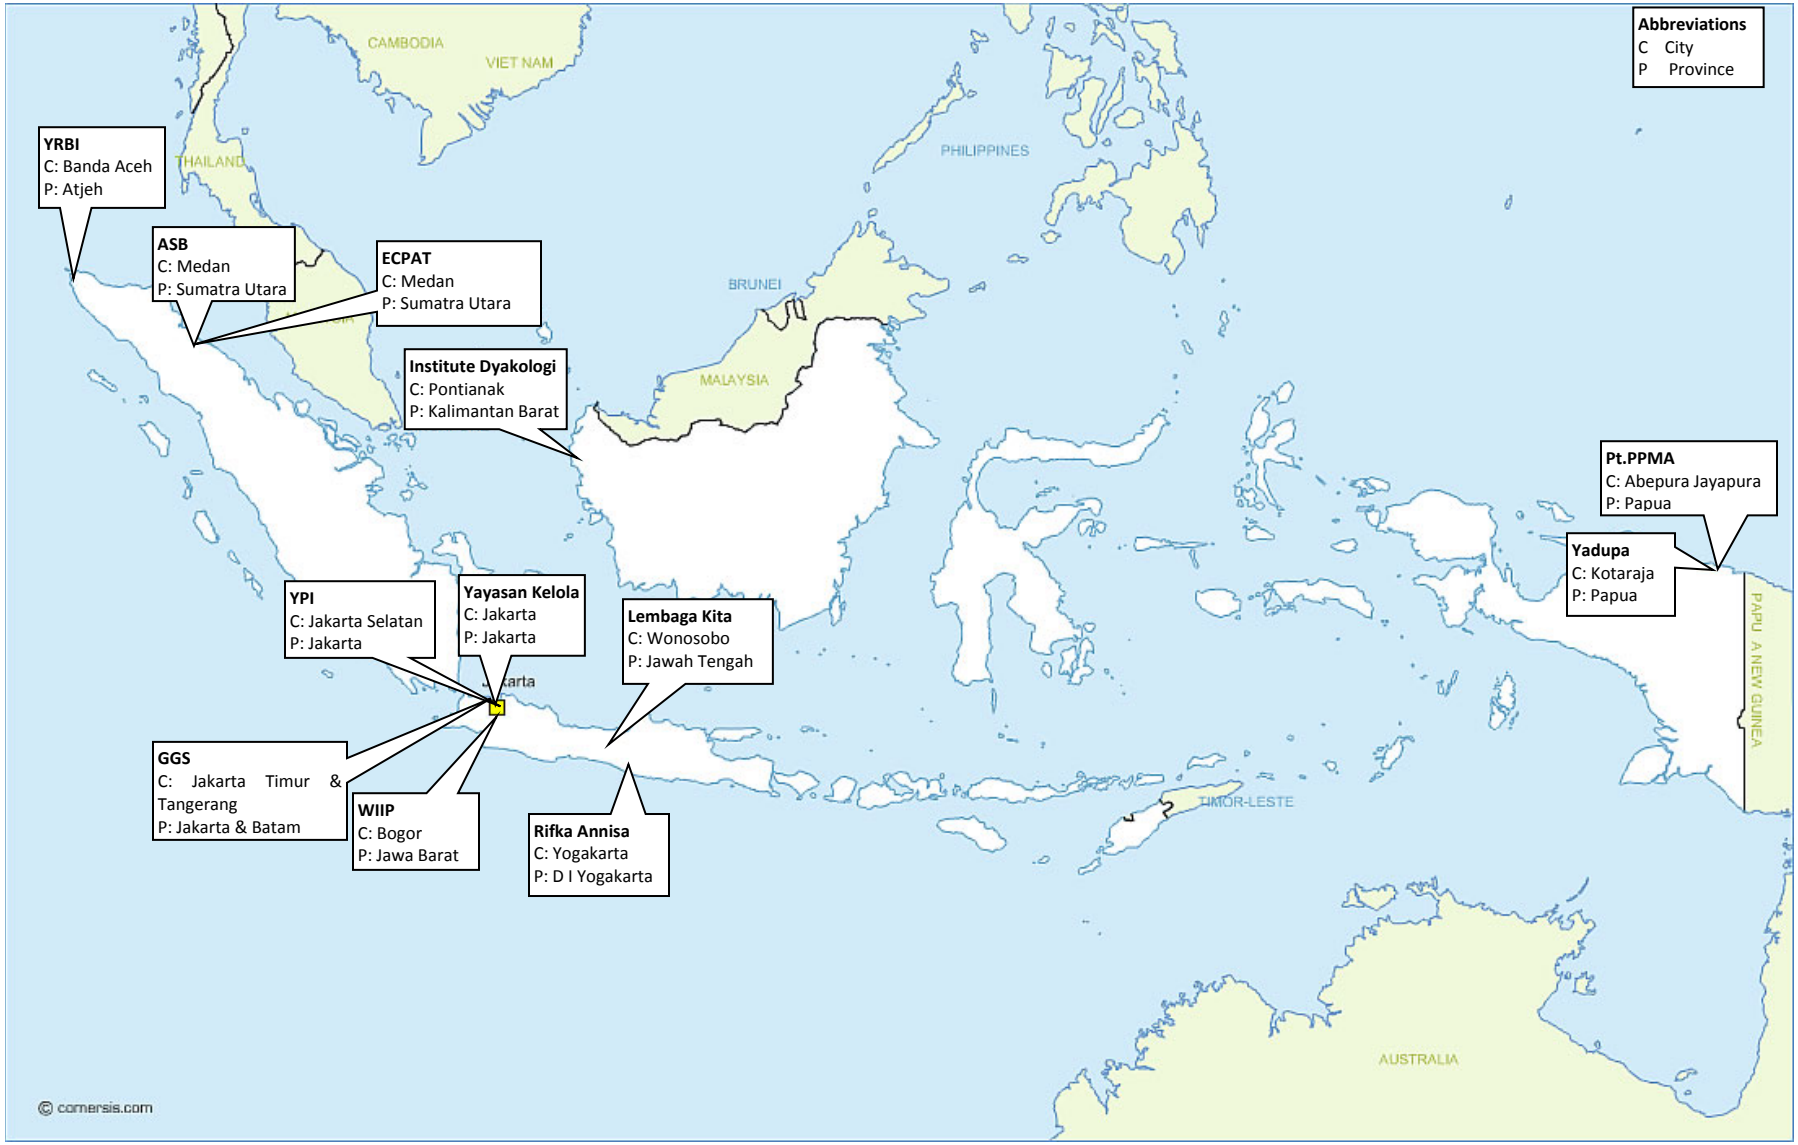
**Table 6: Scoring of MDG projects**

| Statement | Score | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | WIIP | Pt.PPMA | NTFP-EP | FIELD | SC GREEN | KSP-QT | LRC-KJHAM | YRBI | HuMa | SC LED-NTT | Rifka Annisa | YPI |
| 1. The project was well designed | 9 | 8 | 8 | 8 | 8 | 8 | 9 | 8 | 8 | 8 | 8 | 8 |
| 2. The project was implemented as designed | 9 | 1 | 7 | 8 | 6 | 9 | 9 | 9 | 9 | 9 | 8 | 9 |
| 3. The project reached all its objectives | 9 | 3 | 6 | 7 | 6 | 8 | 9 | 7 | 7 | 7 | 8 | 7 |
| 4. The observed results are attributable to the project interventions | 7 | 1 | 7 | 7 | 7 | 7 | 4 | 8 | 7 | 6 | 4 | 8 |
| 5. The observed results are relevant to the project beneficiaries | 9 | 2 | 8 | 7 | 8 | 7 | 10 | 7 | 7 | 6 | 10 | 8 |
| 6. The project was implemented in the most efficient way | 8 | 1 | 7 | 6 | N.A. | N.A. | N.A. | N.A. | N.A. | 5 | N.A. | 8 |

Notes: Scores are on a scale of 1 to 10, with 1 being “no agreement at all” and 10 being “completely agree with statement”.
N.A. = not applicable

# 3. Capacity development of Southern Partner Organisations

## 3.1. The Evaluation Sample



The pre-selected sample for the capacity development component has been stratified between SPOs with projects selected for the MDG evaluation and SPOs that were not eligible for the MDG study, i.e. SPOs with projects that receive less than EUR 50,000 funding through MFS II and/or with projects that cannot be categorised in any of the MDGs and themes. Following these considerations, a sample of 14 SPOs was pre-selected for Indonesia. However, 2 SPOs (Center for International Forestry Research (CIFOR) and Kapal Perempuan) were dropped from the initial sample as they did not receive MFSII funding at 1 January 2012. Hence, the sample for the capacity development component has been reduced to 12 SPOs. In the sample, 5 SPOs are selected that are also involved in the MDG study. The list of these SPOs is presented in Table 7.

**Table 7: Selected SPOs for the capacity development evaluation**

| Organisation | Dutch Consortium | Dutch CFA | Selected for MDG |
|---|---|---|---|
| Institute Dayakologi | Communities of Change | CORDAID | no |
| Wetlands International – Indonesia Programme (WIIP) | Partners for Resilience | Red Cross | yes |
| Yayasan Rumpun Bambu Indonesia (YRBI) | ICCO Alliance | ICCO | yes |

Notes: The map indicates the name of the SPO, name of the city (C) and province (P).

## 3.2. Methodological approach

The overall evaluation approach for evaluating capacity development of the SPOs is a participatory, theory-based approach using theories of change, impact pathways and process tracing[86,87], in a before-after comparison. Mainly qualitative methods have been used as organisational capacity is characterised by complexity and uncertainty.

The overall evaluation design is centred around the 4 evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5 Capabilities (5C) study. The methodological approach for the other three questions is described in more detail in Annex F.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

**Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see Annex G) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided. The scores were developed by the evaluation team, after thorough analysis and description of the situation during endline and how this changes since the baseline. These scores are based on mainly proportional differences. Whilst the information provided by staff may have provided socially desirable answers, the information provided has been cross-checked using different sources of information (different staff groups based on functions; self-assessments in interviews; interviews with CFA and other externals).

[86] In Stern et al, 2012: Evaluation and IE in particular, is an opportunity to test a programme's theory through the links in the causal chain. In terms of method, this tendency is close to 'process tracing' (George and McKeown, 1985, Collier 2011), defined by Aminzade (1993) as: 'theoretically explicit narratives that carefully trace and compare the sequences of events constituting the process…'. These causal chains are represented graphically as causal maps or neural networks.

[87] Stern et all (2012) say there are 'three main designs that show promise to reinforce existing IE practice when dealing with complex programmes – theory-based; case-based and participatory'.

Key organisational capacity changes – 'general causal m**ap':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described. This general causal map was developed to also get the SPO perspective on what they considered as important capacity development changes since the baseline. For this reason, and since the indicators by themselves could not provide this overall SPO story and perspectives on what they considered important changes, only the SPO perspective has been included. This was an additional activity that wasn't planned for during the baseline. The analysis in terms of organisational capacity changes has however mainly focused on changes in the 5c indicators.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This was also confirmed during the 5c endline study. Theory-based evaluation can help to understand why a program works or fails to work and they attend to not only what a programs do but also to how participants respond[88]. The theory based approach also allows space for the evaluation to reflect the complex nature of the development process, particularly when focusing on changes in organisational capacity. To deal with the attribution question (2), the theory-based approach '(outcome explaining) process tracing' is used.

This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities – the 'capability to act and commit' and the 'capability to adapt and self-renew' –, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

The evaluators have considered the internationally agreed upon evaluation standards as useful guidelines for their work, and ranked in order of importance: 1. Utility, 2. Feasibility, 3. Propriety, 4. Accuracy, 5. Evaluation Accountability. Within the boundaries of the conditions set for this evaluation, the evaluators have as much as possible adhered to these standards, particularly utility, whilst the setup of the evaluation seems to focus more on the accuracy standard.

Organisational capacity is complex and seen as an outcome of an open system. Within a complex system, multiple processes operate simultaneously and by no means in isolation.

[88] Carol H. Weiss (2007).

Interactions between these processes can result in unpredictable and evolving results. According to Stern et all (2012), there are "three main designs that show promise to reinforce existing IE practice when dealing with complex programmes – theory-based; case-based and participatory". In order to understand changes in organisation capacity, it is important to develop a deep understanding of the change process and the dynamics that affect organisational change of organisations. Simple linear input-activities-outputs-outcomes-impact chains do not suffice for complex issue like organisational capacity.

The evaluation is participatory in that SPO staff and stakeholders are engaged in a process of self-reflection, learning and validation of findings. Having interactive workshops with staff is part of this.

The evaluation process is also participatory in terms of design and analysis. The overall methodology, including standard indicators and a Likert scale, has been designed by the CDI, Wageningen University and Research centre (WUR; Ethiopia, India, Indonesia, Liberia), in collaboration with ETC Foundation (Uganda) and Disaster Studies (WUR; DRC), covering in total 6 out of 8 countries. For the endline process CDI has also taken a lead in methodological development, especially in terms of process tracing, for all the 8 countries in the MFS II evaluation. CDI is involved in 4 out of the 8 countries for the 5C evaluation. Due to the nature of the evaluation (multiple countries, with multiple institutions carrying out the evaluation), all possible efforts were made to design a standard methodology to be used across countries. This included a set of common indicators (32); and data collection tools for six countries[89]. The 5 capabilities were reformulated in outcome domains and for each outcome domain performance indicators have been developed. See also Annex H. The methodology has been shared with the country based evaluation teams, the country project leaders, the synthesis team, and MFS II organisations for feedback. Detailed guidelines and tools have been developed by CDI for the baseline and endline, and these have been piloted in each of the countries CDI is involved in, in line with training the in-country team. Country based evaluators have had a critical input in reviewing and adapting these detailed guidelines and tools. This enhanced a rigorous data collection process. Rigorous analysis of the qualitative data is done with the assistance of the NVivo software program. The qualitative data analysis software allows for a transparent and systematic analytical process across an international team. During data collection, analysis and sense-making, the overall 5C coordinator (CDI) provided training, coaching and mentoring and carried out quality checks for each of the 4 5C country teams that CDI is involved in (Ethiopia, India, Indonesia, Liberia). Details specific to the SPO are described in chapter 5.1 of the SPO reports. A detailed explanation of the methodological approach and a reflection on this is provided in Annex F.

[89] DRC, Ethiopia, India, Indonesia, Liberia, Uganda

## 3.3. Key findings and conclusions

This chapter includes brief descriptions for each SPO included in this capacity development (5C) evaluation, and provides main findings and conclusions of the evaluation, in relation to the 4 core evaluation questions as described in the previous section.

### 3.3.1. Key information on the Southern Partner Organisations (SPOs)

Please find below a brief description of the key information on the Southern Partner Organisations.

**ASB**

The United Alliance of Northern Sumatra (*Aliansi Sumut Bersatu*-ASB) was initiated in 2006, intentionally at the occasion of the International Women's Day. The creation of the ASB took place in the context of a "come together" of various NGO's, artists, students, activists and others against an *"ultra-conservative-district-level-"*[90] bill against pornography and indecent behavior, the so-called RUU APP. This bill was intended by the PKS (*Partai Keadilan Sejahtera* or Justice and Prosperity Party) as a way of gaining political popularity among Muslims (90% of Indonesian population) through creating this bill based on PKS' conservative understanding of the Islamic principles. The dialogue between the organisations that stood up against what this bill represented and could bring forth resulted in the declaration of the *Aliansi Sumut Bersatu*. Through peaceful actions, discussions, hearings with the House of Parliament and the collection of signatures ASB was created to stand against RUU APP and all activities, laws, norms and behavior that generate social exclusion. *Aliansi Sumut Bersatu* was officially established in 2008[91]. Initially focused on social pluralism regarding sexual and gender equality issues *Aliansi Sumut Bersatu* (ASB) has broadened its scope of action[92] since 2010. An example of this is ASB's present project: "Civil and Religious Societies' Participation in Promoting Peace and Diversity in North Sumatra". This program, which in the framework of MFS II is co-financed by Hivos, aims at bringing about religious pluralism in North Sumatra. The vision of ASB is '*Aliansi Sumut Bersatu*'s vision is *"the achievement of recognition, protection, fulfilment of and respect toward diversity".*[93] *Aliansi Sumut Bersatu's* strategies are: to offer education in feminism, sexuality and pluralism to the community. In the context explained above, "community" encompasses the cross-religion student activists and other social groups. Furthermore, ASB engages in monitoring the practices of religious intolerance in North Sumatra, advocating on policy and advocacy for groups which became the victim of intolerance and doing research on the practices of pluralism in North Sumatra[94].

**ECPAT**

ECPAT Indonesia is the National Coalition for the elimination of Commercial Sexual Exploitation of Children (CSEC).[95] It was founded when a group of professionals organised a National Consultation Meeting on Fighting CSEC in Jakarta in 2000. This National Consultation resulted in the establishment of the National Coalition for the Elimination of CSEC in Indonesia named ECPAT Indonesia. The objective of this coalition is: "*to eliminate child prostitution, child pornography and child trafficking for sexual purposes and to push community members and government to ensure the fulfillment of children's basic rights and protection from sexual exploitation*".[96]In 2005, the National Coalition was acknowledged as an Affiliate Member Group of the ECPAT International Network. ECPAT Indonesia is a network of 24 members, 20 NGOs in Indonesia and 4 individuals who are working in the field of CSEC. These organisations are spread over 11 provinces in Indonesia: Aceh, North Sumatra, Lampung, Kepulauan Riau, Jakarta, West Java, East Java, Central Java, Yogyakarta, West Kalimantan and West Nusa. The network does not cover all areas where child trafficking takes place because in these areas there is no (trustworthy) NGO working on CSEC.[97]

**GSS**

The Good Shepherd Congregation was founded in 1835 in Angers (France) by Zr. Mary Euphrasia Pelletier. It is an international congregation with about 5,000 members and it operates in 73 countries on five continents. The Good Shepherd Sisters in Indonesia are founded in 1927 and are active in 8 different locations in Indonesia: Jakarta, Tangerang, Bogor, Bantul (near Yogyakarta) and Yogyakarta on Java, Marau (Kalimantan near Pontianak), Ruteng (Flores) and Batam (Riau Islands).[98] The vision of Good Shepherd Sisters is to "*make visible the merciful God, the very best friend of each person who is wounded, marginalized, and morally fragile".* [99] Good Shepherd Sisters mission is: "*We are committed to reaching out each person with respect to living values and human dignity. We also bring the spirit of reconciliation be with our selves, other person, nature, and the almighty God."* Their goal is to bring: "*Services to those who are marginalized and broken, especially women and children*." [100]

**Institut Dayakologi (ID)**

Institut Dayakologi engages in the struggle for the right to self-determination and preservation of the Dayak culture. Through empowering the Dayak community with knowledge; advocating for the Dayak cause and enhancing peace in the community the Institut Dayakologi raises awareness in the community about the value and potential of the Dayak culture in contributing

[95] Mensen met een Missie (2012) Beoordelingsmemo incl. kenschets ECPAT Indonesia 2012 – 2013 - Onderzoek, monitoren en rapporteren cases m.b.t. seksuele uitbuiting van kinderen

to humankind; in its own and traditional way of doing so[101]. The vision of ID is *"The Indigenous peoples - the Dayak peoples in particular - are able to determine and manage their social, cultural, economic and political in together in the spirit of love to struggle for their dignity and sovereignty"*[102]. The mission is *"To conduct research and/or advocacy in the spirit of education, independency and solidarity for the revitalization and restitution of the Dayaks' existence".*[103] In order to maximize the role of "encouraging the advocacy and dissemination of Dayak culture as well as encouraging the better recognition of the Dayak culture and indigenous rights at home and abroad", Institut Dayakologi has strategic actions such as building up a multi-level network approach in order to broaden the impact of its actions. Institut Dayakologi expects "that the advocacy of indigenous peoples' cultural revitalization, environment and natural resources management, as well as efforts to build peace and transformation can work more effectively owing to the supports of various parties, at local, national and international level"[104].

**Lembaga Kita**

Lembaga Kita was founded in 2007 by Sister Antonie, the head of the congregation Putri Maria and Yosef (PMY).[105] The organisation resulted from multiple collaborations, initiated by Sister Antonie since 2001, in the field of gender-equality promotion in Indonesia. Lembaga Kita can be best described as a network-organisation that facilitates and coordinates multiple gender-related programs in and around Wonosobo (Java), all under the supervision of PMY[106]. The organisation consists solely of volunteers who do their work in three villages because of their social engagement. Strategy and activities are designed together with the Sisters PMY. They also guide the Lembaga Kita team in the implementation. The vision of Lembaga Kita is: "*To embody gender equality and gender justice collectively".*[107] The mission of Lembaga Kita is: "*protection and empowerment for women and children, mainstream gender in policy and development, social empowerment for women and children*".[108] Lembaga Kita aims to: "*create a safe and caring environment and society for women, to help and empower victims of gender-*

[105] The Congregation of the Daughters of Mary and Joseph was founded in 1820 and is active in The Netherlands and in Indonesia. The Congregation in Indonesia, *Putri Maria and Yosef* (PMY), is led by Sister Antonie who resides in the Wonosobo community of Sisters. PMY consists in of seven communities and a noviciate, all on Java. The community of Sisters in Wonosobo also leads the Dena-Upakara boarding school for deaf and hearing-impaired children can be found. The community of Sisters in Yogyakarta works at the Helen Keller Institute, an institute for the care and education of deaf-blind children.

*based violence, to (economically) empower women and improve cooperation between various parties and networks.*

**PT.PPMA**

PT.PPMA is a non-profit organisation established in 2001. The underpinnings for PT.PPMA originates from 1988 when *Yayasan Kerjasama Pendidikan Hukum Kritis Irian Jaya* (YKPHM-Irja). YKPHM focussed mainly on increasing the knowledge of indigenous communities in Papua on their rights and educate them on sustainable management of ancestral land and natural resources. During a workshop in 1997, funded by Hivos Netherlands, it was recommended that YKPHM should expand their activities such as socio-cultural, political and economic management of environment and natural resources as well as human-rights and gender equality. As a consequence of this expansion a new organisation was initiated: *"Lembaga Pengkajian dan Pemberdayaan Masyarakat Adat Irian Jaya (LPPMA-IRJA)"/*"The Institute for Irian Jaya Indigenous People's Study and Empowerment". In 2000, LPPMA-IRJA decided to change their institutional organisation to set an example of democratization and transparency. The ownership of the organisation shifted from the founder of the organisation to the members of the organisation. In 2001, this resulted in the establishment of PT.PPMA.[109] PT.PPMA has a long record of working in the field of sustainable forest management and particularly participatory mapping. The vision of PT.PPMA is: "*Indigenous Community men and women in Papua are able to organise themselves and thus to strengthen themselves and the negotiating position of indigenous communities, and also able to develop independently based on their own resources: natural resources, political, social, cultural and economic resources, aspiring to fairness, clear sovereignty over resources, and a sustainable and improved quality of life, without violence*" [110]. The mission of PT.PPMA is: "*Increase the ability and skills of indigenous communities, so that they can develop themselves based on the potential of their resources: natural, political, social, culture and economic whilst fairly achieving an improved quality of live in sustainable way without violence*."[111]

**Rifka Annisa**

Rifka Annisa, meaning "Friends of Women", was founded in 1993 and is based in Yogyakarta. Rifka Annisa's vision is*: "to realize a gender just society that does not tolerate violence against women through the principles of social justice, consciousness and awareness, independence, integrity and preserve local wisdom."*[112] Rifka Annisa's mission is: "*to organise women in particular and society in general to eliminate violence against women and creating gender equitable society through the empowerment of women victims of violence, including children, elderly, Lesbians, Gays, Bisexuals, Transgender and other, and increase public awareness and*

*involvement through education and strengthening critical network."* [113] Rifka Annisa provides services to victims of GBV through (initiation of community-based) crisis centres, counselling to both victims and perpetrators (male groups) legal assistance and women support groups. In addition, Rifka Annisa aims to develop a strong network of health care providers, police and legal aid organisations and to improve the capacity of their partners by providing for example training programs. At the same time Rifka Annisa is strongly advocating against violence and especially violence against women through the media (film production, photo exhibition etc.). They also aim to influence local government to implement gender responsive policies. [114].

**Wetlands International Indonesia (WIIP)**

Wetlands International Indonesia (WIIP) is part of the umbrella organisation Wetlands International (WI). The organisation that later became WI was founded in 1937 under the name of Wildfowl Inquiry. The organisation has been involved in environmental protection since then. WIIP works with communities at village to district level, assessment on community vulnerability and capacity, maintaining of group dynamic and works, trainings, environmental campaign, development of village regulation as well as development of community livelihood and ecosystem restoration (Bio-Rights). Wetlands International Indonesia works with 194 households/ communities in 6 coastal villages and 1 upland village in Flores Island and 1 learning site in Banten Province. During this period, WIIP put many efforts to develop good networking on the integration of Climate Change Adaptation, Disaster Risk Reduction and Ecosystem Restoration and Management. Partnerships have also been built with various relevant stakeholders, including land lords, enabling better environment for the introduction and implementation of the proposed programme. Continued efforts on communication and consultation with relevant local government institutions have resulted into good progress on the development of village regulation and establishment of Village level Disaster Response Team.[115] The vision is that ' Wetlands and water resources are conserved and managed wisely so that the various values and environmental services can provide benefits for biodiversity and human life in a sustainable manner'. The mission is to preserve and maintain wetlands, including resources and biodiversity.

**Yadupa**

In 2000 the Second Papua Peoples' Congress was held, from which, two years later, the Papua Customary Council (Dewan Adat-DAP) came into being. The objective of the DAP council is to peacefully fight the violations of the rights of the Papua indigenous people by emphasising Papua's key assets such as its traditions, culture and natural resources.[116] Initially, DAP's mandate was to struggle for the basic rights of Papua indigenous people and one of the concerns was preservation of culture knowledge to the Papuan youth. It was in this context

[116] Historical Time line developed by Evaluation Team based on conversations with Yadupa staff (2012)

that Yayasan Anak Dusum (Yadupa) came into existence. It was registered in 2003. Until 2005, Yadupa staff mostly consisted of DAP activists and since 2007 Yadupa received a permanent staff from Papuan youth graduated from University. During the first years of its existence, Yadupa's activites consisted mostly of rallies, marches and protest during which they claimed to protect the right of indigenous people. The period 2005 – 2007 was transitional during which Yadupa began to engage in development programs but still participated in the movement.[117] The vision of Yadupa is 'Realization of Papua Indigenous People who have strong Cultural Identity, Sustainable Environment and to be central actors in development processes.' [118] The mission is that 'YADUPA is one of the Papuan youth organisation that active in strengthening the cultural identity of Papua, economic development and environmental protection.'[119] Yadupa's motto is: The young generation of Papua for Papua's future.

**Yayasan Kelola**

Yayasan Kelola is a *"national arts service organisation"*[120] operating in Indonesia. Out of a population of approximately 240 million inhabitants over 2800 Indonesian cultural organisations are registered[121]. The vision is **"**Kelola aims to celebrate, nurture and promote the creativity of Indonesian artists and arts practitioners working in visual arts, music, dance, theatre and film. Through programs with a focus on educational activities, while engaging in cross-cultural dialogue, Yayasan Kelola aims at promoting cultural diversity"[122]. The mission is "To develop its programs in response to the needs and concerns articulated by the Indonesian visual and performing arts as well as by the film communities. As the needs of the communities shift and change, Kelola's programs change in response. Promoting cultural exchange by facilitating artists and art practitioners' engagement in dialogue, so as to gain and share skills and knowledge is also a focus of Yayasan Kelola. Finally, Yayasan Kelola aims at building networks within Indonesia as well as in the international cultural communities"[123].

**YPI**

Yayasan Pelita Ilmu (YPI), which was established on December 4, 1989, focuses on improving Sexual and Reproductive Health and Rights (SRHR) knowledge among the youth (15 – 24 year old) in Indonesia. With this aim YPI fills a much needed gap as SRHR education for youths is not widespread in Indonesia. Yayasan Pelita Ilmu (The Pelita Ilmu). The vision is 'To be a reputable and consistent institution in creating a society that has healthy-life behaviour, is independent

and productive as well as providing quality health services.[124] The mission is 'Empowering society to combat HIV and AIDS through education, assisting, outreach, and livelihood based on the principles of participation, partnership, equality, transparency and accountability.'[125]

**YRBI**

In 1995 YRBI was established by 4 founders concerned in empowering indigenous institutions, agriculture and environment[126]. YRBI envisions a community that *"will be able to manage natural resources independently and develop the potential of the region to achieve the prosperous life in a fair way"*[127]. The mission includes: strengthen the management of natural resource and the area; strengthening of civil based economy; strengthening of local values; strengthening of public policy with community justification based; strengthen the solidarity among social community.

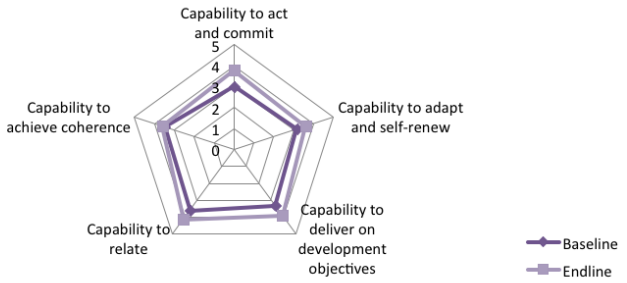
### 3.3.2. Changes in partner organisation's capacity and reasons for change (evaluation questions 1 and 4)

This section describes the main findings for the first evaluation question: What are the changes in partner organisations' capacity during the 2012-2014 period? And the fourth evaluation question: "What factors explain the findings drawn from the questions above?"

These questions are mainly addressed by reviewing standard indicators that have been developed for each of the five core capabilities, which make up the capacity of an organisation (see also Annex H). Through a mix of methods (self-assessments – SPO staff; interviews with SPO staff and externals; document review; observation), data have been selected on whether and what changes have taken place in these indicators since the baseline in 2012. See also a description of the methodology in Annex F. The main findings and conclusions are described below. In addition to reviewing standard 5C indicators, the evaluation team facilitated a discussion on what the organisation perceived as the key organisational capacity changes since the baseline, and how these changes have come about. Key findings are also explained below.

#### *Changes in terms of the five core capabilities*

Below you can see how each of the SPOs changed since the baseline in terms of their average capability and specific indicators.



**ASB**

Since the baseline, two years ago, ASB has seen most changes in the capability to act and commit (see Figure 6). Better task delegation, clearer job descriptions and strategic planning have helped ASB's leadership in organising staff and program activities better. The capability to adapt and self-renew also slightly improved through the improved application of M&E and the

[124] Evaluation Team (2012) Historical Timeline
[125] Evaluation Team (2012) Historical Timeline
[126] Historical time line developed by Evaluation team (2012)
[127] YRBI (2010) Profil_English version

establishment of a diversity communication forum, through which ASB can easier keep track of developments amongst its beneficiary communities. The capability to deliver on development objectives has improved through more systematic working. Day to day activities have been more aligned to the organisation's strategy and each other. In the capability to relate ASB's improved in its networking capacity. More stakeholders are engaged in the development of policies and strategies, which is a very slight improvement compared to the baseline. New partnerships with academia have strengthened external relations and opened up new opportunities. Finally, ASB has very slightly improved in its capability to achieve coherence. Operational guidelines of ASB have slightly improved with the introduction of standard operating procedures for all divisions.

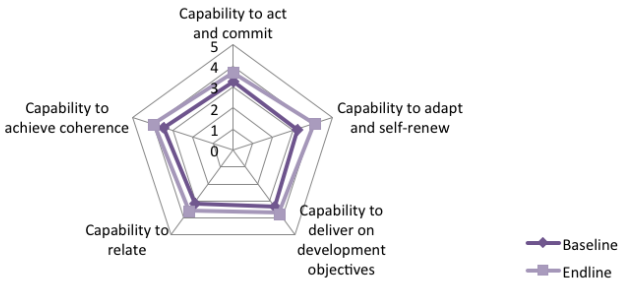


**Figure 6: Changes in the capability to act and commit (ASB)**

**ECPAT**

Since the baseline, two years ago, ECPAT has seen a slight improvement in the capability to act and commit (see Figure 7). The change in leadership style brought about more open communication between staff and management and more room for feedback. Staff turnover remained high, whilst day to day operations were more in line with the strategic plan and supported by new SOPs. ECPAT has very slightly improved in its capability to adapt and self-renew, which was mainly due a clear M&E protocol being in place for 2014 and onwards. ECPAT staff has also developed its M&E competencies, and is more aware of developments in their environment. A slight improvement occurred in the capability to deliver on development objectives as well: clear operational plans have been developed in the form of an implementation work plan and budget plan to control the execution of activities. Delivering planned outputs has improved as virtually all objectives have been met, particularly in the CSEC case program. The capability to relate improved somewhat as a result of better coordination of with partners and stakeholders. Strong lobby activities ensured strong ties to key government and policy makers. Informal communication amongst the staff is now stronger and helps them connect and discuss programmatic issues. Finally, ECPAT has realised a slight improvement in the capability to achieve coherence through its operational guidelines. In 2013 ECPAT hired a consultant to support them to improve the management system and develop several new sets of standard operating procedures in terms of finance, HR and program procedures.

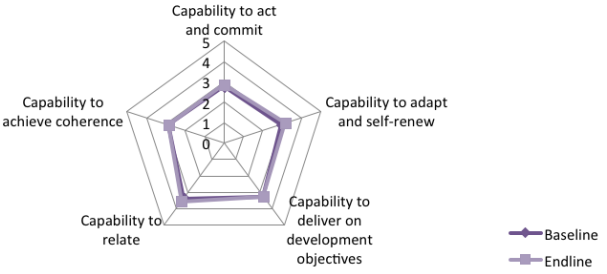

**Figure 7: Changes in the capability to act and commit (ECPAT)**

**GSS**

Since the baseline, two years ago, GSS has seen a slight improvement in the capability to act and commit (see Figure 8). A greater number of training opportunities have increased staff skill and promoted the sharing of knowledge amongst sisters and volunteers. The capability to adapt and self-renew has slightly improved now that M&E application and understanding has improved. No changes occurred however in terms of the capability to deliver on development objectives. The capability to relate improved very slightly as GSS focused its engagement on its biggest area of influence: the Catholic Church. Overall more engagement with target groups has taken place as well. No change has occurred in the capability to achieve coherence.

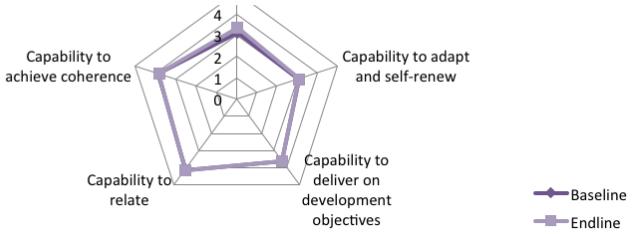

**Figure 8: Changes in the capability to act and commit (GSS)**

**Institut Dayakologi (ID)**

Since the baseline, two years ago, Institut Dayakologi has only seen changes in the capability to act and commit (see Figure 9). A slight improvement occurred in this regard. This was particularly through a change in staff turnover as a result of several senior staff members resigning. New, younger staff was attracted to replace these functions, which resulted in overall lower costs of wages, more training opportunities and better communication between staff members and management. No further changes occurred in any of the other four capabilities.

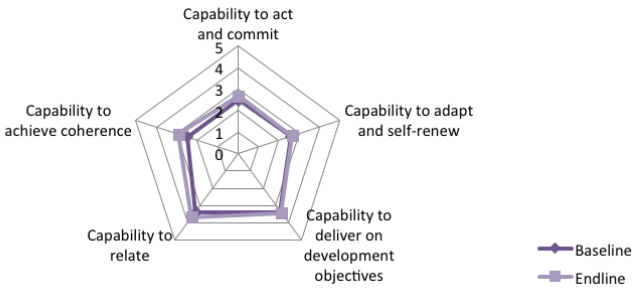

**Figure 9: Changes in the capability to act and commit (ID)**

**Lembaga Kita**

Since the baseline, two years ago, Lembaga Kita has seen a slight improvement in the capability to act and commit (see Figure 10). The organisational structure of the organisation improved with the addition of a new Steering Committee and Organisation Committee and clearer responsibilities between the two. Training opportunities also improved with the addition of training on human trafficking by IOM and training in PME by Mensen met een Missie. The capability to adapt and self-renew has improved slightly in terms of freedom for ideas as well as the system to track the environment as Lembaga Kita has made an extra effort to gather stakeholders in villages to thoroughly assess their situations. In the capability to deliver on development objectives a slight improvement occurred. In terms of delivering on planned outputs for example, Lembaga Kita has started to reap the rewards from their intensive door to door policy to gain trust from local communities in their output planning. The capability to relate improved slightly due to more frequent engagement with beneficiaries, as well as better internal communication through the fusion of field offices which encouraged staff members to talk and share more frequently. The greatest improvements occurred in the capability to achieve coherence. The organisation's focus has broadened to now also include anti-trafficking issues. Since the restructuring of the organisation, job and task descriptions have been specified and made clearer and are now documented, but not yet developed in the standard operating procedures. A very slight improvement also occurred in mutually supportive efforts. Lembaga Kita attempts to go beyond solving the problem on its own. For instance, they don't just warn communities for the dangers of trafficking, but also attempt to remove the reasons why people sometimes fall victim to it. They try to give them good opportunities in life.

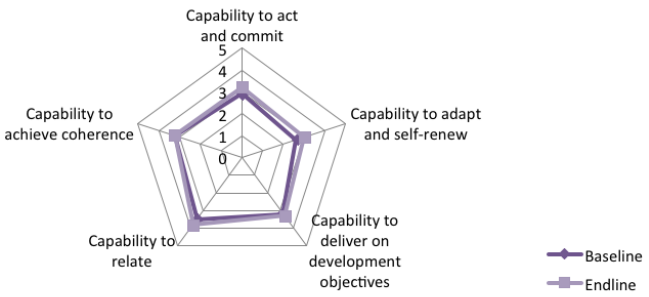

**Figure 10: Changes in the capability to act and commit (Lembaga Kita)**

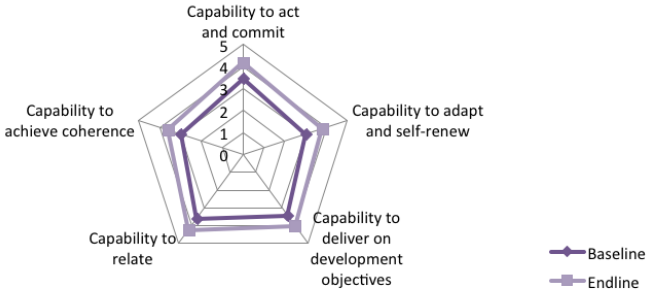
**PT.PPMA**

Since the baseline, two years ago, PT.PPMA has seen some improvement in the capability to act and commit (see Figure 11). Responsive leadership improved slightly after a turbulent change in management of the organisation after the passing of the late director and losing IUCN's funding. The new leader enabled staff to feel free to express their ideas and be included in the development of proposals. This resulted in successfully acquiring short term funding from IFACS and "Partnership" between 2012 and 2014 for eco-forestry and the mapping of indigenous territory, as well as advocacy towards local government. Through new donor funded training, staff skills have improved slightly. A slight improvement took place in PT.PPMA's capability to adapt and self-renew. A slight improvement in M&E competences has been achieved through a training in 2014 by Partnership. The capability to deliver on development objectives has improved slightly. The lack of funding has provided a clear impulse to be cost-effective. Delivering planned outputs has however slightly deteriorated. PT.PPMA was unable to deliver or accomplish the planned outputs of the program funded by IUCN. Lack of responsiveness in reporting to the CFA caused the ending of IUCN funding. PT.PPMA on the other hand was unable to fulfil these reporting requests due to a lack of internal coordination and knowledge to provide the required information. Monitoring efficiency has improved in that the lessons and experiences with IUCN do not want to be repeated. PT.PPMA now emphasises coordination and program management more. The capability to relate has slightly improved. PT.PPMA now has closer connections to the local authorities, and internally, staff can relate easier to the new director. No changes have occurred in terms of the capability to achieve coherence.

**Figure 11: Changes in the capability to act and commit (PT.PPMA)**

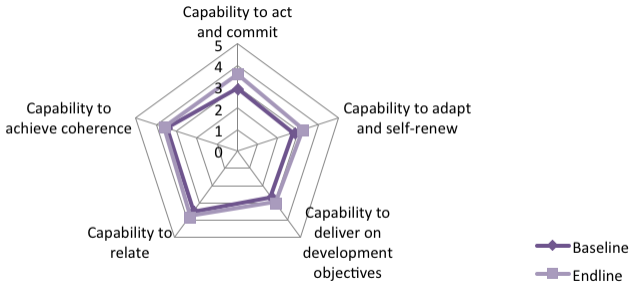


**Rifka Annisa**

Since the baseline, two years ago, Rifka Annisa has seen an improvement in the capability to act and commit (see Figure 12). The relation between upper management and staff has improved, with considerable improvements in strategic guidance and responsive leadership as a result. Staff turnover has improved and been reduced as a result of more focus on capacity building activities, which also led to greater staff skills. Employment benefits increased, whilst funding sources improved very slightly with the adoption of business programs to generate income and become less dependent of donors and more self-sufficient. The capability to adapt

and self-renew has improved overall. M&E tools have been developed and consistently applied, although Rifka Annisa still needs to step further building an effective MIS, database and knowledge management system. Rifka Annisa is also more aware of its surroundings through increased public discussions and knowledge sharing. The capability to deliver on development objectives has improved through more efficient operations and timely delivery of planned outputs. The capability to relate has also improved. This was achieved through various new relations to authorities and stakeholders at all levels of government. Engagement with target groups through the application of social media has aided in reaching out to new beneficiaries. In the capability to achieve coherence, operational guidelines have slightly improved as they are laid down in standard operational procedures (SOPs), for example in a finance manual and a method for setting up a referral system to other organisations.

**Figure 12: Changes in the capability to act and commit (Rifka Annisa)**



**WIIP**

Since the baseline, two years ago, WIIP has seen an improvement in the capability to act and commit (see Figure 13). The leader has gained extensive experience, is strong and dedicated, and able to maintain good relationships with other parties. Staff turnover has improved and more staff members now work for WIIP with permanent contracts. Overall, employment benefits have increased and the organisation is now more in line with the Indonesian labour law. Strategic plans at project level have been well developed and implemented. Funding procedures have been improved slightly after 2012. The capacity to adapt and self-renew has improved the most out of all capabilities. Systematic M&E is applied at the project level consistently, and M&E competencies have increased slightly. WIIP is employed by other NGO's to evaluate and monitor other projects in Indonesia. Considerable improvement was made in terms of tracking the organisation's environment: WIIP has increased their networks and is up to date about development in various areas and fields of work. In the capability to deliver on development objectives, a slight improvement took place. Cost-effective resource use has slightly improved, as well as a slight improvement in mechanisms to meet beneficiary needs: WIIP now determine field projects based on thorough assessment of needs and perspectives of local communities and stakeholders. Considerable improvement has occurred in terms of balancing quality and efficiency, as WIIP in some cases used the organisation's own money to cover budget gaps in case of cost-exceeding projects to maintain good quality of results. The

capability to relate has also slightly improved. Stakeholders are more involved in policies and strategies and engagement with government and NGO's has intensified. Internal relations have improved through a policy to communicate more face-to-face, and less through email and telephone calls. The capability to achieve coherence has slightly improved through the adoption of new operational procedures related to finance and HRM. Staff agrees that WIIP has been able to successfully align its vision and mission with that of Wetlands International. Mutually supportive efforts have been considerably improved through the cross-project coordination.

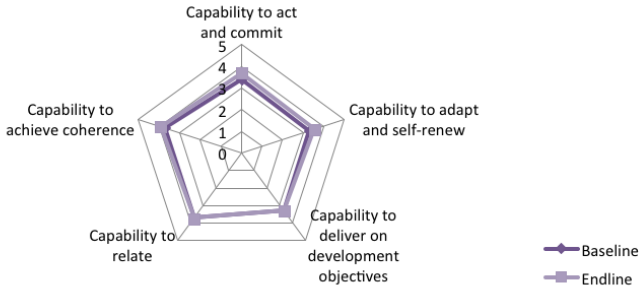


**Figure 13: Changes in the capability to act and commit (WIIP)**

**Yadupa**

Since the baseline, two years ago, Yadupa has seen most improvements in the capability to act and commit (see Figure 14). The organisation has been able to stabilize its staff turnover and maintain some of its talent. Staff has been more involved in the implementation of the strategic plan. Various donors support the organisation now through additional funding sources, which has resulted in more training opportunities for the staff. The capability to adapt and self-renew has improved very slightly. This was mostly due to the development and more systematic use of new M&E formats and financial monitoring practices. M&E competencies improved through several training workshops. No changes were reported on the capability to deliver on development objectives and on the capability to relate. The capability to achieve coherence improved very slightly. This occurred mostly due to the revision of the strategic plan in December 2014, as well as more strict application of day-to-day financial guidelines.

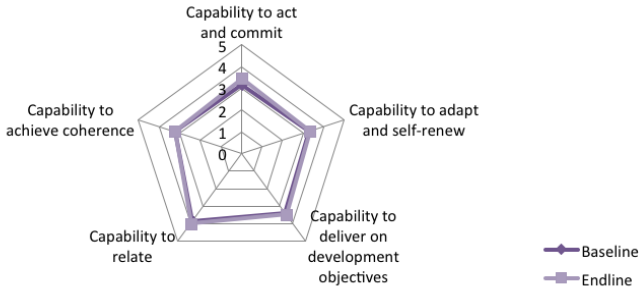

**Figure 14: Changes in the capability to act and commit (Yadupa)**

**Yayasan Kelola**

Since the baseline, two years ago, Yayasan Kelola has seen a slight increase in the capability to act and commit (see Figure 15). The director's leadership is more approachable and attentive, staff skills have improved, and new funding sources have been acquired. In terms of the capability to adapt and self-renew a slight improvement has also occurred as M&E is performed more regularly and systematically. The capability to deliver on development objectives has very slightly improved as a result of more cost-effective use of resources. The capacity to relate has improved slightly as well as the organisation has engaged in more networking activities with prominent organisations and is now starting to get more recognized. No changes have occurred in the capability to achieve coherence compared to 2012.

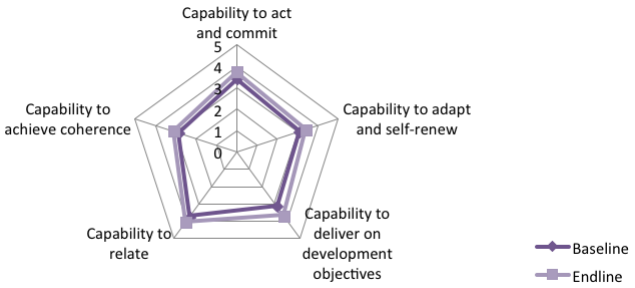

**Figure 15: Changes in the capability to act and commit (Yayasan Kelola)**

**YPI**

Since the baseline, two years ago, YPI has seen a slight improvement in the capability to act and commit (see Figure 16). The merging of offices has made coordination between staff and management easier. Leadership has become more responsive and open. Better M&E approaches in developing work plans and strategies has aided in terms of articulating strategies. Staff skills improved slightly due to several trainings and YPI's funding procedures have improved slightly through the construction of a self-sustaining business unit that assists in fundraising and ensures financial sustainability of the organisation. The capability to adapt and self-renew improved slightly as well. This occurred mainly through more structured M&E practices in terms of a clear reporting and monitoring system. Staff has become more skilled in data collection and reporting. On the capability to deliver on development objectives, YPI has shown the greatest improvement. The cost-effective use of resources has greatly improved through a variety of new policies. The implementation of operational plans has improved resulting in better delivery of planned outputs, and a monitoring system is in place to ensure that quality and efficiency in activities remains balanced. The capability to relate has slightly improved due to greater engagement with stakeholder groups and beneficiaries, particularly youths and government. The capability to achieve coherence has only resulted in very slight improvements, particularly as in 2013 the organisation's vision, mission and strategies were reviewed and re-evaluated.

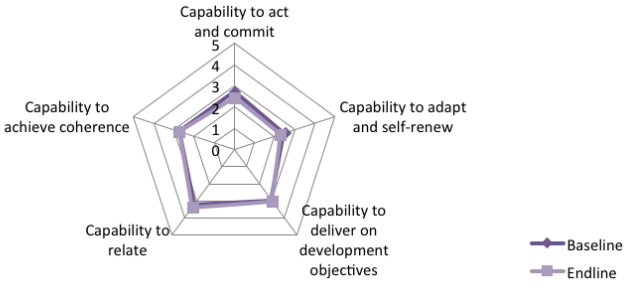

**Figure 16: Changes in the capability to act and commit (YPI)**

**YRBI**

Since the baseline, two years ago, YRBI has seen most changes under the capability to act and commit (see Figure 17). Overall a slight deterioration took place as compared to the baseline, although some positive developments were found as well. Changes in the staff composition, including the leadership position, created a positive change in responsive leadership and internal communication, but a negative change in staff turnover, strategic guidance and the articulation of strategies. No new funding sources have been found after the ICCO contract ended which left the organisation unable to act or perform. In terms of the capability to adapt and self-renew, a very slight deterioration took place. This could be attributed largely to the deterioration in terms of critical reflection. Less meetings, and opportunities for feedback from colleagues to management were the main reasons for this. The capability to deliver on development objectives has effectively remained unchanged. This was because although operational plans have become clearer, the efficiency of monitoring has slightly deteriorated. The capability to relate has very slightly improved. YRBI has expanded its network to several new networks and groups, but does not have the resources anymore to continue to engage with its target groups. Internal relations within the organisation have improved. No changes occurred in terms of the capability to achieve coherence since the baseline in 2012.

**Figure 17: Changes in the capability to act and commit (YRBI)**

**Summary**

All in all, changes took place in all the five capabilities, for most of the SPOs, as can also be seen in Table 8, and most of these changes were slight improvements. There were a few exceptions. For Institut Dayakologi no change took place in terms of the average for four of the capabilities. For GSS, Yadupa, and Yayasan Kelola no changes took place in two of these average capabilities. The picture for YRBI is very different from the others, since no changes took place in two capabilities, and a slight deterioration took place in two other capabilities. For 6 (50%) of the SPOs (slight) improvements took place in all of the capabilities: ASB, ECPAT, Lembaga Kita, Rifka Annisa, WIIP, and YPI. WIIP has seen most progress, since in all of the capabilities changes of more than 0.5 have taken place. For ASB and ECPAT also did well, since in three capabilities the progress was 0.5 or more. It must be noted that within these capabilities, and related to the specific indicators, mainly improvements but also some deteriorations have taken place. This is very much specific to the organisation. For specific details about each SPO, we refer to the specific 5C reports.

**Table 8: Changes in terms of average capabilities**

| Changes in terms of average capabilities | ASB | ECPAT | GSS | INSTITUT DAYAKOLOGI | LEMBAGA KITA | PT.PPMA | RIFKA ANNISA | WIIP | YADUPA | YAYASAN KELOLA | YPI | YRBI |

### *Key organisational capacity changes as perceived by the SPO - general causal map*

For each organisation, a discussion with staff was facilitated, so as to understand what they perceived as the key organisational capacity changes in the organisation since the baseline, and how these changes have come about. It was expected that this would provide a comprehensive story for the SPO on what they perceived as the most important changes as well as providing reasons for change, which were difficult to surface from the 33 standard indicators. It must be noted that this information has not been verified with other sources of information, as has been done with the process tracing as explained in the next paragraph. Below you find the results per SPO.

**ASB**

During the endline workshop some key organisational capacity changes were brought up by ASB's staff: the provision of health insurance (BPJS) linked to investments; increased job security, through more permanent staff contracts; improved staff capacity to implement programs. Within two of these organisational capacity changes, changes overlap with the key organisational capacity changes that were selected for process tracing because they were linked to MFS II funded capacity development interventions, namely the capacity to manage the organisation. More details can be found in the relevant section below.

The overall organisational capacity change to be more recognized as an organisation focused on pluralism issues, with its underlying 3 organisational capacity changes mentioned above, can only be partially attributed to MFS II supported capacity development interventions. In particular the MFS II (Hivos) funded strategic planning workshop has played an important role in terms of the change in leadership style and having a strategic planning document. Furthermore, Hivos (MFS II) supported the revision of the financial standard operating procedures (SPOs), which ultimately supported getting more funds for program implementation, more staff, better staff welfare and job security. However, non-MFS II funded interventions such as the TIFA foundation (in this case trainings supported and funded partially by external funders) in the field of finance and communication also played an important role in these changes. It can be said that the MFS II capacity development interventions contributed more to the strategic organisational changes, whilst other interventions provided more change at an operational level.

**ECPAT**

During the endline workshop some key organisational capacity changes were brought up by ECPAT's staff: professionalization of the organisation; expansion and sustaining of donors; more effective advocacy; improved staff capacity for CSEC case monitoring. Professionalization of the organisation occurred mainly due to the improvement of ECPAT's financial system and staff management. Both factors can be partially attributed to the development of the secretariat on the one hand, and the development and expansion of program activities on the other. Both these factors can be attributed in part to MFS II funding, whilst funds from the

Bodyshop Indonesia were also applied. Improved program management and implementation capacity also led to the professionalization of the organisation, and could be attributed to a specific MFS II intervention in the form of a capacity scan carried out by Mensen met een Missie in 2012. In addition the hiring of new manpower of the organisation as part of the MFS II funded legal service unit program, has also led to organisational capacity change in the form of improved job descriptions, functioning of the secretariat and ultimately the improved program management and implementation capacity. The expansion and sustaining of donors can be attributed to the fact that donors credited ECPAT's work more frequently, which significantly raised their profile amongst other potential partners and donors. This was enabled by better program implementation, made possible through the strategic planning 2011-2014 as well as the staff's capacity improvements to manage programs, their knowledge on CSEC as well as the lobby and negotiation skills. This was in turn enabled by the program becoming more diverse and larger in scale, which was enabled by Mensen met een Missie's support in developing ECPAT's program. The development of ECPAT's program and secretariat were both due MFS II funding and funding from The Bodyshop Indonesia, although not specific MFS II capacity development interventions. More effective advocacy can be attributed to ECPAT having a better bargaining position in their negotiations with authorities. This came about from the support and recommendations from ECPAT International, the expansion of the national network, as well as more information about the organisation and their activities being distributed. This can be attributed to becoming more recognized by various stakeholders in Indonesia after the program has expanded and became more diverse, largely funded with MFS II funds. However, no MFS II funded capacity development interventions were specifically mentioned under this organisational capacity change. Lastly the improved staff capacity for CSEC monitoring was enabled by an increased ability to conduct written documentation, raising the awareness about CSEC issues, and having a monitoring instrument in place. The former two changes were the result of assisting the reflection process of the law unit service, the latter through a better understanding about monitoring CSEC issues of the program staff. Strengthening the ECPAT monitoring and investigation efforts contributed significantly to this. Both these changes can be attributed to the development of program documentation, as part of the program diversification and expansion funded by MFS II. These are not organisational capacity development interventions, but through staff's experience of being involved in these projects their understanding in conducting investigations, monitoring and reporting on CSEC cases has improved and they have been able to develop a monitoring instrument for CSEC cases. Therefore, their capacity has been built not through specific organisational capacity development interventions but rather through the experience in these 2 projects.

**GSS**

During the endline workshop some key organisational capacity changes were brought up by GSS's staff: more effective work performance and improved case handling. GSS has become more visible on the issues of single moms and trafficking largely due to the increased trust from stakeholders (donors, beneficiaries and partners). This can be attributed to more effective work performance, improved case handling and the fact that GSS has a better

position in its network, which has allowed them to reach out to new partners, form new alliances and overall streamline operational processes. More effective work performance resulted from better financial management, better job descriptions and better program directions. These last two developments can be attributed to improved organisational management skills, whilst better program directions resulted from the development of impact indicators as a result of better monitoring and evaluation. Mensen met een Missie supported GSS with a one week training on M&E in 2014, which contributed to this capacity improvement. The underlying improved organisational management skills came from improved staff capacity, which can be attributed to the sharing of knowledge from volunteers to the sisters. This in turn can be attributed to more volunteers being involved in GSS (supported by MFS II capacity training on anti-trafficking), as more RGS communities are collaborating with GSS, and the more active role that GSS plays in its network. Improved case handling was enabled by improved advocacy skills and better technical support from GSS's network. Whilst the former results from the improved staff capacity, the latter is the result from a wider network, which enabled more support, as well as the direct support from three main dioceses. In conclusion, according to the GSS staff present at the endline workshop, MFS II capacity development interventions can be tied to several of the organisational capacity changes as indicated by the SPO, although GSS did not specify exactly how. This was not the purpose of this particular exercise, since GSS was not selected for process tracing.

**Institut Dayakologi (ID)**

During the endline workshop some key organisational capacity changes were brought up by Institut Dayakologi's staff: improved secretarial coordination and support, improved staff morale, strengthened role as a networking hub for advocacy on Dayak communities and culture, increased executive team's capacity to develop proposals, improved staff decision-making process, more qualified human resources. According to the SPOs staff, MFS II funded capacity development interventions for program support have contributed to organisational capacity change in several ways, both directly and indirectly. The supported training interventions to increase staff capacity in the competencies to document and spread information to the public has contributed significantly to inspiring the community to think back to the Dayak culture and indigenous customs, that has helped improve program implementation and achievements. On the other hand the continuous support of Cordaid in reconstruction by rebuilding the offices, infrastructure and office structure have helped in improving day to day operations of the secretariat, strengthened the role of Institut Dayakologi as a networking hub and improved staff morale, all leading to improved program implementation and achievements. Although the 5C indicators in the previous section don't show great change for the organisation, the general causal map highlighted that MFS II support has certainly contributed to strengthening the organisational capacity and laying the foundation for increased capacity to mobilize resources for operations and program management of Institut Dayakologi. However, it must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect.

**Lembaga Kita**

During the endline workshop some key organisational capacity changes were brought up by Lembaga Kita's staff: a more visible organisation through the implementation of the community assistance model; and greater recognition amongst stakeholders through the systematic production of documentation. The organisation becoming more visible with the more accepted community assistance model can be attributed to the increased trust in the organisation. This was enabled by the beneficiaries being more satisfied with better services provided, which was the result of better staff working performance and a quicker response to beneficiaries' concerns. Increased staff working performance can be attributed to the change in the incentive system, better outputs achieved and increased community participation in the programming. Lembaga Kita has become more recognized by stakeholders through the production of documentation as a result of better documentation of data. This initiative can be attributed to the change in organisational management that took place. Various changes were indicated by the SPO that can be linked to one of the MFS II capacity development interventions by Mensen met een Missie: the organisational capacity scan that took place after the external MFS II 5c baseline in 2012. This influenced the change in organisational management, improved its organisational profile and brought about a change in the Community Assistance Model, which are the main underlying reasons for these key changes in the organisation, as perceived by the SPO. The CFA indicated that other capacity development interventions took place, including several trainings, but these could not be directly linked to the mentioned key organisational capacity changes mentioned in the general causal map, and process tracing was not carried out for this SPO since the SPO was not selected for this.

**PT.PPMA**

PT.PPMA was selected for process tracing but since no capacity development interventions were carried out by IUCN since the baseline, it was decided a 'general causal map' would be developed based on input from the SPO staff, but where possible, also with additional references. Therefore this part has been described under process tracing in the section below, even though the procedure for process tracing could not be adequately applied in this particular case.

**Rifka Annisa**

During the endline workshop some key organisational capacity changes were brought up by Rifka Annisa's staff: staff being more productive and involved in the organisation's decision-making; greater motivation for staff to get promoted; staff being motivated to improve their facilitation skills; improved quality of monitoring and evaluation and a stronger partnership with local authorities in form of a signed MoU. According to the SPO staff, these changes can partly be attributed to MFS II funded capacity development interventions, in particular in relation to improved monitoring and evaluation in the organisation. This specifically refers to the MFS II funded training on M&E and more particularly the development of M&E tools. The development of these tools was an MFS II funded capacity development intervention by

Rutgers WPF, and can be attributed to the Donor requirement to adopt Results Based Management in program implementation. Furthermore, specific issues that required organisational development, were found in an MFS II funded organisational capacity scan that has led to some changes in the way staff performs. However, this has also been affected by other developments such as a major change in leadership as well as a greater focus on facilitation skills.

**WIIP**

During the endline workshop some key organisational capacity changes were brought up by WIIP's staff: Improved staff capacity in their respective roles and fields of work; increased communication on WIIP and wetlands issues; improved collaboration and networking with local and international partners; a healthier and safer financial condition of the organisation; increased organisational management capacity. SPO staff attributed the above mentioned organisational capacity changes partly to MFS II capacity development interventions. WIIP staff experienced these as the most important capacity changes in the organisation since the baseline. Improved staff capacity resulted from joining the "community of practice". This is an international community whose members are organisations with similar focus (global warming-wetlands). This was the result of the change of vision and mission of Wetlands International, which in turn can be attributed to the development of the global agenda for wetlands. Increased communication on WIIP and wetlands issues was attributed by the SPO staff to improving media content and packages as well as strengthening media relations. Both these developments sprung from the need for stronger communication and publication which resulted from a change of vision and mission of Wetlands International. Improved collaboration and networking was attributed by the SPO to joining the joint community of practice, the strengthening of activities of advocating policies and other strategic activities, and more extensive and diverse programs. Whilst the work area expansion was due to the change of vision and mission of Wetlands International, the increased accountability resulted from an orderly financial administration. This was an important conclusion from the OD consultant who was hired after Wetlands International provided coaching and a capacity development workshop through MFS II funding. The improved and healthier financial condition of WIIP occurred through an increasing number of donations, and increased staff capacity to manage responsibilities. The greater number of donations was already explained above. The increased staff capacity to manage responsibilities resulted from increased experience and knowledge sharing. Both of these were enabled by staff placement in project management, and staff being sent to trainings and workshops. Both these were recommended by the organisational capacity scan and HQ workshop on capacity development. The increased organisation management capacity resulted from an increased ability of staff to manage responsibilities, strengthening the existence and recognition of the organisation in front of the government, an increased number of managerial staff, and improved supporting facilities. Strengthening the existence and recognition of the organisation in the eyes of the government was due a revision and addition of Employment SOP as well as an adjustment of employment welfare according to Indonesian labour laws after a series of formalizations in the employment policy and contracts.

Both can be attributed to the recommendations made by the consultant regarding integration of Indonesian laws and regulations as well as recommendations regarding reviewing and revising SOP's. This in turn resulted from the MFS II sponsored Capacity Development (CD) scan in March 2013. In conclusion MFS II interventions have been tied to key organisation capacity changes, as experienced by the SPO, although they were only in part responsible for all changes that have occurred. The redevelopment of the global agenda of Wetlands International has also had profound impact on the organisation's capacity changes, particularly in the field of program quality and focus, as well as networks addressed. The development of a more structured, accountable and transparent organisation that adheres to Indonesian law and has increased its' organisational management capacity can however for a large part be attributed to MFS II, according to SPO staff present at the endline workshop. However, it must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect.

**Yadupa**

During the endline workshop some key organisational capacity changes were brought up by Yadupa's staff: Increased trust from Donor agencies; Better capacity to manage budget efficiently in order to have organisation saving; Delays in the program and report. Trust from the donor agencies has increased as a result of better organisational performance, improved report writing, and Yadupa being more recognized by its stakeholders. The improved report writing could be attributed largely to MFS II funded capacity development interventions, particularly through the M&E training and the English course. Other changes however, such as organisational performance, financial efficiency and stakeholder recognition, which were all more related to the improved capacity to manage the budget efficiently to increase savings and delays in the program and reporting, were more the result of external and internal developments such as the increase in program activities and staff motivation. Better capacity to manage the budget efficiently in order to lead to saving, was due an increase in financial efficiency of the organisation. This could be attributed to the addition of a branch office, which has reduced the accommodation cost. The office was added as three new kampungs were added as beneficiary communities in the city of Biak, as a result of the new programs that were rolled out. The new programs that started were funded by MFS II, and although they are not MFS II capacity interventions, they did contribute to organisational change in terms of budget efficiency and greater saving. Delays in the program and reports can be attributed to the increasing workload and lack of staff capacity that increased as a result of the increasing scale of Yadupa's programs. This was a result of the new programs that were started. On the other hand reporting was delayed due to the new staff requiring technical assistance to implement the program and carry out reporting tasks. The high staff turnover caused the high influx of new staff, which in turn occurred due to the government of Papua releasing larger number of civil servants from their positions who consequently joined Yadupa due to better employment benefits and using the organisation as a stepping stone to other work. Delays in program and reporting can therefore only be slightly attributed to MFS II supported activities, and cannot be linked to specific MFSII capacity interventions. On the whole, according to SPO staff, these

changes can only partly be attributed to MFS II capacity development interventions, but were also related to other, internal and external factors.

**Yayasan Kelola**

During the endline workshop some key organisational capacity changes were brought up by Yayasan Kelola's staff: increase of staff capacity, and becoming an organisation with an international reputation. According to the SPO staff, these key organisational capacity changes can only to a minor extent be attributed to MFS II capacity development interventions. The involvement of Hivos to support Kelola with the arts coalition initiative since 2012 has helped in building connections to government and lobbying and advocating activities, although this was not executed in the form of a specific MFS II capacity development intervention. Also a small role of MFS II continues to exist in trainings and workshops. Hivos has stated that they were able to reduce their fundraising from 30% to 5% in recent years due to the increased fundraising capacity of the organisation. This is difficult to attribute to MFS II interventions without going into more detail through for example process tracing.

**YPI**

During the endline workshop some key organisational capacity changes were brought up by YPI's staff: an increase in staff working performance; an improved network maintenance; strengthened organisation independency. According to YPI staff in the endline workshop, all of these are expected to contribute to YPI's improvement in service quality. YPI staff experienced these as the most important capacity changes in the organisation since the baseline. Increased staff working performance resulted from increased frequency of controlling beneficiaries for YPI program improvement; staff having opportunities to attend training; comparative studies and courses; ideas from staff being accepted; response to problems in the field; increased job security. The increased frequency of controlling of beneficiaries was enabled by the greater number of staff proficient in M&E, which was enabled by more training, such as the MFS II capacity intervention for a PME workshop funded by Rutgers WPF. This could be attributed to an overall improvement of the organisations' professionalism due to donor requirements. Staff has had more opportunities to attend trainings and develop due to YPI's leader's willingness to send staff to more training opportunities as well as more funding to do so being available as a result of external funding. This was enabled by incentives from the leaders and the openness between staff and board due to the close internal relationships between management, board and staff. Both these factors can be attributed to the change in leadership style. Ideas from staff were more accepted which can again be attributed to the greater openness between staff and management. Quicker response to problems in the field was enabled by a more responsive organisation, which was made possible by the new leadership style. Appropriate action responses from staff were enabled by more detailed working descriptions, which can be attributed to the change of leadership on the one hand, and by better guidelines in the form of revisions of SOPs and new SOPs on the other. Increased job security was due the implementation of a salary standard and improving employment status to full time contracts.

Both were enabled by utilizing savings from other costs to improve employment benefits. These resources were freed up through simplifying the organisational structure and optimizing the use of resources. This efficiency initiative was enabled by the change in leadership. Improving YPI's network resulted from the use of social media as a communication tool to address stakeholders, and extending networks through other alliances and partners. Both were enabled by the existence of new partners for the YPI program due to good relationships with related organisations as a result of more intense networking activities. The network also extended to new groups through YPI's proactive stance to find network partners and funds. This can be attributed to the urgency imposed on the organisation by the decreasing of donors. Increased independency of YPI was enabled by the founding of a private company to provide services in training, facilitation, health services and accommodation. With this business, new more sustainable funding sources are being attempted. In conclusion, the general key changes causal map only provides limited information about the relation between MFS II interventions with the organisational capacity changes that YPI considered most important since the baseline. During the endline process tracing workshop, YPI did not mention specific MFS II capacity interventions that in their opinion had affected the key changes. However, it must be noted that this workshop was held very early on in the evaluation process and that YPI struggled in developing the initial maps and relating them to capacity development. In the course of their involvement in the endline evaluation process, this has changed, and additional insights were developed. The process tracing maps in section 5.3 provide more detailed information about the relation between MFS II funded capacity interventions and key organisational capacity changes. For a more detailed analysis on this matter, please refer to section 5.3 where process tracing findings are presented which can answer the attribution question with more certainty and validity.

**YRBI**

During the endline workshop some key organisational capacity changes were brought up by YRBI's staff: staff capacity on *mukim* and *gampong* sovereignty issues is more recognized; an improved and more extensive network; reduced paid workforce and program funds. Two of these changes were selected for process tracing as they were tied to MFS II funded capacity development interventions, namely the 'poor financial situation of the organisation' (the third change mentioned above), as well as 'YRBI becoming the leading organisation in mukim and gampong sovereignty issues in Aceh and Indonesia' (related to the first change mentioned above). See also the section below. YRBI staff indicated that, according to them, staff capacity is more recognized due to more invitations from the community to share staff knowledge and skills on mukim and gampong issues. The increase of staff capacity can be attributed to internal knowledge sharing and learning from various staff capacity building activities by ICCO through MFS II funded capacity development interventions. This increase of staff capacity has also led to a more prominent recognition of YRBI in these areas. According to YRBI staff, YRBI has become the leading organisation in mukim and gampong sovereignty issues in Aceh and Indonesia. MFS II initiatives allowed YRBI to develop new empowerment programs for the poor and programs focused on participatory mapping of communities. YRBI's network improved and

became more extensive. The latter can be attributed to the optimal use of the organisation's facilities for events and trainings, the initiation of sovereignty institutions, as well as mukim and gampong issues becoming more widespread and therefore attracting greater public attention. No relationship has been indicated with MFS II funded capacity development interventions. Most of the changes are due to the organisation's own initiatives. The reduction in paid work force and program funds was a negative development, due to a poor financial situation that led to the closure of programs, staff leaving the organisation and staff not being paid. This poor financial situation can be partly attributed to a change of ICCO policy following the renewal of the MoU between ICCO and the Indonesian government, in which political areas and topics complicated the continuation of projects in the area. Furthermore, the organisation itself did not develop successful proposals since not many proposals were developed – even though staff had the capacity to write proposals –, and the new leader didn't have adequate fundraising experience. Whilst there was no link indicated with MFS II funded capacity development interventions, the fact that the main funder ICCO (MFS II) withdrew from funding the organisation has had an important effect on the organisation's financial situation. For more information about the poor financial situation please see the section below.

**Summary**

On the whole, according to SPOs for which a 'general causal map' was developed based on what they perceived as key organisational capacity changes since the baseline, MFS II funded capacity development interventions were mentioned as playing a role in bringing about these changes, especially in terms of enhancing staff capacity, mainly in terms of (planning), and M&E (5 SPOs): GSS, ID, Rifka Annisa, Yadupa, YPI, whilst for ASB the strategic planning workshop has sparked of many changes, since it resulted in a leadership change and a strategic plan. Internal factors have also been perceived as very important, whilst external factors have also played a role, particularly in the case of WIIP, with the change of vision and mission at WI.

**Table 9: Key underlying reasons for key identified organisational capacity changes**

| Key underlying reasons for key identified organisational capacity changes, as perceived by the SPO | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **SPOs:** | **ASB** | **ECPAT** | **GSS** | **Institut Dayakologi** | **Lembaga Kita** | **PT.PPMA** | **Rifka Annisa** | **WIIP** | **Yadupa** | **Yayasan Kelola** | **YPI** | **YRBI** |
| **Key organisational capacity changes as identified by SPO and key underlying reasons for change** | the provision of health insurance (BPJS) linked to investments; increased job security, through more permanent staff contracts; improved staff capacity to implement programs. | professionalization of the organisation; expansion and sustaining of donors; more effective advocacy; improved staff capacity for CSEC case monitoring. | more effective work performance and improved case handling | improved secretarial coordination and support, improved staff morale, strengthened role as a networking hub for advocacy on Dayak communities and culture, increased executive team's capacity to develop proposals, improved staff decision-making process, more qualified human resources | a more visible organisation through the implementation of the community assistance model; and greater recognition amongst stakeholders through the systematic production of documentation the organisational capacity scan | See next section | staff being more productive and involved in the organisation's decision-making; greater motivation for staff to get promoted; staff being motivated to improve their facilitation skills; improved quality of monitoring and evaluation and a stronger partnership with local authorities in form of a signed MoU | Improved staff capacity in their respective roles and fields of work; Increased communication on WIIP and wetlands issues; Improved collaboration and networking with local and international partners; A healthier and safer financial condition of the organisation; Increased organisational management capacity; | Increased trust from Donor agencies; Better capacity to manage budget efficiently in order to have organisation saving; Delays in the program and report. | increase of staff capacity; becoming an organisation with an international reputation. | An increase in staff working performance; An improved network maintenance; Strengthened organisation independency | staff capacity on *mukim* and *gampong* sovereignty issues is more recognized; an improved and more extensive network; reduced paid workforce and program funds. |

### 3.3.3. Attribution of changes in partner organisation's capacity and reasons for change (evaluation questions 2 and 4)

This section describes the main findings and conclusions for the second evaluation question: To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)? And the fourth evaluation question: "What factors explain the findings drawn from the questions above?"

Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. Furthermore, since 'process tracing' is used for this purpose, and this is a very intensive process, not all capabilities could be focused on. For more information about the methodology, please see Annex F. ASB, ECPAT, PT.PPMA, YPI, YRBI were the five SPOs selected for process tracing. Below the key findings are discussed. But for more detailed information please see the 5C reports for the SPOs.

**ASB**

Two organisational capacity changes were more closely investigated with process tracing: the improved capacity to manage the organisation, and the improved capacity to communicate results on diversity issues. The improved capacity to manage to manage the organisation can be attributed to a large extent to the planned MFS II (Hivos) capacity development intervention of the strategic planning workshop. The intervention was the main underlying reason for the change in leadership style and the development of a strategic plan. Both of these proved very important to bring about changes in the organisation for enhanced capacity to manage the organisation. The improved capacity to communicate results on diversity issues can only be partially attributed to MFS II interventions. Particularly competencies to communicate results about diversity issues have improved as a result of the English course, although other non-MFS II interventions (externally funded through TIFA) have impacted this as well. Despite Hivos' detailed plans to address the issue, ASB has developed a great deal of initiatives on their own to address this issue and improve this particular capacity.

**ECPAT**

The organisational capacity changes that were focused on with process tracing were: Improved program management and implementation capacity; improved skill of ECPAT in the investigation, monitoring and reporting of CSEC cases. According to ECPAT, the improved program management and implementation capacity of ECPAT has resulted in better organisational work performance, increased bargaining power over donors and government and greater recognition of ECPAT as an organisation dealing with CSEC issues. The improved

program management and implementation capacity can be attributed to the improved functioning (operating) of the secretariat, the availability of human resources to conduct programming, and improved operational management. Whilst none of these capacity changes can be directly attributed to MFS II interventions, the hiring of staff that has occurred, as well as the consultant assessments are results of the funding from programs sponsored by Mensen met een Missie (legal unit service implementation, November 2013). On the other hand operational management improved due to an improved administration mechanism as regulated in the organisation's statutes, as well as due greater financial efficiency. This administrative mechanism was altered due to a revision in the organisation's statutes and SOP's, as recommended by the consultant in the March 2013 assessment, as well as the 2012 capacity scan performed by an external consultant hired by MM. Greater financial efficiency could also be attributed to the development of these new SOPs, which regulated stricter financial procedures as well as program and project procedures. More accountable and transparent financial reports allowed for improved financial management as well, which was enabled by the revision of the financial guidelines as recommended by the Indonesian consultant in her assessment. The MFS II funded intervention of hiring another independent consultant to perform a capacity scan in 2012 was part of a greater Mensen met een Missie initiative to scan all their partner organisations in Indonesia. This resulted in a report which laid the foundation for self-inspection of ECPAT, and the series of organisational capacity changes, initiatives and developments that took place.

Improved skill of ECPAT in the investigation, monitoring and reporting of CSEC cases resulted in the successful handling of 10 CSEC victim cases as well as the development of a referral mechanism of CSEC cases for other organisations to use. This skill was improved due to a monitoring instrument for CSEC cases being available, and to program staff having gained better understanding in conducting investigations, monitoring and reporting of CSEC cases in practice. ECPAT's monitoring system can be attributed to the development of program documentation for the justice unit service project. The program was intended to build a model for other organisations to work on similar issues, which was done through the publication of a book and a database on the 10 CSEC cases that were followed and supported. This in turn was enabled by the staff's increased ability to capitalize on learning experiences which can be attributed to the staff's work on the reflection process in the case work to find lessons learned, challenges and develop best practices. This resulted directly from the Legal Unit Service Project supported by MFS II, which was a continuation of the CSEC investigating, Monitoring and Reporting project which took place in 2012.

**PT.PPMA**

PT.PPMA was selected for process tracing but since no capacity development interventions were carried out by IUCN since the baseline, it was decided a 'general causal map' would be developed based on input from the SPO staff, but where possible, also with additional references. Therefore this part has been described under process tracing, even though the procedure for process tracing could not be adequately applied in this particular case. During

the endline workshop some key organisational capacity changes were brought up by PT.PPMA's staff: "funding for IUCN project has been stopped" and "Improved recognition of other NGO's, local government and beneficiaries (indigenous people) that PT.PPMA is a leading organisation on indigenous people empowerment". This latter change was mainly related to the following key organisational capacity changes: increased staff experience and knowledge on advocacy with the government; increased staff knowledge on community forestry resources management and community economic knowledge; and capacity to organise indigenous people. None of these changes can be attributed to MFS II supported capacity development interventions since these haven't taken place since the baseline in 2012. The discontinuation of funding from IUCN resulted largely because of the lack of required reporting, which can be attributed to the death of the former director as it left the organisation without the leadership and support to submit the required project information. On the other hand, the improved recognition that PT.PPMA experienced from government can be largely attributed to changes in leadership and by getting short term funding from other donors including IFACS, Partnership and Local Government. The changes that have come about in the organisation since the baseline are therefore mainly due to internal reasons, even though the reduction of funding from IUCN has had a big impact of the organisation.

**YPI**

In terms of process tracing, three organisational capacity changes have been focused on: more motivated staff at YPI; staff being confident in giving training and in delivering SRHR information to beneficiaries; and improved reporting. On the whole, more motivated staff at YPI, due to improved staff welfare and improved management working mechanisms, where the result of many internal changes brought about by a change in leadership, after understanding organisational gaps which were identified in an internal evaluation that was set up after realising organisational capacity gaps with the external 5C baseline (MFS II) in 2012. Staff being confident in giving training and in delivering SRHR information to beneficiaries, can to a large extent be attributed to the MFS II capacity interventions that were carried out by RutgersWPF since the baseline in 2012. Specifically, these capacity interventions were a SRHR training; the training for youth friendly services; and a workshop on strategic communication, all held in 2013. In addition to that, having new volunteer staff members also played a role in this improved capacity. The key organisational capacity change "improved reporting" can to a large extent be attributed to MFS II funded capacity development interventions, in particular the M&E trainings in 2012 and the writing skills training in 2013, since these are related to enhanced capacity to collect robust data and enhanced capacity to write reports. Furthermore, the organisation has taken steps to improve their meetings after realising the importance of this during the 5C baseline study (MFS II).

**YRBI**

In terms of process tracing the following organisational capacity changes were focused on: 'poor financial situation' and 'Becoming the leading organisation in *mukim* and *gampong*

sovereignty issues in Aceh and Indonesia'. The poor financial situation of YRBI resulted from a lack of obtaining new funds, which in turn resulted from the expiration of the ICCO contract, no follow up on fundraising activities occurred, and rejection of proposals for funding (see 4.3.1) took place, even though the organisation has increased its capacity to provide financial reports based on donor standards. This developed competence cannot be related to any MFS II supported capacity development interventions. The expiration of the YRBI and ICCO contract was due to a change of ICCO policy. In this policy ICCO stated that they couldn't further support activities with "mukim and gampong" issues, as they did not receive permission to work in these areas in Aceh any longer after the renewal of the MoU between ICCO and the Government of Indonesia. No follow up for fundraising occurred, despite increased competencies in resource mobilization as the result of the Resource Mobilization training in 2013 by ICCO. The competencies to raise public funds as generated in the ICCO intervention to mobilise resources training in February 2013, were not utilized for YRBI's own financial situation. Instead YRBI elected to share these training outcomes amongst its beneficiary communities, some of which successfully applied this to raise public funds through cooperation with private parties. No evidence for a relation could be found between the poor financial situation of YRBI and the improved transparency and accountability in financial reporting which resulted from the Financial Management training. Despite the positive outcomes in reaching the CFA's objectives in terms of utilizing the financial software and becoming a more transparent and accountable reporting organisation, these developments did not impact the financial situation of YRBI. Instead the capacity built up in this area is now unused, as YRBI does not have any ICCO programs to carry out anymore.

YRBI has become more visible as a leading organisation in Mukim and Gampong sovereignity issues in Aceh in Indonesia. This was due to YRBI's staff capacity on Gampong and Mukim issues becoming more recognized amongst its stakeholders, due to more invitations from the community to share staff knowledge and skills. Village maps were produced and utilized by the people as a result of the application of the training skills to some of the villages independently. This can be attributed to key organisational capacity changes can to a large extent increased staff ability to develop maps independently, following internal knowledge sharing gained from trainings. The knowledge shared in this case can be contributed to the participatory mapping internship (GIS) that took place in 2014 and was MFS II funded. The 'Making Markets Work for the Poor' Training (MFS II), which took place in the course of 2014 parallel to the endline evaluation, resulted in the successful creation of a economic development project for beneficiary communities on the topic of honey bee exploitation and commercialisation. An increased amount of beneficiary groups has started getting involved in this project, again leading to greater trust amongst beneficiary communities. Encouraging the community to use the results of training as a strategy to raise public and corporate funds resulted from the sharing of training knowledge to beneficiaries. This can be attributed to the gained staff skill to do fundraising from public or corporate CSR funds. This was due the internal knowledge sharing of the MFS II funded resource mobilization training that took place in 2013 as well. On the whole, YRBI has grown into a leading organisation in Mukim and Gampong sovereignty issues in Aceh and Indonesia, and this is mainly due to positive effects at community level of

the projects implemented by staff whose competencies have been enhanced in the MFS II trainings on participatory mapping, 'Making Markets Work for the Poor' and resource mobilisation. On the whole, the changes in the key organisational capacity change can be attributed to a large extent to MFS II supported capacity development interventions.

**Summary**

On the whole it can be concluded that for 3 of the 5 SPOs, selected key organisational capacity changes can to a large extent be attributed to MFS II funded capacity development interventions: ASB (1 out of 2 changes); YPI (2 out of 3 changes); and YRBI (1 out of 2 changes). Internal factors have also played an important role in many of these changes. These include changes in leadership (PT.PPMA; YPI) and leadership style (ASB); enhancing staff competencies (ASB, ECPAT, YRBI) and other internal changes. For many of the selected organisational capacity changes internal changes have played an extremely important role: ASB (2 out of 2); ECPAT (1 out of 2); PT.PPMA (2 out of 2); YPI (1 out of 3); YRBI (1 out of 2). It must be noted that some of the important internal changes were very closely related to MFS II funded capacity development interventions such as the change in leadership style and a strategic document at ASB as a result of the Hivos supported strategic planning workshop which sparked off many internal changes. Only in one case external factors have been mentioned: for YRBI contract with ICCO expired due to a change in ICCO policy, which was the result of the renewal of the MoU between ICCO and the government of Indonesia. For 4 out of the 5 SPOs (all except PT.PPMA), MFS II capacity development interventions have played a role in enhancing staff competencies. The poor funding situation was a negative change, and has been an issue for two of the SPOs (YPI and YRBI). It is interesting to see that YPI experienced the 5C baseline in 2012 as a capacity development intervention that sparked of many changes in the organisation. For PT.PPMA, there have been no capacity development interventions, even though the CFA has asked the SPO many times for a capacity development plan. For more details please see the separate 5C reports for the SPOs.

## 3.4. Reflections

We recommend for future capacity development evaluations to be more utilisation focused, engaging stakeholders in a learning process so that they can also take up the lessons learned in order to further improve upon their organisations. Now, the evaluation was too much accountability driven. Furthermore, it is important that sufficient time is taken into account for the evaluation process in order to provide useful insights for all involved. The time period of two years was too short to see remarkable changes in terms of capacity development.

Organisational capacity contains many different aspects that are constantly changing. Therefore, it is important to see these as part of a whole rather than separate issues, unlike it had to be done for this evaluation in terms of standard indicators. The different aspects relate to each other and need to be seen more from a whole systems perspective. Furthermore,

organisational capacity is complex, methodologies for evaluation need to be tuned to the specific situation of each organisation.

Overall, process tracing has proven to be a useful exercise that provided a lot of insight into how changes in terms of capacity development have taken place. Many SPOs and CFAs valued this insightful learning process and indicated that they would work with the results to further improve the organisational capacity of the SPO. Furthermore, in case of staff turnover, this may have seriously affected institutional memory, which is an important factor, next to the difficulty of recall when describing a chain of events, in qualitative information.

None of the CFAs and SPOs had a clear and explicit theory of change for the organisational capacity development of the SPO and this made it difficult to compare and test this theory of change with the final narrative after the process tracing. For future purposes , we recommend that SPO and CFA do a proper analysis of the organisational capacities that the SPO needs to further enhance and make this explicit in the theory of change for the organisational capacity strengthening of the SPO. This would also strengthen theory-based evaluation.

# 4. Efforts to Strengthen Civil Society

## 4.1. The Evaluation Sample

Contrary to the MDG and capacity development sample, the ToR did not specify the sample for the civil society evaluation. The selection of these was left for the country teams. As the ToR explicitly emphasised the focus on the relevant MDGs and themes in the selected country for the civil society evaluation, the team first identified the most relevant MDGs and themes in terms of the number of MFS II funded projects classified under the MDGs and themes that have a civil society and/or policy influencing component. The sampling procedure was the following:

1. Identify the 2 most relevant (frequent) MDGs and themes.
2. Randomly sample 7 SPOs per selected MDG/theme, from which the last 2 are reserves. Hence, the sample size is 10 SPOs in total.
3. If SPO is part of the capacity development sample, replace the SPO from the reserve list.

Only those SPOs were eligible for the civil society evaluation that had an on-going contract with a CFA on 1 January 2012 and were directly contracted by the CFA (due to this condition one of the selected SPOs was redrawn by the evaluation team). Based on information obtained from the Synthesis team, the three most frequent MDGs/topics the MFS II sector worked on were the good governance theme with 28 SPOs excluding overlapping projects, and sustainable living environment & biodiversity (MDG 7ab) with 26 SPOs, followed by gender (MDG 3) with also 26 SPOs. In total, 120 civil society organisations in Indonesia have a partnership relation with Dutch NGOs.

The evaluation team decided to focus on the theme good governance and MDG 7ab, as natural resources and biodiversity are especially relevant in the Indonesian context. The list of the sampled SPOs are presented in Table 11. Further information on the sampling of the SPOs for the Civil Society component can be found in section 0 and in Annex J[128].

[128] See the evaluation methodology for the civil society component as described in the annex of the baseline report.

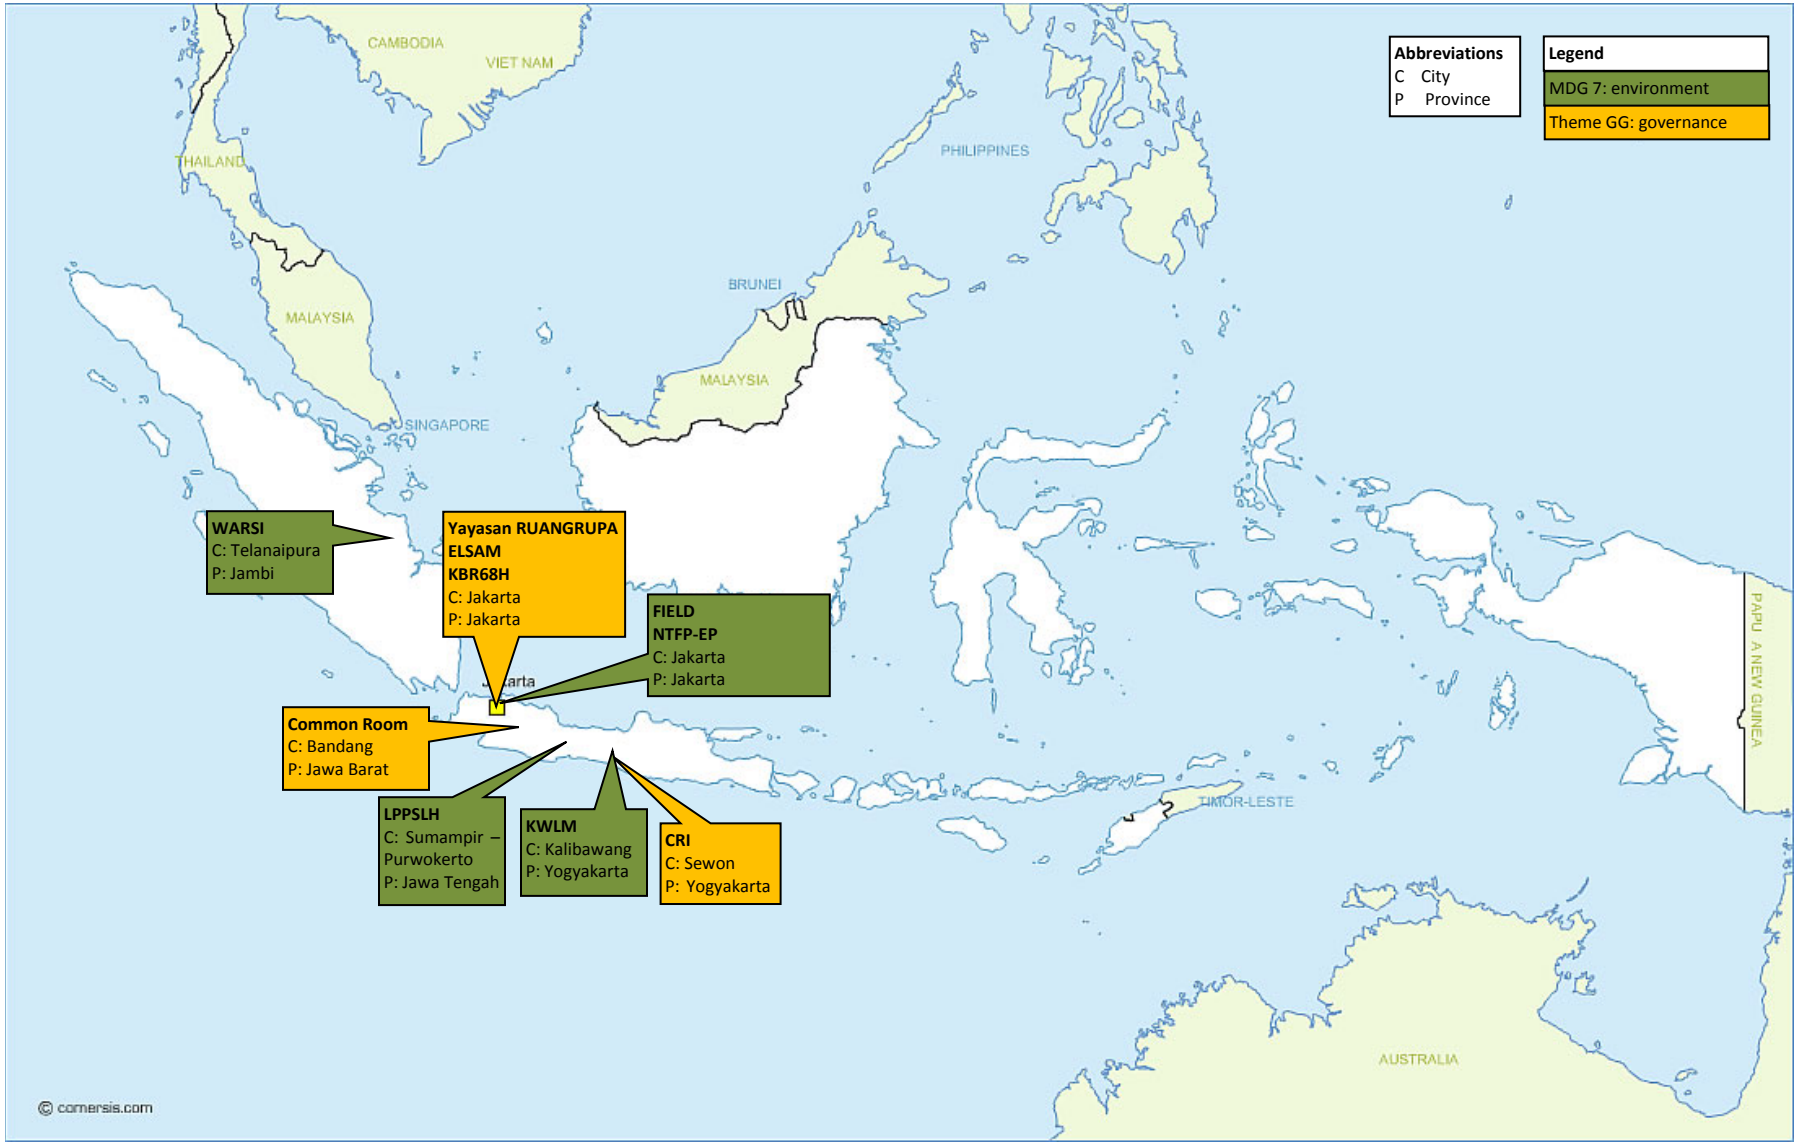

**Table 11: Selected sample for the civil society evaluation**

| Organisation | Dutch Consortium | Theme | Selected for MDG |
|---|---|---|---|
| ELSAM Institute of Policy Research and Advocacy | People Unlimited 4.1 | Good governance | no |
| Yayasan RUANGRUPA | People Unlimited 4.1 | Good governance | no |
| Combine Resource Institution (CRI) | People Unlimited 4.1 | Good governance | no |
| Common Room | People Unlimited 4.1 | Good governance | no |
| Kantor Berita Radio (KBR68H) | Press Freedom 2.0 | Good governance | no |
| Farmer Initiatives for Ecological Livelihoods and Democracy (FIELD) | People Unlimited 4.1 | MDG 7ab | yes |
| Koperasi Wana Lestari Menoreh (KWLM) | People Unlimited 4.1 | MDG 7ab | no |
| Lembaga Penelitian dan Pengembangan Sumberdaya dan Lingkungan Hidup (LPPSLH) | People Unlimited 4.1 | MDG 7ab | no |
| Non-Timber Forest Products – Exchange Programme (NTFP-EP) | Ecosystem Alliance | MDG 7ab | yes |
| WARSI - Komunitas Konservasi Indonesia | Ecosystem Alliance | MDG 7ab | no |

Source: MFS II Joint Evaluations Synthesis team and SPO reports on Civil Society in Indonesia.

In the civil society sample, there are 2 SPOs that overlap with the MDG evaluation. However, there are no studies that are jointly included in the capacity development and civil society sample. This decision was made due to considerations towards the SPOs, as we did not want to overburden them with two evaluations each taking 2-3 days of their resources.

**Figure 18: Location of the SPOs selected for the civil society strengthening evaluation**

Notes: The map indicates the name of the SPO, name of the city (C) and province (P).

## 4.2. Methodology

This civil society evaluation uses the CIVICUS framework and seeks to answer the following questions:

1. What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?
2. To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3. What is the relevance of these changes?
4. What factors explain the findings drawn from the questions above?

The CIVICUS framework that comprises five dimensions (civic engagement, level of organisation, practice of values, perception of impact and contexts influencing agency by civil society in general) has been used to orient the evaluation methodology and is presented in Annex I.

The overall evaluation methodology selected is a participatory, theory-based evaluation through a before and after comparison. This methodology is meant to acknowledge the complexity of change processes related to civil society arenas and processes to influence public and private sector organisations. It is theory-based and participatory in nature and it triangulated methods and information sources to come to robust and reliable findings. The first evaluation question identified *changes in civil society* in the 2012 – 2014 period, with a particular focus on the relevant MDGs & themes in Indonesia. A scoring tool with 17 indicators was developed during the baseline, resulting in the description and a score (0-3) in 2012. During a workshop with the SPO in 2014, workshop participants received the descriptions of each of the indicators from the baseline report and where asked to describe qualitative changes as well as to give an indication of the importance of the change on a scale of -2 -- +2. Apart from this document analysis and follow-up interviews with the SPO provided additional information.

For the *attribution question,* a theory based methodology was used for five of the ten NGOs and comprising a maximum of two outcomes achieved in the 2012 – 2014 period because of resource constraints. For this in-depth outcome, process tracing method was used. A quick contribution assessment was done for the remaining five NGOs. The selection of the five NGOs included in the in-depth-process tracing was based upon an estimation of the MFS II budget for that NGO that is related to CIVICUS dimensions, ensuring that both NGOs working on MDG 7 and on governance were amongst the selected and a variety of Dutch partners.

For those SPOs included for in-depth process tracing, priority was given towards assessing impact with regards to the creation and performance of new CSOs by the SPOs and with regards to policy influencing The steps to be followed were as follows:

- With the SPO identifying outcomes achieved in the 2012 -2014 period, providing evidence for these outcomes and develop pathways that according to the SPO explain the outcome;
- With external resource persons and written materials, confirm that the outcome was achieved, and develop pathways that according to these persons explain the outcome (with a particular focus on rival pathways);
- Construct a model of change that encompasses all pathways that possibly explain the outcome;

- Identify information needs to confirm or reject each of the pathways and collect relevant information be it through interviews, document search etc.;
- Analyse findings and conclude about the most likely pathway that explains the outcome, the nature of the relation between the pathway and the outcome and the role of the SPO and MFS II in this;

The *relevance question* was assessed through interviews with the Indonesian NGOs and their Dutch partners, as well as through context information and written documents. Relevance was assessed against the Theory of Change constructed with the SPO during the baseline assessment in 2012, the context in which the NGO is operating and the civil society policies of the Dutch MFS II alliance.

The *explaining factors* question assessed organisational factors of the SPO, its external context and the relation between the Dutch and the Indonesian SPO that explained the civil society changes achieved or not. No additional information was collected for this question.

A last additional assessment was made with regards to the *design* of the interventions by the Indonesian partner.

In 2013, a decision was made with the commissioner of the study to exclude an evaluation question related to efficiency because of the resources available.

More information on the methodology can be found in Annex J.

## 4.3. Overview of selected Southern Partner Organisations

### 4.3.1. Overview of sample

In 2012 a sample was taken of Southern Partner Organisations (SPOs) that according to their Dutch partners worked on MDG 7 ab, natural resources and the general governance theme. Most SPOs in Indonesia work on those two themes.

In 2014 we have contacted all above mentioned SPOs and we were able to conduct an end line assessment for all, although one of the contracts had already ended in November 2012 (KWLM) and another in December 2012 (KBR 68H).

The following table presents the SPOs and their Dutch partner organisations in the sample.

**Table 12: Sample of SPOs and their Dutch partners in the civil society evaluation**

| SPO | Dutch Partner | Dutch Alliance | MDG/theme | Contract period | Contract amount MFS II |
|---|---|---|---|---|---|
| **ELSAM Institute of Policy Research and Advocacy** | Hivos | People Unlimited 4.1 | Governance | January 2011 - December 2012, extension until March 2013 | € 120,000 |
| | | | | July 2012 –June 2013, no-cost, extension until January 2014 | € 17,450 |
| **Yayasan RUANGRUPA** | Hivos | People Unlimited 4.1 | Governance | December 2010 – December 2013 | € 105,000 |
| **Combine Resource Institution (CRI)** | Hivos | People Unlimited 4.1 | Governance | February 2012 - December 2013, extension until March 2014 | € 76,200 |
| **Common Room (CR)** | Hivos | People Unlimited 4.1 | Governance | May 2012 – December 2013 | € 35,000 |
| **KBR68H** | Free Press Unlimited | Press Freedom 2.0 | Governance | July 2011 - December 2012 | € 279,403 |
| **FIELD** | Hivos | People Unlimited 4.1 | MDG 7ab | February 2011 – February 2013 | € 112,000 |
| **KWLM** | Hivos | People Unlimited 4.1 | MDG 7ab | January 2010 – November 2012 | € 59,558 |
| **LPPSLH** | Hivos | People Unlimited 4.1 | MDG 7ab | April 2011 – March 2013 | € 54,833 |
| | | | | December 2013 – August 2015 | € 67,200 |
| **NTFP-EP** | IUCN | Ecosystem Alliance | MDG 7ab | September 2011 – March 2014, extended till June 2015 | € 135,217 |
| | | | | January 2013 – July 2015 | € 45,950 |
| **KKI-WARSI** | IUCN | Ecosystem Alliance | MDG 7ab | October 2011 – October 2014, extension until April 2015 | € 180,750 |
| | | | | January 2013 – June 2015 | € 42,876 |

### 4.3.2. Background of the SPOs

In this section we briefly present each of the SPOs in the sample for MDG 7ab and the Governance theme.

#### *SPOs in the sample for Governance*

Within the Governance sample we found two organisations working in the field of arts (Common Room and RUANGRUPA), two organisations working with radio networks and social media (CRI and KBR) and one organisation working in the field of Human Rights (ELSAM). This sample is very diverse in nature which might possibly be explained by the fact that all SPOs having a clear relation with one of the MDGs were left out of the population for Governance and leaving all other SPOs in a very diverse category.

*Common Room* (CR) was created in 2006 and it aims to develop a civil society through arts, culture and the use of technology (ICT/media). It wants civil society to be inclusive, and until its move to a less

central location in Bandung it became a place that facilitates dialogue to connect individuals, communities and various organisations with diverse economic, social and political interests. CR was the source for the emergence of a new sub-culture on the music scene that merged traditional Sundanese music with underground metal music. Cooperation with Hivos started in 2009 and ended in December 2013.

Similarly, Yayasan RUANGRUPA was set up by a group of artists in 2000, and has built its credibility as a progressive and a visual arts organisation that is producing critical views on Indonesian urban contemporary issues. The organisation promotes collaborative projects involving artists and other disciplines, such as social science, politics, technology, and media. Collaboration with Hivos started in 2003 and support to RUANGRUPA is continuing through the international Arts Collaboratory initiative. This initiative considers culture to be a potential driver of social innovation and change and views artistic processes as a means to facilitate relations that bring people together to develop new perspectives.

*Kantor Berita Radio 68H* (KBR) began in 1999 and became the first radio news agency acting outside the state after Indonesia's transition to democracy. KBR is part of a limited company and currently serves up to 900 radio stations throughout Indonesia of which 100 are community radio stations, as well as 9 countries in Asia. Free Press Unlimited and KBR implemented the Teen Voice Programme for one and a half year, informing youth and teenagers with news content made by young reporters and engaging them in discussions.

*Combine Resource Institution's* (CRI) vision is to provide communities access to knowledge and resources needed that help them to be better positioned in society and to have stronger accountability relationships with government and private sector. It started in the early 2000 with the creation of community forums, followed by the creation of community radios in 2003 and the incorporation of ICT. In 2008 Suara Komunitas, an interactive online platform was launched to connect hundreds of community radio in Indonesia and to promote citizen journalism and information exchange. Collaboration with Hivos started in 2005 – 2006. The 2012 "act upon information" project wants to make Suara Komunitas a strategic medium in supporting advocacy for the fulfilment of basic rights of citizens. CRI cooperates amongst others with the Indonesian Community Radio Network (JRKI) which it helped create.

*ELSAM* supports the development of a democratic political order since its creation in 1993. The organisation played a significant role in Indonesia's ratification of the International Convention Against Torture and the Convention for the Elimination of All Forms of Racial Discrimination (1998), the promulgation of the Truth Reconciliation Commission Law which is still under review and the recently revised Law on Witness and Victim Protection (2014). It has a wide network of CSOs within the country that amongst others document human rights atrocities. Cooperation with Hivos, Evangelischer Entwicklungsdienst (EED) and Miserior started in 2011 aimed at influencing policies, defending the rights of human rights victims and strengthening the organisational capacity of ELSAM itself. Apart from this large project, Hivos financed another small project on internet governance form a human rights perspective together with ICT Watch.

### *SPOs in the sample for MDG 7ab*

Within the MDG 7ab sample we found two partner organisations working with IUCN under the Ecosystem alliance (NTFP-EP and WARSI) and three partners of Hivos who are improving the livelihoods of small scale producers. We observe that NTFP-EP and WARSI are the two SPOs most relevant for MDG 7ab and that the HIVOS partners are more aligned with interventions for MDG1.

*NTFP-EP Indonesia* was created in 2012 as an independent organisation of a regional network in South and Southeast Asia. It aims to promote forest conservation through the empowerment of forest-based communities and the sustainable management of Non-Timber Forest Products. Its partner organisations work directly with forest communities to meet local demands, while the NTFP-EP platform provides technical support and shares experiences. NTFP-EP has worked with IUCN since 2004 and implements two projects; the first aiming at ensuring market access for NTFP products whilst sustainably exploiting natural resources; the second aiming at showcasing sustainable livelihood models at the national level to attract consumers of NTFP products, which is a collaborative initiative with all Ecosystem Alliance (EA) partners in Indonesia.

*KKI-WARSI* started in 1993 and currently works with twelve regional NGOs based on Sumatra. Its mission is to uphold conservation principles of indigenous communities and encourage the development of a model for conservation area management that leads to community prosperity. Collaboration with IUCN started in 2010. A first contract until October 2014 meant to build the capacities of forest managing groups and to support them in their efforts to secure forest management rights as a strategy to stop concessions being granted to private companies. A second contract brings all EA grantees together under the coordination of WARSI to lobby for smoother licence procedures for village forests managed by communities.

*LPPSLH*, established in 1987, has a vision is to become a professional organisation that contributes to social justice and democratisation. Collaboration with Hivos started in 2008 and continued until March 2013 to support small-scale coconut palm sugar producers with the creation of cooperatives and ensuring a premium market outlet for crystal sugar through LPPSLH's business unit.

*KWLM* is a cooperative of timber producers since 2009 that wants to create a sustainable natural environment that generates profits for community members in a fair manner. KWLM manages three business units which are certified timber (including FSC); herb and spices, vegetables and other agricultural products, and; seedlings. The focus in the 2012-2014 period was on creating further developing a 'sustainable community logging' model, which brings benefits to communities. Products are marketed through a company of which KWLM is a shareholder. Hivos supported the creation of KWLM in the 2010 – 2012 period based upon another successful cooperative model of another Hivos partner.

*FIELD* was established in 2001 and is a creation of former FAO experts in Integrated Pest Management (IPM) and Famer Field Schools (FFS). It aims to create farmer and rural community movements by means of participatory education, action research and network building. FIELD's main partner is the Indonesian IPM Farmers Association (IPPHTI). To address the dependence of farmers on private companies for agricultural inputs and advisory services, FIELD's contract with Hivos is meant to develop; an independently operating farmers' credit cooperation; a learning process for Farmers' Seed Certification;

a Community Seeds System, and; strengthening the farmer's cooperative unit. This is the last contract with Hivos with whom FIELD has collaborated since 2003: IPPHTI is expected to look after the program as of February 2013.

## 4.4. Changes in the civil society context

### 4.4.1. Civil society in a historical perspective

With Indonesia's transition from authoritarian leadership to a democracy in 1998, restrictions on citizen participation, press freedom and association were removed.

As of 2000 Indonesia started a decentralisation process which narrowed the gap between regional governments and citizens but this was accompanied by localised political power struggles, decentralisation of corruption and rent-seeking practices. The 2013 decentralisation law, meant to strengthen local governance at village level is seen by some as a new opportunity for local elites to misuse government funds if not properly monitored. According to the Indonesian Governance Index however, the performance of regional governments (legislative bodies), regional administrations, civil society organisations and private sector organisations in terms of participation, transparency, fairness, accountability, efficiency, and effectiveness has increased in the 2008 – 2012 period, with civil society improving its scores significantly and the administration only seeing a slight improvement.

### 4.4.2. Civil Society according to CIVICUS

As required in the Terms of Reference, the evaluation team looked at changes in Indonesia's context in line with the CIVICUS framework. Where possible, changes were identified between 2010 and 2014. More information regarding the civil society context of Indonesia can be found in Annex K.

With regards to the *socio-political context*, civil society has become an important actor since the transformation in 1998 and the number of civil society organisations comprising associations, NGOs, research institutions, cooperatives and small and medium increased between 2012 and 2013. Amongst these CSOs, also hard-line religious groups and leaders can be found who contest the values of diversity and freedom.

NGO and CSO networks came under scrutiny in 2013 when the Mass/Societal Organisations (Ormas) Law No 17 replaced a law of 1985, reinforcing the control of foundations and association. As a consequence the 2014 Freedom House Index rating for civil liberties in Indonesia declined from Free to Partly Free[129]. The 2013 CIVICUS report interpreted the new law as part of the state's reaction to a perceived threat that environmental, land rights and indigenous activists pose to political and economic interests due to the "shadowy connections that can exist between transnational corporations and politicians" in the agriculture, extractive and construction industries.

The Freedom House's Press Index illustrates that Indonesia's media remained partly free in the 2010-2014 period: the country's press system is vibrant and fast growing digital connectivity is being used as a new space for debate and participation in recent years. Current laws however still curtail openness,

[129] http://www.freedomhouse.org/report/freedom-world/freedom-world-2014#.VE4BahbarZk

accessibility, inclusiveness and place limits on its use for expression, issues which are being addressed by a handful of NGOs, like ICT Watch and CRI.

With regards to the *socio-economic context*, Indonesia has recently become a lower-middle income country. Its Human Development Index remained stable in the 2010-2014 period but gender equality still remains a major issue. According to the Social and Economic Rights Fulfilment (SERF) Index, Indonesia's position worsened when compared to the situation in 2010 with regards to the right to food and to work; it improved with regards to the right to education and remained stable with regards to the right to health and shelter.

The Index of Economic Freedom which comprises 4 pillars, rule of law, limited government, regulatory efficiency, and open markets still categorises Indonesia as a "mostly unfree" country.

These macro-level figures illustrate the complexity of the socio-economic context. While the economy has grown, 65 million people remain highly vulnerable to shocks. Disparities in income and geographic areas remain, made more complex by the number of people 'floating' between the poor and middle class'.

With respect to the *socio-cultural context* that provides insights into the level of trust between ordinary people and the extent to which tolerance exists, Indonesia has slightly improved its position on the Global Peace Index. However inequality, socio-economic conditions and rights claims (especially land rights) are still a source of localized incidences of conflict in Indonesia: and the number of resource and identity-based incidences reported in the 2010-2014 period increased.

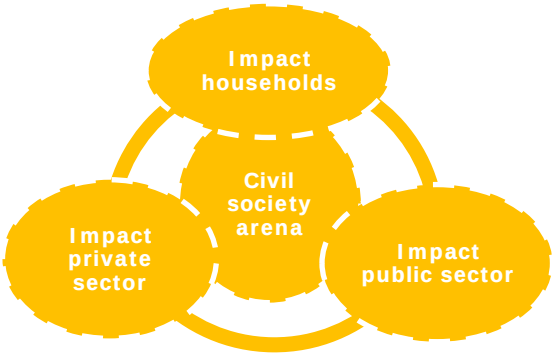
When assessing the extent to which individuals have the opportunity to reach their full potential Indonesia scores are weak for the freedom of religion and tolerance for immigrants (Social Progress Index).

Indonesian people trust the private sector more than NGOs, government and media according to the Edelman Trust Barometer Survey. Businesspeople are said to be more inclined to tell the truth than their government counterparts and three times more likely to fix problems.[130] Interestingly, the trust in NGOs has declined since 2011 but sharply increased again in 2014. This is attributed to NGOs now being able to 'walk the talk' in accountability and transparency, as well as the emergence of 'corporate NGOs'.[131]

## 4.5. Results

### 4.5.1. Changes in civil society with a particular focus on the selected MDGs or theme

The CIVICUS framework has five dimensions, civic engagement, level of organisation, practice of values, perception of impact and civil society context. During data collection we observed considerable overlap in indicators and also between dimensions. For a more meaningful overview of *changes* that occurred in



[130] Indonesians Trust Businesses More Than Govt, Survey Shows. By Harriet Conron & Nicole Jade Millane on Feb 05, 2014. http://thejakartaglobe.beritasatu.com/news/indonesians-trust-businesses-more-than-govt-survey-shows/& Further Rise in Trust in Indonesia, with Business as the Most Trusted Institution in the Country, Says the 2014 Edelman Trust Barometer, Edelman Indonesia, February 5, 2014 http://www.edelman.id/edelman-indonesia/further-rise-in-trust-in-indonesia-with-business-as-the-most-trusted-institution-in-the-country-says-the-2014-edelman-trust-barometer/

[131] Jakarta Globe (Indonesians Trust Businesses More Than Govt Survey Shows)

the 2012 – 2014 period we here conclude about changes and perceived impacts that occurred in the civil society arena, those at household, the public sector and the private sector level (see Figure 19). These relate in the following way to the CIVICUS dimensions:

- Within the civil society arena all findings regarding civic engagement, level of organisation, practice of values and a number of indicators from the perception of impact dimension are regrouped together.
- Perceived impacts at household level are derived from information mostly found in the civic engagement dimension and that of perception of impact.
- The perceived impacts for the public and the private sector are part of the perception of impact dimension.

**Figure 19: Changes in civil society**

In line with the evaluation question, we draw conclusions for those SPOs in MDG 7ab and those in the governance theme. However we have not found any information suggesting that SPOs and their interventions have mutually reinforced each other to create one civil society arena. Each SPO had and still has its own arena, with possible impacts upon households, public sector and private sector.

### *Changes in civil society – Governance theme*

Source: Individual evaluation reports.
Notes: Presentation of the absolute scores in 2012 (0-3) + relative change observed in 2014 (-2;+2)

As already mentioned CR and RUANGRUPA work in the field of arts, CRI and KBR are working with radio stations and social media and ELSAM is working on Human Rights.

**Perceived impact in the civil society arena**

*Common Room's* most significant contribution to civil society consists of its support to a musician group that is at the origins of a new contemporary culture, merging a traditional music instrument in the Sundanese customary community, the karinding, with underground metal music. Most significant impacts of this new sub-culture are a revival of the Sundanese culture; an improvement of the position of underground metal groups often labelled as antisocial and westernised and; the use of spells and mantras and burning incenses, often considered as a violation of Islamic rule, becoming an integral part of karinding group performances. Common Room has promoted this instrument since 2008.

Through the RURU Gallery, Jakarta 32$^{o}$C and the OK.Video festival, *RUANGRUPA* provides platforms for artists and introduces the public to new forms of artistic expression. Since 2012 these festivals have become large enough to become separate divisions under RUANGRUPA; they are partly run by volunteers and increasingly host international artists and receive international recognition. RUANGRUPA's online presence improved since 2012 and it developed new visual and video art forms which increasingly help the organisation to position itself and to earn an income.

The organisation itself became an associate partner for the international Arts Collaboratory initiative, an initiative by Hivos and Stichting Doen to support independent visual arts organisations in Africa, Asia and Latin America and social innovation. In consequence RUANGRUPA expanded both its domestic and international network of artists.

*KBR68H* started with a network of independent radios in the early 2000 and currently reaches out to 900 radio stations across Indonesia and radio stations abroad. KBR also uses television and internet platforms that have become popular mediums in the past four years. Its Teen Voice programme was made by teenage reporters and sought to inspire children and teenagers through compelling news content. Originally a radio show, Teen Voice expanded to television and internet in 2012 and at its height, 53 radio stations relayed televised versions of Teen Voice, reaching some 400,000 viewers and around 770,000 listeners.

After the end of the project, KBR discontinued Teen Voice on radio and television in January 2014, but continued with the online platform but the number of visitors declined. Although KBR aimed to mainstream the Teen Voice programme through the radio of its parent company and its online news portal, this did not materialise in 2013 and 2014, but is currently being addressed. The organisation however remains a reliable and active member of the international Kids News Network of Free Press Unlimited.

The online platform (Suara Kommunitas) of *CRI* that promotes citizen journalism to bring grassroots information into the public space is seen by a number of contributors as a unique feature with content making a difference for local communities. 37 percent of the contributors represent community radios and many other bloggers have joint the platform. Since 2012 the number of contributors increased with 25 percent, contributions increased with 56 percent and web visitors with 7 percent. Despite these positive figures, the platform did not meet CRI's and Hivos' expectations to escalate grassroots issues for further lobby and advocacy towards government officials or the private sector.

Concerns were raised with regards to time spend by community radios to write for the online platform rather than improving their radio services to communities.

CRI intensified its collaboration with the Indonesian Community Radio Network (JRKI) not only to increase the members of its online platform, but also to lobby for the revision of the Broadcasting Law.

*ELSAM's* position in civil society is that of a resource centre that documents human rights atrocities and mobilises voices to influence policies based upon evidence. One of its significant contributions in the past two years has been the development on an online data base where local CSOs and other actors can upload human rights cases they documented. The data base currently contains 14,000 cases that have become publically available.

The organisation is a member of many networks at national level that influence Indonesia's policies and regulations with regards to human rights issues in many sectors, from the forest sector to justice. Together with a number of networks, the SPO intensified its lobby in early 2014 to ensure that a new law regarding Witness and Victim Protection was promulgated in October 2014, just before the new parliament was sworn in. Apart from these ELSAM is a member of the National Human Rights Commission (Komnas HAM).

**Perceived impact at household level**

Perceived impact at household level for Common Room and RUANGRUPA is to be translated into people being exposed to alternative arts expressions during events organised by both organisations. Generally speaking figures have gone up. Apart from this, mostly young upcoming artists possibly generate an income during these events or expose their products. The popularity of the karinding instrument starts to create a market for those rural people who know how to make it.

For CRI and KBR, impact at household level is to be translated in terms of number of online visitors, viewers and listeners. KBR's Teen Voice programme reached 400,000 viewers and around 770,000 young listeners: a survey concluded that children and teenagers learned from the television programs and 88 percent from the radio programs. The programme contributed to confidence building and was unlike other mass media that sometimes exploited them. CRI's online platform's visitors increased with 7 percent since the baseline.

ELSAM, together with other human rights organisations and networks successfully influenced the regulatory framework for the Witness and Victims Protection Agency and that of the National Human Rights Commission for granting statements for victims and their families: Eligibility criteria for reparation and indemnification of human rights victims were enlarged, leading to an increase of human rights victims being serviced from 750 in the last quarter of 2013 to 1,000 persons in the first semester of 2014. ELSAM decided to decrease its direct involvement with human rights victims, implying fewer interventions to directly defend their interests.

**Perceived impact with the public sector**

Apart from receiving occasionally financial support for specific arts activities RUANGRUPA and Common Room are collaborating with public sector officials but not in a very meaningful way. . Common Room provided policy inputs for the Provincial Development Planning Agency and the Ministry of Tourism and Creative Economy without clear results. RUANGRUPA does not seek engagement with the public sector

but is involved in the Indonesian Arts Coalition that seeks greater government support for artist-run initiatives.

Whereas CRI does not engage with local governments with regards to the community radio network and the online platform, it has a huge market to put in place digital village information systems, meant to improve local governments' service delivery towards their citizens. Together with the Indonesian Community Radio Network, CRI lobbies for a revision of the Broadcasting Law, which has until so far not been a priority for the central government.

For KBR 68H the government is a source and a recipient of information and occasionally a client to disseminate messages. KBR does not engage in policy influencing.

ELSAM positions itself as a 'moderate' human rights defender and in this position occasionally is the chair of multi stakeholder agencies like the Witness and Victims Protection Agency, the National Human Rights Commission. ELSAM is well aligned with the Office of the President, where it tries to advance the decision to put in place a Truth and Reconciliation Commission. It participated in a fact finding mission with the Ministry for People's Welfare in response to violent land disputes between communities and plantation companies in Lampung.

As a member of several coalitions, ELSAM successfully lobbied for a revision of the law on Witness and Victim Protection in October 2014, just before the new government was sworn in. As already mentioned the eligibility criteria for indemnification of human rights victims were enlarged as a result of ELSAM and the coalitions it works with. Its position in these coalitions is that of conducting research and drafting position papers that incorporate the concerns of human rights victims.

**Perceived impact with the private sector**

In the arts sector Common Room only engage with a few small local businesses as service delivers for the organisation of events. CRI has similar nearly absent relations with private sector organisations.

For KBR and RUANGRUPA private companies are potential revenue sources: international companies support KBR with their Corporate Social Responsibility funding and buy airtime. RUANGRUPA itself created two business entities to support the promotion of alternative artists and artworks, as well as to stimulate the involvement of artists in shaping public spaces. They are amongst others working with advertising companies who use their contemporary visual arts experiences.

ELSAM has developed a two-pronged approach with regards to agribusiness companies and extractive industries. In the first place the organisation investigates land and natural resource conflicts between these companies and poor and/or land-less farmers. Findings are being submitted to the National Commission on Human Rights, the national police, and the Witnesses and Victims Protection Agency which successfully sparked responses from each of the agencies that sought to protect and provide reparations for those affected. Besides this more confrontational approach, ELSAM has produced a manual for companies on "how to do business without violating human rights".

### *Changes in civil society – MDG 7ab*

**Figure 21: Perception of impact upon civil society, households, public and private sector.**

| SPO | Civil Society | Households | Public Sector | Private Sector |
|---|---|---|---|---|
| **FIELD** | 2+1 | 2+1 | 1+1 | 1+0 |
| **KWLM** | 1+1 | 1+1 | 1+0 | 2+0 |
| **LPPSLH** | 2+1 | 2+1 | 1+2 | 1+0 |
| **NTFP-EP** | 2+1 | 2+1 | 1+0 | NA+NA |
| **WARSI** | 2+0 | 2+0 | 2+2 | 2+0 |

Source: Individual evaluation reports.
Notes: Presentation of the absolute scores in 2012 (0-3) + relative change observed in 2014 (-2-;+2)

As already mentioned FIELD, KWLM and LPPSLH are cooperatives or support these to support small scale farmers and timber loggers. NTFP-EP and WARSI defend the interests and rights of forest people and indigenous people by means of community based forest management and income generating activities.

**Perceived impact in the civil society arena**

*FIELD's* most important success since 2012 has been the amendment of the 1992 Crop Production and Protection Act. However the process for the legalisation by local governments of locally developed seed varieties produced by farmers and the cooperatives is very slow although those governments have helped fund multi-location trials for seed breeding.

Since the baseline study *KWLM* cooperative became more mature: staff now knows what they are talking about and members are better informed about KWLM's systems and procedures. The cooperative has expanded its interventions to another sub-district. Because the organisation does not need technical support anymore from other NGOs on how to run a cooperative, its civil society network declined. It kept however a strong relation with a credit union to serve its members. Its cooperative model has been replicated in Lampung Province.

*LPPSLH* has helped the creation of two additional cooperatives and is now operational in three districts, with another district asking for the creation of a fourth cooperative. The cooperatives are functioning according to their bylaws; in at least one cooperative the internal accountability systems was used to replace the management committee. Cooperatives still rely upon LPPSLH for the costs of certification, quality control and for access to international premium markets of crystal sugar. Members have broadened their network, are actively engaging in the cooperatives live and have gained confidence in engaging with local government officials. Both farmers and middlemen have become members and whereas farmers now access a new premium market, middlemen benefit of an improved management of their cash flows. In this respect the cooperatives have been successful in managing the complex relations between middle-men and farmers.

LPPSLH itself expanded its network with other NGOs that also work on small holder agriculture, becoming the chair of a regional coalition that promotes organic farming and works closely with a Food Sovereignty coalition.

With support of IUCN-NL, WARSI supported 19 villages to set-up their community based forest management (CBFM) groups of which nine were officially endorsed by the Ministry of Forestry and the local government for their rights to manage forest areas for the next 35 years since 2012. The endorsed groups have two years to acquire a village forest permit. All these procedures require the assistance of third-parties to navigate the procedures with local authorities. CBFM groups have started to share experiences with each other, increasingly engaging with local governments and are about to form an umbrella organisation. Other NGOs have started the replication of the creation of these groups and ask WARSI's assistance in at least 8 other districts. However some of the CBFM groups are considering returning their permit because they cannot overcome the financial burden of forest management, and concerns exist that some groups only represent the interests of village elites.

*NTFP-EP* and its partners work in 75 villages in Kalimantan, seven more than in 2012. In these villages 37 groups (seven more than in 2012) receive support to process and market NTFP products. These groups are being linked to the Craft Kalimantan network created by NTFP-EP in 2011 to sell their products to the network's business unit Borneo Chic. For rattan products the Indonesian Sustainable Rattan Initiative was launched in March 2012 with the role to ensure market access for rattan products certified under a Participatory Guarantee System developed by NTFP-EP which became operational in 2014.

Both in Malinau and Sintang, NTFP-EP attempts to secure tenure rights and eco-cultural livelihoods of communities by involving them in participatory resource mapping. Communities increasingly face palm oil companies and extractive industries obtaining concession rights. The participatory maps are meant to be endorsed by the districts and integrated in its own spatial plans for both forests and agricultural land. Until sofar this has not yet been successful.

NTFP-EP continues to have the same type of relations with actors in the civil society arena in three distinct typologies, namely relations with: community-based organisations and networks, local NGOs and national NGOs. Whereas the CBOs and local NGOs are the main implementers of the programme at district and village level, NTFP-EP collaborates with national organisations for lobby purposes.

**Perceived impact at household level.**

Based upon visits to two of FIELD's six cooperatives, membership has probably doubled since 2012 (from 160 farmers to 360 farmers) and female membership is reaching 45 % in 2014. Most members are landless farmers of have only small plots. The FFS and cooperatives helped them to become less dependent upon middlemen for seeds and inputs, because they learned how to breed their own seeds and engaged in organic farming. Farmers have regained pride in what they do, but they face difficulties in accessing markets and therefore are still dependent on middlemen. With the amended Crop Production and Protection Act in 2012, farmers' dependency on seed companies like Monsanto has been decreasing, as they no longer had to buy and use mass produced, hybrid seedlings and fertilizers. Farmers have gained more control over their production resource, which contributed to 'farming democratization'.

KWLM cooperative has a waiting list of some 1000 persons and its actual membership increased from 900 in 2012 to 1200 persons in 2014. A major constraint for increased membership is that KWLM has not been able to manage its cash flow, because it prefinances its members when it buys their certified timber for premium markets. KWLM has not been successful in supporting its female members to

identify a market for herbs and spices and does not accept landless people. Due to the premium market, members have improved their bargaining position vis-à-vis middlemen and apply a more systemised form of logging.

LPPSLH started with one cooperative with 46 members and now has three cooperatives with 1750 members, of which 33 percent are women and 75 percent are landless people. Also middlemen have become members. Coconut palm sugar producers have access to a premium market for crystal sugar and therefore become less dependent upon middlemen. Crystal sugar production is a more labour requiring activity that requires the participation of both men and women at household level. It is not known how increased incomes are shared at household level. Advantages for smaller middlemen to join the cooperative consist of a better cash flow management with fewer farmers being indebted with them, when they accept the cooperative arrangements in place.

Although WARSI's approach to secure the management of village forests by CBFM groups as a means to improve forest people's livelihoods is promising, evidence of improvements or alternative livelihood opportunities emerging is lacking. Increased incomes and livelihood assets are insignificant compared to Indonesia's poverty line and monthly inflation rates; access of households to electricity has not yet materialised.

According to *NTFP-EP's* information, 1,440 members (186 members more than in 2012) of the groups that process and market NTFPs now earn each € 137 per year against € 53 per member in 2012 . The 17 female members of a rattan weaver association earned € 182, € 276 and € 290 per person in respectively 2012, 2013 and 2014 . However processing rattan bags is not the first income source of these women, other more important income generating activities at household level consist of off-farm employment and incomes in the rubber sector.

**Perceived impact with the public sector**

*FIELD's* most important success since 2012 has been the amendment of the 1992 Crop Production and Protection Act. However the process for the legalisation by local governments of locally developed seed varieties produced by farmers and the cooperatives is very slow although those governments have helped fund multi-location trials for seed breeding.

Upon request of the local government, *KWLM* has provided training on the process of certifying wood products which has become mandatory for forest companies and other concessionaries. The Forestry Department is also replicating KWLM's GPS-based inventory system to locate, track and record trees and timber. KWLM has helped streamline district certification processes which shortened the bureaucratic processes to legalise the origin of timber.

The successes of *LPPSLH's* three cooperatives improved collaboration with the districts where they are based and other districts gained interest to replicate LPPSLH's cooperative model and consider the organisation an expert in the creation of cooperatives and in consequence ask for its assistance.

The three districts increasingly engage with the cooperatives and provide some financial assistance; however increased reliance upon the local governments may also backfire upon the transparency of financial transactions. Crystal sugar production has raised the awareness of government officials that this product is a potential export market for Indonesia, leading to changes in the land use plans for small-scale district industries in favour of palm sugar in two districts. The three districts also started to

campaign with the private sector for a reduction of chemical fertilizers on other crops as a means to ensure the organic production of crystal sugar.

One of *WARSI's* CBFM groups has been successful in preventing a company to obtain concession rights and three villages rejected plans of their local governments to designate forested areas into and industrial forest plantation area. In Jambi province two districts and the province created CBFM task forces that function as a one-stop-shop service for the expansion of CBFM schemes and developed a five-year road map for CBFM, targeting 500,000 hectares to be managed by communities. In West Sumatra, the provincial government has integrated CBFM schemes in their forestry policy, possibly offering more opportunities for community groups to regain control of forest resources. WARSI's two pronged approach of supporting groups to become CBFM groups making use of existing policies and influencing these policies seems successful. Together with the other partners of the Ecosystem Alliance WARSI managed to simplify the procedures to obtain a village forest licence in 2014.

*NTFP-EP*, through the partner organisations it works with has been trying to influence district policies to include participatory mapping results in the spatial plans. However none of these maps have been actually endorsed by local governments. On one occasion, a participatory map was used by the local government to refuse a request for a concession by a palm oil company and on another occasion it helped to protect a natural dye-producing plant that is used in the production of woven materials and crafts. In many cases though, local governments are in favour of the arrival of palm oil companies or extractive industries.

In collaboration with other NGOs, NTFP-EP succeeded in obtaining positive results of the Malinau district government with regards to the review of a 2012 law on indigenous rights on forests.

At the national level, NTFP-EP still engages with other NGOs for strategic lobby work, leading to advancements in the registration of indigenous lands.

**Perceived impact with the private sector**

*KWLM* regularly supplies timber to six buyers who are in the export business but demands are higher than the organisation can fulfil. Yet KWLM is not yet in the position to negotiate more favourable terms of payments and often has to deal with delayed payments.

*LPPSLH's* own business unit increased its exports from 20 tons/month in 2012 to 90 tons/month in 2014 indicating there is a demand. However LPPSLH's collaboration with private sector organisations decreased since the baseline, although the replication of the creation of cooperatives in other districts is likely to be financed with the corporate social responsibility funds of (para-statal) companies.

*FIELD* does not engage with private sector actors and cooperative members observe there access to markets for organic produce needs to be improved.

*NTFP-EP* does not collaborate with private sector companies and with its programmes tries to prevent companies to take concessions that deprive local people from their natural resources and land through lobby activities targeting districts. Only for the manufacturing of NTFP products it works with its own business unit and other small enterprises.

Also *WARSI's* intention is to stop agribusiness and mining companies to obtain concessions that deprive forest dependent people from their land and natural resources. However the area currently managed by

CBFM groups (54,978 hectares for 25 villages) along one of the watersheds in Jambi province is just a tiny fraction compared to the 853,430 hectares of forest land authorized to 18 corporations. In West Sumatra possibilities for companies to obtain concession rights improved since 2011; WARSI has until so far successfully protected 9 villages from private sector organisations.

### 4.5.2. To what degree are the changes identified attributable to the Southern partners?

#### *Introduction*

This section presents findings with regards to the attribution question. Starting with an outcome achieved, the evaluation team developed a model of change that identifies rival pathways that possibly explain the outcome. Data collection was done to obtain evidence that confirms or rejects each of these pathways. Based upon this assessment, the evaluation team concluded about the most plausible explanations of the outcome after which the role of the SPO and MFS II were being discussed.

The relations between the pathways and the outcomes can differ in nature as is being explained in the following table.

**Table 13: Nature of the relation between parts in the Model of Change**

| Nature of the relation between parts and other parts or outcome |
|---|
| The part is the only causal explanation for the outcome. No other interventions or factors explain it. (necessary and sufficient) |
| The part does not explain the outcome at all: other subcomponents explain the outcomes. |
| The part explains the outcome but other parts explain the outcome as well: there are multiple pathways (sufficient but not necessary) |
| The part is a condition for the outcome but won't make it happen without other factors (necessary but not sufficient) |
| The part is a contributory cause it is part of a 'package' of causal actors and factors that together are sufficient to produce the intended effect. |
| Sources: Mayne, 2012; Stern et al, 2012 |

Not all SPOs underwent the same assessment. During the June 2013 NWO-WOTRO workshop strategies were discussed to fit the amount of evaluation work to be done with the available resources. It was decided to conduct a full in-depth process tracing process for only five SPOs in India, and for a maximum of two outcomes. Those SPOs are ELSAM and CRI for the governance theme and WARSI, NTFP-EP, LPPSLH for MDG 7ab. For the other SPOs a quick assessment was conducted.

#### *Explaining outcomes achieved - governance theme*

In total seven outcomes were explained, of which four with the help of in-depth process tracing.

**RUANGRUPA**

1. We assessed the emergence and demand for contemporary visual and video art in Jakarta. For this we identified two rival pathways, one that consists of RUANGRUPA's intervention and another that comprises other actors intervening independently which was rejected. The outcome is explained by RUANGRUPA who has promoted these arts since 2000. RUANGRUPA's networking capability, the establishment of a separate business unit (RURU Corps) since 2012, and in improved use of online media explain this outcome. Most organisations operating in the same sector in Jakarta do this in collaboration with RUANGRUPA or are not working in Jakarta. Another factor consists of the arts expressions of RUANGRUPA being trendy in Jakarta.

**Common Room**

2. We assessed the Karinding community having become more organised and capable of championing the revival of an interest in a traditional Sundanese instrument and supporting the underground metal scene. Three rival pathways were identified, the first explaining the outcome by the Karinding Attack band alone, the second being the emergence of a contempory subculture, and the third being Common Room as the initiator. The most likely explanation of this outcome is a combination of the three pathways. Common Room's innovation to combine both music genres and the popularity of the personnel of the Karinding Attack band that was the first to explore the possibilities, followed by the emergence of a trend or hype. Common Room facilitated the musical experimentation, assisted artists in music composition, and provided space for trainings and performances.

**Combine Resource Institute**

3. We assessed the increased participation of community radios and others to the online platform that provides information of grassroots interest. We identified three rival pathways, the first consisting of the online platform created by CRI, the second consisting of community radios and others having the capacity to engage in the platform, the third explaining the outcome because increasingly Indonesian people are using social media. The first and the second pathway are a condition for the outcome (necessary but not sufficient), and the second pathway provides a sufficient but not necessary explanation. The community radios receive capacity building support from several actors, one being CRI.
4. We assessed an outcome claimed by CRI that the Ministry of Health validated national health insurance beneficiary data that grant these beneficiaries access to the health insurance scheme. Three pathways were identified, the first explaining the outcome because CRI's online platform and other media created public pressure upon the MoH (rejected), the second being lobby and advocacy efforts (confirmed), and the third being the MoH acting upon its own initiative (rejected). The outcome is to be explained by a combination of different CSOs, public sector actors and parliamentarians. CRI's role was found not to be significant in the achievement of this outcome, because it did not seem to be successful in generating substantial public pressure through the online platform to obtain a response from the Ministry of Health, and its participation in the lobby efforts of one of the CSO coalitions was not confirmed.

**Kantor Berita Radio**

5. The outcome to be explained is the engagement of teenagers and children in the Teen Voice Program. We identified two rival pathways, the first consisting of KBR using social media including an online platform, and the second consisting of KBR using mainstream media like radio and television. A combination of both was necessary to achieve the outcome from July 2011 to 2014.

**ELSAM**

6. The first outcome achieved that we looked at is the revised Law on Witnesses and Victim Protection approved in October 2014. This new law will step up the Witnesses and Victims Protection Agency's (LPSK) efforts to support victims of past human rights abuses. Three rival pathways were identified; ELSAM providing regulatory reviews and a draft of the law to an NGO-CSO coalition (confirmed); human right victims taking the initiative to relate to the same coalition without the support of ELSAM (rejected), and; the Government led Human Rights commission lobbying parliament (rejected). The most important factor that explains the outcome is the collaboration of an NGO-CSO coalition to which ELSAM belongs. Most of the advocacy activities were conducted through this coalition and ELSAM's role was the provision of regulatory reviews and the drafting of the bill.
7. The second outcome that we looked at is ELSAM's network capacity to generate evidence of human rights atrocities as an input for evidence based advocacy. Two pathways were identified, the first being ELSAM supporting CSOs in monitoring and documenting human rights violations (necessary but not sufficient) and the second consisting of other NGOs supporting smaller organisations in doing so (sufficient but not necessary). ELSAM's network became more systematic in the manner in which cased of human rights violations are documented and followed up by lobby and advocacy. ELSAM's role was to provide a digital platform for data uploading and managing a national database system.

### *Explaining outcomes achieved - partners working on MDG 7ab*

With regards to MDG 7ab, nine outcomes achieved were explained, of which six were assessed with in-depth process tracing.

**FIELD**

1. The first outcome assessed was the improved performance of the cooperatives. Two rival pathways were identified, the first consisting of the creation of the cooperatives by FIELD and the second consisting of FIELD's interventions to start Farmer Field Schools. Both pathways are sufficient but not necessary. FIELD contributed to their organisational and financial capacity not only through training and technical assistance on cooperative governance and networking but also through its farmer field school approach that helped to increase farmers' productive capacities and interactive learning. There is insufficient evidence that the cooperatives have increased business opportunities for their members.

2. Since 2012 farmers are free to ensure their access to seeds and other inputs when the 1992 Crop Production and Protection Act was reviewed in their favour. Two pathways were identified. The pathway that most likely explains this outcome is that FIELD, together with a NGO/CSO coalition, developed policy inputs and mobilized farmers' in West Java to provide evidence and testimonies that have resulted in a ruling in their favour. The rival pathway consists of another farmer's sovereignty platform in East Java that rallied already in 2010 to demand the revision. It is likely that local actions were taken by separate members of the coalition and that these joined the national level coalition.

**KWLM**

3. The outcome to be explained is an increase in the number of smallholders being organised to produce certified legal timber and being interested in sustainable community logging. Three pathways were identified; KWLM providing the incentives for small holders (sufficient but not necessary); community members take up sustainable logging out of an environmental concern (necessary but not sufficient); the government supports community forest management (necessary but not sufficient). The outcome is to be explained by KWLM's cooperative model and its organisational performance. There is a waiting list for new members which shows the interest people have in joining the cooperative. Also an enabling environment has been created by the local government and the economic incentives provided by KWLM in terms of decreasing dependence upon middlemen and providing access to a premium market. This combination then helped introduce sustainable forestry practices.

**LPPSLH**

4. For the outcome "small-scale palm sugar producers into three cooperatives that are operational and profitable" the following rival pathways were identified; connecting farmers with premium markets; LPPSLH's approach to organise producers; the government's approach to organise producers and; other actors supporting the cooperatives. The outcome is to be explained by the causal package of the two first pathways. The role of local governments in organising palm sugar producers has been rejected as an alternative explanation, together with the role played by other actors and factors.
5. A second outcome achieved is that those farmers that produce crystal sugar have improved their bargaining position vis-à-vis their middlemen with whom they do business for cast sugar. The outcome is important as it shows that LPPSLH's intervention have had an impact on social mobility, which is a precondition for a healthy civil society. Three rival pathways were identified; LPPSLH's role in the establishment of a new palm sugar value chain including access to premium markets has rivalled the domination of traditional value chains. One former LPPSLH staff has also been successful in creating these alternative value chains with possibly better bargaining position of producers vis-à vis middlemen. The traditional value chain as an explanatory cause was rejected as well as other actors helping to change the relations between middlemen and farmers.

**WARSI**

6. The first outcome that we looked at is "community-based forest management (CBFM) groups in 9 villages have received full endorsement". The most likely explanation consists of the political will of the government being improved along with WARSI's efforts to intensively accompany the communities through the bureaucracy. These two pathways form a causal package. A third pathway of other actors and factors explaining the outcome was rejected.
7. The fact that CBFM is being mainstreamed into West Sumatra Province's forestry policy is to be explained by different actors: The provincial government's willingness to mainstream CBFM into its policies is evidenced in several policies, the formulation of which was co-authored by WAHLI and WARSI, academics and others. WARSI and WALHI hold a strategic position vis-à-vis the local government, which has allowed them to contribute to these new policies. A last factor is that WARSI's reputation was probably influenced by their existing CBFM model and the application of it in two of West Sumatra's districts. These three rival pathways (the government's willingness, WARSI's advocacy efforts and other actors involved in the policy formulation form a causal package.

**NTFP-EP**

8. Seventeen women saw their incomes for the production and marketing of rattan bags increase to € 15, € 23 and € 24 per month per person in respectively 2012, 2013 and 2014. In the same period the share of incomes from rattan products in the total household income increased from 8 percent in 2012 to 12 percent in 2014. Two pathways, a Participatory Guarantee System (PGS) and Cordaid's and Both Ends support the creation of a business unit were identified and tested and both provide a sufficient but not necessary explanation. The most plausible explanation of this increased income consists of several actors buying these bags, in the first place actors not associated with NTFP-EP, followed by Borneo Chic, a business unit created with support from Cordaid and Both Ends until 2011. The Participatory Guarantee System which was for the first time used mid-2014 may have provided some additional value, but not significantly. The system was developed with support from IUCN-NL. Each actor provides a sufficient explanation for the outcome but is not necessary.
9. The ability of forest dependent communities to claim their rights to manage forest resources and land in four villages was reached partially because those maps have not yet been endorsed by the districts, although they helped to secure a natural-dye plant and prevent a palm oil company to obtain a concession right. Of the three pathways identified, the outcome is to be explained by two necessary but not sufficient causes; community groups formed by others and resource mapping by NTFP-EP. The third pathway, lobby work by NTFP-EP based upon the maps, was neither a sufficient nor a necessary cause for the endorsement of the maps.

### 4.5.3. What is the relevance of these changes?

The evaluation team assessed the relevance of changes achieved in the light of a Theory of Change (ToC) constructed during a workshop with each SPO in 2012; in the light of the context in which the SPO is operating and; in the light of the MFS II programme that support the organisation.

### *Relevance of the changes in relation to the Theory of Change of 2012*

The following table shows the extent to which changes in civil society are relevant in relation to the Theory of Change that was constructed in 2012.

**Figure 22: Relevance of outcomes achieved in relation to the ToC constructed in 2012**

| SPO | Relevance in relation to 2012 ToC |
|---|---|
| **ELSAM** | Relevant: Outcomes serve both victims of human rights atrocities and address policy issues. A new relevant issue addressed is internet governance from a human rights perspective. |
| **Yayasan RUANGRUPA** | Relevant: Changes positively affected the existence of public space, networking, and the capacity of society. |
| **Combine Resource Institution (CRI)** | Partially relevant: Online platform was meant to help citizen journalists to escalate grassroots issues to be addressed by governments but this part of the 'act upon information' did not materialise. |
| **Common Room (CR)** | Partially relevant: A healthy society characterized with strong cultural identity and freedom of expression was enhanced, but CR's ability to network, to offer public space for artist expression has declined, and their intention to make the use of media and technology a defining feature of Common Room's work did not happen. |
| **KBR68H** | Relevant: KBR produced quality content with and for children who are an underserved age group, and engaged its network to disseminate content through television and radio up until 2013. |
| **FIELD** | Relevant: FIELD contributed both to creating an enabling policy environment for farmers and organises them to obtain access to, and control over resources. |
| **KWLM** | Relevant: KWLM supports the prosperity and autonomy of forest-dependent communities, by delivery of services, obtains support from the public sector, raises community awareness on sustainable timber and ensures access to premium markets |
| **LPPSLH** | Relevant: LPPSLH developed a sustainable and inclusive business model for palm sugar sector<br>But: LPPSLH did not contribute to capacitate farmers to demand their rights and enhance their participation in the political economy. |
| **KKI-WARSI** | Relevant: Outcomes lead to conserved forest and welfare for communities. Some of WARSI's ToC preconditions such as campaign on community-based forest management, increased value of NTFPs and ecosystem-based economy, and major assumption such as political will from the Ministry of Forestry and political momentum are well reflected from the outcome's contribution analysis. |
| **NTFP-EP** | Partially Relevant: NTFP-EP worked on the integration of NTFPs in value chains and tenure rights.<br>But: It will take a long time before NTFPs will become a viable part of sustainable livelihoods, in particular when they are not the most important income generating activity. NTFP-EP underestimated the importance of lobby and advocacy work to be done at district level to integrate participatory maps into district spatial maps. |

### *Relevance of the changes in relation to the context in which the SPO is operating*

Generally speaking the outcomes achieved by the SPOs are relevant in relation to the context they are working:

- ELSAM's efforts to address human rights violations are still needed and ELSAM also addresses these in new areas such as internet governance.
- RUANGRUPA and Common Room help to provide opportunities for non-market – driven artists and help to create alternative spaces where alternative visions and ideas can flourish.
- KBR provided a platform for teenagers and CRI for citizen journalists to voice their concerns, both groups being underserved by mainstream media.
- FIELD, KWLM and LPPSLH organise small scale farmers and timber producers to integrate new value chains that decrease their dependence upon middlemen, help them to gain confidence

and earn an income. Except for KWLM, these organisations also address policies and practices as a means to create an enabling environment

- WARSI and NTFP-EP outcomes are relevant but yet insufficient to ensure the livelihoods of forest dependent people and to prevent the depletion of scarce forest resources by agribusiness and extractive industries. WARSI's model is more relevant with regards to providing a means for forest communities to claim management rights over village forest areas.

### *Relevance of the changes in relation to the policies of the MFS II alliance and the CFA*

*ELSAM* contributes to Hivos' Rights and Citizenship Programme, which aims to the recognition of human rights and women's rights, good governance and a pluralistic society. ELSAM's outcomes are relevant to Hivos' strategies because the SPO has adopted an alternative, more moderate lobby approach as opposed to more common 'radical' strategies often taken on by human rights activists in Indonesia. Its recent focus on human rights with respect to internet governance also aligns with this policy.

Hivos' support to *RUANGRUPA* and Common Room are part of its Expression and Engagement programme aiming to generate social debate and cultural dialogue. Hivos considers space for socially engaged art and culture to be limited in developing countries and sees this as a means to generate critical reflection, pluralism and diversity. Hivos continued support to RUANGRUPA because created spaces for artists to experiment, while expanding organisationally through the creation of different (business) units. Hivos made RUANGRUPA a member of the Arts Collaboratory initiative which helps the SPO to engage with other organisations around the world. Although Common Room's outcomes are also relevant for Hivos' policy, its declining organisational performance actually hampers its contribution to the policy, being a reason for Hivos to end the partnership in December 2013.

Hivos' support to *CRI* fits within the scope of a vision defined in 2008. In particular, Hivos recognized the important emergence of virtual movements that has gone hand-in-hand with the development of communication technologies. Hivos sees CRI's online platform as a shared interest that gives an opportunity to citizen journalists to express their opinions and provide citizens access to bottom-up information. However the platform has not yet resulted in broad citizen activism.

*KBR's* Teen Voice programme relates to one of the tree objectives of Press Freedom's 2.0 in Indonesia, promoting a free and professional media landscape aimed at children and youth, as well as independent journalism. KBR's biggest challenge was to develop and implement a sound business strategy that would ensure sufficient income to cover production and broadcast costs, which however did not materialize. Despite this, KBR continued to engage with the international Kids News Network of Free Press Unlimited.

The changes achieved by *FIELD*, *LPPSLH* and *KWLM* contribute to Hivos' green entrepreneurship programme which focuses on "enterprising men and women as catalysts for green socio-economic progress". Hivos supports small producers to improve their productivity (not at the expense of biodiversity) and strengthening their representative organisations. Hivos also states in its 2008 Vision Paper on Civil Society Building that "In the economic domain it is civil society's role to counterbalance short-term profit policies, and to struggle for long term production policies which are socially and environmentally sound." KWLM and LPPSLH have provided alternative business models that are

inclusive and biodiverse. FIELD did not address market access for the organic farmers. KWLM did not manage to support women as green entrepreneurs whereas FIELD was successful in doing so. Although LPPSLH's cooperatives have many female members, gender issues in the process of producing crystal palm sugar at household level are not being addressed.

*WARSI* and *NTFP-EP* are part of the Ecosystem Alliance's (EA) programme that aims to "to improve the livelihoods of the poor and create an inclusive economy, through participatory and responsible management of ecosystems". Both SPOs contribute to the Livelihoods & Ecosystems theme, WARSI having achieved more success on the ecosystem part and NTFP-EP on the livelihoods part. EA introduced the programmatic approach as a means to contribute to civil society development and policy influence. This implies that all EA partners in Indonesia work together to reach joint results.

NTFP-EP is the coordinator the partner organisations to produce collective achievements on Sustainable Livelihood Initiatives and Models (SLIMs).

WARSI is the coordinator of the partner organisations to simplify the procedures to obtain a village forest recognition and license. In 2014 a regulation was published by the Ministry for Forests that states that it is not any longer necessary to get a license from the governor.

Another objective of the Ecosystem Alliance, halting the expansion of palm oil and mining concessions was only very partially achieved. This objective is rather ambitious given the stakes and interests of both private sector and local elites to quickly make advantageous deals.

### 4.5.4. Explaining factors

#### *Internal factors*

Internal factors that explain the findings are as follows:

RUANGRUPA and LPPSLH's *capability to act and commit* explains part of the positive findings: the first SPO has a dynamic leadership and created separate divisions that are operating rather independently and involve alumni, and; the second works with highly motivated staff and a belief in the principles of community empowerment.

However high staff turnover and loss of institutional memory with CRI and Common Room; Implementing partners of NTFP-EP are missing the capacity to do lobby and advocacy at local level, and; Common Room's absolute dependency upon its director and only having three staff at the moment also explain the less positive findings on changes in civil society.

Four organisations show to avail of the *capability to relate:* RUANGRUPA's open character with a relaxed and informal atmosphere is attracting alumni who want to contribute to the life of the organisation; KWLM, FIELD, and LPPSLH have been capable of relating rural and less-educated farmers and loggers to private sector actors, and; NTFP-EP's staff has good personal networks that help to relate with local partners.

ELSAM's board becoming more effective, NTFP-EP becoming and independent foundation in May 2012 and LPPSLH's intensive accompaniment of cooperatives which the government is not able to replicate all

are elements that explain their *capability to deliver on development objectives*. WARSI has demonstrated that it is a mature organisation that delivers on outcomes due to its technical, managerial, administrative and financial capacities.

Common Room's move to a less central location in Bandung and NTFP-EP being mainly based in Jakarta whilst activities are being implemented in Kalimantan through sub-contracts with local partners negatively affect the civil society changes. Common Room, KBR and KWLM to a lesser extend having not been able to sustain funding for their activities also explain a lower capability to deliver on development outcomes.

ELSAM's strategy changing from direct support to human rights victims and training local NGOs into a resource centre, as well as; RUANGRUPA's reorientation towards becoming a knowledge producer and developer prove their *capacity to adapt and self-renew.*

On the other side CRI is still struggling with its position in society, its wish to become a resource centre but not knowing what services to deliver and to whom.

For all SPOs in the civil society sample, we observe that the monitoring systems in place do not allow drawing lessons at outcome level in terms of what works and what works not and why. Reporting takes place at activity and output level, but not at outcome level: important issues to look at from a civil society perspective are for instance the performance of organisations created, a more systematic gathering of information on client satisfaction or impact at household level, and the government becoming accountable to its citizens.

There is a gap between Common Room's ambitions and its realisations: currently this is exacerbated because the organisation is deviating from its original visions and missions mentioned in project documents. It has difficulties with its *capability to achieve coherence.*

### *External factors*

Indonesia's connection to the internet; contemporary arts becoming the latest trends; anti-corruption being on the agenda of the government; regulations in favour for community based forest management and the creation of cooperatives, and; growing demands for certified timber and crystal sugar all provide a conducive environment for the interventions of the SPOs.

*Indonesia's access to internet* is booming and in 2013 some 30 % of its population had access to internet, in particular those between 15 and 30 years old. However internet is still an urban phenomenon. RUANGRUPA took this opportunity to disseminate the application of contemporary visual arts which creates an alternative market for artists. CRI is busy with the installation of Village Information Systems (Non MFS II) and uses the internet for its online platform of citizen journalists. For KBR the online platform for the Teen Voice programme further enhanced the engagement of children and teenagers with the radio and television programmes until these were stopped.

Both Common Room and RUANGRUPA experience a positive environment for *contemporary arts* in respectively Bandung and Jakarta. Since these have become the latest trend, competition with mainstream artists and others providing alternative public spaces has increased (Common Room).

RUANGRUPA observes that the increased appreciation for contemporary arts also may discourage more critical and provocative discourses: "navigate between idealism and commodity".

*Anti-corruption* is on the political agenda, including better legislation to protect whistle blowers, which is important for ELSAM, and the increased acknowledgment that corruption impacts upon the protection and management of natural resources and forests, which is relevant for NTFP-EP and WARSI.

These last two organisations also use the opportunities provided by the 2007 and 2008 regulations with regards to *community based forest management and the REDD + schemes* in place, although according to the latest information the new government is about to dissolve the Indonesian agency in charge of the implementation of this scheme[132].

The three organisation that work with *cooperatives all* experience good enabling environments at district level and *growing and stable demands* for certified timber and crystal sugar of coconut palm (FIELD, LPPSLH and KWLM).

Not so conducive factors are; the broadcasting law that creates unfair advantages to large media conglomerates and risks to decrease the diversity of expression (CRI and KBR); free expression on the internet (ELSAM and KBR); the market for NTFP products is very limited and still needs to be created in Indonesia (NTFP-EP); NTFP-EP missing the political commitments of district governments for the management of natural resources by communities themselves rather than giving these as concessions to agribusiness and extractive industries, and; regular mutations of government staff which implies that results of previous lobby activities are not being secured .

### *Relations CFA-SPO*

Generally speaking, the relations between the Co-Funding Agencies and their partner organisations are or were very constructive:

Most often mentioned support by Hivos, consisted of linking the partner organisation to other partners of Hivos (ELSAM, Common Room, KWLM, LPPSLH) and at the international level (RUANGRUPA); help to build the organisational capacities and support to the creation of business units or cooperatives (RUANGRUPA, CRI, Common Room, LPPSLH) and creating relations with the new Agri-Profocus Network in Indonesia (FIELD and LPPSLH).

Hivos' expectations with regards to Common Room were not met despite support given to strengthen the organisational capacity of the organisation.

Specific support provided by Hivos to LPPSLH to mainstream gender in its project also did not materialise.

Also Free Press Unlimited supported KBR by means of a series of trainings to support the Teen Voice project to produce news content for children, which required a different journalistic approach. At the end of the project, KBR became a member of the World Kids Network and Kids News Network aiming to create a platform for cooperation and generate revenues for Teen Voice.

[132] http://news.mongabay.com/2015/0113-bp-redd-indonesia-lbell.html

IUCN's most important contribution, and in particular that of the entire Ecosystem Alliance consisted of bringing all partners together in a programmatic approach: WARSI and partners have successfully lobbied for a simplification of the procedures to obtain a community forest management license and NTFP-EP is busy to prepare a festival on Sustainable Livelihoods Initiatives and Models to lobby the national government for a more conducive policy environment and to attract urban middle-class consumers to buy NTFP products. According to IUCN, its partners see the annual meetings of experience sharing as beneficial.

## 4.6. Discussion

### 4.6.1. Design of the intervention

This section answers a question by the synthesis committee about the 'replicability' of the interventions. The evaluation team interpreted this in terms of innovations or approaches that can be replicated by another organisation or in another context. In addition to this replicability implies a project mode and short term interventions. In this paragraph we have organised the intervention models that are replicable, those that are not replicable because they do not fit into a project mode of development and those that need to be redesigned.

#### *Intervention models that are replicable*

**Combine Resource Institution**

Creating an online platform to relate community radios, bloggers and other community journalists to each other to share news and information for grass root level is replicable and relevant in Indonesia's context. However CRI's experience has learned that more interventions are needed if such platforms become a tool to increase pressure upon governments to improve their services. Citizen journalists, members of the platform need lobby and advocacy capacities to campaign on the internet. The online platform itself may need the capacities to mobilise the platform members to take collective action and relate with those organisations capable of directly engaging with the lobby targets.

**KBR68H**

Free Press Unlimited developed a more or less fixed project format, consisting of an 18 months project after which KBR was supposed to be able to continue on its own. The project design would have become stronger if a more in-depth assessment would have been made of the links between civic participation and media usage among youth, factoring in specific age groups, types of media used, and identifying information gaps. A combination of radio, television and online discussion platforms contributed to the success of Teen Voice program but more social media are worthwhile exploring. The financial sustainability of the program would probably have been ensured when business strategies had been developed right from the start of the project.

**FIELD**

FIELD's interventions have three components: learning and empowerment through farmer field schools (FFS); legalising farmers' seeds both formally and informally and; the creation of cooperatives and businesses. Studies have shown that FFS are less suitable for profit-driven approaches to rural development that include credit cooperatives[133]. While these interventions can be complementary, FIELD's example shows that its increased production through FFS did not yet increase their market access through the cooperatives. These relations in FIELD's project design are rather vague, with the cooperatives acting more as an extension of the FFS rather than a means to access markets.

A successful replication of FIELD's model would in the first place require additional expertise in improving market access for organic produce next to the highly technical seed breeding expertise already available.

**KWLM**

The KWLM cooperative model is already being replicated by others. However, the following issues need to be taken into account to further improve the model: In the first place KWLM's cooperative is rather exclusive in membership and community members find it hard to comply with the entry requirements. KWLM's four intervention areas (socialisation, inventory of timber, nursery development and certification) all ensure that market demands are being met rather than meeting farmers' demand for support in FSC certification and other technical issues. In the second place a solution needs to be found for KWLM to avail of sufficient financial capital to purchase timber from members up front for which buyers pay for fully upon delivery. A four-year period would be sufficient to create such a performing cooperative.

**LPPSLH**

LPPSLH itself has shown that it is capable to replicate the model of creating cooperatives of palm sugar farmers in other districts, as well as a former staff of LPPSLH. Government replication efforts however failed because they do not provide intensive guidance to cooperative members, which unlike the government, LPPSLH does provide. Important conditions that need to be in place are the existence and access to premium markets, a clear organisational direction and ideas, a project duration of some 3 to 4 years and organisational competences needed. Pending issues are the gender dimension, assessing the performance of the value chain and traceability of products, in particular when organic products are being marketed.

**WARSI**

WARSI's model and design is replicable if certain conditions are in place. Despite taskforces being in place in West Sumatra to support the expansion of village forest schemes and the simplification of the procedures to obtain village forest licences in 2014, external third-party assistance will still be required for communities to deal with the bureaucracy. A second condition for success remains the local political context, in favour of village forests or in favour of concession rights for agribusiness and extractives. However a major point of attention in the design of WARSI's intervention is that of effectively increasing

[133] Ibid

impact at household level after community based forest management groups have obtained the necessary licenses to manage the forests.

### *Intervention models that are not replicable but successful*

**ELSAM**

According to a report published in 2010 by AusAID regarding the Indonesian Knowledge Sector, the Government lacks the structure for obtaining reliable internal policy analysis[134]. Experiences have shown that where NGOs are involved in collecting, analysing and disseminating data and information to government officials, they have been challenged to provide solutions based on the knowledge they produce[135]. Given this context, the design of ELSAM's interventions has been suitable to the prevailing conditions. Not only has ELSAM been producing information and data on human rights abuses, it has succeeded in working with the government to seek policy solutions by providing its expertise in producing legislative inputs. A 2013 AusAID follow-up initiative, the Knowledge Sector Initiative (KSI) which now also supports ELSAM produced 'stories of change' on successful interventions of its partners. These interventions are: 1) being able to collect research evidence to inform policy makers; 2) the existence of a need for data and information within the government; 3) organisational reputation; 4) engagement with the parliament; 5) collaboration with network organisations; 6) media engagement, and 7) an understanding of the context.[136] ELSAM's role in amending the Law on Victim and Witness Protection and its broader but related work to document human rights violations shows that these success factors were present in the SPO's design.

Another organisation would not be able to replicate this model in a 'project-mode' or short term intervention. The outcomes are the result of 20 years of consistent attention on human rights issues.

**RUANGRUPA**

The outcomes achieved are to be considered as emerging features in an urban context. They evolve and cannot be planned as an intervention. Therefore, although RUANGRUPA has been successful, its strategy is not necessarily replicable in other context. On the other hand, there are more events emerging in Jakarta that cover visual and video art. But it is difficult to assess whether similar events were inspired by RUANGRUPA. The organisation has brought contemporary art closer to the masses so to speak, making it possible for those without an artistic background to take part in shaping the discourse.

### *Interventions that need to be redesigned*

**Common Room**

The Common Room success story is that of having contributed to a progressive sub-culture amongst youth through the fusion of musical genres and the revival of Sundanese traditions, however this has not yet led to larger influences in the creative industry or economy of Bandung. There is a considerable

[134] Page 8, Overview of the Indonesian Knowledge Sector, Final Report. Petrarca Chawaro Karetji. 30 September 2010, AusAID.
[135] Page 12, Ibid
[136] Working Politically: A Story of Change about the contribution of research evidence to the new Village Law in Indonesia (Revised Version). Australian Aid Knowledge Sector Initiative, April 2014.

gap between Common Room's ToC and what they have been able to realise until so far. More strategic thinking is required, as well as a clear focus in the interventions needed to realise the ToC and the vision and mission of the organisation. Meanwhile, the organisation's performance has weakened.

**NTFP-EP**

NTFP-EP's project design could have benefitted from a concentration of efforts on fewer districts as a strategy to successfully oversee, monitor and assist project implementers and local stakeholders in achieving impact. The design fell short of clearly identifying how interventions as the community level would lead to strategic results for civil society. This is in particular the case with regards to communities claiming their rights on natural resources and lobbying districts governments to endorse natural resources maps for land use with a forest or an agricultural destination. Future interventions would benefit from a plan of action that includes: a context analysis including the identification of favourable district policies; a joint development of NTFP management plans with local government; creating working groups within the local government regarding NTFP management; support them to produce regulations in favour of the participatory management of NTFPs, and; improved value chain analysis meant to make NTFP-based livelihoods more sustainable and which includes market access through Borneo chic.

### 4.6.2. Evaluation methodology

A methodology was design to conduct this evaluation – see Annex J. The methodology in itself provides enough guidance to conduct a Theory Based Evaluation, although the process tracing methodology requires substantial understanding of the different steps to take.

Generally speaking we observe that the CIVICUS framework has never been used for evaluation purposes, and that the period between the baseline and end line study hardly covers two years, whereas the entire MFS II period covers 5 years. Furthermore, we observe that the interventions by the SPOs do not distinguish interventions that relate to Civil Society or Policy influencing from other interventions. This makes it occasionally difficult to obtain a clear focus for the civil society evaluation.

Critical steps in the evaluation methodology are the following:

1 Linking project interventions from the SPO to the CIVICUS framework. The project documents do not provide this information and are based upon the interpretation by the evaluation team in the Netherlands.
2 The extent to which the project documentation enables the Dutch team to understand the in-country realities. If the quality of the reports is weak, then the guidance provided to the in-country evaluation team is weak. Therefore deciding upon the outcomes to be selected for in-depth process tracing was sometimes hampered by incomplete and un-clear project documents.
3 After the workshop with the SPO, the in-country team had to decide upon which outcomes they will focus on for the in-depth process tracing. There was a tendency to selecting positive outcomes achieved.
4 Designing the model of change that explains the outcome achieved, followed by the inventory of rival pathways to explain that outcome has also proven to be a critical and difficult step. In this phase it is critical that the evaluation team works together to brainstorm on alternative pathways. A

major challenge is that in-country teams at this moment of the evaluation have obtained a lot of information from the SPO, and not from other NGOs or resource persons, which possibly might strengthen their bias in favour of attributing change to the SPO.

5 The following step of identifying the information needs to confirm or reject these pathways and to identify the method of collecting the information needed. Also this step has most chances to be successful when the evaluators work together.

6 The usefulness of process tracing for all outcomes that were identified and for which process tracing was used. A preliminary conclusion is that this methodology is in the first place suitable for the assessment of contribution towards policy changes and when many actors and factors are involved. Not all outcomes achieved in the civil society study are of this nature.

Information gathering to assess the relevance of the changes in civil society and the explaining factors generally speaking was not challenging.

Critical conditions for this evaluation methodology are:

1 Project documents and progress reports need to be available in time, and they need to systematically report not only on outputs but also on effects on the changes in peoples livelihoods (civic engagement), and at least the performance of organisations that received support from the SPO. None of the SPOs in the sample have an M&E system in place that measures the organisational capacity of the organisations they support.

2 Some of the SPOs seemingly do not have been subject to external evaluations and therefore often were unable to provide the evidence needed (at outcome -impact level) for the evaluation.

3 The evaluation team needs to have a thorough understanding of the CIVICUS framework and the interpretation of the indicators used for this evaluation.

4 The evaluation team needs to understand how process-tracing works and the in-country evaluation teams need to develop a critical stand towards the interventions of the SPO that enables them to identify rival explanations for the outcomes achieved and to identify the appropriate questions to confirm or reject pathways. Because this is a new methodology, much depends upon the team's previous experiences of theory-based evaluations.

5 The methodology developed and in more generally terms theory-based evaluations are more time-consuming than randomized control trials.

6 The process-tracing methodology requires a continuous process of analysis of information obtained and identification of further information needs to be able to make a plausible contribution claim. This capacity of critical reflection is one of the core capacities needed to successfully conduct a theory-based evaluation like process-tracing.

### *Experiences during end line from in-country teams - Indonesia*

The in-country team experienced difficulties in working on the first evaluation question regarding changes in civil society. The team would have preferred a similar workshop as during the baseline that would recapitulate the essence of the CIVICUS model and the content of each standard indicator developed. Although some members of the in-country team were also involved in the 2012 base line assessment, they and their new colleagues experienced a kind of "CS dimension shock" when these

topics where not addressed during the workshop, where a lot of time was spend to work on the second evaluation question on contribution. A guidance sent later in the year was helpful but came late according to the Indonesian team.

The many appendices prepared for data collection and meant as a step-wide approach for the end line study, sometimes became a burden and a limitation when applied directly in collecting data. Like mentioned for the baseline study the questions sometimes limited the probing for information. In addition, in-country team members had to deal with the "CS dimension shock".

The organisation of the entire MFS II evaluation did provide very little opportunities for SPOs to engage with the evaluation and to feel concerned. For many of the SPOs the evaluation does not provide a strategic value in terms of drawing lessons. This lack of ownership is felt more strongly with those SPOs that already ended their contract with the Dutch MFS II organisation and with those SPOs that due to high staff turn overs were confronted with past tense issues that they did not experience.

Some of the SPOs simply didn't care about the evaluation. This could have been anticipated if there had been a special workshop (for the directors, perhaps, and the CFAs) prior to the endline. Via such workshops, appointments and agreements could have been set, allowing the in-country teams to plan their time and schedule. What ended up happening was that many of the SPOs kept putting off appointments and this also affected the schedule of the team.

Many SPOs are unfamiliar with the CIVICUS framework and the in-country team tried to ease them into it by sending background information and the indicator questions regarding changes in civil society prior to the workshop. This was effective for some SPOs (Common Room, WARSI), but not very effective for LPPSLH, RUANGRUPA, and CRI. The latter three found it too difficult to answer these questions by themselves. Common Room, on the other hand dedicated a special discussion session to discuss the questions internally. The questions were however the same as those dealt with during the baseline and possibly high staff turnovers may also explain this "CS dimension shock".

Fieldwork was sometimes inefficient since the in-country team assumed that each step (workshop, interview, drafting model of change, selecting outcome, finding evidences) would neatly fall into sequence and could be packed tightly within 4 or 5 days with strong commitment from the SPO. This often did not happen.

## 4.7. Conclusion

### 4.7.1. What are the changes in civil society in the 2012-2014 period?

#### *Governance theme*

**Perceived impact in the civil society arena**

Common Room and RUANGRUPA have contributed to the emergence of new expressions of contemporary arts; Common Room with regards to the fusion of traditional Sundanese music and culture with underground metal music and RUANGRUPA through several forms of artistic expression, including a new visual and video art form which is expanding and also creating business opportunities.

KBR temporarily offered the space for children and teenagers to be informed and to inform others about issues of their concern, but its Teen Voice programme discontinued when KBR failed to mainstream the programme into other networks.

CRI with its online platform has created the space for sharing grassroots information amongst bloggers, community radios and other citizen journalists to voice the day-to-day issues of citizens. It fails however to mobilise these voices for collaborative action.

ELSAM has further positioned itself in the human rights sector as a resource centre that is capable to mobilise the documentation of cases on human right atrocities and to use this information for evidence-based advocacy together with its network of both national and local NGOs-CSOs.

**Perceived impact at household level.**

Most tangible impacts at household level consist of an increased exposure of people to alternative expressions of arts (Common Room and RUANGRUPA); children having learned from the Teen Voice program; more citizens being exposed to grass root level information through CRI's online platform, and; ELSAM and the coalitions it works with having ensured that more human rights victims have become eligible for indemnification or reparation.

**Perceived impact with the public sector**

Only ELSAM, as a 'moderate' human rights defender and as such occasionally a chair of multi stakeholder agencies like the Witness and Victims Protection Agency, the National Human Rights Commission is engaging with the public sector to change policies and practices.

The other four partner organisations occasionally engage with the public sector to obtain financial support, to provide advice or as service delivers.

**Perceived impact with the private sector**

Only ELSAM has interventions in place to influence agribusiness companies and extractive industries. It investigates land and natural resource conflicts between these companies and poor and/or land-less farmers and submits these finding to the National Commission on Human Rights and other actors, which sometimes provides reparations for those affected. Besides this more confrontational approach, ELSAM has produced a manual for companies on "how to do business without violating human rights".

The other SPOs engage with small local businesses as service deliverers, or have created their own business units (RUANGRUPA). For KBR and RUANGRUPA, the private sector is a potential client who wants to buy airtime.

### *MDG 7ab*

**Perceived impact in the civil society arena**

The most significant contributions of FIELD, KWLM and LPPSLH in the past two years consist of the expansion of the number of cooperative structures and/or the improvement of their organisational performance. Meanwhile more people adhered to the cooperatives. Members improved their

bargaining position vis-à-vis middlemen because the cooperatives either help them access premium markets (KWLM and LPPSLH) or provide them access to credits (FIELD).

Cooperative members (and members of FIELD's farmer field schools) have strengthened their personal network and as representatives they have developed relations with local government officials. Whereas FIELD involves small scale farmers in lobby activities with national coalitions, LPPSLH better positioned itself in networks that promote organic farming and food sovereignty.

WARSI's community based forest management groups increasingly are being endorsed by the authorities, enabling them to manage their village forests for the next 35 years. CBFM groups have started to share experiences, increasingly engage with local governments and are about to form an umbrella organisation. Other NGOs have started replicating the creation of those groups in other districts. Concerns raised are the representativeness of those CBFM groups and how to overcome financial burdens attached to the village forests.

**Perceived impact at household level.**

FIELD's, KWLM and LPPSLH's perceived impact at household level consists of more households adhering to the cooperatives; improved incomes because they produce for premium markets (KWLM and LPPSLH) and because they have access to credits (KWLM and FIELD). FIELD's small scale farmers (45 percent are female farmers) regained their control over seeds and inputs when the Crop Production and Protection Act was amended in 2012. Market access for these farmers and their households however remains an issue of concern.

Whereas FIELD and LPPSLH cooperative members consist of small scale producers, land-less or landowners, KWLM's membership excludes land-less people. LPPSLH and KWLM failed to take into account a gender perspective in their activities.

WARSI's CBFM approach until so far did not generate significant increases in incomes and livelihood assets.

**Perceived impact with the public sector**

FIELD, LPPSLH and their cooperatives, and KWLM have constructive relations with local governments with the creation of cooperatives which is aligned with national policies. All three SPOs are engaged in the replication of their cooperative model with local governments.

Apart from this FIELD's most important success since 2012 has been the amendment of the 1992 Crop Production and Protection Act. This was the result of lobbying as a network, including the members of the cooperatives. However no impact was found with regards to farmers being able to legalise the intellectual property rights they have when they breed new seed varieties.

WARSI successfully lobbied in Jambi province to create one-stop-shop services to accelerate the implementation of the CBFM scheme. At the same time the government designated 500,000 hectares of forests to be managed by CBFM groups. In West Sumatra the CBFM scheme has been mainstreamed into the provincial forest policy. Together with the other partners of the Ecosystem Alliance WARSI managed to simplify the procedures to obtain a village forest licence in 2014.

**Perceived impact with the private sector**

KWLM and LPPSLH do not have impact upon the private sector but engage with buyers to access premium markets and are increasingly successful in doing so. FIELD's farmers have not yet found a market for organic produce.

The most important relations NTFP-EP and WARSI have with private companies consists of stopping them to take concessions for agribusiness or extractive industries, by organising villages in CBFM groups or other village group that seek to secure their rights with district authorities.

### 4.7.2. To what degree are the changes attributable to the Southern partners?

#### *Governance theme*

In total, seven outcomes were explained, of which four with the help of in-depth process tracing.

*One of the outcomes cannot* be explained by the partner SPO: this is CRI's claim that it contributed to the Ministry of Health granting more beneficiaries access to the health insurance scheme through the online platform. Its online platform did not exert public pressure upon the Ministry of Health to change its regulations.

*Multiple actors* explain the second outcome of CRI, increased participation on the online platform. Each of these actors separately, including CRI contributed to the increased participation to the platform and form a *sufficient but not necessary* explanation for the outcome.

RUANGRUPA's and KBR68H' interventions *sufficiently and necessarily* explain their outcomes. RUANGRUPA created the necessary infrastructure and demand for contemporary visual art in Jakarta. Its reputation and role were key in achieving this outcome.

KBR68H's interventions also explain the engagement of teenagers and children in the Teen Voice Program. The most valid explanation for the increased quality of participation of the target group in Teen Voice since the baseline is the shift towards a web-based platform for Teen Voice, in combination with the use of radio and television broadcasts.

Three outcomes are the result of *a causal package*, in which the SPO played a substantial role. ELSAM has an enormous network in which its particular role is to mobilise local information that it uses to draft position papers used by the network for lobby and advocacy. This causal package explained two lobby outcomes.

Common Room's innovation to combine traditional Sundanese instruments with heavy metal music and its collaboration with a popular band explain the revival of Sundanese traditions and the integration of heavy metal groups in society.

#### *MDG 7ab*

With regards to MDG 7ab, nine outcomes achieved were explained, of which six were assessed with in-depth process tracing.

Three outcomes can be explained by a causal package of actors and factors that cannot be disentangled and in which the SPO showed to be indispensable. This was the case with FIELD's work in the coalition to push the government for a review of the 1992 Crop Production and Protection Act; WARSI's work to obtain the endorsement of CBFG which required also the support of local authorities at district, provincial and national level, and; WARSI, other NGOs and the provincial government to mainstream CBFM in the West Sumatra forest policies.

The realisation of four other outcomes can be 'attributed' to the SPO, with local government playing a constructive role. FIELD's, KWLM's and LPPSLH's interventions were a *sufficient and necessary* cause for the creation of cooperatives, and districts provided the enabling environment to do so. The same applies for the second outcome achieved by LPPSLH which consists of the bargaining position of small holders being improved vis-à-vis middlemen markets because it provided these small holders with alternative and promising value chains through the cooperative.

NTFP-EP's support to the Crafts Kalimantan network and its business unit to market NTFP products is one of the explaining actors for the increased incomes of 17 women weaving baskets. MFS II financing for this came in the first place from Cordaid until 2011, and IUCN-NL support to establish a Participatory Guarantee System possibly started to have some effect in 2014. NTFP-EP provides a *sufficient but not necessary* explanation, because other buyers most often buy these products.

NTFP-EP's outcome that communities are able to claim their rights to manage natural resources and land in four villages in the first place was only partially realised. NTFP-EP's support in mapping the resources and previous work done by other NGOs to organise communities in groups both are a *necessary but not sufficient* cause to explain the outcome; more lobby efforts are needed to integrate the participatory maps into the spatial plans of the district.

### 4.7.3. What is the relevance of these changes?

Most outcomes explained and other changes in civil society are relevant in the light of the Theory of Change constructed in 2012 during the baseline. Some outcomes were however partially relevant, such as

- CRI's online platform to prepare citizen journalists to 'act upon information';
- Common Room's ability to network, to offer public space having declined and the organisation not having invested in the use of media and technology;
- LPPSLH not having capacitated farmers to demand their rights and enhance their participation in the political economy.

All outcomes are relevant with regards to the context in which they realised.

The outcomes and changes in civil society are generally speaking relevant in relation to the MFS II policies. However:

- Common Room's declining organisational performance made its contribution not effective
- Gender issues in Hivos' green entrepreneurship programme were insufficiently addressed by KWLM and LPPSLH.

### 4.7.4. What factors explain the findings drawn from the questions above?

Most SPOs avail of the *capabilities* to introduce change in civil society. However Common Room's high staff turnover, decline in staff members and the gap between its ambitions and realisations make this organisation one of the weakest.

CRI, having faced high staff turnover rates (but is growing) and still repositioning itself in society, may also have influenced its outcomes related to the online platform.

Based upon the progress reports made available by the SPOs we observe that the monitoring systems in place do not allow drawing lessons at outcome level in terms of what works and what works not and why. Reporting mostly takes place at activity and output level, but not at outcome level: important issues to look at from a civil society perspective are for instance the performance of organisations created, a more systematic gathering of information on client satisfaction or impact at household level and governments becoming accountable to citizens. .

External factors that provide a conducive environment for the SPOs are Indonesia's connection to the internet; contemporary arts becoming the latest trends; anti-corruption being on the agenda of the government; regulations in favour for community based forest management and the creation of cooperatives, and; growing demands for certified timber and crystal sugar.

Not so conducive factors are; the broadcasting law that creates unfair advantages to large media conglomerates and risks to decrease the diversity of expression (CRI and KBR); free expression on the internet (ELSAM and KBR); unfavourable markets for NTFP-EP products in Indonesia because middle class consumers do not buy these products (NTFP-EP), and; NTFP-EP missing the political commitments of district governments for the management of natural resources by communities themselves rather than giving these as concessions to agribusiness and extractive industries.

Relations between the Co-Funding Agencies and the SPOs were overall constructive and supportive.

### 4.7.5. Design of the intervention

#### *Intervention models that are replicable*

Interventions that are replicable but with adaptations are those of Combine Resources Institution, KBR68H, FIELD, KWLM, LPPSLH and WARSI.

Interventions that are not replicable because they do not fit into a 'project mode of development' are those of ELSAM and RUANGRUPA.

Interventions that need to be redesigned are Common Room and NTFP-EP.

# Annex C. Outcome indicators for the selected MDG projects

**Table 15: Outcome indicators for reforestation projects (MDG7)**

| Outcome indicator | Scale (minimum; maximum) | Project | Uniform Indicator | Discussed in the report |
|---|---|---|---|---|
| | | E1. WIIP | MDG7 | |
| **Panel A. Reforestation** | | | X[1] | |
| Number of villages with efforts at forest protection | (0;n) | X | | X |
| Percentage of households participating in reforestation efforts | (0-100%) | X | | X |
| Number of planted seedlings | (0;NM) | X | | X |
| **Panel B. Forest management** | | | | |
| Number of villages with forest management structure in place (Mangrove forests) | (0;n) | X | | X |
| Number of villages with forest management structure in place (Dry-land forests) | (0;n) | X | | X |
| Number of villages with village regulations on natural resources (Mangrove forests) | (0;n) | X | | X |
| Number of villages with village regulations on natural resources (Dry-land forests) | (0;n) | X | | X |
| **Panel C. Condition of forests** | | | | |
| Condition of mangrove forests | (1;6) | X | | X |
| Condition of coastal forests | (1;6) | X | | X |
| Condition of upland forests | (1;6) | X | | X |
| Condition of lake area | (1;6) | X | | X |
| **Panel D. Household's knowledge of mangroves** | | | | |
| Percentage of respondents correctly describing mangroves | (0-100%) | X | | X |
| Percentage of respondents incorrectly recognising mangroves | (0-100%) | X | | |
| Percentage of respondents partially correctly recognising mangroves | (0-100%) | X | | |
| Percentage of respondents correctly recognising mangroves | (0-100%) | X | | X |
| Number of benefits of mangrove forests | (0;5) | X | | X |
| **Panel E. Number of actions taken for disaster risk preparedness** | | | | |
| Information action taken by hh to reduce the risk of disaster | (0-100%) | X | | X |
| Preparation action taken by hh to reduce the risk of disaster | (0-100%) | X | | X |

| Outcome indicator | Scale (minimum; maximum) | Project | Uniform Indicator | Discussed in the report |
|---|---|---|---|---|
| | | E1. WIIP | MDG7 | |
| Savings action taken by hh to reduce the risk of disaster | (0-100%) | X | | X |
| Volunteering action taken by hh to reduce the risk of disaster | (0-100%) | X | | X |
| Number of information measures taken by any hh member to reduce the risks of disaster | (0;4) | X | | X |
| Number of preparation measures taken by any hh member to reduce the risks of disaster | (0;7) | X | | X |
| Number of volunteer measures taken by any hh member to reduce the risks of disaster | (0;3) | X | | X |
| **Panel F. Income of households from sustainable use of the ecosystem** | | | | |
| Contribution of mangrove forest resources to livelihood | (1;5) | X | | X |
| Respondent has income from either forestry, livestock or fishing | (0-100%) | | | X |
| HH income per HH member out of forestry per month (Rp.) | (0;NM) | X | | X |
| HH income per HH member from livestock per month (Rp.) | (0;NM) | X | | X |
| HH income per HH member out of fish per month (Rp.) | (0;NM) | X | | X |

Notes: NM = no minimum/maximum, n is the number of villages in either the treatment group or the comparison group

1. It is related to the uniform indicator “deforestation” but we could not measure this because of sample size.

**Table 16: Outcome indicators for projects on poverty elimination (MDG1)**

| Outcome indicator | Scale (minimum; maximum) | Project | | | | | Uniform Indicator | Discussed in the report |
|---|---|---|---|---|---|---|---|---|
| | | E1. WIIP | E4. FIELD | E5. SC GREEN | E6. KSP-QT | E10. SC LED-NTT | MDG1 | |
| A**. Use of financial instruments** | | | | | | | X | |
| Percentage of households that know a place to borrow | (0%; 100%) | | X | X | X | | | X |
| Percentage of households that have borrowed in the past 12 months | (0%; 100%) | | X | X | X | | | X |
| Percentage of households involved in a financial institution | (0%; 100%) | | X | | X | | | X |
| Percentage of households with savings in bank account | (0%; 100%) | | | | X | | | X |
| Percentage of households with savings in savings and credit cooperative | (0%; 100%) | | | | X | | | |
| Percentage of households with savings in savings and credit group | (0%; 100%) | | | | X | | | |
| Percentage of households that have savings in the form of savings in group, cooperative or bank | (0%; 100%) | | X | | | | | |
| **B. Financial knowledge and skill** | | | | | | | X | |

# Annex F. Methodological Approach and Reflection for Capacity Development

## 1. Introduction

This Annex describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this Annex, a brief methodological reflection is provided.

## 2. Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Annex G. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.[137] Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff. This general causal map was developed to also get the SPO perspective on what they considered as important capacity development changes since the baseline. For this reason, and since the indicators by themselves could not provide this overall SPO story and perspectives on what they considered important changes, only the SPO perspective has been included. This was an additional activity that wasn't planned for during the baseline. The analysis in terms of organisational capacity changes has however mainly focused on changes in the 5c indicators.

[137] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

The scores were developed by the evaluation team, after thorough analysis and description of the situation during endline and how this changes since the baseline. These scores are based on mainly proportional differences. Whilst the information provided by staff may have provided socially desirable answers, the information provided has been cross-checked using different sources of information (different staff groups based on functions; self-assessments in interviews; interviews with CFA and other externals).

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
    - -2 = Considerable deterioration
    - -1 = A slight deterioration
    - 0 = No change occurred, the situation is the same as in 2012
    - +1 = Slight improvement
    - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*
3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
    - Intervention, actor or factor at the level of or by **SPO**: ..... .
    - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
    - Intervention, actor or factor at the level of or by the **other funders**: ..... .
    - **Other** interventions, actors or factors: ..... .
    - Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also

added to the endline formats for review by respondents. These descriptions are based on document review, observation, and interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3.* ***Send the formats*** *adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4.* ***Collect, upload & code the documents*** *from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;

- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;
- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5.* ***Prepare and organise the field visit*** *to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6.* ***Interview the CFA*** *– CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

5C Endline assessment Dutch co-financing organisation;

5C Endline support to capacity sheet - CFA perspective.

*Step 7.* ***Run the endline workshop*** *with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

Explain the purpose of the fieldwork;

Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.

Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

***Purpose of the fieldwork*****:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

***Brainstorm on key organisational capacity changes and influencing factors***: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative. This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

***Self-assessments*****:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether

this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8.* ***Interview SPO staff*** *– in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9.* ***Fill-in observation sheets*** *– in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

5C Endline observation sheet;

5C Endline observable indicators.

*Step 10.* ***Interview externals*** *– in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11.* ***Upload and auto-code all the formats*** *collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the* ***overview of information*** *per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13.* ***Analyse the data and develop a draft description*** *of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14.* ***Analyse the data and finalize the description*** *of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final

descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15.* ***Analyse the information*** *in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

## 3. Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

### Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the

case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.

Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.

Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for

different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);

Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;

Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;

Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

**Table 43: The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia**

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Source: country baseline report, Ethiopia.

Notes: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

**Table 44: SPOs selected for process tracing – Ethiopia**

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| **AMREF** | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| **CARE** | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| **ECFA** | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| **FSCE** | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| **HOA-REC** | Sustainable Energy project (ICCO Alliance): 2014<br>Innovative WASH (WASH Alliance):<br>Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| **HUNDEE** | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| **NVEA** | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| **OSRA** | C4C Alliance project (farmers marketing): December 2014<br>ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| **TTCA** | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

**Table 45: The extent to which the Dutch NGO explicitly targets the following capabilities – India**

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Source: country baseline report, India.

Notes: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA,

COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

**Table 46: SPOs selected for process tracing – India**

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| **BVHA** | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| **COUNT** | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| **DRISTI** | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| **FFID** | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |
| **Jana Vikas** | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| **NEDSF** | | | | | | | No – delayed baseline |
| **RGVN** | | | | | | | No - delayed baseline |
| **Samarthak Samiti (SDS)** | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| **Shivi Development Society (SDS)** | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| **Smile** | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| **VTRC** | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

**Table 47: The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia**

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | Pt.PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Source: country baseline report, Indonesia.

Notes: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, Pt.PPMA, YPI, YRBI.

Table 6

*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| **ASB** | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| **Dayakologi** | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| **ECPAT** | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| **GSS** | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| **Lembaga Kita** | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| **Pt.PPMA** | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| **Rifka Annisa** | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| **WIIP** | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| **Yayasan Kelola** | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| **YPI** | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| **YRBI** | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| **Yadupa** | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

**Table 48: The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia**

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Source: country baseline report, Liberia.

Notes: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

**Table 49: SPOs selected for process tracing – Liberia**

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| **BSC** | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| **DEN-L** | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| **NAWOCOL** | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| **REFOUND** | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| **RHRAP** | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ‘ general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.

A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).

**Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.

**Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for coding documents received from SPO and CFA in NVivo on the following:

5C Indicators: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.

Information related to the capacity development interventions implemented by the CFA (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

MFS II supported capacity development interventions during the MFS II period (2011 until now).

Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.

For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.

Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.

There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:

- In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
- During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;
- During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
- During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

The causal pathways that relate the intervention to the realised change/ outcome;

Rival explanations for the same change/ outcome;

Assumptions that clarify relations between different components or parts;

Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;

Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non-sequential and non-temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.

The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

**Figure 35: An imaginary example of a model of change**

*Step 5. Identify **types of evidence** needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, *"What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?"*. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

**Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.

**Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).

**Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.

**Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

**Table 50: Format for identifying types of evidence for different causal relationships in the model of change (example included)**

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| **Describe relationship between the subcomponents of the model of change** | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions. Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y?<br>Can we find this information by means of :<br>Pattern evidence;<br>Sequence evidence;<br>Trace evidence;<br>Account evidence? | Describe where you can find this information |
| **Example:**<br>**Training workshops on M&E provided by MFS II funding and other sources of funding** | Example:<br>What type of training workshops on M&E took place?<br>Who was trained?<br>When did the training take place?<br>Who funded the training?<br>Was the funding of training provided before the training took place?<br>How much money was available for the training? | Example:<br>Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br>Sequence evidence on timing of funding and timing of training<br>Content evidence: what the training was about | Example:<br>Training report<br>SPO Progress reports<br>interviews with the CFA and SPO staff<br>Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process

tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality** of data and **analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

Confirming/ rejecting a causal relation (yes/no);

Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;

Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

**Table 51: Example format for the adapted evidence analysis database (example included)**

| Description of causal relation | Confirming/ rejecting a causal relation (yes/no) | Type of information providing the background to the confirmation or rejection of the causal relation | Strength of evidence: strong/ rather strong/ rather weak/ weak | Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected |
|---|---|---|---|---|
| **e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice** | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

## 4. Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this Annex. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

## 5. Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.

Difficulty of verifying each and every single change and causal relationship:

- Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
- Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs and providing a comprehensive story per SPO in terms of its organisational capacity development. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information

(2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation. For future evaluation purposes, it is important to keep 'utility' in mind since this is the first and most important evaluation standard. Helping to think through how

evaluation can be useful for primary intended users is crucial. Ensuring a process whereby stakeholders involved are engaged in a learning process can support utility. However, it must be noted that, with qualitative information, respondents may suffer from recall bias if they describe a chain of events. Particularly when attrition is high, learning becomes limited since it is hard to find institutional memory.

For future evaluations it is important to be more utilisation focused next time with engagement of stakeholders in a learning process so that they can also take up the lessons learned for further improve upon their organisations. Now, the evaluation was too much accountability driven. Furthermore, it's important that enough time is taken into account for the evaluation process, to provide useful insights for all involved. The time period of two years was too short to see remarkable change in terms of capacity development. Process tracing has proven to be a useful exercise that provided a lot of insight into how changes in terms of capacity development have taken place. Many SPOs and CFAs valued this insightful learning process and indicated they would work with the results to further improve the organisational capacity of the SPO. Furthermore, in case of staff turnover, this may have seriously affected institutional memory, which is an important factor, next to the difficulty of recall when describing a chain of events, in qualitative information. Organisational capacity contains many different aspects that are constantly changing and it's important to see these as part of a whole rather than a separate issues, which had to be done for this specific evaluation in terms of standard indicators. The different aspects relate to each other, a need to be seen more from a whole systems perspective. Furthermore, organisational capacity is complex, methodologies for evaluation need to be tuned to the specific situation of each organisation. For future purposes it would be useful if SPO and CFA develop a clear theory of change together in terms of organisational capacity strengthening. This would strengthen theory-based evaluation.

# Annex G. Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organisation to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

1. The capability to act and commit;
2. The capability to deliver on development objectives;
3. The capability to adapt and self-renew;
4. The capability to relate (to external stakeholders);
5. The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Annex H. Overview of capabilities, and related outcome domains and performance indicators

| Capabilities | Outcome domains | Performance indicators |
|---|---|---|
| Capability to act and commit | Level of Effective Leadership | 1.1.Responsive leadership: 'Leadership is responsive, inspiring, and sensitive' |
| | | 1.2.Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)' |
| | | 1.3.Staff turnover: 'Staff turnover is relatively low' |
| | Level of realistic strategic planning | 1.4.Organisational structure: 'Existence of clear organisational structure reflecting the objectives of the organisation' |
| | | 1.5.Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E' |
| | Level of translation of strategy into operations | 1.6.Daily operations: 'Day-to-day operations are in line with strategic plans' |
| | Level of Staff Capacity and Motivation | 1.7.Staff skills: 'Staff have necessary skills to do their work' |
| | | 1.8.Training opportunities: 'Appropriate training opportunities are offered to staff' |
| | | 1.9.1.Incentives: 'Appropriate incentives are in place to sustain staff motivation' |
| | Level of Financial Resource Security | 1.9.2.Funding sources: 'Funding from multiple sources covering different time periods' |
| | | 1.9.3.Funding procedures: 'Clear procedures for exploring new funding opportunities' |
| Capability to adapt and self-renew | Level of effective application of M&E | 2.1.M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes' |
| | | 2.2.M&E competencies: 'Individual competencies for performing M&E functions are in place' |
| | Level of strategic use of M&E | 2.3.M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies' |
| | Level of openness to strategic learning | 2.4.Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes' |
| | | 2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives |
| | Level of context awareness | 2.6.System for tracking environment: 'The organisation has a system for being in touch with general trends and developments in its operating environment' |
| | | 2.7.Stakeholder responsiveness: 'The organisation is open and responsive to their stakeholders and the general public' |
| Capability to deliver on development objectives | Extent to which organisation delivers on planned products and services | 3.1.Clear operational plans: 'Organisation has clear operational plans for carrying out projects which all staff fully understand' |

| Capabilities | Outcome domains | Performance indicators |
|---|---|---|
| | | 3.2.Cost-effective resource use: 'Operations are based on cost-effective use of its resources' |
| | | 3.3.Delivering planned outputs: 'Extent to which planned outputs are delivered' |
| | **Extent to which delivered products and services are relevant for target population in terms of the effect they have** | 3.4.Mechanisms for beneficiary needs: 'The organisation has mechanisms in place to verify that services meet beneficiary needs' |
| | **Level of work efficiency** | 3.5.Monitoring efficiency: 'The organisation monitors its efficiency by linking outputs and related inputs (input-output ratio's)' |
| | | 3.6.Balancing quality-efficiency: 'The organisation aims at balancing efficiency requirements with the quality of its work' |
| **Capability to relate** | **Level of involving external parties in internal policy/strategy development** | 4.1.Stakeholder engagement in policies and strategies: 'The organisation maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organisation' |
| | **Level of engagement of organisation in networks, alliances and collaborative efforts** | 4.2.Engagement in networks: 'Extent to which the organisation has relationships with existing networks/alliances/partnerships' |
| | **Extent to which organisation is actively engaging with target groups** | 4.3.Engagement with target groups: 'The organisation performs frequent visits to their target groups/ beneficiaries in their living environment' |
| | **Level of effective relationships within the organisation** | 4.3.Relationships within organisation: 'Organisational structure and culture facilitates open internal contacts, communication, and decision-making' |
| **Capability to achieve coherence** | **Existence of mechanisms for coherence** | 5.1.Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organisation' |
| | | 5.2.Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management' |
| | **Level of coherence of various efforts of organisation** | 5.3.Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organisation' |
| | | 5.4.Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts' |

# Annex I. CIVICUS and Civil Society Index

CIVICUS, the World Alliance for Citizen Participation is an international alliance of members and partners which constitutes an influential network of organisations at the local, national, regional and international levels, and spans the spectrum of civil society. It has worked for nearly two decades to strengthen citizen action and civil society throughout the world. CIVICUS has a vision of a global community of active, engaged citizens committed to the creation of a more just and equitable world. This is based on the belief that the health of societies exists in direct proportion to the degree of balance between the state, the private sector and civil society.

One of the areas that CIVICUS works in is the Civil Society Index (CSI). Since 2000, CIVICUS has measured the state of civil society in 76 countries. In 2008, it considerably changed its CSI.

## 1. Guiding principles for measuring civil society

*Action orientation*: the principal aim of the CSI is to generate information that is of practical use to civil society practitioners and other primary stakeholders. Therefore, its framework had to identify aspects of civil society that can be changed, as well as generate knowledge relevant to action-oriented goals.

*CSI implementation must be participatory by design*: The CSI does not stop at the generation of knowledge alone. Rather, it also actively seeks to link knowledge-generation on civil society, with reflection and action by civil society stakeholders. The CSI has therefore continued to involve its beneficiaries, as well as various other actors, in this particular case, civil society stakeholders, in all stages of the process, from the design and implementation, through to the deliberation and dissemination stages.

This participatory cycle is relevant in that such a mechanism can foster the self-awareness of civil society actors as being part of something larger, namely, civil society itself. As a purely educational gain, it broadens the horizon of CSO representatives through a process of reflecting upon, and engaging with, civil society issues which may go beyond the more narrow foci of their respective organisations. A strong collective self-awareness among civil society actors can also function as an important catalyst for joint advocacy activities to defend civic space when under threat or to advance the common interests of civil society vis-à-vis external forces. These basic civil society issues, on which there is often more commonality than difference among such actors, are at the core of the CSI assessment.

*CSI is change oriented*: The participatory nature that lies at the core of the CSI methodology is an important step in the attempt to link research with action, creating a diffused sense of awareness and ownerships. However, the theory of change that the CSI is based on goes one step further, coupling this participatory principle with the creation of evidence in the form of a comparable and contextually valid assessment of the state of civil society. It is this evidence, once shared and disseminated, that ultimately constitutes a resource for action.

*CSI is putting local partners in the driver's seat*: CSI is to continue being a collaborative effort between a broad range of stakeholders, with most importance placed on the relationship between CIVICUS and its national partners.

## 2. Defining Civil Society

The 2008 CIVICUS redesign team modified the civil society definition as follows:

*The arena, outside of the family, the state, and the market – which is created by individual and collective actions, organisations and institutions to advance shared interests.*

*Arena*: In this definition the arena refers to the importance of civil society's role in creating public spaces where diverse societal values and interests interact (Fowler 1996). CSI uses the term 'arena' to describe the particular realm or space in a society where people come together to debate, discuss, associate and seek to influence broader society. CIVICUS strongly believes that this arena is distinct from other arenas in society, such as the market, state or family.

Civil society is hence defined as a political term, rather than in economic terms that resemble more the 'non-profit sector'.

Besides the spaces created by civil society, CIVICUS defines particular spaces for the family, the state and the market.

*Individual and collective action, organisations and institutions*: Implicit in a political understanding of civil society is the notion of agency; that civil society actors have the ability to influence decisions that affect the lives of ordinary people. The CSI embraces a broad range of actions taken by both individuals and groups. Many of these actions take place within the context of non-coercive organisations or institutions ranging from small informal groups to large professionally run associations.

*Advance shared interests*: The term 'interests' should be interpreted very broadly, encompassing the promotion of values, needs, identities, norms and other aspirations.

They encompass the personal and public, and can be pursued by small informal groups, large membership organisations or formal associations. The emphasis rests however on the element of 'sharing' that interest within the public sphere.

## 3. Civil Society Index- Analytical Framework

The 2008 Civil Society Index distinguishes 5 dimensions of which 4 (civic engagement, level of organisation, practice of values and perception of impact), can be represented in the form of a diamond and the fifth one (external environment) as a circle that influences upon the shape of the diamond.

*Civic Engagement*, or 'active citizenship', is a crucial defining factor of civil society. It is the hub of civil society and therefore is one of the core components of the CSI's definition. Civic engagement describes the formal and informal activities and participation undertaken by individuals to advance shared interests at different levels. Participation within civil society is multi-faceted and encompasses socially-based and politically-based forms of engagement.

*Level of Organisation*. This dimension assesses the organisational development, complexity and sophistication of civil society, by looking at the relationships among the actors within the civil society arena. Key sub dimensions are:

- Internal governance of Civil Society Organisations;

- Support infrastructure, that is about the existence of supporting federations or umbrella bodies;
- Self-regulation, which is about for instance the existence of shared codes of conducts amongst Civil Society Organisations and other existing self-regulatory mechanisms;
- Peer-to-peer communication and cooperation: networking, information sharing and alliance building to assess the extent of linkages and productive relations among civil society actors;
- Human resources, that is about the sustainability and adequacy of human resources available for CSOs in order to achieve their objectives:
  - Financial and technological resources available at CSOs to achieve their objectives;
  - International linkages, such as CSO's membership in international networks and participation in global events.

**Figure 36: Civil Society Index**

*Practice of Values*. This dimension assesses the internal practice of values within the civil society arena. CIVICUS identified some key values that are deemed crucial to gauge not only progressiveness but also the extent to which civil society's practices are coherent with their ideals. These are:

- Democratic decision-making governance: how decisions are made within CSOs and by whom;
- Labour regulations: includes the existence of policies regarding equal opportunities, staff membership in labour unions, training in labour rights for new staff and a publicly available statement on labour standards;
- Code of conduct and transparency: measures whether a code of conduct exists and is available publicly. It also measures whether the CSO's financial information is available to the public.
- Environmental standards: examines the extent to which CSOs adopt policies upholding environmental standards of operation;

- Perception of values within civil society: looks at how CSOs perceive the practice of values, such as non-violence. This includes the existence or absence of forces within civil society that use violence, aggression, hostility, brutality and/or fighting, tolerance, democracy, transparency, trustworthiness and tolerance in the civil society within which they operate.

*Perception of Impact.* This is about the perceived impact of civil society actors on politics and society as a whole as the consequences of collective action. In this, the perception of both civil society actors (internal) as actors outside civil society (outsiders) is taken into account. Specific sub dimensions are

- Responsiveness in terms of civil society's impact on the most important social concerns within the country. "Responsive" types of civil society are effectively taking up and voicing societal concerns.
- Social impact measures civil society's impact on society in general. An essential role of civil society is its contribution to meet pressing societal needs;
- Policy impact: covers civil society's impact on policy in general. It also looks at the impact of CSO activism on selected policy issues;
- Impact on attitudes: includes trust, public spiritedness and tolerance. The sub dimensions reflect a set of universally accepted social and political norms. These are drawn, for example, from sources such as the Universal Declaration of Human Rights, as well as CIVICUS' own core values. This dimension measures the extent to which these values are practised within civil society, compared to the extent to which they are practised in society at large.

*Context Dimension*: *External Environment*. It is crucial to give consideration to the social, political and economic environments in which it exists, as the environment both directly and indirectly affects civil society. Some features of the environment may enable the growth of civil society. Conversely, other features of the environment hamper the development of civil society. Three elements of the external environment are captured by the CSI:

- Socio-economic context: The Social Watch's basic capabilities index and measures of corruption, inequality and macro-economic health are used portray the socioeconomic context that can have marked consequences for civil society, and perhaps most significantly at the lower levels of social development;
- Socio-political context: This is assessed using five indicators. Three of these are adapted from the Freedom House indices of political and civil rights and freedoms, including political rights and freedoms, personal rights and freedoms within the law and associational and organisational rights and freedoms. Information about CSO experience with the country's legal framework and state effectiveness round out the picture of the socio-political context;
- Socio-cultural context: utilises interpersonal trust, which examines the level of trust hat ordinary people feel for other ordinary people, as a broad measure of the social psychological climate for association and cooperation. Even though everyone experiences relationships of varying trust and distrust with different people, this measure provides a simple indication of the prevalence of a world view that can support and strengthen civil society. Similarly, the extent of tolerance and public spiritedness also offers indication of the context in which civil society unfolds.

# Annex J. Methodology of Civil Society Strengthening

This Annex describes the evaluation methodology that was developed to evaluate the efforts of Dutch NGOs and their Southern Partner Organisations (SPO) to strengthen Civil Society in India, Ethiopia and Indonesia. The first paragraph introduces the terms of reference for the evaluation and the second discusses design issues, including sampling procedures and changes in the terms of reference that occurred between the 2012 and 2014 assessment. The third paragraph presents the methodologies developed to answer each of the evaluation questions.

## 1. Introduction

### 1.8. Terms of reference for the evaluation

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System ('MFS) is its most recent expression. MFS II is the 2011-2015 grant programme which meant to achieve sustainable reduction in poverty. A total of 20 consortia of Dutch Co Financing Agencies have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

One component of the MFS II programme addresses the extent to which the Southern Partners of the Dutch Consortia are contributing towards strengthening civil society and this evaluation assesses this contribution for Southern Partner countries in Indonesia, India and Ethiopia. The evaluation comprised a baseline study, carried out in 2012, followed by an end line study in 2014.

The entire MFS II evaluation comprises assessments in eight countries where apart from a civil society component, also assessments towards achieving MDGs and strengthening the capacity of the southern partner organisations by the CFAs. A synthesis team is in place to aggregate findings of all eight countries. This team convened three synthesis team meetings, one in 2012, one in 2013 and one in 2014. All three meetings aimed at harmonising evaluation methodologies for each component across countries. CDI has been playing a leading role in harmonising its Civil Society and Organisational Capacity assessment with the other organisations in charge for those components in the other countries.

This Annex describes the methodology that has been developed for the evaluation of the efforts to strengthen civil society priority result area. We will first explain the purpose and scope of this evaluation and then present the overall evaluation design. We will conclude with describing methodological adaptations, limitations and implications.

### 1.9. Civil Society assessment – purpose and scope

The overall purpose of the joint MFS II evaluations is to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern partners and to contribute to the improvement of future development interventions.

The civil society evaluation is organised around 5 key questions:

- What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?

- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- Were the development interventions of the MFS II consortia efficient?
- What factors explain the findings drawn from the questions above?

Furthermore, the evaluation methodology for efforts to strengthen civil society should:

- Describe how a representative sample of Southern partner organisations of the Dutch CFAs in the country will be taken
- Focus on five priority result areas that correspond with dimensions of the Civil Society Index (CSI) developed by CIVICUS (see paragraph 6.4 - Call for proposal). For each of those dimensions the call for proposal formulated key evaluation questions.
- Should compare results with available reference data (i.e. a CSI report or other relevant data from the country in question).

The results of this evaluation are to be used by the Dutch Ministry of Foreign Affairs, the Dutch Consortia and their partner organisations. The evaluation methodology has to be participatory in the sense that Dutch Consortia and their partner organisation would be asked to give their own perception on a range of indicators of the adjusted CIVICUS analytical framework in 2012 and in 2014.

# 2. Designing the methodology

## 2.1. Evaluation principles and standards

The overall approach selected is a participatory, theory-based evaluation through a before and after comparison. This paragraph briefly describes these principles and how these have been translated into data collection principles. It also describes how a 'representative sample' of Southern Partner Organisations was selected and how the initial terms of references were adjusted with the consent of the commissioner of the evaluation, given the nature of the evaluation component and the resources available for the evaluation.

### *Recognition of complexity*

The issues at stake and the interventions in civil society and policy influence are complex in nature, meaning that cause and effect relations can sometimes only be understood in retrospect and cannot be repeated. The evaluation methods should therefore focus on recurring patterns of practice, using different perspectives to understand changes and to acknowledge that the evaluation means to draw conclusions about complex adaptive systems (Kurtz and Snowden, 2003)[138].

Changes in the values of the Civil Society Indicators in the 2012-2014 period are then the result of conflict management processes, interactive learning events, new incentives (carrots and sticks) that mobilise or demobilise civil society, rather than the result of a change process that can be predicted from A to Z (a linear or logical framework approach)[139].

[138] C. F. Kurtz, D. J. Snowden, The new dynamics of strategy: Sense-making in a complex and complicated world, in IBM Systems Journal vol 42, no 3, 2003.

[139] Caluwe de, L & Vermaak H. (2003) "Learning to Change. A Guide for Organisation Change Agents" Sage Publications.

### *A theory-based evaluation*

Theory-based evaluation has the advantage of situating the evaluation findings in an analysis that includes both what happened over the life of the project as well as the how and why of what happened (Rogers 2004). It demonstrates its capacity to help understand why a program works or fails to work, going further than knowing only outcomes by trying to systematically enter the black box (Weiss, 2004).

Theory-based evaluations can provide a framework to judge effectiveness in context of high levels of complexity, uncertainty, and changeability when traditional (impact) evaluation methods are not suitable: the use of control groups for the civil society evaluation is problematic since comparable organisations with comparable networks and operating in a similar external environment would be quite difficult to identify and statistical techniques of matching cannot be used because of a small n.

Because SPO's theories of change regarding their efforts to build civil society or to influence policies may alter during the 2012-2014 period, it requires us to develop a deep understanding of the change process and the dynamics that affect civil society and policies. It is important to understand what has led to specific (non-) changes and (un)-expected changes. These external factors and actors, as well as the SPO's agency need to be taken into account for the attribution question. Linear input-activities-outputs-outcomes-impact chains do not suffice for complex issues where change is both the result of SPOs' interventions as those by other actors and/or factors.

Therefore, the most reasonable counterfactual that can be used for this evaluation is that of considering alternative causal explanations of change (White and Philips, 2012). Therefore the SPOs' Theory of Change constructed in 2012 is also related to a Model of Change constructed in 2014 that tries to find the ultimate explanations of what happened in reality, including other actors and factors that might possibly explain the outcomes achieved.

### *Triangulation of methods and sources of information*

For purposes of triangulation to improve the robustness, validity or credibility of the findings of the evaluation we used different types of data collection and analysis methods as well as different sources of information. The CIVICUS analytical framework was adjusted for this evaluation in terms of providing standard impact outcome indicators to be taken into account. Data collection methods used consisted of workshops with the SPO, interviews with key resource persons, focus group discussions, social network analysis (during the baseline), consultation of project documents; MFS II consortia documents and other documents relevant to assess general trends in civil society

### *Participatory evaluation*

The evaluation is participatory in that both baseline and end line started with a workshop with SPO staff, decision makers and where possible board members. The baseline workshop helped SPOs to construct their own theory of change with regards to civil society. . Detailed guidelines and tools have been developed by CDI for both baseline and follow-up, and these have been piloted in each of the countries CDI is involved in. Country based evaluators have had a critical input in reviewing and adapting these detailed guidelines and tools. This enhanced a rigorous data collection process. Additionally, the process of data analysis has been participatory where both CDI and in-country teams took part in the process and cross-check each other's inputs for improved quality. Rigorous analysis of the qualitative data was done with the assistance of the NVivo software program.

### *Using the evaluation standards as a starting point*

As much as possible within the boundaries of this accountability driven evaluation, the evaluation teams tried to respect the following internationally agreed upon standards for program evaluation (Yarbrough et al, 2011). These are, in order of priority: Utility; Feasibility; Propriety; Accuracy; Accountability. However, given the entire set-up of the evaluation, the evaluation team cannot fully ensure the extent to which the evaluation is utile for the SPO and their CFAs; and cannot ensure that the evaluation findings are used in a proper way and not for political reasons;

## 2.2. Sample selection

The terms of reference for this evaluation stipulate that the evaluators draw a sample of southern partner organisations to include in the assessment. Given the fact that the first evaluation questions intends to draw conclusions for the MDGs or the themes (governance or fragile states) for Indonesia a sample was drawn for the two or three most frequent MDGs or themes that the SPOs are working in.

In 2012, the Dutch MFS II consortia were asked to provide information for each SPO regarding the MDG/theme it is working on, if it has an explicit agenda in the area of civil society strengthening and/or policy influence. The database then provided an insight into the most important MDG/themes covered by the partner organisations, how many of these have an explicit agenda regarding civil society strengthening and/or policy influence. The entire population of SPOs in Indonesia was 120, of which those exclusively working on the governance theme (28 SPOs), those working on MDG 7ab (26 SPOs) and on MDG 3 (26 SPOs) where the most frequent ones. With regards to MDG 3 and MDG 7ab the evaluator decided to select MDG 7ab, which is a very specific and relevant MDG for Indonesia.

Five 5 partner organisations were randomly selected for respectively MDG 7 (natural resources) of a population of 26 SPOs and 5 for the governance theme from 28 SPOs[140].

## 2.3. Changes in the original terms of reference

Two major changes have been introduced during this evaluation and accepted by the commissioner of the MFS II evaluation. These changes were agreed upon during the 2013 and the 2014 synthesis team meetings.

The efficiency evaluation question:

During the June 2013 synthesis meeting the following decision was made with regards to measuring how efficient MFS II interventions for organisational capacity and civil society are:

*[...] it was stressed that it is difficult to disentangle budgets for capacity development and civil society strengthening. SPOs usually don't keep track of these activities separately; they are included in general project budgets. Therefore, teams agreed to assess efficiency of CD [capacity development] and CS activities in terms of the outcomes and/or outputs of the MDG projects. This implies no efficiency assessment will be held for those SPOs without a sampled MDG project. Moreover, the*

[140] See the evaluation methodology for the civil society component as described in the annex of the baseline report.

*efficiency assessment of MDG projects needs to take into account CD and CS budgets (in case these are specified separately). Teams will evaluate efficiency in terms of outcomes if possible. If project outcomes are unlikely to be observed already in 2014, efficiency will be judged in terms of outputs or intermediate results (e-mail quotation from Gerton Rongen at February 6, 2014).*

### *Attribution/contribution evaluation question*

During the June 2013 NWO-WOTRO workshop strategies were discussed to fit the amount of evaluation work to be done with the available resources. Therefore,

1. The number of SPOs that will undergo a full-fledged analysis to answer the attribution question, were to be reduced to 50 percent of all SPOs. Therefore the evaluation team used the following selection criteria:

- An estimation of the annual amount of MFS II funding allocated to interventions that have a more or less direct relation with the civil society component. This implies the following steps to be followed for the inventory:
- Covering all MDGs/themes in the original sample
- Covering a variety of Dutch alliances and CFAs

2. The focus of the attribution question will be on two impact outcome areas, those most commonly present in the SPO sample for each country. The evaluation team distinguishes four different impact outcome areas:

- The extent to which the SPO, with MFS II funding, engages more and diverse categories of society in the 2011-2014 period (Civicus dimensions “Civic engagement” and “perception of impact”)
- The extent to which the SPOs supports its intermediate organisations to make a valuable contribution to civil society in the 2011 -2014 period (Civicus dimension “Level of organisation” and “perception of impact”)
- The extent to which the SPO itself engages with other civil society organisations to make a valuable contribution to civil society in the 2011-2014 period (Civicus dimension “level of organisation”)
- The extent to which the SPO contributes to changing public and private sector policies and practices in the 2011-2014 period (Civicus dimension “perception of impact”)

3. The CS dimension ‘Practice of Values’ has been excluded, because this dimension is similar to issues dealt with for the organisational capacity assessment.

The aforementioned analysis drew the following conclusions:

**Table 52: SPOs to be included for full-fledged process tracing analysis.**

| Country | SPO in the in-depth analysis | Strategic CS orientation to include |
|---|---|---|
| **Indonesia** | ELSAM, WARSI, CRI, NTFP-EP, LPPSLH | 1. Strengthening intermediate organisations AND influencing policies and practices<br>2. If only one of the two above mentioned is applicable, then select another appropriate impact outcome area to look at. |
| **India** | NNET, CWM, CECOEDECON, Reds Tumkur, CSA | 1. Enhancing civic engagement AND strengthening intermediate organisations<br>2. If only one of the two above mentioned is applicable then select another appropriate impact outcome area to look at. |
| **Ethiopia** | OSSA, EKHC, CCGG&SO, JeCCDO and ADAA | 1. Strengthening the capacities of intermediate organisations AND SPO's engagement in the wider CS arena<br>2. If only one of the two above mentioned is applicable then select another appropriate impact outcome area to look at. |
| Source: Consultation of project documents available in February 2014 | | |

## 2.4. Answering the evaluation questions

### *Evaluation question 1 - Changes in civil society for the relevant MDGs/topics*

Evaluation question 1: *What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?*

**Indicators and tools used**

In line with the CIVICUS Civil Society Index, a scoring tool was developed in 2012 which comprises 17 indicators. The selection was inspired by those suggested in the terms of reference of the commissioner. Each indicator was, also in line with the CIVICUS index accompanied by an open evaluation question to be used for data collection in 2012 and 2014. In 2012 the scoring tool contained four statements describing the level of achievements of the indicator and scores ranged from 0 to 3 (low score - high score).

A comparison of the scores obtained in 2012 informed the evaluation team that there was a positive bias towards high scores, mostly between 2 and 3. Therefore during the 2014 assessment, it was decided to measure relative changes for each indicator in the 2012 – 2014 period, as well as the reasons for changes or no changes and assigning a score reflecting the change between -2 (considerable deterioration of the indicator value since 2012) and +2 (considerable improvement).

In 2012 and based upon the Theory of Change constructed with the SPO, a set of standard indicators were identified that would ensure a relation between the standard CIVICUS indicators and the interventions of the SPO. However, these indicators were not anymore included in the 2014 assessment because of the resources available and because the methodology fine-tuned for the attribution question in 2013, made measurement of these indicators redundant.

Also in 2012, as a means to measure the 'level of organisation' dimension a social network analysis tool was introduced. However this tool received very little response and was discontinued during the end line study.

**Key questions to be answered for this evaluation question**

In 2012, SPO staff and leaders, as well as outside resource persons were asked to provide answers to 17 questions, one per standard indicator of the scoring tool developed by CDI.

In 2012, the SPO staff and leaders were given the description of each indicator as it was in 2012 and had to answer the following questions:

1. How has the situation of this indicator changed compared to its description of the 2012 situation? Did it deteriorate considerably or did it improve considerably (-2 → +2)
2. What exactly has changed since 2012 for the civil society indicator that you are looking at? Be as specific as possible in your description.
3. What interventions, actors and other factors explain this change compared to the situation in 2012? Please tick and describe what happened and to what change this led. It is possible to tick and describe more than one choice.
    - Intervention by SPO, NOT financed by any of your Dutch partners ……..
    - Intervention SPO, financed by your Dutch partner organisation ……(In case you receive funding from two Dutch partners, please specify which partner is meant here)
    - Other actor NOT the SPO, please specify…….
    - Other factor, NOT actor related, please specify……
    - A combination of actors and factors, INCLUDING the SPO, but NOT with Dutch funding, please specify…
    - A combination of actors and factors, INCLUDING the SPO, but WITH Dutch funding, please specify…
    - Don't know
4. Generally speaking, which two of the five CIVICUS dimensions (civic engagement, level of organisation, practice of values, perception of impact, environment) changed considerably between 2012 – 2014? For each of these changes, please describe:
    - Nature of the change
    - Key interventions, actors and factors (MFS II or non-MFS II related) that explain each change (entirely or partially).

**Sources for data collection**

During the baseline and the end line and for purposes of triangulation, several methods were used to collect data on each (standard) indicator:

- Self-assessment per category of staff within the SPO: where possible, three subgroups were made to assess the scores: field staff/programme staff, executive leadership and representatives of the board,, general assembly, and internal auditing groups if applicable completed with separate interviews;
- Interviews with external resource persons. These consisted of three categories: key actors that are knowledgeable about the MDG/theme the SPO is working on and who know the civil society arena around these topics; civil society organisations that are being affected by the programme through support or CSOs with which the SPO is collaborating on equal footing, and; representatives of public or private sector organisations with which the SPO is interacting

- Consultation and analysis of reports that relate to each of the five CIVICUS dimensions.
- Project documents, financial and narrative progress reports, as well as correspondence between the SPO and the CFA.
- Social network analysis (SNA), which was discontinued in the end line study.

During the follow-up, emphasis was put on interviewing the same staff and external persons who were involved during the baseline for purpose of continuity.

## 2.5. Evaluation question 2 – "Attribution" of changes in civil society to interventions of SPOs.

Evaluation question 2: *To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?*

**Adapting the evaluation question and introduction to the methodology chosen**

In line with the observation of Stern et al. (2012) that the evaluation question, the programme attributes, and the evaluation approaches all provide important elements to conclude on the evaluation design to select, the teams in charge of evaluating the civil society component concluded that given the attributes of the programmes it was impossible to answer the *attribution* question as formulated in the Terms of References of the evaluation and mentioned above. Therefore, the evaluation teams worked towards answering the extent *to which the programme contributed towards realising the outcomes.*

For this endeavour explaining outcome process-tracing[141] was used. The objective of the process tracing methodology for MFS II, in particular for the civil society component is to:

- Identify what interventions, actors and factors explain selected impact outcomes for process tracing.
- Assess how the SPO with MFS II funding contributed to the changes in the selected impact outcomes and how important this contribution is given other actors and factors that possibly influence the attainment of the outcome. Ruling out rival explanations, which are other interventions, actors or factors that are not related to MFS II funding.

**Methodology – getting prepared**

As described before a limited number of SPOs were selected for process tracing and for each country strategic orientations were identified as a means to prevent a bias occurring towards only positive impact outcomes and as a means to support the in-country evaluation teams with the selection of outcomes to focus on a much as was possible, based upon the project documents available at CDI. These documents were used to track realised outputs and outcomes against planned outputs and outcomes. During the workshop (see evaluation question on changes in civil society) and follow-up interviews with the SPO, two impact outcomes were selected for process tracing.

[141] Explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented. The aim of process tracing is not to verify if an intended process of interventions took place as planned in a particular situation, but that it aims at increasing our understanding about what works under what conditions and why (Beach & Pedersen, 2013).

**Steps in process tracing**

1. Construct the theoretical model of change – by in-country evaluation team

After the two impact outcomes have been selected and information has been obtained about what has actually been achieved, the in-country evaluation team constructs a visual that shows all pathways that might possibly explain the outcomes. The inventory of those possible pathways is done with the SPO, but also with external resource persons and documents consulted. This culminated in a Model of Change. A MoC of good quality includes: The causal pathways that relate interventions/parts by any actor, including the SPO to the realised impact outcome; assumptions that clarify relations between different parts in the pathway, and; case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance specific attributes of the actor or socio-cultural-economic context. The Models of Change were discussed with the SPO and validated.

2. Identify information needs to confirm or reject causal pathways as well as information sources needed.

This step aims to critically reflect upon what information is needed that helps to confirm one of causal pathways and at that at same time helps to reject the other possible explanations. Reality warns that this type of evidence will hardly be available for complex development efforts. The evaluators were asked to behave as detectives of Crime Scene Investigation, ensuring that the focus of the evaluation was not only on checking if parts/interventions had taken place accordingly, but more specifically on identifying information needs that confirm or reject the relations between the parts/interventions. The key question to be answered was: "What information do we need in order to confirm or reject that one part leads to another part or, that X causes Y?". Four types of evidence were used, where appropriate:[142]

- *Pattern evidence* relates to predictions of statistical patterns in the evidence. This may consist of trends analysis and correlations.
- *Sequence evidence* deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A. However, if we found that event B took place before event A, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
- *Trace evidence* is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of meeting minutes, if authentic, provides strong proof that the meeting took place.
- *Account evidence* deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

3. Collect information necessary to confirm or reject causal pathways

Based upon the inventory of information needs the evaluation teams make their data collection plan after which data collection takes place.

[142] Beach and Pederson, 2013

4. Analyse the data collected and assessment of their quality.

This step consists of compiling all information collected in favour or against a causal pathway in a table or in a list per pathway. For all information used, the sources of information are mentioned and an assessment of the strength of the evidence takes place, making a distinction between strong, weak and moderate evidence. For this we use the traffic light system: **green letters mean strong evidence**, **red letters mean weak evidence** and **orange letter mean moderate evidence:** The following table provides the format used to assess these issues.

**Table 53: Organisation of information collected per causal pathway and assessing their quality**

| Causal pathway | Information that confirms (parts of) this pathway | | Information that rejects (parts of) this pathway | |
|---|---|---|---|---|

5. Assessing the nature of the relations between parts in the model of change

The classification of all information collected is being followed by the identification of the pathways that most likely explain the impact outcome achieved. For this the evaluators assess the nature of the relations between different parts in the MoC. Based upon Mayne (2012) and Stern et al (2012) the following relations between parts in the MoC are mapped and the symbols inserted into the original MoC.

**Table 54: Nature of the relation between parts in the Model of Change**

| Nature of the relation between parts and other parts or outcome | |
|---|---|
| **The part is the only causal explanation for the outcome. No other interventions or factors explain it. (necessary and sufficient)** |  |
| **The part does not explain the outcome at all: other subcomponents explain the outcomes.** |  |
| **The part explains the outcome but other parts explain the outcome as well: there are multiple pathways (sufficient but not necessary)** |  |
| **The part is a condition for the outcome but won't make it happen without other factors (necessary but not sufficient)** |  |
| **The part explains the outcome, but requires the help of other parts to explain the outcome in a sufficient and necessary way (not a sufficient cause, but necessary) → it is part of a causal package** |  |
| Sources: Mayne, 2012; Stern et al, 2012 | |

*6.* Write down the contribution and assess the role of the SPO and MFS II funding

This final step consists of answering the following questions, as a final assessment of the contribution question:

- The first question to be answered is: What explains the impact outcome?
- The second question is: What is the role of the SPO in this explanation?
- The third question, if applicable is: what is the role of MFS II finding in this explanation?

7. Sources for data collection

Information necessary to answer this evaluation question is to be collected from:

- Interviews with resource persons inside and outside the SPO
- Project documents and documentation made available by other informants
- Websites that possibly confirm that an outcome is achieved and that the SPO is associated with this outcome
- Meeting minutes of meetings between officials
- Time lines to trace the historical relations between events
- Policy documents
- etc

## 2.6. Evaluation question 3 – Relevance of the changes

Evaluation question 3: *What is the relevance of these changes?*

The following questions are to be answered in order to assess the relevance of the changes in Civil Society.

- How do the MFS II interventions and civil society outcomes align with the Theory of Change developed during the baseline in 2012? What were reasons for changing or not changing interventions and strategies?
- What is the civil society policy of the Dutch alliance that collaborates with the SPO? And how do the MFS II interventions and civil society outcomes align with the civil society policy of the Dutch alliance that collaborates with the SPO?
- How relevant are the changes achieved in relation to the context in which the SPO is operating?
- What is the further significance of these changes for building a vibrant civil society for the particular MDG/ theme in the particular context?

**Sources for data collection**

For this question the following sources are to be consulted:

- Review of the information collected during interviews with the SPO and outside resource persons
- The 2012 Theory of Change
- Interview with the CFA liaison officer of the SPO;

- Review of reports, i.e: the civil society policy document of the Dutch Alliance that was submitted for MFS II funding, relevant documents describing civil society for the MDG/ theme the SPO is working on in a given context.

### 2.7. Evaluation question 4, previously 5 - Factors explaining the findings

Evaluation question 4: What factors explain the findings drawn from the questions above?

To answer this question we look into information available that:

- Highlight changes in the organisational capacity of the SPO
- Highlight changes in the relations between the SPO and the CFA
- Highlight changes in the context in which the SPO is operating and how this might affect positively or negatively its organisational capacity.

**Sources for data collection**

Sources of information to be consulted are:

- Project documents
- Communications between the CFA and the SPO
- Information already collected during the previous evaluation questions.

## 3. Analysis of findings

A qualitative software programme NVivo 10 (2010) was used to assist in organising and making sense of all data collected. Although the software cannot take over the task of qualitative data analysis, it does 1) improve transparency by creating a record of all steps taken, 2) organise the data and allow the evaluator to conduct a systematic analysis, 3) assist in identifying important themes that might otherwise be missed, and 4) reduce the danger of bias due to human cognitive limitations, compared to “intuitive data processing” (Sadler 1981). The qualitative data in the evaluation consisted of transcripts from semi-structured interviews, focus group discussions workshops, field notes from observation, and a range of documents available at the SPO or secondary information used to collect reference data and to obtain a better understanding of the context in which the CS component evolves.

To analyse this diverse collection of data, several analytical strategies are envisioned, specifically content analysis, discourse analysis, and thematic analysis. Although each of these strategies can be understood as a different lens through which to view the data, all will require a carefully developed and executed coding plan.

Data have been coded according to: standard civil society indicator; outcome included for in-depth contribution analysis; relevance, and; explaining factors.

This qualitative analysis will be supported by a limited amount of quantitative data largely arising from the score assigned by the evaluation team to each performance indicator described in the civil society scoring tool. Other quantitative data in this study are drawn information provided in background literature and organisational documents as well as the Social Network Analysis method.

# 4. Limitations to the methodology

## 4.1. General limitations with regards to the MFS II evaluation

**The MFS II programme and CIVICUS**

Although the MFS II programme stated that all proposals need to contribute to civil society strengthening in the South[143], mention was made of the use of the CIVICUS framework for monitoring purposes. The fact that civil society was to be integrated as one of the priority result areas next to that of organisational capacity and MDGs became only clear when the MoFA communicated its mandatory monitoring protocol. In consequence, civil society strengthening in the MFS II programmes submitted to the ministry is mainstreamed into different sub programmes, but not addressed as a separate entity.

This late introduction of the Civil Society component also implies that project documents and progress reports to not make a distinction in MDG or theme components vs those of civil society strengthening, leaving the interpretation of what is a civil society intervention our outcome and what not to the interpretation of the evaluation team.

At the same time the evaluation team observes that SPOs and CFAs have started to incorporate the organisational capacity tool that is being used in the monitoring protocol in their own organisational assessment procedures. None of the SPOs is familiar with the CIVICUS framework and how it fits into their interventions.

**Differences between CIVICUS and MFS II evaluation**

CIVICUS developed a Civil Society Index that distinguishes 5 dimensions and for each of these a set of indicators has been developed. Based upon a variety of data collection methods, a validation team composed of civil society leaders provides the scores for the civil society index.

Major differences between the way the Civil Society Index is been used by CIVICUS and for this MFS II evaluation is the following:

1. CIVICUS defines its unit of analysis is terms of the civil society arena at national and/or subnational level and does not start from individual NGOs. The MFS II evaluation put the SPO in the middle of the civil society arena and then looked at organisations that receive support; organisations with which the SPO is collaborating. The civil society arena boundaries for the MFS II evaluation are the public or private sector organisations that the SPO relates to or whose policies and practices it aims to influence
2. The CIVICUS assessments are conducted by civil society members itself whereas the MFS II evaluation is by nature an external evaluation conducted by external researchers. CIVICUS assumes that its assessments, by organising them as a joint learning exercise, will introduce change that is however not planned. With the MFS II evaluation the focus was on the extent to which the interventions of the SPO impacted upon the civil society indicators.
3. CIVICUS has never used its civil society index as a tool to measure change over a number of years. Each assessment is a stand-alone exercise and no efforts are being made to compare indicators over time or to attribute changes in indicators to a number of organisations or external trends.

[143] Policy Framework Dutch Cofinancing System II 2011 - 2015

**Dimensions and indicator choice**

The CIVICUS dimensions in themselves are partially overlapping; the dimension 'perception of impact' for instance contains elements that relate to 'civic engagement' and to 'level of organisation'. Similar overlap is occurring in the civil society scoring tool developed for this evaluation and which was highly oriented by a list of evaluation questions set by the commissioner of the evaluation.

Apart from the overlap, we observe that some of the standard indicators used for the civil society evaluation were not meaningful for the SPOs under evaluation. This applies for instance for the political engagement indicator "How intense is your (individual staff or organisational) participation in locally-nationally elected bodies and/or sectoral user groups?".

**Measuring change over a two-year period**

The MFS II programme started its implementation in 2011 and it will finish in 2015, whereas its evaluation started mid-2012 and will end in the beginning of 2014. The period between the baseline and the end line measurement hardly covers 2 years in some cases. Civil society building and policy influence are considered the type of interventions that requires up to 10 years to reap significant results, especially when taking into account attitudes and behaviour. Apart from the fact that the baseline was done when MFS II was already operational in the field for some 1,5 years, some SPO interventions were a continuation of programmes designed under the MFS I programme, hence illustrating that the MFS II period is not a clear boundary. Contracts with other SPOs ended already in 2012, and practically coincided with the baseline assessment being conducted at the moment the relationship with the CFA had practically ended.

**Aggregation of findings**

Although working with standard indicators and assigning them scores creates expectations of findings being compared and aggregated at national and international level, this may lend itself to a quick but inaccurate assessment of change. Crude comparison between programs on the basis of findings is problematic, and risks being politically abused. The evaluation team has to guard against these abuses by ensuring the necessary modesty in extrapolating findings and drawing conclusions.

**Linking the civil society component to the other components of the MFS II evaluation**

The Theory of Change in the terms of reference assumes that CFAs are strengthening the organisational capacity of their partners, which is evaluated in the organisational capacity components, which then leads to impact upon MDGs or upon civil society. Because the evaluation methodology designed for both the organisational capacity and the civil society evaluation require considerable time investments of the SPOs, a deliberate choice was made not to include SPOs under the organisational capacity component in that of Civil Society. This may possibly hamper conclusions regarding the assumption of capacitated SPOs being able to impact upon civil society. However, where information is available and where it is relevant, the civil society component will address organisational capacity issues.

No such limitations were made with regards to SPOs in the MDG sample, however, apart from Indonesia; none of the SPOs in the civil society sample is also in that of MDG.

### 4.2. Limitations during baseline with regards to the methodology

A very important principle upon which this evaluation methodology is based is that of triangulation, which implies that different stakeholders and documents are consulted to obtain information about the same indicator from different perspectives. Based upon these multiple perspectives, a final score can be given on the same indicator which is more valid and credible.

For Indonesia this has not always been possible:

- For 7 out of 10 SPOs a Survey Monkey questionnaire was developed to assess the intensity of the interaction between stakeholders in the network. Out of 156 actors that were invited to fill in this 5 minute questionnaire, only 7 actors effectively filled in the questionnaire = 4.5 %. The online Social Network Analysis aims at having both the opinion of the SPO on the intensity of the interaction with another actor, as well as the opinion of the other actor for triangulation. Important reasons for not filling in this form are that actors in the network are not technology savvy, or that they have difficulties in accessing internet. Data obtained by survey monkey were not used in the baseline. Instead the evaluation team did a social network assessment during the baseline workshop with the SPO.
- With regards to filling in offline interview forms or answering questions during interviews a number of civil society actors did not want to score themselves because they do not benefit from the interventions of the MFS II projects. Having the scores of their own organisations will help to assess the wider environment in which the SPO operates and possibly an impact of the SPO on other civil society organisations in 2014.
- With regards to public officials the evaluation team faced difficulties to have their opinions on a certain number of indicators such as perception of impact on policy influencing and relations between public organisations and civil society. Public officials fear that they will be quoted in the assessment, which may have repercussions for their position.

### 4.3. Experiences during end line from in-country teams - Indonesia

The in-country team experienced difficulties in working on the first evaluation question regarding changes in civil society. The team would have preferred a similar workshop as during the baseline that would recapitulate the essence of the CIVICUS model and the content of each standard indicator developed. Although some members of the in-country team were also involved in the 2012 base line assessment, they and their new colleagues experienced a kind of “CS dimension shock” when these topics where not addressed during the workshop, where a lot of time was spend to work on the second evaluation question on contribution. A guidance sent later in the year was helpful but came late according to the Indonesian team.

The many appendices prepared for data collection and meant as a step-wide approach for the end line study, sometimes became a burden and a limitation when applied directly in collecting data. Like mentioned for the baseline study the questions sometimes limited the probing for information. In addition, in-country team members had to deal with the “CS dimension shock”.

The organisation of the entire MFS II evaluation did provide very little opportunities for SPOs to engage with the evaluation and to feel concerned. For many of the SPOs the evaluation does not provide a strategic value in terms of drawing lessons. This lack of ownership is felt more strongly with those SPOs that already ended their contract with the Dutch MFS II organisation and with those SPOs that due to high staff turn overs were confronted with past tense issues that they did not experience.

Some of the SPOs simply didn't care about the evaluation. This could have been anticipated if there had been a special workshop (for the directors, perhaps, and the CFAs) prior to the endline. Via such workshops, appointments and agreements could have been set, allowing the in-country teams to plan their time and schedule. What ended up happening was that many of the SPOs kept putting off appointments and this also affected the schedule of the team.

Many SPOs are unfamiliar with the CIVICUS framework and the in-country team tried to ease them into it by sending background information and the indicator questions regarding changes in civil society prior to the workshop. This was effective for some SPOs (Common Room, WARSI), but not very effective for LPPSLH, RUANGRUPA, and CRI. The latter three found it too difficult to answer these questions by themselves. Common Room, on the other hand dedicated a special discussion session to discuss the questions internally. The questions were however the same as those dealt with during the baseline and possibly high staff turnovers may also explain this " CS dimension shock".

Fieldwork was sometimes inefficient since the in-country team assumed that each step (workshop, interview, drafting model of change, selecting outcome, finding evidences) would neatly fall into sequence and could be packed tightly within 4 or 5 days with strong commitment from the SPO. This often did not happen.

## 4.4. Civil Society Scoring tool - baseline

**Table 55: Civil Society Assessment tool – Standard Indicators**

| Dimension | Outcome domains | | Question | Statements 0 | 1 | 2 | 3 | x | What are factors (strengths, weaknesses) that explain the current situation? |
|---|---|---|---|---|---|---|---|---|---|
| Civic engagement | 1 | Needs of marginalised groups | How does your organisation take the needs of your beneficiaries/target groups, in particular marginalised groups into account in your planning, actions, activities, and/or strategies? | Are NOT taken into account | Are POORLY taken into account | Are PARTLY taken into account | Are FULLY taken into account | Question not relevant, because ..... | |
| | 2 | Involvement of target groups | What is the level of participation of your beneficiaries/target groups, in particular marginalised groups in the analysis, planning and evaluation of your activities? | They are INFORMED about on-going and/or new activities that you will implement | They are CONSULTED by your organisation. You define the problems and provide the solutions. | They CARRY OUT activities and/or form groups upon your request. They provide resources (time, land, labour) in return for your assistance (material and/or immaterial) | They ANALYSE PROBLEMS AND FORMULATE IDEAS together with your organisation and/or take action independently from you. | Question not relevant, because ..... | |
| | 3 | Political engagement | How intense is your (individual staff or organisational) participation in locally-nationally elected bodies and/or sectoral user groups? | No participation | You are occasionally CONSULTED by these bodies | You are a member of these bodies. You attend meetings as a participant | You are a member of these bodies. You are chairing these bodies or sub groups | Question not relevant, because ..... | |
| | | | | | | | | | |

| Dimension | Outcome domains | | Question | Statements 0 | 1 | 2 | 3 | x | What are factors (strengths, weaknesses) that explain the current situation? |
|---|---|---|---|---|---|---|---|---|---|
| organisation level | 5 | Relations with other organisations | In the past 12 months what has been the most intensive interaction you had with other CSOs? | No interaction at all | Networking - Cooperation: Inform each other; roles somewhat defined; all decisions made independently | Coordination - Coalition: ideas and resources shared; roles defined and divided; all have a vote in decision making | Collaboration: organisations belong to one system; mutual trust; consensus on all decisions. | Question not relevant, because ..... | |
| | 5 | Frequency of dialogue with closest CSO | In the past 12 months how many meetings did you have with the CSO that you have most intensive interaction with? | No interaction at all | Less thatn 2 times a year | Between 2 and 3 times a year | More than 4 times a year | Question not relevant, because ..... | |
| | 6 | Defending the interests of marginalised groups: | Which CSO are most effective in defending the interests of your target groups? In the past 12 months, how did you relate to those CSOs? | No interaction at all | Networking - Cooperation: Inform each other; roles somewhat defined; all decisions made independently | Coordination - Coalition: ideas and resources shared; roles defined and divided; all have a vote in decision making | Collaboration: organisations belong to one system; mutual trust; consensus on all decisions. | Question not relevant, because ..... | |
| of | 7 | Composition current financial resource base | How does your organisation finance institutional costs such as workshops of the General Assembly (if applicable); attendans to workshops of other CSOs; costs for organisational growth and/or networking? | Depends on 1 indernational donor | Depends on few financial sources: one fund cover(s) more than 75% of all costs. | Depends on a variety of financial sources; one fund cover(s) more than 50% of all costs. | Depends on a variety of sources of equal importance. Wide network of domestic funds | Question not relevant, because ..... | |
| | | | | | | | | | |
| Practice of Values | 8 | Downward accountability | To what extent can mandatory social organs (steering committee, general assembly, internal auditing group) ask your executive leaders to be accountable to them? | (financial) information is made available and decisions are taken openly | They fulfil their formal obligation to explain strategic decisions and actions | They react to requests of social organs to justify/explain actions and decisions made | Social organs use their power to sanction management in case of misconduct or abuse | Question not relevant, because ..... | |

| Dimension | Outcome domains | | Question | Statements 0 | 1 | 2 | 3 | x | What are factors (strengths, weaknesses) that explain the current situation? |
|---|---|---|---|---|---|---|---|---|---|
| | 9 | Composition of social organs | What % of members of your mandatory social organs belong to the marginalised target groups you are working with/for? | Between 0-10 % of all members of the social organs | Between 11-30 % of all members of the social organs | Between 31-65 % of all members of the social organs | More than 65% of all members of the social organs | Question not relevant, because ..... | |
| | 10 | External financial auditing | How regularly is your organisation audited externally? | Never | Occasionally, upon request of funders | Periodically and regularly, because our external funder asks for it | Periodically and regularly, because it is part of our code of conduct | Question not relevant, because ..... | |
| | | | | | | | | | |
| Perception of impact | 11 | Client satisfaction | What are the most important concerns of your target groups? How do your services take into account those important concerns? | Majority of target groups are NOT satisfied | Majority of target groups are POORLY satisfied | Majority of target groups are PARTLY satisfied | Majority of target groups are MOSTLY satisfied | Question not relevant, because ..... | |
| | 12 | Civil society impact. | In the past 12 months, what impact did you have on building a strong civil society? | You have not undertaken any activities of this kind | You have undertaken activities of this kind but there is no discernible impact | You have undertaken activities of this kind but impact is limited | You have undertaken activities and examples of significant success can be detected. | Question not relevant, because ..... | |
| | 13 | Relation with public sector organisations. | In the past 12 months, what interaction did you have with public sector organisations to realise your programme and organisations' objectives? | No direct interaction | You have been invited by public sector organisations for sharing of information | You have been invited by public sector organisations for regular consultations (but public sector decides) | Formal and regular meetings as a multi-stakeholder task force. | Question not relevant, because ..... | |
| | 14 | Relation with private sector organisations | In the past 12 months, what interaction did you have with private sector organisations to realise your programme and organisations' perspective? | No direct interaction | You have been invited by private sector organisations for sharing of information | You have been invited by private sector organisations for regular consultations (but public sector decides) | Formal and regular meetings as a multi-stakeholder task force. | Question not relevant, because ..... | |

| Dimension | Outcome domains | | Question | Statements 0 | 1 | 2 | 3 | x | What are factors (strengths, weaknesses) that explain the current situation? |
|---|---|---|---|---|---|---|---|---|---|
| | 15 | Influence upon public policies, rules, regulations | How successful have you been in influencing public policies and practices in the past 2 years? | No activities developed in this area | Some activities developed but without discernible impact | Many activities developed in this area, but impact until so far has been limited | Many activities developed in this area and examples of success can be detected | Question not relevant, because ..... | |
| | 16 | Influence upon private sector agencies' policies, rules, regulations. | How successful have you been in influencing private sector policies and practices in the past 2 years? | No activities developed in this area | Some activities developed but without discernible impact | Many activities developed in this area, but impact until so far has been limited | Many activities developed in this area and examples of success can be detected | Question not relevant, because ..... | |
| | | | | | | | | | |
| **Environmental context** | 17 | Coping strategies | In the past 2 years, how did your organisation cope with these changes in the context that may have been positive or negative consequences for civil society. | No analysis of the space and role of civil society has been done. | You are collecting information of the space and role of civil society but not regularly analysing it. | You are monitoring the space and role of civil society and analysing the consequences of changes in the context for your own activities. Examples are available. | You are involved in joint action to make context more favourable. Examples are available. | Question not relevant, because ..... | |

# Annex K. Changes in the Civil Society Context 2010-2014

## 1. Political context

### 1.1. Brief historical perspective

Indonesia's rise to being the world's third largest democratic nation has been lauded by many world leaders. The county is often considered to be a model Muslim democracy. As the fourth most populous nation with an estimated 250 million people[144], Indonesia has sustained its democratic commitment since transitioning from an authoritarian leadership to a democracy in 1998. The decentralized administration now consists of 34 provinces and 508 districts and municipalities.

Prior to 1998, Indonesia was under strict authoritarian regime. Suharto, known for his so-called New Order (1966-1998) regime, ushered in radical transformations that would place social and political forces under direct state supervision. The defining characteristics of the Suharto era were a focus on economic growth and controlled consensus and political stability devoid of dissent. A series of tumultuous economic and political transitions in the nineties severely diminished the credibility of ageing President Suharto, who was forced to resign amidst mass street protests.

His departure in 1998 laid bare three decades of social inequalities, state-perpetuated abuses against human rights, and a lack of civilian liberties. The regime change opened the way for a period of *Reformasi* started under the presidency of B. J. Habibie (1998-1999) and continued by Abdurrahman Wahid (1999–2001), Megawati Soekarnoputri (2001–2004), and Susilo Bambang Yudhoyono (2004–2014). Restrictions on citizen participation, press freedom and association were removed. Democratic reforms and decentralization led to direct elections, portioned authority, devolution of authority to regional authorities, formation of new political parties and ended the military's parliamentary influence. The distinct historical periods of the New Order Regime and *Reformasi* (1998-present) have shaped the emergence of civil society. Defining characteristics are summarized in the table below.

**Table 56: Characteristics that have defined the emergence of civil society in Indonesia**

| Characteristics | New Order, authoritarian period (1966 – 1998) | Reformasi (1998 – present) |
|---|---|---|
| **Political system** | Centralized, authoritarian characterized by unipolarity. Golkar as the dominant political party. | Decentralized, democratic. Fragmentation of power and atomization of patronage relationships. Emergence of numerous political parties. Direct presidential elections since 1999. |
| | In 1999, there were 27 provinces, 306 | Decentralization altered the political and administrative landscape: 34 provinces, 410 |

[144] In 2010 the population was estimated to be around 237 million people (BPS 2010 Population Census). The current figure is an estimate from BKKBN and similar figures are cited in the CIA's World Fact Book and the World Bank.

| Characteristics | New Order, authoritarian period (1966 – 1998) | Reformasi (1998 – present) |
|---|---|---|
| | districts and around 60,000 villages. | districts, 98 municipalities, 6,944 sub-districts and 81,253.[145] |
| **State-citizen interaction** | Benevolent leader, obedient population. Down to the village level, the state permeated society. | Modern political culture marked by diminishing hierarchy between the state and citizens, allowing for citizens to interact more freely. |
| **Citizen representation and voice** | Strict control of speech, expression and association. | Burgeoning of CSOs, pressure groups and NGOs following the political euphoria after Suharto's fall. |
| | CSOs and their networks largely "hiding behind the screen", and operating under state surveillance. A period of growth occurred in 1995-98, as resistance was building. | Indonesian CSOs began to establish new networks internationally. Up until the early 2000s the focus was on state-centrist issues. Later, issues that CSOs were tackling became more diverse, ranging from pluralism, poverty reduction to fulfilment of economic, social and cultural rights. |
| **Media** | No free press, censorship and state-control. Suharto had firm grasp over how to use print & broadcast medias to promote political ideologies. | More vibrant media environment, flourishing of media businesses albeit in control of 12 main conglomerates that are mostly profit-driven and often have political ties. |
| | Limited public and CS use and access to internet until mid-90s. | Twitter nation, widespread social media use. |
| | | Growing realization of the importance of media/free press as the fourth pillar of democracy. |
| **Artistic forms of expression** | Art and literary censorship conducted by the state. Art forms were a means to reinforce political order. | Greater freedom of the arts and cultural sectors. Organisations able to hold art events more freely. Freedom of expression a catchphrase amongst individuals and artistic groups, but challenged by more conservative members of society. |
| **Religious expression** | Regime repressed religious groups, especially radical forms. | Emergence of religious groups seeking to restore Islamic values and defend Muslim values. |

With political reforms came greater freedom and space for civic engagement. In the *Reformasi* period, there was a remarkable increase in the number of civil society organisations, many of which were Islamic in character. In 2000, the Central Agency on Statistics (BPS) recorded around 70,000 registered

[145] Latest data (2014) See: http://www.rumahpemilu.org/in/read/3351/Gambaran-Singkat-Pemilihan-Umum-2014-di-Indonesia

organisations, compared to just 10,000 in 1996.[146]New groups sprung up with donors encouraging activists to establish NGOs they could fund. These organisations were eager to distance themselves from state and often took an anti-government stance. Proliferating CSOs and NGOs have taken advantage of decentralization and greater regional autonomy to engage in public affairs. Civil society and government relations have improved, although both sides remain sceptical of the others' intentions.

### 1.2. Recent trends in the political context

Indonesia is considered to be a story of democratic success, but it still struggles to realize the benefits of sustained and equitable economic growth. In the political context, the main challenges lie in governing such geographically vast and decentralized country, applying principles of good governance and the enormous task of reforming the country's bureaucracy.

Although, Indonesia's 'big bang' decentralization initiated at the turn of the century narrowed the gap between local government and citizens, it has also localized political power struggles. While the devolution of authorities relieved tensions between the central government and the regions, it has also created opportunities for corrupt and rent-seeking practices, at the local level. As indicated by Transparency International's corruption index scores, perceived corruption in Indonesia remains high.

**Table 57: Transparency International's Global Corruption Barometer survey: Indonesia**

| Year | Corruption perceptions Index Score *(0 perceived as highly corrupt and 100 perceived as clean)* | Rank |
|---|---|---|
| **2011** | 30 | 100/182 |
| **2012** | 32 | 118/174 |
| **2013** | 32 | 114/177 |
| Source: Transparency International | | |

In 2013, decentralization was taken a step further with the approval of the Village Law, intended to address weak governance arrangements and empower rural communities to participate politically. The new law could also lead to village elites distorting power relations and misusing government funding if not properly monitored.

Indonesia is still transitioning politically and many challenges lie ahead. According to the 2012 Indonesia Governance Index's Executive Report, "Indonesia is witnessing a paradox in its democracy. On one hand, a successful opening-up of civil liberty has led to the avalanche of democratic demands across the nation, however on the other hand, democratic institutions' are inadequately respond to those demands." Nonetheless, the Indonesian Governance Index, which focuses on measuring provincial governance, does show a general improvement in the performance of the government (political office) bureaucracy, civil society and economic society based on principles of participation, transparency, fairness, accountability, efficiency, and effectiveness between 2008 and 2012. Civil society scores improved the most significantly, while scores for bureaucracy rose slightly.[147]

[146]http://intranet.law.unimelb.edu.au/staff/events/files/Microsoft%20PowerPoint%20-%20LSM%20dan%20Islam%20di%20Indonesia%20--Melbourne%202010-FINAL.pdf

[147] The IGI uses a scale of 1 (lowest) to 10 (highest). Data is available online through their website.

**Table 58: Indonesia Governance Index: Average provincial scores**

| Arena | 2008 | 2012 |

In the past decade, Indonesians have generally enjoyed a freedom to participate in the political process through a direct-election mechanism. However, in September 2014 lawmakers voted in favour of a bill reviving indirect elections of regional heads. The controversial vote provoked public outcry which saw peaceful protests and the public voicing their discontent through social media. In early October, just before the end of his term, president Yudhoyono issued a regulation in lieu of the law, effectively repealing the law until further judicial review.

The recent 2014 elections which marked the end of Yudhoyono's 10-year term, demonstrated that Indonesian voters are increasingly voting for popular figures irrespective of political party alliances. While practices of corruption, vote-buying and poor voter administration remained in the recent election, the public seems to have matured politically, indicated by the enormous interest in televised debates between the leading candidates. The appeal of the newly sworn in President Joko Widodo, popularly known as Jokowi, has come from his hands-on, man-of-the-people approach. As Jokowi begins his five-year term he will need to start addressing a myriad of challenges that include corruption, stagnant economic growth, and human rights concerns, particularly with respect to the rights to freedom of expression, peaceful assembly, and religious intolerance. If left unaddressed, these challenges could seriously undermine Indonesia's stability and democratic reforms.

## 2. Civil Society context

### 2.1. Socio-political context

Today, there are tens of thousands of civil organisations in the country[148], comprising of religious organisations, unions, mass-based membership organisations, ethnic groups, professional associations, politically affiliated organisations, NGOs, and other community organisations.[149] CSOs in Indonesia work on wide range of themes. Thematic areas recently prominent include democratization and human rights; issue-based campaigns; protecting economic, social and cultural rights; promoting community access to basic services; environmental and natural resources management, and; climate change and disaster risk reduction. In 2012, the Ministry of Home Affairs documented more than 65,000 organisations, of which around 9,000 were officially registered with the Ministry.[150] A year later, the figure increased to more

[148] Under state law, there are two forms of organisation recognized legally: "yayasan" or foundations, and "perkumpulan" or associations. The main difference between foundations and associations is that the latter is member-based and in the way they are governed internally and under law. A large majority of NGOs in Indonesia are private foundations.
[149] NGO Accountability: Politics, Principles and Innovations edited by Lisa Jordan, Peter van Tuijl
[150] Source: http://www.koran-jakarta.com/?112-1000-ormas-perbarui-pendaftaran. This figure is similar to 2010 data provided by Rustam Ibrahim in An ASEAN Community for All: Exploring the Scope for Civil Society Engagement, FES 2011.

than 130 thousand foundations, associations, NGOs, research institutions, and other organisations.[151] It is worth noting that NGOs in Indonesia are also allowed to establish cooperatives or SMEs, of which there are 203,701 with a membership reaching 35.2 million people.[152] Under recently reinstated Law No. 25/1992 concerning cooperatives, the cooperatives' objectives are to improve the welfare of its members and participate in developing the economy.[153] Given these regulations it is possible to expand the definition of civil society to include cooperatives.[154]

The civil society stage has become more diverse; the stage is now "shared with more players, like political parties, religious organisations and universities, all able to speak out and publicize their views in a multitude of media outlets that have sprung up in recent years.[155]" NGOs and civil society in Indonesia are now starting to deal with the dissolve of traditionally-compartmentalized roles and responsibilities as their activities begin to overlap with those of the government and private sector. As one recent report stated, "NGOs that were united against Suharto are now without a common enemy and something to unite them to a common vision.[156]" While the government has come to recognize that "a strong civil society is an important contributor to both launching and sustaining a transition to democratic governance"[157], NGOs and CSO networks continue to be scrutinized and criticized for being vehicles of foreign intervention.

Despite the considerable number of organisations, those operating effectively are likely to be a small proportion.[158] The accountability and transparency of CSOs and NGOs themselves has also come under greater scrutiny. "Donors have started to become impatient with some of their NGO counterparts, who have difficulties accepting that they now have to fulfil much greater demands"[159]. In recent years foreign donor funding has depleted, which has led to more organisations turning to the private sector and government programmes.

Since 1985 the state has regulated member-based, citizen organisations under a Mass Organisations Law making it obligatory for social organisations to register with government. This law was largely ignored in the period of reform following 1998. However, in 2013 the law was replaced by a new controversial Mass/Societal Organisations (*Ormas*) Law No. 17, reinforcing control of foundations and associations. The Law could be used to prohibit or dissolve CSOs. Many NGOs and civil society networks deplored the Law for constricting democratic space and the freedom of civil society. The 2014 Freedom

The 2013 CIVICUS report hinted that the legislation could be part of the state's reaction to a perceived threat that environmental, land rights and indigenous activists pose to political and economic interests due to the "shadowy connections that can exist between transnational corporations and politicians" in the agriculture extractive and construction industries.

The annual Freedom of the Press Index produced by Freedom House illustrates that Indonesia's media remains "partly free". From 2011 to 2012 there was significant numerical improvement from 53 points to 49 with the reduction of restrictions and a greater ability of journalists to cover news more freely. From 2012 to 2014, the country's rating remained steady at 49, with slight changes in global ranking (2012: 97$^{th}$, 2013: 96$^{th}$, 2014: 98$^{th}$).[161]

Overall, the press system in Indonesia is vibrant, with a wide range of news sources and perspectives, further growing with the developments in digital media. "Indonesia's online growth in recent years is recognised as nothing short of phenomenal" (Matt Abud 2012). While the Internet is seen as a new space for debate and participation, current laws still curtail openness, accessibility, inclusiveness and place limits on its use for expression. Only a limited number of organisations like ICT Watch are addressing freedom of expression and online rights. Nonetheless, citizens are using cyber space to set up online communities and organise campaigns. Some recent examples include the commuter movement 'masukbusway.com' aimed to capture and shame traffic violators in Jakarta.

Less progressive sources of rhetoric can be found amongst a number of hardline religious groups and leaders, such as *Front Pembela Islam* (Islamic Defenders Front or FPI), who have links with traditional religious schools (pesantren) and recruit members through these and online networks. Radical groups organise frequent protests to apply pressure on the government and are a threat to diversity and freedom.[162]

## 2.2. Socio-economic context

At a macro-level, Indonesia's socio-economic situation has been improving. The country is a regional and global economic force, and has recently graduated to lower-middle income country (LMIC) status.

Source: Human Development Report 2014 & Explanatory Note for Indonesia

In recent years, Indonesia has consistently been ranked in the medium development category of the UN's Human Development Index (HDI) measuring a long and healthy life, access to knowledge and a decent standard of living. In 2013, the HDI value was 0.684with a rank of 108 out of 187 countries and territories. However, the value falls to 0.553, or 19.2 percent, when taking into account inequality. Indonesia's HDI is above its peers in the medium development category but below the average of 0.703 in East Asia and the Pacific. The Gross National Income (GNI) per capita is steadily rising to US$ 8,970, a remarkable feat considering it was just 2,931 in 1980. Despite improvements, the 2014 report and its explanatory note show that growth is slowing and the country has yet to achieve equitable growth. For example, women only hold 18.6 percent of the seats in parliament, 10 percent fewer women reach secondary education compared to men, and women's labour market participation is 51.3 percent compared to 84.4 percent for men.[163]

The Basic Capabilities Index (BCI) produced by Social Watch offers a picture of the status of key human capabilities of accessing basic services. It utilizes three main indicators: under-five mortality rate, births attended by skilled personnel, and enrolment of children up to the 5th grade. Countries are categorized into five groups accordingly based on their BCI values: 1) Basic: 98 and over; 2) Medium: from 91 to 97; 3) Low: from 81 to 90; 4) Very Low: from 71 to 80, and; 5) Critical: values below 70. Results for Indonesia saw stable or improving scores for child and maternal health, but a regression for education. While no

[163] Human Development Report 2014, 'Sustaining Human Progress: Reducing Vulnerabilities and Building Resilience': Explanatory note on the 2014 Human Development Report composite indices Indonesia

data beyond 2011 is available, other data sources confirm that Indonesia still has high maternal mortality rates but basic education through primary school enrolment is improving.[164]

**Table 61: Indonesia's Rank & Score: Basic Capabilities Index**

| Year | Children reaching 5th grade | Survival up to 5 | Births attended by skilled health personnel | BCI |
|---|---|---|---|---|
| **2011** | 87 (low) | 96 (medium) | 73 (very low) | 88 (low) |
| **2010** | 94 (medium) | 96 (medium) | 79 (very low) | 90 (low) |
| **2000** | | | | 86 (low) |
| **1990** | | | | 74 (very low) |

Indonesia does not fare too well on the Social and Economic Rights Fulfilment (SERF) Index. In 2012 Indonesia achieved 67.86 percent of protecting social and economic rights. Although there was an improvement compared to 2011 values, performance worsened when compared to 2010. The country consistently preforms poorly in the areas of right to food and right to work, although it improved in fulfilling rights to education.

**Table 62: Social and Economic Rights Fulfilment (SERF) Index Values: Indonesia**

| Year | SERF Index Value | Right to Food | Right to Heath | Right to Education | Right to Housing | Right to Work |
|---|---|---|---|---|---|---|
| **2012** | 67.86 | 45.33 | 83.95 | 95.19 | 64.26 | 50.56 |
| **2011** | 65.71 | 45.01 | 85.16 | 93.43 | 63.88 | 41.09 |
| **2010** | 69.29 | 45.75 | 85.95 | 93.82 | 65.88 | 54.72 |
| Source: Social Watch, Core Country SERF Indices 2010, 2011 and 2012 (Note that 2010 data was adjusted in 2013). | | | | | | |

Trends in the country's Economic Freedom Scores produced by The Heritage Foundation and The Wall Street Journal are also rather bleak. From 2010 to 2014 the country has been categorized as 'Mostly Unfree', with only a small increase in its score from 55.5 to 58.5.[165]

These macro-level figures illustrate the complexity of the socio-economic context. While the economy has grown, 65 million people remain highly vulnerable to shocks. Disparities in income and geographic areas remain, made more complex by the number of people 'floating' between the poor and middle class'.[166]

## 2.3. Socio-cultural context

[164] See: Social Progress Index 2014 Country Scorecards published by the Social Progress Imperative; and the World Bank's Indonesia Development Policy Review 2014.
[165] http://www.heritage.org/index/
[166] World Bank's Indonesia Development Policy Review 2014

With respect to the socio-cultural context it is of interest to look at global indices that provide some insight into the level of trust between ordinary people and the extent to which tolerance exists. On a whole, Indonesia has been able to maintain peace as indicated in the improvements in scores recorded by the annual Global Peace Index. In 2010, the country scored 1.950 on a scale of 1 to 5, with 1 being the best score. This has gradually improved to 1.853 in 2014, with a rank of 54 out of 162 countries. Nonetheless, inequality, socio-economic conditions and rights claims (especially land rights) are still a source of localized incidences of conflict in Indonesia. Between 2010 and 2014 there has been a rising incidence of resource and identity-based conflicts as well as vigilantism.[167]

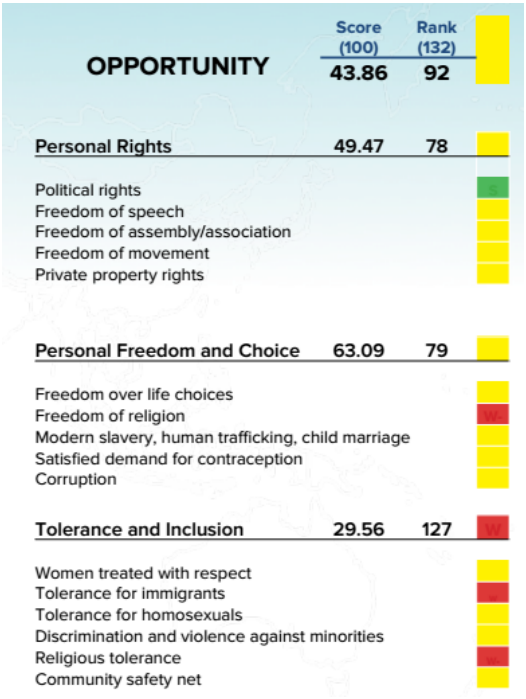

**Figure 37: Indonesia's 2014 Social Progress Index Scorecard illustrating selected elements of the Opportunity component.**

Amongst other components, the Social Progress Index published in 2014 examines whether there is opportunity for individuals to reach their full potential by scoring four different components: personal rights; personal freedom and choice; tolerance and inclusion; and access to advanced education. Indonesia scores low in this regard, at just 43.86 out of 100 and ranking 92nd out of 132 countries. Freedom of religion, tolerance for immigrants and religious intolerance are all considered to be weak (red), while the majority of the components are scored as neutral (yellow).

The Edelman Trust Barometer Survey, which collects annual data from 33,000 respondents in 27 countries has shown that on aggregate, Indonesians' confidence in nongovernmental organisations, government, media and businesses increased by 10 percent in the 2014 trust index. Interestingly, businesses, with 82 percent, are the most trusted of the four sectors compared to 73 percent for NGOs, 53 percent for government and 73 percent of respondents putting their trust in the media. According to survey results, Indonesians believe businesspeople are more inclined to tell the truth than their government counterparts and three times more likely to fix problems.[168]

The trends in levels of trust in NGOs over the past four years are noteworthy. In 2011, the trust level was at 61 percent, decreasing to 53 percent in 2012 and 51 percent in 2013. Reports claimed this was due to a lack of transparency and accountability. Edelman reported that the trust levels in 2013 were the lowest amongst eight Asia Pacific countries surveyed, ascribed to the growth of horizontal, peer-to-

# 1. Introduction

## 1.1. Context project

Earthquakes, floods, volcanic eruptions, drought, landslides and tsunamis are natural hazards that occur in Indonesia almost every day, causing a large number of casualties every year. In 2011 according to the National Disaster Management Agency (BNPB), 1598 natural disasters happened in Indonesia. Among these, hydro-meteorological disasters such as floods, flash floods, drought, landslides, cyclones and tidal waves are the dominant type, constituting 89% of all disasters during the period of 2010-2011. In the same year, 834 people died or were missing due to disasters; while 325,361 people had to be displaced. Regarding material costs, 15 166 houses were heavily damaged, 3,302 houses were damaged and 41,795 houses were slightly damaged.[1] Hence, disasters are a serious and constant threat to people, bringing about heavy economic losses every year, and affecting social and economic activities all over the country.

This situation is particularly true for the relatively poor province of Nusa Tenggara Timur (NTT), which Partners for Resilience (PfR) chose as their programme area for the *Medefinancieringsstelsel* (MFS) II. The province is characterised by a dry ecosystem and it is prone to various natural hazards, such as landslides, floods, earthquakes, tsunamis, drought and cyclone. This condition has led to many difficulties for the lives of local communities in the province. The tsunami event in 1992 has created a traumatic experience where thousands of islanders have lost their lives and some more thousands have lost their shelter and livelihood. However, communities that live in the surroundings of relatively dense mangrove forests have been spared from substantial damage. This is an indication that mangroves have a vital function in the protection from heavy waves of tsunamis. The first efforts at mangrove reforestation on the island of Flores were inspired by this traumatic event.

Through disaster risk management measures, such as mangrove reforestation, it is possible to reduce the environmental risk and economic burden of natural hazards on society. Therefore, the Government of Indonesia (GoI) has declared its determination to fight the risks from natural hazards by introducing pro-active measures (e.g. early warning systems) to enhance the resilience of society. It is also realised that local communities have to be involved in the assessment and implementation of Disaster Risk Reduction (DRR) measures if they are to become resilient.

As the above example indicates, the resilience of coastal communities can be increased by integrating the ecosystem rehabilitation/restoration into the current DRR strategy. National and local governments are supportive of the restoration and rehabilitation efforts, for example through the mainstreaming of tree planting into the programme of the Ministry of Forestry (e.g. One Billion Tree Programme or OBIT), as well as other pro-environment initiatives. This was also supported by the GoI initiative on the establishment of the National Mangrove Working Group (KKMTN) and Forest Land Restoration Partnership Working Group at the national level. At provincial/district level, a Regional Mangrove Working Group was also encouraged to be established in the regions with mangrove areas, including the one in Ende district (Nusa Tenggara Timur province), which has just been established in 2012. Together with Sikka district in Nusa Tenggara Timur, Ende district is the location of the MFS II project areas of Wetlands International – Indonesia Programme (WIIP). In Sikka district, a decree of the head of district has been released on 29 September 2012 that put a moratorium on destroying mangrove forests with the aim to protect the remaining mangrove forests

[1] Source: http://healthmdgs.wordpress.com/2012/01/04/bnpb-1-598-bencana-alam-terjadi-di-tahun-2011/

in the district. In addition to the government's initiative, the enabling environment has also been developed by local communities, where various local communities' initiatives have carried out mangrove restoration programmes, during the consultation stage, prior to the formal implementation of the MFS II in the related villages. Restoration and rehabilitation of wetlands have in the most recent years been more widespread and politically recognised activities in a number of countries including Indonesia.

The restoration and rehabilitation of wetlands provides not only protection of the vital environment and its resources but also a source of livelihood for locals if managed sustainably. Mangrove forests are rich in crab and fish, the fruit of certain types is edible, but also honey can be harvested. In addition, the timber is a valuable building and construction material. Hence, mangrove forests contribute to the resilience of local communities both by mitigating the effects of natural disasters and by providing sustainable livelihoods.

## 1.2. Evaluation objectives

This report evaluates the Climate-Proof Risk Reduction project of Wetlands International Indonesia Programme (WIIP)[2] funded by the Partners for Resilience alliance (PfR). This project has been selected as part of the MFS II evaluation for Indonesia under the Achievement of Millennium Development Goals (MDG) component[3] under the goals on sustainable living environment, forests and biodiversity (MDG 7a and 7b).[4] In particular, the current evaluation focuses on the following research questions: how many hectares of community land are covered by mangrove and dry-land forests? How did the condition of the forests change? How did the number of households applying sustainable forest management (i.e. participating in reforestation efforts)? How did the attitude and awareness of households change towards natural resources, in particular mangroves? How did the communities' disaster risk preparedness change? How did the attitude and awareness of households change towards natural disasters and disaster reduction technologies? Finally, how did the livelihood of households living from sustainable use of ecosystem change?

We investigate whether the project had a favourable effect on the above mentioned outcomes using difference-in-difference methodology: we compare the changes in the outcome variables between the baseline and endline periods for the project beneficiaries to the changes in outcomes for a comparison group. We survey all WIIP project villages (7 in total) in Flores and an equal number of comparison villages.

In the 14 surveyed villages, we conducted community survey in each village with community leaders, and a total of 320 household surveys. In treatment villages, we stratified the sampling by direct beneficiary households and indirect beneficiary households. For the endline surveys, the same respondents were re-interviewed in 2014 whenever it was possible. The survey respondents were selected randomly from the list of project beneficiaries, and households living close to the coast. In addition, we surveyed the ecological conditions of mangroves in both treatment and comparison villages, and interviewed WIIP staff regarding the implementation and costs of the project.

[2] The project is described in more detail in section 3.

[3] Please note that this project has been also evaluated under the Capacity Development of Southern Partner Organisations component of the MFS II Evaluation.

[4] Based on the project objectives, the WIIP project is also partially classified under the goal on poverty alleviation (MDG 1). Therefore, the evaluation addresses the impacts of the project with respect to both MDGs 7a&b and MDG1.

As specified in the Terms of Reference for this evaluation, the report addresses five evaluation questions to assess the project outcomes:

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?
2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern partner organisations (SPO) efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

## 1.3. Summary of findings

This study evaluates the Climate-Proof Risk Reduction project of WIIP funded by the Partners for Resilience alliance focusing on the project's effects on the direct beneficiaries. The project was implemented in 7 coastal villages in Flores, Eastern Indonesia, a poor area prone to tsunamis. The project provided conditional grants to communities to plant and maintain mangrove forests, and sponsored community based activities to increase sustainable income from forestry and disaster preparedness. Later tranches of the funds were disbursed conditionally on demonstrated progress in mangrove reforestation. The approach well known as *bio-rights* mechanism (see section 3).

We find clear evidence, from monitoring reports, community and household surveys, and ecological surveys conducted by a forestry expert, that the project was successful in mobilizing communities to replant mangrove forests. At the end of the project, 136 hectares of additional forest was realized, 90 percent of which can be attributed to the project. The planting also resulted in additional income for villagers. However, we do not find evidence that the disbursed project funds and the trainings on sustainable livelihood activities resulted in a lasting livelihood impact on the villagers.

At the village level, the project had some impact at disaster risk preparedness: hazard-prone areas were identified and awareness raising campaigns were conducted in 6 of 7 project villages; while alert teams were set up in every project village; and village regulations on natural resource extraction and land use now take into account natural hazards. At the household level, we find some impact on disaster preparedness and awareness for the bio-rights group members (direct project beneficiaries), especially in terms of volunteering, while the project did not have an impact on the disaster preparedness of other households in the villages. However, it has to be noted that the project's effects are muted due to improvements occurring also in the comparison areas.

## 1.4. Structure of report

The rest of this report proceeds as follows: section 2 will describe the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1 till 4 in turn. Section 11 describes the relationship between the Capacity Development and MDG component. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. The project implementation is described in Annex I. Regarding the survey data, the construction of the outcome

indicators and indices is summarized in Annex II, and Annex III presents summary statistics of the variables used in the analysis. Annex IV in turn describes the study locations, and Annex V reports detailed descriptive statistics of the sample; detailed figures on the change in outcome indicators is presented in Annex VI, and on regression results in Annex VII. Annex VIII provides additional information that is used to explain the findings. Finally, the results of the ecological survey are presented in Annex IX.

## 2. Literature overview

Related to the WIIP project, this section provides a short overview on the benefits of mangrove ecosystems and then summarizes the results and best practices of mangrove reforestation projects.

### *Benefits of mangrove ecosystem*

Reforestation of mangroves is acknowledged as an appropriate method for coastal disaster risk reduction. Yanagisawa et al. (2010) found that mangroves substantially decrease the hydrodynamic force of waves by researching the 2004 Indian Ocean tsunami in Banda Aceh. Using a numerical model, their findings show that a 10 year old mangrove forest in a 500 m wide area can reduce a tsunami's hydrodynamic force by approximately 70% for a 3 meter wave – which could be categorised as level 6 on the scale of Beaufort[5] –, while a 30 year old mangrove forest would survive a 5 m tsunami (level 7 on the Beaufort scale[6]) and absorb 50% of its hydrodynamic force.

Looking at the actual protective effects of mangrove forests, the International Federation of Red Cross and Red Crescent Societies (IFRC) evaluated mangrove reforestation projects between 1994 and 2010 in Vietnam aimed at community-based disaster risk reduction, which included awareness raising activities and plantation and disaster preparedness training (IFRC, 2011; IFRC, 2012). The studies compared the impact of typhoons under similar conditions before and after the reforestation and found protective benefits of mangroves in several areas. For example, in 1987 a level 9 typhoon on the Beaufort scale hit the commune Dai Hop, which caused serious damage to a three km-stretch of the sea-dyke that needed to be repaired for 300,000 US dollars. After 835 ha of mangroves were planted, the repaired dyke did not sustain any damage due to protective capacity of the mangrove forests during a comparable storm in 2005 (IFRC, 2012).

Mullan (2014) reviewed existing literature about the effects of mangroves on coastal protection. Comparing villages with and without protection of mangroves during the 1999 super-cyclone (wind speed of around 260 km/h, larger than level 12 on the scale of Beaufort) in Orissa, India, it was found that in absence of all existing mangroves in the area (17,900 hectares), the cyclone would have resulted in an increase from 0.63 to 1.72 deaths per village within 10 km of the coast (Das & Vincent, 2009). In addition, it is estimated with contingent valuation that for households with annual incomes of 490 United States Dollars (USD) damage costs averaged 33 USD per household (6.7%) in a village with mangrove protection, and 154 USD per household (31.4%) in a similar village without mangrove protection (Badola & Hussain, 2005). Hence, we can conclude that the presence of

[5] The lowest level on this scale is 0, which means no wind, while the highest level is 12, indicating a hurricane of 118 km/h or more. Level 6 is a strong breeze between 39 and 49 km/h, which means that using an umbrella becomes difficult (http://www.bom.gov.au/lam/glossary/beaufort.shtml; http://en.wikipedia.org/wiki/Beaufort_scale).

[6] A high wind/moderate gale between 50 and 61 km/h, heaping up the sea and bringing whole trees in motion.

mangrove forests reduced the costs of damaged caused by the super-cyclone by almost 25% of the average annual household income in Orissa.

Other studies tried to estimate the value of mangrove forests based on the benefits they provide to local communities. For example, Barbier (2007) estimated the net present value of benefits from mangrove forests per hectare. Using a discount rate between 10% and 15%, he found that the net present value of mangrove forests per hectare for habitat-fishery linkage was 708-987 USD, for storm protection it was 8,966-10,821 USD, for net income from forest products it was 484-584 USD, while it was 1,078-1,220 USD for net economic returns from shrimp farming. These results suggest that net social benefits are highest if mangroves are protected. However, Barbier et al. (2008) conclude that for large areas of mangroves, the storm protection benefits of an additional hectare are minimal by accounting for the nonlinear impact of mangrove area on wave weakening. In that case, conversion of mangroves may be welfare improving.

In addition, using a case study on Panay Island, Philippines, Walton et al. (2006) examined the economic benefits associated with a restored mangrove forest using a socioeconomic survey of fishermen in the area (in 2004). A total of 241 fishermen were surveyed divided into four groups according to their dependence on mangroves as their fishing areas: mangrove only; mangrove and other areas; shoreline; and coastal areas. The mangrove only group offered 0.7% of their estimated annual earnings for the protection of the mangroves, compared with 0.13% and 0.15% offered by the shoreline and coastal groups, respectively. Adding income from tourism, timber sales and fish production up, the total direct economic benefits from the replanted mangroves were estimated to be USD 564-2316 ha/yr, depending on what percentage of the coastal and shoreline catches of mangrove-associated species were attributable to the replanted mangrove (10-80%). This income can equal that of brackish-water aquaculture ponds. In the Philippines, the initial planting costs were estimated at USD 211 per ha (USD 14 per year if depreciated), which is relatively small compared to results. The authors conclude that the additional services of mangroves make them the best of the coastal reforestation options.

Forecasting the overall benefits of mangrove ecosystems, Brander et al. (2012) conducted a meta-analysis assessing the impact of the loss of mangrove forests in Southeast Asia for the period of 2000 to 2050 under a business as usual scenario. 41 studies on mangrove valuation were used reporting 130 monetary values on coastal protection, water quality, fisheries, fuel wood, mangrove area, mangrove abundance, roads, Gross Domestic Product (GDP) per capita and population. Based on their model, Indonesia is expected to suffer the highest losses using an estimation of mangrove losses of 38% (1.656 million hectares) for the period 2000-2050, namely 1.728 billion USD per year (95% C.I. of 1.239-2.241 billion).

Hence, all the studies above confirm that mangrove forests are hugely beneficial for coastal communities both in terms of protection and other economic benefits they provide.

### *Effectiveness of reforestation projects and best practices*

A general challenge with mangrove reforestation is to keep the survival rates high. This is very important because, as discussed above, the older the mangrove forest, the more protection it offers (Yanagisawa et al., 2010). The IFRC (2011) also found high losses due to low survival rates at the beginning of the project. This was particularly due to the lack of technical knowledge, because after receiving technical advice from the Vietnam National University, survival rates averaged around 60%.

Evaluating eight mangrove initiatives in the Philippines, Primavera and Esteban (2008) found that survival rates of mangrove forests in the Philippines differ a lot between projects: some have a survival rate as low as 17%, while others have rates approaching 90%. All the evaluated projects were funded from international development assistance channelled through the Philippine national government. Among them, the success stories of mangrove reforestation (with 90% survival rates) were mainly low-budget initiatives, which share two common features: regular maintenance by residents who live right next to the plantations and co-management with local governments. This suggests that community-initiated efforts borne out of a shared need (e.g. for coastal protection) have greater prospect of success than heavily funded and donor-driven international development assistance projects.

At the bottom line, the authors find that lower survival rates are mostly due to the use of incorrect species and unsuitable locations, which shows lack of technical knowledge. The natural colonizers in most replanting sites are small seeds and therefore labour-intensive (*A. marina* and *S. alba*), while government agencies and Non-Governmental Organisations (NGO) prefer *Rhizophora*, large propagules that are easy to collect and plant. However, these are suited for more sheltered areas. Planting locations have mostly been seaward in the lower intertidal zones down to the subtidal zones which pose little threat of ownership conflicts, but they are not optimal for mangroves. However, the upper to middle intertidal sites that are ideal are occupied by ponds. The challenge for the Philippines was to muster enough political will to make abandoned, underdeveloped and otherwise illegal culture ponds available for mangrove rehabilitation.

The authors state that involving the community is a more sustainable approach to reforestation because participatory approaches empower local communities to contribute more effectively to forest management. Funding seems to be of secondary importance. Hence, the essential requirements are suitable sites, correct species, community involvement and commitment, and grant of tenure.

### *Results of other bio-rights projects*

The WIIP project uses the bio-rights approach [7] developed by Wetlands International for rehabilitation of mangrove forests. Van Eijk and Kumar (2009) describe case studies of similar projects implemented by Wetlands International that used the bio-rights approach, which has mainly been used in Indonesia (the coastal district of Pemalang on Central Java, Kalimantan, the Aceh Durassalam province on Sumatra), but also in Mali, Vietnam, the Philippines and India. It was implemented for the first time in 1998 in Central Java, Indonesia, in cooperation with local NGOs in order to restore biodiversity and the ecological functioning of mangroves, improving the livelihoods for poor coastal communities through developing a sustainable fisheries system. It provided awareness-raising and training activities and created a mangrove belt and re-greened existing fishponds on 50 hectares. Rapid inventories showed that incomes had increased threefold of approximately 200 people and there was a significant decrease in vulnerability to erosion and storm damage. The community has voluntarily replanted more mangroves after the project. Survival rates were well above 76% in 2005. Starting small-scale and allocating sufficient time for project implementation was a key to success.

A project for ecological restoration of tsunami impacted areas coupled with sustainable community development was implemented in the coastal areas in Sumatra, between 2005 and 2008. In total,

[7] The bio-rights approach is described in section 3.1.

1000 ha of mangrove and beach forest was rehabilitated in 70 project sites, supporting sustainable development activities for 5000 people and improving livelihoods of 60,000 people resulting from improved ecosystem conditions. Replanting activities were unsuccessful in a small number of projects as a result of the limited technical capacity of several of the local programme managers. So, a key point in this project is that accomplishing full sustainability of community activities requires an intense and long-term process of capacity building and training.

***Summary***

Overall, it is found that community based mangrove reforestation, using either the bio-rights approach or other more conventional methods, generates direct economic benefits to the locals and reduces the damage from natural disasters. It was found that mangroves substantially decrease the hydrodynamic force of tsunami's and the damage caused by typhoons (Yanagisawa et al., 2010, IFRC, 2012 and Mullan, 2014). By analysing the perceived benefits of mangrove fishers and additional services of mangroves, Walton et al. (2006) concluded that mangroves are the best of coastal reforestation options. However, it is a challenge to keep survival rates high, which is important because older forests give more protection. Starting on a small scale, community commitment and capacity building and training for technical knowledge are key factors to success.

# 3. The project

## 3.1. Project description

Wetland International – Indonesia Programme (WIIP) is part of the umbrella organisation Wetlands International. WIIP aims to sustain and restore wetlands, their resources and biodiversity through research, information exchange and conservation activities.

The Climate-Proof Disaster Risk Reduction project of WIIP started on 1 October 2011 after six months of inception phase (March-September 2011). The implementation period of the project is carried out between 1 October 2011 and 30 June 2015,[8] while the project administration has to be finalized by 31 December 2015.

The project is implemented as part of the 'Climate-Proof Disaster Risk Reduction' programme of the Partners for Resilience (PfR), an alliance consisting of Netherlands Red Cross, the Red Cross/Red Crescent Climate Centre, Cordaid, Wetlands International and CARE Netherlands. In the framework of the PfR programme, the five partner organisations collaborate on the intersection of Disaster Risk Reduction (DRR), Climate Change Adaptation (CCA) and Ecosystem Management and Restoration (EMR), through three strategic intervention areas: strengthening community resilience, civil society capacity building and policy dialogue at all levels.[9] The project of WIIP closely follows this strategic intervention design: WIIP implements its own bio-rights approach (explained below) aimed at DDR, CCA and EMR in the project locations but also works with other PfR partners (joint capacity building), local NGOs and Community-Based Organisations(CBO) and the local government.

[8] The project period is implemented in 3 phases: the first implementation contract ran between 1 Oct 2011 – 30 November 2013, the second between 1 December 2013 – 30November 2014 and the third between 1 December 2014 – 30 June 2015.

[9] See http://www.careclimatechange.org/adaptation-initiatives/climate-proof-drr, Assessed on 17 December 2014.

The *bio-rights* approach of WIIP encourages community groups (with 20-30 members) to restore coastal ecosystems through awareness raising on DRR, CCA and Sustainable Ecosystem Management (SEM) and signing a contract with community members to commit to reforestation of community areas in exchange for a substantial conditional grant. If after 3 years more than 80% of the agreed number of plants are live (a dead plant is defined as having no green live leaves – although in reality, some are still able to grow subject to the proper treatment) and/or community groups participated on the related policy initiatives (such as development of village regulation, development of village contingency plan, and establishment of village level disaster response team), the communities can keep the grant. Otherwise it has to be repaid in proportion with the survival rate of trees. However, enrichment and new planting are possible during the 3 year period.

To increase the impact of its programme, WIIP is also active in policy dialogues at district and provincial/national level regarding the Green Belt Policy and ecosystem-based DRR, ecosystem assessments in the various PfR sites, climate trend risk mapping; and it provides a large number of trainings on ecosystem and landscape approaches in DRR measures of PfR partners, local field staff and other actors in civil society. As PfR aims at innovating DRR practices through integrating climate and ecosystem smart information and expertise, Linking & Learning is a very important part of the programme. In the context of PfR Indonesia, WIIP engages in a number of Linking & Learning activities including establishment of a so-called PfR Learning Site in Banten Bay and facilitating community exchanges from all PfR partners to its various PfR sites.

The present evaluation focuses solely on the effects of the WIIP project in the project villages in Sikka and Ende districts of Flores. Therefore, in the following we focus exclusively on this aspect of the project implementation.

## 3.2. Project implementation

The implementation of the WIIP project follows the plans discussed in the baseline report. All planned project activities have been implemented in a timely manner so far. In fact, the project has enjoyed substantial support in the project area, and communities have exceeded their commitment in planting mangroves. At the end of 2013, a total of 495,000 seedlings have been planted (including replanting) compared to the agreed minimum of 400,000 seedlings. In total, 66% of all seedlings have survived or 82.7% of the agreed seedling number – 50,000 (WIIP Yearly Report 2013, also see Table 14 in Annex I). This percentage increased to 87% by the end of 2014.[10]

We now turn to the project activities that have been implemented in the project villages. Since, the project started already before the baseline survey (July 2012), we discuss the project activities before and after the baseline survey separately.

In January 2012, WIIP selected 7 project villages in Flores based on a rapid project site assessment and integrated ecosystem mapping conducted in 2011. Six of the project villages (Nangahale, Reroroja, Talibura and Darat Pantai in Sikka district; and Kota Baru and Tou Timur in Ende district) are located at the coast, while one of them (Ndone in Sikka district) is located upland. After the socialisation of the project at the village level, community groups responsible for the implementation of the planting and sustainable livelihood activities were formed in each village. The formation of the bio-right community group has been finalized with 8 new bio-right community

[10] Information for 2014 is based on feedback from WIIP.

groups (2 groups have been formed in Reroroja village) established in the 7 project villages during the period of January and February 2012. In total, the community groups contain 185 members of which 71 (38%) are women.[11]

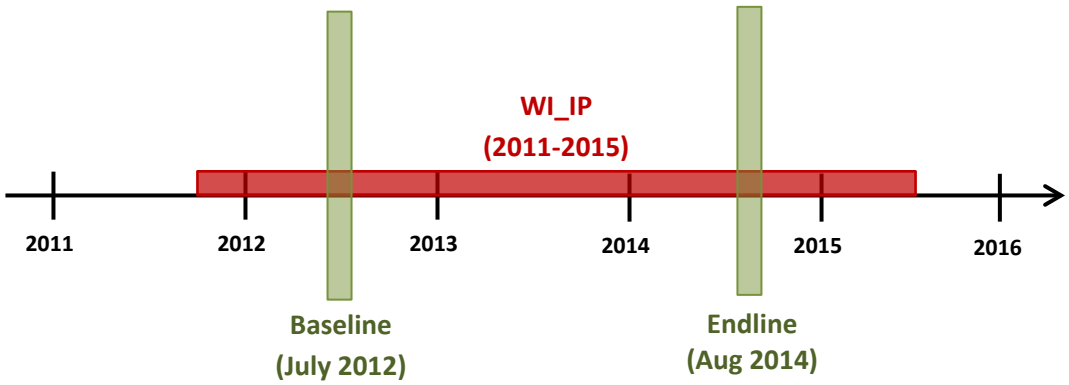
In March and April 2012, WIIP conducted trainings on ecosystem management and restoration, mangrove planting and administration for the newly formed community groups. Finally, in May 2012 the community groups signed the bio-right contract with WIIP for the period of May 2012-June 2015 (3 years). In the contract the communities commit to planting a minimum of 50,000 seedlings (mainly mangrove but also other species in coastal and upland forest areas) per community group and to providing a livelihood activity plan at community and member level for the use of the grant. In exchange, WIIP provides 50 million rupiahs (4,136.61 EUR in 2012 prices[12]) per community group as a grant for the rehabilitation activities; and the same amount as a conditional grant with the condition that at least 80% of the agreed number of planted seedlings is not dead. Hence, the project grants 100 million rupiahs per community group disbursed in 4 instalments over the project period.

The first instalment (30 million rupiahs or 2,481.96 EUR per community group) was disbursed in June 2012. Hence, the community group members could have received around 1.3 million rupiahs (107.33 EUR), on average, shortly before the baseline period.

In addition, in May and June WIIP conducted various awareness raising activities on DRR/CCA/EMR and livelihood activity trainings at the communities. The livelihood trainings covered a variety of activities like chicken rearing, salt production, water desalination, biogas, organic fertilizer production, honey production and marketing, goat and chicken husbandries and weaving craft. These activities were primarily focused on the community group members, while the awareness raising activities targeted school children and other community members as well.

Turning to activities conducted after the baseline survey of the MFS II evaluation, the awareness raising and livelihood training activities continued in the second half of 2012 and also in 2013. With respect to disaster risk reduction, the focus is on mangrove ecosystem rehabilitation but also other hazards and early warning systems were considered. For example, in Darat Pantai, an observation tower has been built to be used as an early warning facility; and in Talibura, an innovative sediment trapping system has been built using bamboo sticks and later planting mangrove seedlings in trapped sediments to mitigate coastal erosion. Both were constructed by community group members based on plans developed with the assistance of WIIP.

The activities on climate change adaptation were closely linked to alternative livelihood activities. Training on the re-introduction of sorghum as a staple crop was conducted both in 2013 and 2014, with the effect that 2 villages set up a sorghum demonstration plot in 2013, while the other villages followed in 2014. In addition, trainings were conducted on the production of organic fertilizers and sustainable forest honey management. All three of these activities were conducted as a cooperation between WIIP and a local NGO.



[11] Including the 9 members of the community group in Banten Bay, the total number of bio-right community members (direct beneficiary households) is 194, as indicated in the Yearly reports of WIIP.
[12] Using yearly average exchange rate for 2012 at 12,087.20 IDR/EUR.

In March and April 2013, the second bio-rights disbursement handed out 20 million rupiahs (1,436.47 EUR[13]) per community group. A third disbursement was carried out between August 2013 and January 2014. Four community groups received 25 million rupiahs (1,795.59 EUR) and the other four groups only 20 million rupiahs. The conditions for the third disbursement were that (1) at least 80% of the agreed number of seedlings is not dead; (2) the development of village regulation on environment management; and (3) the establishment of village level disaster response team (TBSD). The timing of the disbursement varied among the villages due to differences in fulfilling these conditions. Note that there are still 25-30 million rupiahs to be disbursed per community group after the endline survey of the MFS II evaluation.

Due to the project's success in mangrove rehabilitation and lobbying, several of the project villages secured additional funds for mangrove planting from private sector (e.g. BNI bank) and government institutions (e.g. Ministry of Forestry). As a result, by the end of 2013, a total of 136.26 ha of land had been reforested with over 495,000 seedlings planted.

Further information about the implementation of the bio-rights project in Flores can be found in Annex I. We do not list the many other activities WIIP conducted with PfR partner NGOs and other local organisations.

**Figure 1: Timing of intervention and study**

## 3.3. Result chain

Before turning to the evaluation design, we summarize the bio-rights project of WIIP using a simplified result chain focusing on the project's impacts on the project villages (Figure 2). The activities, outputs and outcomes related to capacity building of CBOs and NGOs, lobbying at government institutions are not included on the figure as mentioned before. We only focus on the project components that have a direct impact on the surveyed beneficiary population. It also has to be noted that the figure does not show other factors influencing the result chain. However, it is important to keep in mind that it is not only the project that can influence the project outcomes.

[13] The yearly average exchange rate for 2013 is used at 13,923.00 IDR/EUR.

**Figure 2: Result chain**

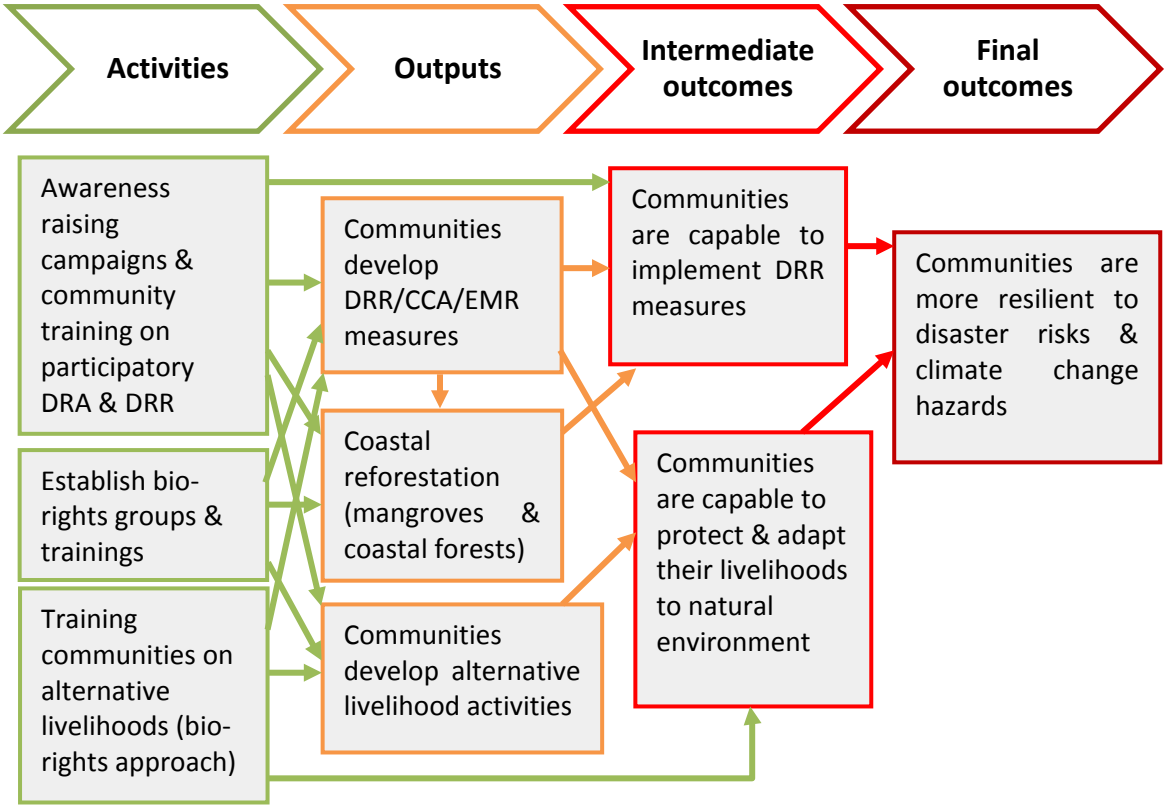


Figure 2 shows that, at the community level, the project combines three inter-related activities to reach its overall project objective: increase the resilience of communities in the face of disaster risks and climate change hazards.

Awareness raising campaigns and trainings on participatory disaster risk assessment (DRA) and reduction (DRR) address potential hazards facing the communities and discuss alternatives to mitigate these hazards: such as coastal reforestation to stop erosion, landslides and lessen the effects of tidal waves; developing alternative livelihoods that can cope with climate change; relying on multiple types of livelihoods to mitigate the effects of catastrophic events like droughts or floods. EMR and the benefits of mangrove ecosystems are also discussed related to disaster risk reduction (protection from tidal waves) and livelihood activities (for example, mangrove honey and shrimps). The campaigns are targeted at youth, the community group members and also other community members.

However, the heart of the project is the bio-rights approach. The established bio-right community groups are responsible for the reforestation efforts and implementation of DRR measures with the assistance of WIIP and its partners (like PMI, another NGO). In return, WIIP organises trainings and financially supports the development of alternative livelihood activities.

Hence, the project contributes to developing the communities' capability to implement DRR measures, and to protect their livelihoods against environmental hazards and to adapt their livelihoods to such hazards. As a result, communities become more resilient to disaster risks and climate change.

### 3.4. Other possible impacts

Through the bio-rights approach and alternative livelihood trainings the project not only increases the resilience of the community (group) members but also affects their livelihood. This is not an explicit objective of the project based on the result chain. However, the bio-right disbursements may have a substantial effect on the livelihood of the group members, which may or may not affect other community members as well (spillover). Therefore, we investigate the project's effect on livelihood and food security as outcome indicators of the project.

## 4. Evaluation questions and outcome variables

### 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. In the baseline report specific evaluations questions were specified. Table 1 shows these five questions and what it implies for this project.

**Table 1: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| **1** | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | 1. How many hectares of community land are covered by mangrove and dry-land forests?<br>2. How did the condition of the forests change?<br>3. How did the number of households applying sustainable forest management change (i.e. participating in reforestation efforts)?<br>4. How did the attitude and awareness of households change towards natural resources, in particular mangroves?<br>5. How did the communities' disaster risk preparedness change?<br>6. How did the attitude and awareness of households change towards natural disasters and disaster reduction technologies?<br>7. How did the livelihood of households living from sustainable use of ecosystem change? |
| **2** | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Are the observed changes above attributable to the intervention? |
| **3** | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>• Does the project address an important issue for the beneficiaries? |
| **4** | Efficiency: Were the development interventions of the Southern partner organisations efficient? | Was the intervention cost effective? |
| **5** | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

The evaluation questions are loosely linked to the result chain discussed in section 3.3 and the project logic. The first three questions mainly relate to the reforestation activity of the bio-rights community groups, while questions 4-6 are related to the awareness raising campaign of the WIIP project. Finally, the last question relates to the trainings and funding for livelihood activities.

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators. The outcome indicators are split up into 8 sub-sections: reforestation, forest management, condition of forests, household's knowledge of mangroves, number of actions taken for disaster risk preparedness, income of households from sustainable use of the ecosystem, household livelihood and food security and vulnerability.

Table 2 displays the outcome indicators of the main analysis and the scale of these variables, while Annex II describes the outcome indicators in more detail and highlights the components per index. The last column of Table 2 indicates which outcome indicators fall under the uniform indicators specified by the Synthesis team for MDG 7ab.

We also wanted to include the size of forests as a measure of the reforestation effort but, unfortunately, most of the communities did not consistently report on the size of the forest area. Therefore, we are not able to quantify the changes in forest size in an indicator based on the household survey. Our estimates of the size and health of the mangrove forest are based on project reports and field work conducted by a forestry expert. From the household survey we use information on the number of seedlings planted, an activity they directly participated in.

**Table 2: Overview outcome indicators**

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| **Panel A. Reforestation** | | | X[1] |
| Number of villages with efforts at forest protection | (0;n) | Community survey | |
| Percentage of households participating in reforestation efforts | (0-100%) | Household survey | |
| Number of planted seedlings | (0;NM) | Household survey | |
| **Panel B. Forest management** | | | |
| Number of villages with forest management structure in place (Mangrove forests/Dry-land forests) | (0;n) | Community survey | |
| Number of villages with village regulations on natural resources (Mangrove forests/Dryland forests) | (0;n) | Community survey | |
| **Panel C. Condition of forests** | | | |
| Condition of mangrove/coastal/upland forests | (1;6) | Community survey | |
| Condition of lake area | (1;6) | Community survey | |
| **Panel D. Household's knowledge of mangroves** | | | |
| Percentage of respondents correctly/incorrectly/partially correctly describing mangroves | (0-100%) | Household survey | |
| Number of benefits of mangrove forests | (0;5) | Household survey | |

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| **Panel E. Number of actions taken for disaster risk preparedness** | | | |
| Information action taken by hh to reduce the risk of disaster | (0-100%) | Household survey | |
| Preparation action taken by hh to reduce the risk of disaster | (0-100%) | Household survey | |
| Savings action taken by hh to reduce the risk of disaster | (0-100%) | Household survey | |
| Volunteering action taken by hh to reduce the risk of disaster | (0-100%) | Household survey | |
| Number of information measures taken by any hh member to reduce the risks of disaster | (0;4) | Household survey | |
| Number of preparation measures taken by any hh member to reduce the risks of disaster | (0;7) | Household survey | |
| Number of volunteer measures taken by any hh member to reduce the risks of disaster | (0;3) | Household survey | |
| **Panel F. Income of households from sustainable use of the ecosystem** | | | |
| Contribution of mangrove forest resources to livelihood | (1;5) | Household survey | |
| Respondent has income from either forestry, livestock or fishing | (0-100%) | Household survey | |
| HH income per HH member out of forestry per month (Rp.) | (0;NM) | Household survey | |
| HH income per HH member from livestock per month (Rp.) | (0;NM) | Household survey | |
| HH income per HH member out of fish per month (Rp.) | (0;NM) | Household survey | |
| **Panel G. Household livelihood** | (0;NM) | | X |
| Per capita food consumption of households per month | (0;NM) | Household survey | |
| Per capita non-food consumption of households per month | (0;NM) | Household survey | |
| Housing facilities index | (NM;NM) | Household survey | |
| Asset index | (NM;NM) | Household survey | |
| Self-reported well-being (Happiness) | (1;4) | Household survey | |
| Self-reported well-being (current wealth status) | (1;6) | Household survey | |
| **Panel H. Food security and vulnerability** | | | X |
| Percentage of households not able to cover their living costs/have not enough to eat | (0-100%) | Household survey | |
| Current status of living: daily needs covered | (1;3) | Household survey | |
| Current status of living: food consumption covered | (1;3) | Household survey | |

Notes:
n is the number of villages in either the treatment group or the comparison group
NM stands for no minimum/maximum
1. It is related to uniform indicator 'speed of deforestation'.

# 5. Data collection

This section describes the survey instruments and the sampling design and outcome in turn.

## 5.1. Survey instruments

We collected three types of data: quantitative, ecological and financial. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

To analyse the impact of the programmes, three surveys have been conducted to collect quantitative data:

- **Household survey:** was designed to collect information about socio-economic condition, households' knowledge and attitudes towards natural resources and disaster risk preparedness, and households' livelihoods.
- **Community survey:** the community survey was administered together with the household surveys both during the baseline and endline period. The head of the community or another local leader was interviewed regarding matters of the community including natural resources and disaster risk preparedness.
- **Community group leader survey:** a short survey was administered to the bio-right community group leaders regarding the activities of the community group.

The baseline data have been collected in July 2012; while the endline data was collected in August 2014.

### *Ecological data*

In order to assess the ecological condition of the rehabilitated and existing mangrove forests, an ecological survey was carried out in the survey villages. The timing of this survey coincided with the baseline and endline quantitative data collection. The results of the survey are presented in Annex IX.

### *Financial data collection*

To collect information about the costs of the WIIP project, we conducted a project cost survey with the programme manager and finance manager on 4 October 2013.

## 5.2. Sampling outcome

The evaluation focuses on the impact of the WIIP project in the bio-right community group members (direct beneficiaries) and other community members (indirect beneficiaries) in the 7 treatment villages in Flores.

The following sub-sections discuss the selection procedure for the survey respondents (sampling design) and the results of its implementation (sampling outcome).

### *Sampling design*

All seven villages that participated in the bio-rights project in Flores were included in the sample. These villages were selected by WIIP based on ecosystem, disaster and climate risk mapping of the area and the strong commitment of the village on environmental actions. Seven comparison villages were selected based on disaster risk mapping and geographical location information with the aim to

sample comparable comparison group. Hence, the sampling of the villages was not random. See Annex IV for more details of the sampled villages.

We sampled two treatment and one comparison groups for the household survey: (i) Households directly involved in the bio-rights project: these households are involved in planting the seedlings for which they receive a (conditional) grant from WIIP, and they also participate in trainings on livelihood activities and DRR/EMR (110 in total);[14] (ii) Other households living in the project villages who benefit from spillover effects (105 in total); and (iii) Households from comparison villages (105 in total from 7 comparison villages). Hence, the treatment group was separated into the 'bio-rights' households and the 'spillover' households.[15]

During the baseline survey, for the treatment group, 15 households[16] per bio-rights group were selected randomly from the list of members, except that the group leader was always included in the sample.[17] For the spillover group, 15 households per treatment village were selected randomly from households living in communities close to the rehabilitation area. For the comparison group, 15 households per comparison village were selected randomly from households living in communities close to the water side or rehabilitation area. Hence, the households in the villages were sampled randomly stratified by treatment type.

At the endline survey, we aimed to re-interview all respondents and households participating in the baseline survey. However, if it was not possible to interview the same household or the household moved out of the village, we replaced the household with a randomly selected household following the sampling design from the baseline survey. As some of the questions in the survey relate to the knowledge or attitude of the respondent, we aimed to interview the same respondent as for the baseline survey. If this was not possible, we interviewed another household member knowledgeable about natural resource management and consumption.

### *Sampling outcome*

Table 3 summarizes the planned and actual number of households interviewed during the baseline and endline period. In both the baseline and endline period the planned number of households have been interviewed (320 in total). Although, there was a slight change in the number of bio-rights and spillover households. This partially due to the fact that some community group members between the establishment of the group (February 2012) and the baseline survey (July 2012) became inactive, while some new members joined the group.

The fifth column of the table (panel households) shows the number of households that were interviewed both for the baseline and endline survey. Among the bio-right group, 108 (96%) of the baseline households were re-interviewed, while this number is 94 (91%) among the spillover group, and 99 (94%) among the comparison households. The households that could not be re-interviewed have moved out of the village (15), were not at home (3) or were unavailable due to another reason (1).

[14] Note that these households have self-selected themselves into the project.

[15] Note that the so-called 'spillover' households also benefit from the village wide project activities, therefore they are not only benefiting from spillover effects.

[16] In Reroroja village there are 2 bio-rights groups. There we have only sampled 10 households from the members per group.

[17] The bio-right groups have between 16 and 33 members, with a total of 185 registered members upon the signing of the bio-right contract.

The last column (panel respondent) shows the number of cases where the same respondent was interviewed both for the baseline and endline survey. Overall, for 75% of the sample the same respondent has been interviewed. This percentage is similar among the assignment groups. The most common reason for a new respondent at the endline survey was that the respondent was not at home (47).[18]

**Table 3: Sampling outcome**

| Assignment group | Planned households | Baseline outcome | Endline outcome | Panel households | Panel respondents |
|---|---|---|---|---|---|
| **Bio-rights group** | 110 | 112 | 112 | 108 | 88 |
| **Spillover group** | 105 | 103 | 103 | 94 | 76 |
| **Comparison group** | 105 | 105 | 105 | 99 | 76 |
| **Total** | **320** | **320** | **320** | **301** | **240** |

In the data analysis, unless noted otherwise, we report the data only on the 'panel households' in tables using both rounds of data (change in variables).

# 6. Descriptive statistics

This section summarizes the characteristics of the sampled villages and households by treatment group. In addition, the exposure of villages and households to the WIIP and other project activities is explored. Additional tables are provided in Annex VI.

## 6.1. Village characteristics

Table 18 in Annex V provides an overview of community characteristics of the comparison and treatment villages. While in the comparison villages the size of the population has slightly decreased, the total number of inhabitants in the treatment area has increased from 2,134 to 2,196. The percentage of households with electricity has mostly increased in the comparison villages, while in the treatment villages the increase is only small. Looking at the different types of schools present in the villages, there have not been any significant changes. In both the treatment and comparison area, the number of villages with a junior high school has increased by 1.

Number of villages reporting a coastal forest has increased both in the comparison (5 at endline) and treatment villages (6 at endline). It is not clear whether these were non-existent or just not reported at the baseline. In addition, at the endline all treatment villages and almost all comparison villages reported an upland forest.

The table also reveals that small-scale disasters are common in the survey area (both in treatment and comparison villages). Most cases are flood, forest fires, cyclone and erosion/landslides. Among these, floods are the most prevalent: 10 out of 14 villages reported to be affected by at least 2 flood events during the evaluation period (same number in treatment and comparison groups) (Table 20 in Annex V). This figure is also representative for a longer period: at the baseline, 5 villages reported 10 flood events over the past 10 years (or floods reoccur annually), while 7 villages reported less frequently occurring flood events (Table 19 in Annex V). Forest fires are also prevalent in the survey are: 9 of 14 villages reported at least 2 such events during the evaluation period, and 7 villages

[18] Other reasons were refusal (5), death (4), moved (3) and illness (2).

reported annually occurring forest fires over the past 10 years during the baseline period. However, in contrast to floods, which usually cause substantial damage at the communities (see Annex I), forest fires are less harmful for the livelihood of communities. During the evaluation period, several villages (7) have also been affected by cyclones/typhoons damaging numerous houses.

It is also important to note the WIIP project does not work in an isolated environment: Table 21 (in Annex V) shows that are several other NGOs working in the survey area, especially in the field of education (in 8 villages) and health (6 villages). However, the distribution of these programmes is similar between the treatment and comparison villages.

Further information about the study locations can be found in Annex IV, which provides details about the project locations and activities implemented by WIIP and other NGOs.

## 6.2. Household characteristics

To provide a better insight into the general characteristics of the households in our sample, Table 4 displays the most important socio-economic characteristics including age, gender, education level of the household head, wealth indices, economic activities of the household, and the distance from the household to forests. [19]

The table shows all characteristics for the households in the treatment villages as well as the comparison villages. The treatment group is separated into the 'bio-rights' households that are directly involved in the bio-rights project and the 'spillover' households that live in the project villages and benefit from spillover effects. Characteristics are described at the baseline survey (Base) and the endline survey (End) for all households that have been interviewed in both survey rounds (panel sample). We also report on the significance of the change in the variables (p-value). [20] If the p-value is small (say smaller than 5%), it indicates that the change is significantly different from zero (at 5% significance level). [21]The sample size for all variables is reported in Annex III, and the significance of differences in the characteristics among the treatment (bio-rights and spillover, separately) and comparison groups at the baseline can be assessed in Table 23 in Annex V).

[19]The baseline report already described most of these time invariant characteristics of the sample between different groups (see table 11 of the baseline report). However, results were only displayed for the 'participant in intervention' group.

[20]P-values are calculated using standard errors corrected for heteroskedasticity and clustering at the village level. This means that the standard errors are allowed to have an arbitrary correlation for comparison or treatment respondents in the same village. In other words, we allow respondents in the same village in the same treatment group (comparison or treatment) to be more similar to each other than they are to a different randomly selected respondent in another village from the other treatment group.

[21]For some of the indicators the p-value is missing although the numbers for the base- and endline survey show a change (for example, percentage of female headed households). This is due to the fact that some observations are missing either for the baseline or the endline, while no change is observed for thee households for which we have data for both survey rounds.

**Table 4: Household background characteristics**

| Assignment group | Comparison | | | Bio-rights | | | Spillover | | |
|---|---|---|---|---|---|---|---|---|---|
| Reporting period | Base | End | p-value | End | Base | p-value | Base | End | p-value |
| Household (HH) size | 5.2 | 5.9 | 0.000 | 5.1 | 5.9 | 0.001 | 5.3 | 6.0 | 0.009 |
| % HHs with female HH head | 7.1 | 7.5 | | 13.0 | 11.7 | | 7.4 | 6.9 | |
| Age of the HH head | 47.3 | 48.4 | 0.000 | 43.9 | 45.7 | 0.000 | 46.8 | 48.7 | 0.000 |
| Highest level of education attended by the household head (%) | | | | | | | | | |
| *No school/Islamic school* | 7.1 | 8.6 | 0.734 | 6.5 | 5.9 | 0.817 | 4.3 | 3.4 | 0.597 |
| *Primary school* | 65.7 | 67.7 | 0.634 | 64.8 | 63.7 | 0.828 | 64.9 | 64.4 | 0.685 |

Source: Household survey E1; MFS II Evaluation Indonesia
Notes: Robust standard errors corrected for clustering at the village level are used to calculate p-values.
P-values are not defined for variables where there was no change.

Table 4 and Table 23 show that the treatment groups (bio-rights and spillover) and comparison group are similar in terms of household size (5.1-5.3 household members at baseline and 5.8-6.0 at endline), education of the household head (around 65% with primary school education and 4-7% no education at baseline) and main economic activity (55-67% crop farming, 10-16% fishing, 13-14% wage employment and 6-11% non-farm business at the baseline). During the evaluation period, the household size has increased by 0.7 members on average in all groups. However, the changes in the other two characteristics are not significant.

Regarding the age and gender of the household head, we observe that the household heads in the comparison and spillover groups are very similar on average (7% female and 47 years old), while the household heads in the bio-rights group are on average younger (44 years) and more often female (13%). However, these differences are not statistically significant (Table 23 in Annex V). No significant change is observed in the gender of the household heads, while the heads got approximately two years older during the evaluation period.[22]

Table 23 shows that the characteristics of the bio-rights group are (significantly) different from the spillover and comparison groups in terms of their distance to mangrove and non-mangrove forests: at the baseline, the treatment households lived closer to both mangrove (43% less than 500 metres away vs. 24-31%) and non-mangrove (26% less than 500 metres away vs. 12-15%) forests, and despite their closeness, reported to use fire wood from the forests less often (58% vs. 70-83%).

Somewhat surprisingly, the self-reported distance to non-mangrove forests increased overall during the evaluation period, with the change most pronounced for the bio-rights group despite the reforestation efforts. However, we do not observe any significant change regarding the distance to mangrove forests, where most rehabilitation took place.

Households were also asked which parts of mangrove forests and which parts of non-mangrove forests contribute to their livelihood. The last rows of Table 4 show the percentage of households mentioning the different resources as parts contributing to their livelihood, combining both answers for mangrove forests and non-mangrove forests.[23]

Looking at the changes between the baseline and endline surveys, we observe a significant overall increase in the percentage of households reporting that crabs and prawns contribute to their livelihood (from around 14% to 50% in the comparison group, and from 32% to 50% in the bio-rights group). Also more households mention that fish contribute to their livelihood at the endline (7-13 percentage point increase) but the change is only significant in the comparison group.

In addition, more households mention that forest honey contributes to their livelihood at the endline (9-18%) compared to the baseline (0-7%). These percentages are the highest in the bio-rights group, but the change is only significant in the spillover group.

[22] In the comparison group the reported change in the age of household head is one year on average instead of the actual two years between the baseline and endline periods.

[23] The answer categories differ slightly between the base- and endline survey, so that the category 'Other Resources' includes not only all answers which don't fall into the given categories, but also all remaining categories which do not overlap in the two surveys.

## 6.3. Treatment exposure

Before turning to the outcome indicators, it is important to discuss what activities related to the objectives of the WIIP project have taken place in both the treatment and comparison villages. Table 5 summarizes the number villages that reported to have had awareness raising campaigns or trainings related to use/management of natural resources in the two years before the baseline survey and during the evaluation period. The results are reported separately for mangrove and non-mangrove forests.[24]

The table shows that in 3 (2) of 7 project villages awareness raising campaigns related to the protection of mangrove (non-mangrove) forests have been already implemented before the baseline, while in 3 (4) villages during the evaluation period. In total, 4 of 7 project villages reported to have had such campaigns based on interviews with community leaders. However, based on interviews with the bio-rights community leaders, we found that WIIP organised such campaigns in 6 of 7 villages (Annex IV).

Table 5 also shows that awareness raising campaigns were not restricted to the project villages: 2 (2) of 7 comparison villages also reported to have had such activities both prior to the baseline and the endline (in total 3 comparison villages).

**Table 5: Exposure to project - Community**

| Assignment group | Comparison | | Treatment | |
|---|---|---|---|---|
| **Reporting period** | Base | End | Base | End |
| Number of villages with awareness raising campaigns about use and protection of […] in the past two years | | | | |
| *Mangrove forests* | 2 [n=6] | 2 [n=5] | 3 [n=6] | 3 [n=6] |
| *Non-mangrove forests* | 2 [n=6] | 2 [n=7] | 2 [n=5] | 4 [n=7] |
| Number of village with training on […] in the past two years | | | | |
| *Natural resource management of mangrove forests* | 1 [n=6] | 2 [n=5] | 3 [n=6] | 6 [n=6] |
| *Natural resource management of non-mangrove forests* | 0 [n=6] | 0 [n=7] | 1 [n=5] | 2 [n=7] |
| *The sustainable use of natural resources of mangrove forests* | 0 [n=6] | 1 [n=5] | 0 [n=6] | 3 [n=6] |
| *The sustainable use of natural resources of non-mangrove forests* | 0 [n=6] | 0 [n=7] | 0 [n=5] | 2 [n=7] |

Source: Community survey E1; MFS II Evaluation Indonesia
Notes: Sample size given between brackets

Looking at trainings on natural resource management, we find similar figures: 3 (1) treatment communities already had trainings on the management of mangrove (non-mangrove) forests at the baseline, while all 6 coastal project villages had a training on mangrove forest management during the evaluation period, and 2 villages had trainings on the management of non-mangrove forests. Overall, all 7 project villages had natural resource management trainings during the evaluation

[24] Please note that non-mangrove forests include both coastal and upland forests.

period. In addition, 3 (2) project villages indicated that there were also trainings on sustainable use of natural resources during the evaluation period. In the comparison communities, trainings on natural resource management were much less common (1 village at baseline and 2 villages at endline). The trainings in the treatment villages and also in one of the comparison communities were organised by WIIP.

Source: Household survey E1; MFS II Evaluation Indonesia
Notes: Robust standard errors corrected for clustering at the village level are used to calculate p-values.
1. P-value for the difference between the comparison group and the bio-rights group at the baseline
2. P-value for the difference between the bio-rights group and the spillover group at the baseline

Turning to the participation of the surveyed households in these trainings, Table 6 shows[25] that a significant difference between the bio-rights and comparison groups existed already at the baseline in terms of having heard of (knowledge) and having attended trainings or meetings on natural resource management/protection (88% vs. 36% and 63% vs. 17%, respectively) and sustainable livelihood activities (68% vs. 26% and 59% vs. 12%). This is due to the fact that the project already started before the baseline survey.

Other households in the treatment villages (spillover) were also more likely to have heard of these trainings or meetings at the baseline but their attendance rates were not significantly higher than in the comparison villages.

Looking at changes in these indicators during the evaluation period, we observe that the percentage of bio-rights group members that heard and attended trainings on natural resource management and sustainable livelihood activities in the 12 months preceding the survey has somewhat decreased, while the percentages have increased in the comparison and spillover groups. However, at the endline still 63% of bio-rights group members compared to 34% of the spillover group and 30% of the comparison group participated in trainings on natural resource management in the past 12 months. These figures are 49%, 33% and 23% for trainings on sustainable livelihood activities.

These findings show that while the bio-rights group members are more likely to participate in trainings related to natural resources, the project does not exclusively target the group members. In

[25] In Table 6 a number of p-values are included to compare the differences between different groups: the significance of difference between the treatment groups (bio-rights and spillover) and the comparison group at the baseline are reported in columns 5 and 9 (respectively), and the significance of change over time is reported for each assignment group in columns 3, 7 and 11.

addition, WIIP is not the only organisation conducting trainings and meetings on natural resource management as the figures for the comparison group indicate.

However, it is important to point out that in addition to the trainings, the bio-rights group members also benefit from grants and conditional grants from the WIIP project in exchange for their active involvement in reforestation (see the project logic on Figure 2, the self-reported amount of disbursements for households in Table 27 in Annex VIII, and the total amounts to the community in Annex IV).

Finally, further information about the project activities per village can be found in Annex I and Annex IV.

## 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured between the base- and endline survey (2012-2014) are grouped into 8 categories: reforestation, forests management, condition of forests, household's knowledge of mangroves, number of actions taken for disaster risk preparedness, income of households from sustainable use of the ecosystem, household livelihood and food security and vulnerability.

Table 7 displays the results for the outcome indicators at the community level, while Table 8 displays indicators using the respondent surveys. For the tables at the community level, only the baseline and endline values are reported but not the change because of the small sample size (maximum 7 villages per treatment group).

At the respondent level, the changes in the outcome variables are reported as well (for the panel sample). The table structure is similar to Table 4 with the exception that in Table 8 we also report on the standard error[26] of the variables below the mean in parenthesis. The figures reported in the "treatment group" columns use all data collected in treatment villages, where we used sampling weights to correct for stratification. Hence, the results in these columns are representative of the population of the treatment villages. The column "bio-rights" uses data from households that participated in the bio-rights group only. The following subsections discuss the levels and changes in the outcome indicators.

[26] Standard errors corrected for heteroskedasticity and clustering at the village level. See footnote 20 on page 24.

### *Efforts at mangrove reforestation and forest management*

The community survey shows surprisingly small differences in terms of whether communities protect forests, but in terms of managing the forest, we observe a positive trend in treatment communities which is not visible in control communities (see Table 7). The condition of the mangrove forests remained constant, and was somewhat better in the treatment communities. The number of villages with efforts at forest protection, either mangrove or non-mangrove, did not change much in between baseline and endline, in line with the fact that the project already started before baseline. It is surprising that only four out of six community leaders in the treatment villages (one treatment village is located upland) report efforts at mangrove reforestation while this was the focus of the project. This variable could be interpreted as the awareness of community leaders about the project.

In the control group, two communities reported efforts at reforestation. Over the course of the evaluation period, there has been a clear increase in the number of treatment villages that adopted formal management forest management structures and regulations. On average, at the endline around 3 more villages adopted such practices compared to baseline. In the control group, the pattern is not clear, changes are small, and sometimes negative, sometimes positive.

### *Condition of forests*

On a scale from one to six, the condition the mangrove forests remain constant at 2.8 in control villages and around 4.1 in treatment villages.

The ecological survey shows that the mangrove forests were in a healthy condition at the endline survey (unfortunately, no information is available for the baseline). However, the number of (young) trees per hectare has decreased substantially during the evaluation period in both the treatment and comparison villages. Note that the figures on forest density refer to forests that already existed before the WIIP project.

1. Prices are reported in 2012 real prices. Prices at the endline are deflated by the CPI for 2012 at 4.3% and for 2013 at 8.38% (total of 13.04%). Source: http://www.bps.go.id/eng/aboutus.php?inflasi=1

### *Participation of households in reforestation efforts*

The data from the household survey, reported in Table 8, show that households in both treatment and control communities participated in reforestation, but that the number of seedlings planted was more, and increased more in treatment villages. In treatment communities, the percentage of people that participated in reforestation increased by 17 percentage point, bringing it up to 57%. The increase in this variable is attributable to the spillover group exclusively, as almost all bio-rights group members have reported participation in reforestation in both survey periods. By comparison, in control communities it increased by 9 percent point bring it up to 46%. It is interesting to add that the participation in reforestation in the spillover and comparison groups was similar at baseline (35-36%). Hence, the project villages in general (before the WIIP project) were not more active in reforestation compared to other villages.

The survey also asked respondents who participated in reforestation to estimate the total number of seedlings planted. Here we observe a clear sharp increase in treatment communities, and a moderate increase in control communities. Comparing estimates of the general population, at the endline respondents estimated the number of seedlings planted at 333 per household in treatment group, and 169 in the control group. At baseline the difference between the two groups was small, at a level around 70 trees per household. The bio-rights groups reported a substantially higher increase, from 398 to 1677 at endline.[27]

Looking at other measures of forest protection, Table 27 in Annex VIII shows that almost all households agree that mangroves should be protected. In addition to reforestation, households also reported to protect (mangrove) forest though awareness raising: 64% of bio-rights group and 52% in the other two groups at baseline, when the local government has also passed a district regulation on mangrove protection in Sikka district. By the endline, the percentage of households involved in

[27] Unfortunately, the period in the survey was not well-defined. Therefore, we can only hypothesize that the endline values for the number of seedlings planted also include the ones already planted at the baseline.

awareness raising has decreased to 54% in the bio-rights group and further to 31-40% in the other groups.

In addition, at the endline, 43% of the households in the bio-rights group reported to protect mangroves by participating in committees on natural resource management. Such activity is much less common in the other groups (8-12%).

Interestingly, sustainable use of forest resources is mentioned only by 20% of the bio-rights group at the endline (7% at baseline). However, also in the spillover group 17% mentioned sustainable forest use compared to 0% at the baseline. An increase is also observed in the comparison communities at the endline from 0% to 10%. All these changes are significant.

### *Knowledge and awareness of households regarding mangrove forests*

We find no changes here that could be attributed to the project. The results are in Table 8. We find no clear patterns here that could indicate that the project increased knowledge or awareness.

To test knowledge, households were shown 4 cards with forests, of which two depicted a mangrove forest. Households were asked to identify the mangrove forests. At endline, 33% of households could identify the correct cards in control villages, while 46% in treatment villages. The difference is rather small, and did not change much over time. Another variable, whether households could give a correct description of mangrove forests, however, increased sharply from baseline to endline. This change however occurred equally in treatment and control communities. The sharp increase, to about 100% correct answers, is highly unlikely, given the large number of mistakes with the cards. The fact that the large increase is both in control and treatment villages indicates that it is not related to the project.

To test awareness of benefits, households were asked to name benefits of the mangrove forests. Here we see a small increase in the number of benefits mentioned, by about 0.5-0.8, in both treatment and control villages. The number of benefits respondents mention in treatment villages is about 0.5 higher than in control villages. Table 24 in Annex VI details the type of benefits mentioned by the respondents: firewood and building material (wood) are mentioned the most often, followed by food resources. The percentage of households mentioning the latter one has increased significantly over the evaluation period by 10% in the comparison group and 17-23% in the treatment villages. In the treatment villages the acknowledgement of mangroves in protection has increased to 40% by the endline, while it only increased to 18% in the comparison villages. Interesting to note is that bio-rights group members were already aware of the role of mangroves in protection at the baseline (32%) due to project, while by the endline this knowledge has also spread to other community members (spillover).

In line with the above findings, Table 8 shows that the contribution of mangroves to livelihood has also generally (and significantly) increased over the evaluation period, especially for comparison and spillover groups (by 0.5-0.6 on a scale of 1 to 5). However, the bio-rights group members still report the highest reliance on mangroves at the endline (2.3 vs. 1.3-1.6).

### *Income of households from sustainable use of the ecosystem*

Almost all households obtain at least some income/benefit either from the forest[28] (10-20% at baseline and 20-22% at endline), livestock raising (56-62% at baseline and 57-66% at endline) or fishing (82-92% at baseline and 74-84% at endline). Per capita incomes/benefits per months from these sources have increased in real terms over the evaluation period for forestry and fishing but these changes are not significant. In addition, the income from forestry is marginal on average (7.2-18.9 thousand rupiahs).

Regarding the income from livestock, real incomes have declined for the comparison and spillover groups, while increased for the bio-rights group. But none of these changes are significant.

### *Livelihood of households*

The project could influence household income and consumption in two ways. First, the grant distributed to the communities could result in an income effect. Villagers that work for the project will receive some compensation for it. In addition, the project included several livelihood activities on livestock farming, and also related to sustainable use of mangroves, such as shrimp and honey farming. These also could have changed incomes.

We investigate whether such income effects translated into food and non-food expenditures and into more general assessments of welfare. The data shows that the per capita real[29] food expenditure was the highest both at the baseline (after a bio-rights disbursement) and at the endline in the bio-rights group (418,400 Rp/month vs. about 290,000 Rp/month at the endline), and while in the other groups real food consumption decreased by 15-22%, we do not observe such trend in the bio-rights group. However, the per capita real non-food expenditure changed little over the evaluation period. We also asked households to assess their own welfare. Generally, we find some improvement in asset ownership and housing facilities, both in treatment and comparison villages. Changes in the self-assessed happiness and current wealth status are also in line with the other wealth indicators.

### *Food security and vulnerability*

The most noticeable change in terms of self-assessed welfare is the percentage of households that claims that in the past 12 months, they were not able to cover their living costs and/or had not enough to eat. This increases both in control and treatment villages from around 72 percent to around 90 percent. But we do not see a corresponding change in consumption or self- assessed welfare.[30] When households were asked to place themselves on a scale ranging from 1 (very poor) to 6 (very rich) households in control villages put themselves at 2.1, while households in treatment villages placed themselves at 2.2. This is in line with that consumption is slightly higher in treatment communities. When asked whether their current consumption is sufficient to fulfil daily needs, households puts themselves on average at around 1.6 which is halfway in between “not enough to fulfil daily needs” and “enough to fulfil daily needs”.

[28] Income from selling of wood, honey and fruits picked in the forest is included under income from forests. We used median prices reported by the households to calculate the value of these products.

[29] Income and expenditure at the endline is measured in 2012 prices, correcting for inflation between 2012 and 2014.

[30] We also observe similar increases in the percentage of household not able to cover their living costs in another project in East Flores implemented by SwissContact (E10).

### *Disaster risk preparedness*

The mangrove forests provide protection against natural disasters, particularly tsunamis. The project aimed to increase disaster risk preparedness also in other ways. To assess whether households are better prepared, we asked household whether they have taken a number of disaster preparedness measures.[31] There are 4 information related preparedness measures (which focus on whether households know how to act in case of a disaster), 7 personal preparation measures (which focus on whether households have taken measures to protect their family and personal assets) and 3 community volunteering measures (which measure whether households have participated in any community led efforts).

In general, we find that more households have acquired information about disaster risk measures in both treatment (from 54% to 59-68%) and comparison (from 52%-75%) groups during the evaluation period. Also, the number of information measures taken by households has increased by 0.4-0.5 measures per household on average (to 1.3-1.7 out of 4 at the endline). In particular, at the endline households were more informed about possible hazards affecting their households, warning signals and gathering points/evacuation routes (see Table 24 in Annex VI). We observe this development in both comparison and treatment groups.

In the treatment and spillover groups additional households made preparations to mitigate the impacts of potential disasters (from 75-77% to 85-87%) but the average number of measures taken by the households was only marginally affected (2.5 out of 6 at endline).

At the same time, the percentage of households reporting to have emergency savings for disasters has decreased during the evaluation period in all groups (from 21-31% to 11-23%).

In terms of volunteering, Table 24 shows that bio-rights group members are more active in participating in evacuation drills in the village (60% vs. 22-23% households have reported to do so in the endline) and in participating in alert teams for disasters (48% vs. 12-19% at endline). In both of these measures we observed an approximate 15 percentage point increase in the treatment group, and a 5-11 percentage point increase in the comparison and spillover groups. However, the most common volunteering measure was to provide awareness information in the village: 43% of households in the comparison group and 64-66% in the treatment villages reported to have done so at the endline.

Turning to disaster risk management at the community level, Table 26 in Annex VIII shows that most villages in both treatment and comparison groups had carried out a disaster risk assessment already before the baseline survey (5 and 6 villages out of 7). While this activity was always accompanied by identification of hazard-prone areas in the treatment villages, it was the case of only 3 of 6 villages in the comparison group. Awareness raising campaigns were organised in 3 villages in both treatment and comparison groups prior to the baseline.

During the evaluation period, there were a number of disaster risk reduction measures taken in both treatment and comparison areas. Most of these measures were taken in 4 treatment villages compared to 2 comparison villages.

In addition, potential risks from natural hazards were addressed in regulations on land use and natural resource extraction in 6 treatment villages compared to 2 villages at the baseline. The

[31] For the complete list of disaster preparedness measures see Annex II.

picture is not clear in comparison villages, as the number of villages reporting to have addressed these issues in village regulations has decreased over time.

Hence, overall, we find that disaster risk preparedness increased over time especially in the treatment villages (at the community level). However, at the household level, disaster risk preparedness is generally at a low level, with a small positive trend in terms of information preparedness.

# 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

## 8.1. Methodology

We analyse the effects of the WIIP programme on beneficiaries using regression analysis. The primary analysis uses difference-in-difference methodology: we compare the changes in outcome indicators between the treatment groups (bio-right and spillover groups) and the comparison group. We assume that in the absence of the WIIP project, on average, we would observe the same magnitude of changes in the treatment villages as in the comparison group.

However, because the WIIP project started already before the baseline survey (as discussed in section 3.2), we also analyse the early results of the project using cross-sectional analysis on the baseline data. The total impact of the WIIP project is the sum of the early effects (at the baseline) and the effects found between the baseline and endline survey period (at the endline). Note that we expect most changes to happen during and after the study period since the project is a continuous effort with regular discussions with the community and most important outcome indicators require a longer time-span to materialise.

Below we discuss the model used for the regression analysis for the household data. Regarding projects effects at the village level, the relative small size of the project (7 treatment villages) does not allow us to test the differences in village-level outcome variables between treatment and comparison villages. Therefore, these village level outcomes are omitted from the attribution analysis.

### *Treatment effect on the treated*

Regression (1) represents the general model for estimating the treatment effect of the WIIP project.

(1) $$Y_{it} = \alpha_t + \beta Bioright_{it} + \gamma Spillover_{it} + \zeta X_{it} + \eta_i + u_{it},$$

where $Y_{it}$ denotes an outcome variable from the list presented in section 4.2 (dependent variable) for household $i$ at time $t$; $Bioright_{it}$ is a binary variable with value 1 if household $i$ at time $t$ has been member of a bio-right community group and 0 otherwise; and $Spillover_{it}$ is also a binary variable indicating whether household $i$ at time $t$ has been living in a treatment village but not member of a bio-right group (indirect beneficiary).[32]

[32] Note that the spillover group is indirectly affected by the bio-rights monetary transfer to the bio-rights group, but may directly benefit from trainings and workshops on sustainable livelihood activities and disaster risk management.

In general, because the treatment and comparison groups were not randomly selected, there could be differences in the characteristics of the treatment and comparison villages and of the households sampled in these villages. If some of these characteristics also affect the outcome of $Y_{it}$ and we do not control for these characteristics, we could mistakenly interpret the effect of these characteristics on the outcome variable as an effect of the project. Therefore, in (1) we include $X_{it}$, a set of observable control variables that affect the project outcome but they are not affected by the outcome itself (predetermined). In addition, we also include household fixed effects ($\eta_i$) that pick up unobservable time invariant household specific characteristics; and a time varying trend ($\alpha_t$) in the outcome variable. The remaining residuals ($u_{it}$) are clustered at the village level.

Finally, turning to the variables of interest: we are interested in the estimates of $\beta$ and $\gamma$, the coefficient of the treatment effect on the bio-rights group and spillover group, respectively.

### *Early treatment effect on the treated at the baseline*

First, we adapt (1) to estimate the effect of the WIIP project at the baseline:

(2) $$Y_{i1} = \alpha + \beta Bioright_{i1} + \gamma Spillover_{i1} + \zeta Z_{i1} + u_{i1}$$

Note that the control variables in (2) were adjusted. First, it is not possible to estimate the individual fixed effects using only one observation per household; and second, the set of control variables, $Z$, satisfies the additional condition that it represent the situation of households prior to the start of the WIIP project at the beginning of 2012 (not effected by the project). In regression (2), it is important to control for all observable village and household characteristics that differ between treatment and comparison villages.

We use the full baseline sample when estimating the early effect of the WIIP project.

### *Treatment effect on the treated between baseline and endline*

We use difference-in-differences methodology to estimate the treatment effect of the WIIP project between the baseline and the endline survey. We take the first difference of (1):[33]

(3) $$\Delta Y_{i2} = \alpha + \beta Bioright_{i2} + \gamma Spillover_{i2} + \zeta \Delta W_{i2} + \Delta u_{i2}$$

The time-invariant household fixed effect disappears in (3) due to the differencing, along with some of the control variables in $X$ with $\Delta W_{i2}$ containing the change in the remaining control variables. Only variables where the change is significantly different between the treatment and comparison groups are included in W. In addition, we denote the average change of the outcome variable in the comparison group by $\alpha$.

Note that we omitted the change sign (Δ) from the treatment variables $Bioright_{i2}$ and $Spillover_{i2}$. In principle, taking the differences of the binary variables would be zero due to the project already running at the baseline period. However, there were several project activities occurring between the baseline and endline period. These activities are summarized by $Bioright_{i2}$ and their effect on the indirect beneficiaries by $Spillover_{i2}$.

We report the regression results for the treatment effects, $\beta$ and $\gamma$, with and without control variables (W). In addition to household characteristics, we also control for different types of projects implemented by other NGOs in the villages (see Table 19).

[33] Hence, $\Delta Y_{i2} = Y_{i2} - Y_{i1}$ and so forth.

## 8.2. Results

Table 9 reports the regression results for the outcome indicators in the same order as in section 7, and Annex VII contains detailed results for outcome indices.

The first column of the table contains the mean value of the variable in the comparison group at the baseline. This serves as a reference point for assessing the size of the project impact on the variables. The next three columns report on the project's impact on the direct beneficiaries (bio-rights group): column 2 reports the early treatment effect using regression (2) on the baseline data, column 3 reports the difference-in-difference (DD) regression results of regression (3) without the controls, and column 4 shows the regression results including controls. As mentioned above, the overall effect of the project on the direct beneficiaries should be assessed as the sum of the baseline effect (column 2) and the DD effect (column 4).

In the regression using the baseline data (columns 2 and 5), the education of the household head, the household size, and the household's main income source are used to control for differences between the households. In the diff-in-diff regression (columns 4 and 7), the same household level variables are included. In addition, we control for different type of activities (like livelihood, health or education) implemented by NGOs in the villages (see Table 20).

The regression results for the indirect beneficiaries (spillover group) are reported in columns 5-7 in the same order as for the direct beneficiaries in columns 2-4. Again, the overall effect of the WIIP project should be assessed as the sum of the early effects (column 5) and the DD effect (column 7).

The standard error of the coefficient estimates are calculated correcting for heteroskedasticity and clustering at the village level, and they are reported below the coefficients estimates in brackets (columns 2-7). The significance of the coefficient estimates is denoted by stars next to the coefficient estimates.[34] Note that the sample size for the regressions is not reported but can be inferred from Annex III.

[34]The probability that the coefficient estimates are not significantly different from zero is indicated by stars: * denotes that this probability is smaller than 10%, ** is used if this probability is less than 5% and *** if it is less than 1%. Hence, the more stars indicate a higher probability that the effects are significantly different from zero.

1. Prices are reported in 2012 real prices. Prices at the endline are deflated by the CPI for 2012 at 4.3% and for 2013 at 8.38% (total of 13.04%). Source: http://www.bps.go.id/eng/aboutus.php?inflasi=1

### *Participation of households in reforestation efforts*

Table 9 shows that, as expected, the WIIP project had a strong effect on the percentage of households involved in reforestation efforts (54 percentage point at the baseline), and the number of seedlings planted by the bio rights group: these households planted 318 more seedlings per household compared to the comparison group at the baseline, and 1,187 more seedlings per household during the evaluation period (controlling for household characteristics). We also find a positive (245 seedlings/household) effect on the number of seedlings planted by the spillover group. However, this later effect is not statistically significant from zero.

The WIIP project's success in reforestation efforts may be linked to the financial incentives provided for the reforestation efforts: Table 27 in Annex VIII shows that almost only households in the

treatment villages received compensation for their reforestation efforts in the form of a grant: 53% of the bio-rights group report such compensation at the endline, in contrast to 13% in the spillover group. Note, however, that we would have expected that all bio-rights households receive compensation for their reforestation efforts, while the allocation of funds to the other villagers (spillover) is an actual spillover effect. Looking at the values of grant received per household (for those households that report to have received any grant), we observe at the endline that the bio-rights group members received on average a total of 1,693,000 Rp (1,497,000 Rp in 2012 prices) grant for planting; and that the amount reported is much lower in the spillover group compared to the bio-rights group, which could be explained by the lower number of seedlings planted by this group. In addition, 29% of the bio-rights households also received conditional grants (48% at baseline), which were mostly likely used for investments into livelihood activities. The amount of conditional grant was 1,963,000 Rp (1,737,000 Rp in 2012 prices) at the endline (and 1,091,000 Rp at the baseline) on average for these households.

### *Knowledge and awareness of households regarding mangrove forests*

Regarding the knowledge and awareness of mangroves, we find that the WIIP project contributed to the correct recognition of the mangroves: respondents in both the bio-rights and spillover groups were more likely (10 and 16 percentage points, respectively) to correctly recognise mangroves at the endline (controlling for household characteristics). Somewhat surprisingly, this effect is larger than we would have expected based on the results of Table 8.

In addition, participants in the bio rights group mentioned on average 0.3 more benefits at baseline than the comparison group (controlling for background characteristics) but this effect disappears by the endline as comparison households also become more aware of the benefits of mangroves.

### *Household income, livelihood and food security*

In Table 8 we observed an increase in the contribution of mangrove forests to households' livelihood in both treatment and comparison groups. The regression results in Table 9 show us that in the bio-rights group households became less dependent on mangroves compared to the comparison households (by 0.4 on a scale of 1 to 5).

The WIIP project did not affect household income from forestry, livestock and fishing. However, as discussed above, it disbursed grants and conditional grants in exchange for the reforestation efforts of the households in the project villages. At the baseline, disbursements have been handed out one month before the survey, while at the endline period, the last disbursement happened 6 months before the survey. Overall, the average grant disbursement at the endline amounted to 3.6 months' worth of food consumption (and 1.87 month at the baseline) in the bio-rights group (which had the highest consumption figures) for those households who received such compensation.[35]

Table 9 indeed shows the results of the early disbursements on food consumption (10% higher food consumption) but not on the other livelihood indicators. At the endline, we do not find any livelihood effect of the WIIP project.

[35] In addition, the total amount of conditional grant received could cover 4.2 months' food consumption costs. However, only 29% of the bio-rights group member households reported to have received any conditional grants.

### *Disaster risk preparedness*

Regarding disaster risk preparedness, we find that the WIIP project positively impacted the number of personal preparation and community volunteering measures taken by the bio-rights group (by 0.5 and 0.4, respectively) at the baseline. No further effects at the household level are found as a result of the project activities during the evaluation period, despite the fact that the project achieved results at the community level (see Table 26 in Annex VIII).

### *Summary*

The regression results confirm that beyond the planting of mangrove seedlings, the project has had little impact at the individual level. Most of the benefits of the project are thus in terms of the improved condition of mangrove forests, and as a result on the protection it will provide to the communities as the seedlings mature to trees.

# 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular we look at the size of the impact and whether the project addresses an important issue for the beneficiaries.

## 9.1. The size of the impact

The size of the impact in terms of seedlings planted is substantial. Adding up the early impacts and the impacts achieved over the project period, the bio rights group members in treatment villages report over 1400 seedlings planted. Otherwise, the project has had little impact at the household level. The few impacts that are recorded are only found for the bio-rights group, which is a small group. They did take more preparedness measures, volunteering in the community and preparing to protect their own family and assets. But the impact is small. Adding up the impact for personal preparedness (0.5) and community preparedness (0.4) measures, we find that on average, they took no more than one new preparedness measure. No such effects were found for the general population in the treatment villages.

## 9.2. Does the project address an important issue for the beneficiaries?

Tsunamis have proven to be devastating and the area is tsunami prone. In that sense the project addresses an important issue for beneficiaries. We however find very few impacts on the general population in terms of preparing themselves for an eventual disaster. This could indicate the project does not reach the population. It could also indicate that disaster risk management is not on the top list of priorities of villagers.

# 10. Evaluation question 4: Efficiency of project

This subsection will answer evaluation question 4: Were the development interventions of the Southern partner organisations efficient? To answer this question we will describe the cost effectiveness of the programme. First, the calculation of cost per beneficiary is discussed. Second, these costs are compared to the project effects per beneficiary. Finally, the findings on cost effectiveness are compared to achievements of similar projects.

## 10.1. Costs per beneficiary

A first step to estimate the cost effectiveness of the programme is to calculate the project cost per beneficiary. We conducted a structured interview with the programme manager and finance manager[36] on 4 October 2013 using the 'budget survey' as described in section 0. In 2014, we have asked WIIP to provide us with updates on the cost information. In addition, we used the Technical Progress Reports of WIIP to complete the information reported in this section. Hence, the cost figures are based on the actual costs reported by WIIP for years 2011-2013 and on the approved budget for 2014 (except for the bio-rights disbursements).

Table 10 gives a summary of the collected cost information and the estimates of the costs per year per beneficiary for years 2011-2014. The first two columns of the table report the total costs of the project per year in Indonesian rupiahs and euros (using the actual payment amounts). Column 3 provides information on the costs of the project in Flores including the environmental and disaster risk management campaigns and the bio-rights approach and trainings on sustainable livelihood activities. The cost information in these columns includes all project related costs including personnel and administration costs incurred by WIIP. These data were obtained from the financial administrator of WIIP.

The funds disbursed to the bio-rights community groups are summarized in column 4 of the table. There are 194 households participating in these community groups as shown in column 7. Based on these data, we have calculated the bio-rights disbursements per beneficiary household per year in column 7 in Indonesian rupiahs and in column 8 in international dollars (Int$). International dollars at 2011 prices[37] are used for the cost per unit calculation because it takes both purchasing power parity and inflation into account that would not be the case if we reported the unit costs in euros. Hence, using Int$, the costs can easily be compared across time and countries.

The table shows that until the endline survey, the community group members have received 909.55 Int$ (2011) (the sum of the last column), and they were expected to receive another 268.43 Int$ (2011) later in 2014.

[36] The interview was conducted with Yus Noor, programme manager, and Lusiana Nuris, finance manager.

[37] The following exchange rates are used based on PPP conversion factor using the World Development Indicators: 3,606.57 IDR/Int$ in 2011, 3,636.38 IDR/Int$ in 2012, 3,682.25 IDR/Int$ in 2013 and 4,530.90 IDR/Int$ in 2014. Source: Budget survey and Technical Progress Reports of WIIP.
Notes:

1. Total costs for 2014 are estimated based on the approved budget for the contract period 1 December 2013-30 November 2014 minus the actual costs reported for 2013.
2. Estimated as 95% of the total costs. Between 2011 and 2013, 95% of the budget was spent on the activities in Flores.
3. In 2014, an additional 225,000,000 IDR is available for disbursement.
4. In 2014, including the additional available funds, the disbursement per beneficiary household is 268.43 Int$.
5. PPP conversion factor to 2011 international dollars is calculated using the World Development Indicators: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#.

However, calculating the cost per beneficiary amounts is inaccurate if we only take into account the bio-rights disbursements to the direct beneficiaries. The community group members have also benefitted from the sustainable livelihood trainings and the environmental and disaster risk reduction campaigns. These are the project activities from which also affect the indirect beneficiaries. Therefore, we add the addition project costs per indirect beneficiary to the bio-rights disbursement to get a more realistic estimate of the cost of the project per direct beneficiary.

Table 11 shows the result of calculating the total cost per direct beneficiary household per year. We calculate the cost per indirect beneficiary as the ratio between the total project costs for years 2011-2013 excluding the bio-rights disbursements (column 1) and the number of indirect beneficiaries (column 2). The resulting figure is converted to international dollars at 2011 prices (column 3). The costs for 2014 are omitted because we do not have a good indication of the costs incurred before the endline survey.

The cost per indirect beneficiaries is calculated at the individual level, while the costs at the direct beneficiaries are calculated at the household level. Therefore, in column 4 ofTable 11 we estimate the additional costs per direct beneficiary household assuming the average household size used in the Technical Progress Reports of WIIP (827 direct beneficiaries from 194 households)[38]. Finally, the total costs per beneficiary households per year are reported in the last column of the table. The total cost per direct beneficiary household is calculated at 1,604 Int$ (2011) between 2011 and 2013. In 2014, at least an additional 54 Int$ (2011) per direct beneficiary households have been funded by

[38] The total number of direct beneficiaries of the WIIP project is 194 households, with 185 bio-rights group members in the 7 project villages in Sikka and Ende districts in Flores, and 9 bio-rights group members in Banten Bay.

the project. However, using the information in Table 11, we estimate the cost per direct beneficiary household in 2014 to be as much as 474 Int$ (2011) if all available funds are spent.

**Table 11: Project Unit cost per beneficiary household**

| Year | Cost excluding bio-rights in Flores [IDR] | Number of indirect beneficiaries (population) | Cost per indirect beneficiary (person) per year [Int$ 2011][1] | Additional cost per direct HH per year [Int$ 2011][1,2] | Total cost per direct beneficiary HH per year [Int$ 2011][1] |
|---|---|---|---|---|---|
| **2011** | 1,533,844,534 | 4,490 | 94.72 | 403.78 | 403.78 |
| **2012** | 3,258,616,555 | 19,653 | 45.60 | 194.37 | 551.13 |
| **2013** | 2,549,317,090 | 19,653 | 35.23 | 150.17 | 649.28 |
| **Total 2011-2013** | **7,341,778,179** | - | **175.54** | **748.33** | **1,604.19** |

Notes:
1. PPP conversion factor to 2011 international dollars is calculated using the World Development Indicators: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#.
2. The average household size is estimated at 4.2629 (as used by the Technical Progress Report of WIIP).

However, as the main objective of the project is the rehabilitation of forest areas, in Table 12 we report on the unit cost per hectares of reforested areas. Based on information from WIIP, the project directly contributed to the reforestation of 132.89 hectares of land. Taking into account only the bio-rights disbursements that were used as compensation for the rehabilitation (see Table 10 for the amounts), Table 12 shows that the unit costs were 1,266.21 Int$ per hectare of reforested area. Please note, however, that these costs not only benefit the reforested areas but potentially also provide livelihood improvements for the bio-rights group members.

**Table 12: Project Unit cost per hectares of reforested area**

| Year | Unit cost per ha of reforested area [IDR] | Unit cost per ha of reforested area [Int$][1] |
|---|---|---|
| **2011** | - | - |
| **2012** | 1,806,004.97 | 496.65 |
| **2013** | 2,558,507.04 | 694.82 |
| **2014** | 338,625.93 | 74.74 |
| **Total 2011-2014** | 4,703,137.93 | 1,266.21 |

## 10.2. Cost-benefit

As the next step, the unit costs of the project are compared to the benefits derived from the project.

The benefits of the project are in two areas: benefits from the additional (mangrove) forests and benefits from livelihood activities. Because the attribution analysis did not show any significant income effects of the project, here we focus on the benefits provided by the additional forests.

The benefit is in terms of the additional forest that is planted and is in a healthy state. This forest provides protection. This is difficult to quantify in monetary terms so we estimate this in terms of number of hectares of forest. The project data, as reported in Annex I indicate that 136.26 hectares additional mangrove forest was planted, from which 132.89 hectares are attributable to the project directly.

This overstates the impact of the project, as forests have also been planted through initiatives not related to the project. To assess the net impact of the project, we make use of the data on seedlings planted. In control communities, at endline, we found that on average 169 seedlings were planted (see Table 8). By comparison, in treatment communities this was on average 1,677 at endline. We assume that in the absence of the project the number of seedlings as observed in the control communities would have been planted in treatment communities, that is 10 percent (nr seedlings in control/nr seedlings in treatment *100) of what we observe. Applying this percentage to the amount of hectares of forest, we conclude that 90 percent of the 132.89 hectares, that is 119.6 hectares has been planted as result of the project.

The data from the ecological survey indicate that all sites in the surveyed mangrove forests were in healthy condition at endline. The actual benefit in terms of forest planted is thus 119.6 hectares of healthy forest.

To quantify the benefit from these forests, we turn to the benefits quoted in the literature review in section 2. Predicting the future costs of deforestation, Brander et al. (2012) estimated that the value mangroves in Indonesia are USD 748.19-1,353.26 ha/year using a 95% confidence interval. Also Walton et al. (2006) estimated the total direct economic benefits from the replanted mangroves, and concluded that the total benefits of mangroves constitute USD 564-2316 ha/year.

Based on Brander et al. (2012) and using a discount rate of 15 percent, the net present value of a hectare of mangrove forest is between USD 4,987.92 and 9,021.74 per ha. These benefits are higher

than the unit cost of the project calculated above (Int$ 1,266.21). Hence, the benefit of the project outweighs its costs.

### 10.3. Cost effectiveness

We can conclude that the project is it cost effective because the benefits from mangroves exceed the costs of the project. However, comparing the unit costs of reforestation to other projects, we observe that the WIIP project is on the expensive side. Based on evidence in the Philippines, Primavera and Esteban (2008) estimate the unit costs of mangrove reforestation to be between Int$ 399.00 and Int$ 939.00 per hectare.

## 11. Contribution of Capacity Development and Civil Society

The WIIP project has also been selected for the Capacity Development component of the MFS II Evaluation. Regarding the contribution of the capacity development of Wetlands International Head Quarters and the Partners for Resilience Alliance to WIIP during the implementation of the project, MFS II funding has mainly contributed to increased organisational management capacity and more improved financial administration. These were the results of capacity development workshops and a CD scan in March 2013, both funded by MFS II. However, these improvements do not directly affect the project implementation.

On the other hand, the annual project reports of WIIP testify that the collaboration with PfR partners (funded by MFS II) has benefitted both the implementation of the 'Climate Proof Disaster Risk Reduction' project and the expertise of the project staff in term of the integration of the three PfR working pillars (CCA-DRR-EMR) in their work.

## 12. Conclusion

The WIIP project provided performance-based financing for community members to plant and maintain mangrove forests, and conducted community based activities on sustainable livelihood activities and campaigns on disaster risk awareness and preparedness. The analysis indicates that the project was rather successful in achieving its objectives on reforestation: households in the bio-rights group planted over 1,700 seedlings per households on average, from which more than 1,500 is attributable to the WIIP project. In addition, the project had a small positive effect on the awareness of mangroves in the project villages.

The literature review showed that reforestation of mangroves is acknowledged as an appropriate method for coastal disaster risk reduction. The older the mangrove forest, the more protection it offers to natural disasters. Comparing the findings for the WIIP project in this respect is not possible yet since the project just started and long-term survival rates could not be estimated yet. However, at the short-term the project achieved a survival rate of 66% of the total planted trees and 83% of the agreed planting (with replanting) at the end of 2013. The success WIIP booked in reforestation shows that the project can achieve the impact on coastal disaster risk reduction if the villages manage to keep survival rates high. Due to the bio-rights approach and the increased awareness on the community level we think this is likely to happen.

Regarding disaster preparedness and awareness, the project achieved its objectives at the community level: village disaster risk assessment including identification of hazard-prone areas and awareness raising campaigns was carried out in 6 out of 7 project villages, alert teams were set up in every project village, and village regulations on natural resource extraction and land use now take into account natural hazards. However, at the household level, the project was less effective: we find very small effects on households' disaster preparedness indicators, limited to the bio-rights groups that directly participated in the project.

Our findings show that the WIIP project did not have an impact on the livelihoods of the households. These findings are not in line with the findings in the literature review, where awareness-raising and training activities and reforestation have shown to have a positive impact on the income of households. However, the analysis only investigated incomes from forestry, livestock raising and fishing, and not the diversification and adaptation of incomes to the natural environment. Finally, the MFS synthesis team asked to score each project along a few indicators. Table 13 displays the indicators and the scores we deemed valid for the project.

**Table 13: Overall project scoring**

| Statement | Score | Comments |
|---|---|---|
| **1. The project was well designed** | 9 | The project has some clever design features. It makes project disbursement dependent on realized successes in reforestation. It thus provides a direct financial incentive for the community to contribute their labour to the project. This type of outcome based financing is often advocated over direct input based financing which does not provide such incentives. |
| **2. The project was implemented as designed** | 9 | The evidence generated by the survey and project documents indicates that the project has been implemented as planned without delays. Already at baseline, soon after the start of the project, planning was in full swing. |
| **3. The project reached all its objectives** | 9 | The project has been successful in reaching its objectives in terms of reforestation and disaster risk reduction measures at the community level. At the household level, we do not find evidence of effects on livelihood and on disaster risk reduction. However, the project objectives were mostly set at the community level. |
| **4. The observed results are attributable to the project interventions** | 7 | Attributing the estimated impacts to the project comes with some caveats. First, the project already started before the baseline, we can thus not apply a classical difference in difference analysis. However, on the basis of the observed characteristics, we believe that the comparison group was similar to the treatment group. During the evaluation period, we observe improvement both in the comparison and treatment areas, while the improvements are more pronounced in the treatment areas in the intervention areas of the project. |
| **5. The observed results are relevant to the project beneficiaries** | 9 | The project is in a tsunami prone area. Mangrove forests have proven useful to protect villages from tsunamis. |
| **6. The project was implemented in the most efficient way** | 8 | Project costs are high, which is due to the complex nature of the programme. However, through awareness raising and lobbying at the local government the results of the project will be sustainable. |

Notes: Scores are on a scale of 1 to 10, with 1 being "no agreement at all" and 10 being "completely agree with statement".

# Annex I.Project implementation

This annex summarizes the implementation of the WIIP project in the project villages in Flores based on project information from the Yearly Reports (2012 and 2013) of the project.

## *Summary*

***Beneficiaries:***

- **2012:**
  - Direct beneficiaries (Bio-rights groups): 194 HH or 827 people
  - Indirect beneficiaries: 19,653 people (80% of population)
- **2013:**
  - Direct beneficiaries (Bio-rights groups): 194 HH or 827 people
  - Indirect beneficiaries: 19,653 people (80% of population)
- **2014:**
  - Direct beneficiaries (Bio-rights groups): 194 HH or 827 people
  - Indirect beneficiaries: 24,566 people (100% of population)
  - Indirect beneficiaries reached through capacity building of partners: 6,737 people

***Total reforested area (2014):***

- Darat Pantai village (+ Ministry of Forestry): 3.3 ha (+ 2.5 ha)
- Talibura village (+Ministry of Forestry): 3.69 ha (+0.62 ha)
- Nangahale village: 4.45 ha
- Reroroja village 1: 3.51 ha
- Reroroja village 2: 15.07 ha
- Done village: 76.02 ha
- Tou Timur village: 9.46 ha
- Kota Baru village (+CSR BNI Bank): 17.39 ha (+0.25 ha)

  **WIIP project: 132.89 ha**

  **Other: 3.37 ha**

  **TOTAL: 136.26 ha**

***Bio-rights contract and disbursements:***

- **Bio-rights contract:**
  - Period: May 2012 – June 2015 (3 years)
  - Conditions: conditional grant is received for successful tree planting/ecosystem management with a minimum of 50,000 planted trees; and plan on livelihood activity – grant has to be used on livelihood activities.
  - Total amount: 800 million Rp (in Flores), or 100 million Rp per group from which 50 million is a conditional loan and 50 million is grant for rehabilitation activities
- **1st disbursement**
  - Conditions:
  - Timing: June 2012
  - Amount: 240 million Rp (in Flores)
- **2nd disbursement:**

  - Conditions:
  - Timing: March-April 2013
  - Amount: 160 million Rp (in Flores)
- **3rd disbursement**
  - Conditions: 1. Fulfilment of rehabilitation works (80% planting growth success – "dead" individual tree is defined as a tree which does not have any single green-life leaf); 2. Development of village regulation; 3.Establishment of village level disaster response team (TBSD)
  - Timing: Aug 2013-Jan 2014 (Nov-Dec 2013: Reroroja (2 groups), Done, Nangahale and Darat Pantai; Febr 2014: Tou Timur, Kota Baru and Talibura). Timing in the second round of villages (Febr 2014) was delayed due to low survival rates of planted trees (Tou Timur, Kota Baru and Talibura).
  - Amount: 175 million Rp (in Flores)

### *Project activities*

***2012:***

- January 2012: Socialization of programme at the village level
- January-February 2012: Establishment of local community groups The following criteria has been used to select members:
  1. member of community group should be the representative of each sub-village;
  2. member of community group is living at the respected village;
  3. gender sensitive;
  4. member of community group required to have strong environment cautious;
  5. prioritized for less-privileged family;
  6. member of community group who has a special need.
- March-April 2012: EMR and mangrove rehabilitation training, and training on bio-rights group administration with all community groups
- May 2012: Bio-rights contract signing with the community groups
- May-December 2012:Various awareness raising campaigns on DRR/CCA/EMR to community groups
- May-December 2012:Trainings on livelihood activities (bio-rights group) like chicken rearing, salt production, water desalination, biogas, organic fertilizer production, honey production and marketing, goat and chicken husbandries and weaving craft. Training on weaving techniques was attended by representatives of all community groups.
- Successful advocacy lead to issuance of Head of District Regulation on Mangrove Protection in Sikka district
- Village specific activities:
  - Building of 300 metres long board walk through mangrove forest in Reroroja village as part of the development of the Mangrove Information Centre
  - Building of watch tower and gathering hut in Darat Pantai village to be used also as early warning facility.

***2013:***

- Livelihood activity trainings (use of bio-gas, livestock husbandry, use of natural colour dyeing for ikat handicraft, honey collection and processing, sorghum farming and post-harvest management; chicken vaccine)
- Awareness campaigns on DRR/CCA/EMR targeted to school children and members of community groups (e.g. celebration of World Wetlands Day and World Food Day)
- Trainings on disaster risk reduction; and climate change adaption (e.g. re-introduction of Sorghum as staple crop, production of organic fertilizers, sustainable agriculture (low external inputs, healthy and balanced environment) and sustainable forest honey management)
- Village specific activities:
    - Mangrove Information Centre facilities have been finalized in Reroroja village with almost 500 m track/board walk on mangrove forest and mangrove library.
    - Observation tower and community centre hut built in Darat Pantai village to be used also as early warning facility.
    - Sediment trapping system built in Talibura village using bamboo sticks to mitigate coastal erosion. Mangrove seedlings will be planted in the trapped sediments.
- Working together with other NGOs at the project sites: with SwissContact on honey in Darat Pantai, with PMI on ecosystem mapping in Talibura and Bangkoor (comparison village)
- Advocacy efforts resulted in private and government support for planting activities for the project communities (BNI Bank support to 2 community groups in Reroroja with 3,000 seedlings; Ministry of Forestry support to Talibura and Darat Pantai with 25,000 seedlings)
- Working with communities on developing village regulations on environmental and coastal management and establishment of Village Disaster Preparedness Team
- Research/fieldwork on best practices of coastal rehabilitation (in Darat Pantai, Talibura and Reroroja villages), like sediment trapping and planting on sandy and rocky substrate (best location, timing of planting, planting hole and mangrove variety)

***2014:***

- Sorghum demonstration sites are established in all project villages

***Overall:***

- Total of more than 495,000 planted trees (coastal and up-hill) by community group members (123% of target), including those carried out in cooperation with government institutions (e.g. Ministry of Forestry) and business sector (e.g. BNI bank)

### *Activities in communities*

***General community group meetings***

All community groups organise regular community group meetings facilitated by WIIP local facilitator. The following topics were discussed:

- finalization of community group's structure
- agreement on group administration and regulation/rule (including incentive and dis-incentive)

- development of general programme planning (tree planting, maintenance, enrichment, monitoring of growth success, training programme)
- development of community as well as individual livelihood programme (honey collection, chicken farming, pig farming, duck farming, goat farming, fisheries, food stall, fuel shop, weaving, saving programme, planting of productive trees, vegetable farming)
- planning on building of community group facilities and infrastructure (watch tower, workshop, group secretariat, fencing around mangrove areas, board walk, library)
- evaluation of programme progress
- report writing
- consultation to related government institution

***Darat Pantai village, Kembang Bakau Community Group***

**Disasters**

- March 2012: Typhoon (12 houses damaged)
- January 2013: Heavy rain and high tide (sea water reached settlement)

**Bio-rights group:** 20 members (12 males, 8 females)

**Planting**

- 2013: Ministry of Forestry support for seedling nursery and provided 14.5 million Rp to community group
- 2013: enrichment planting
- Total reforested area: 3.3 ha (+ 2.5 ha with support from Ministry of Forestry)

**Livelihood activities**

- May 2012: Training on the use of de-salination and biogas machines, honey packing and marketing, and compost making.
- 2012: types of livelihood activities supported by WIIP
    - Honey collection
    - Rice seller
    - Pig husbandry
    - Chicken husbandry
    - Goat husbandry
    - Fisheries
    - Handicraft (ikat weaving)
    - Bread seller
    - Food Kiosk
- 2013: 25x50 metres demonstration sites for sorghum farming

**Disaster risk management and regulations**

- 2012: awareness raising events targeted at young people focused on the role of mangrove to support people life and livelihood
- 2013: Observation tower and community centre hut built in Darat Pantai village to be used also as early warning facility.
- 2013: WIIP facilitated finalization of village regulation on environment management

***Talibura village, Klakat Indah Community Group***

**Bio-rights group:** 20 members (7 males, 13 females)

**Disasters**

- January 2012: Landslides (10 ha land affected)
- January 2013: Heavy rain (planted mangrove seedlings washed away)
- February 2013: Flood (25 houses flooded and plants washed away)
- August 2013: House fires (2 houses destructed)

**Planting**

- 2013: Ministry of Forestry support for seedling nursery and provided 14.5 million Rp to community group
- 2013: community carried out enrichment planting to replace dead seedlings
- Total reforested area: 3.69 ha (+0.62 ha with support from Ministry of Forestry)

**Livelihood activities**

- May 2012: Training on chicken farming focussed on preparation of cage, feeding and vaccination
- May 2012: Training on the use of de-salination and biogas machines, honey packing and marketing, and compost making.
- 2012: types of livelihood activities supported by WIIP
    - Chicken husbandry
    - Pig husbandry
    - Chicken husbandry
    - Fisheries
    - Vegetable seller
    - Provision of weaving, milling and gardening equipment
    - Handicraft
- 2014: demonstration site established for sorghum farming

**Disaster risk management and regulations**

- June 2012: Environmental campaign targeting students was implemented including a presentation about mangrove ecosystem.
- 
- 2013: Sediment trapping system built in Talibura village using bamboo sticks to mitigate coastal erosion (community group did the construction based on building design developed together with WIIP). Mangrove seedlings will be planted in the trapped sediments.
- 2013: Ecosystem mapping with support from PMI
    - Hazard from regular floods has been identified due to heavily degraded uplands/mountainous area by shifting cultivators (using fires) and by illegal loggers
    - Community has been advised to implement two crucial actions to mitigate this hazard: (1) development of an integrated village landscape-catchment regulation which includes upland and lowland (including mangrove rehabilitation) approaches; and (2) to develop contingency plan to deal with regular flood hazard

- 2013: WIIP facilitated finalization of village regulation on local environment and contingency plan

***Nangahale village, Nangahale Lestari Community Group***

**Bio-rights group:** 22 members (6 females, 16 males)

**Disasters**

- February 2012: Typhoon (27 houses damaged)
- January 2013: Heavy rain (one week electricity cut)

**Livelihood activities**

- May 2012: Training on the production of Iodinated salt
- 2012: types of livelihood activities supported by WIIP
    - Duck husbandry
    - Pig husbandry
    - Chicken husbandry
    - Cow husbandry
    - Goat husbandry
    - Fisheries
    - Food Kiosk (fried foods, cake)
- 2014: demonstration site established for sorghum farming

**Planting**

- 2013: enrichment planting to replace dead seedlings
- Total reforested area: 4.45 ha

**Disaster risk management and regulations**

- June 2012: environmental campaign through football competition and beach cleaning and discussion on mangrove tree planting.
- 2013: Reinforcement of current village regulation on coastal management

***Reroroja village, Sabar Subur Community Group***

**Bio-rights group:** 16 members (6 females, 10 males)

**Disasters**

- January 2012: Floods
- February 2012: Drought (300 ha rice field affected)
- March 2012: Typhoon (6 houses damaged)
- April 2012: Floods (35 ha ready to harvest rice fields have been destructed)
- January 2013: Typhoon (15 houses damaged)
- July 2013: High wave

**Disaster risk management and regulations**

- June 2012: Awareness campaign targeted to community members through climate change adaptation film show; and to preliminary school students through various competitions, such as canoe, swimming, drawing and beach cleaning.
- 2013: Reinforcement of current village regulation on coastal management

**Planting**

- 2013: BNI support for planting
- Total reforested area: 15.07 ha

**Livelihood activities**

- June 2012: Training on duck and goat farming focusing on topics including selection of goat, cage building, food making, goat caring, disease control, sterilization, and marketing of products
- 2012: types of livelihood activities supported by WIIP
    - Financial cooperatives
    - Pig husbandry
    - Goat husbandry
    - Fisheries
    - Vegetable cultivation
- 2014: demonstration site established for sorghum farming

***Reroroja Village, Sa'ate Community Group***

**Bio-rights group:** 21 members (15 females and 6 males)

**Disasters**

**Disaster risk management and regulations**

- June 2013: Reinforcement of current village regulation on coastal management

**Planting**

- 2013: BNI support for planting
- 2013: enrichment planting
- Total reforested area: 3.51 ha

**Livelihood activities**

- June 2012: Training on duck and goat farming focusing on topics including selection of goat, cage building, food making, goat caring, disease control, sterilization, and marketing of products
- 2012: types of livelihood activities supported by WIIP
    - Financial cooperatives
    - Duck husbandry
    - Pig husbandry
    - Goat husbandry
    - Chicken husbandry
    - Fisheries

  - Food kiosk
- 2014: demonstration site established for sorghum farming

***Done Village, Tedo Tembu Community Group***

**Bio-rights group:** 33 members (8 females, 25 males)

**Disasters**

- March 2012: Typhoon (4 houses damaged)

**Disaster risk management and regulations**

- 2012: awareness campaign was conducted through film show on climate change and environment destruction and video on traditional rice harvesting ritual. An awareness raising campaign targeting primary school children was conducted jointly with PLAN about various disaster types, DRR and climate change issues.
- 2013: WIIP facilitated finalization of village regulation on water sources' management

**Livelihood activities**

- June 2012: Training on duck and goat farming focusing on topics including selection of goat, cage building, food making, goat caring, disease control, sterilization, and marketing of products
- 2012: types of livelihood activities supported by WIIP
  - Duck husbandry
  - Pig husbandry
  - Chicken husbandry
  - Goat husbandry
- 2014: demonstration site established for sorghum farming

**Planting**

- 2013: enrichment planting
- Total reforested area: 76.02 ha

***Tou Timur Village, Bowu Sare Community Group***

**Bio-rights group:** 33 members (8 females, 25 males)

**Disasters**

- March 2012: Anthrax

**Disaster risk management and regulations**

- 2012: Environmental campaign was conducted through film show and discussion focusing on conservation and protection of environment.

**Livelihood activities**

- May 2012: Training on the use of de-salination and biogas machines, honey packing and marketing, and compost making.

- June 2012: Training on duck and goat farming focusing on topics including selection of goat, cage building, food making, goat caring, disease control, sterilization, and marketing of products
- 2012: types of livelihood activities supported by WIIP
    - Pig husbandry
    - Goat husbandry
    - Fisheries
    - Fruit cultivation
- 2013: training on production of organic fertilizers in cooperation with 'Wahana Tani Mandiri' (local NGO)
- 2013: 25x50 metres demonstration sites for sorghum farming

**Planting**

- 2013: low rate of tree growth success due to natural condition and attack of domestic animals
- 2013: enrichment planting
- Total reforested area: 9.46 ha

***Kota Baru, Ma'e Welu Community Group***

**Bio-rights group:** 20 members (7 females, 13 males)

**Disasters**

- March 2012: Anthrax
- 2013: Anthrax (50 cows and 4 buffalo died)
- July 2013: High wave

**Disaster risk management and regulations**

- June 2012: DRR/CCA/EMR messages were conveyed to local communities through film and music show and community discussion. In addition awareness campaign targeted to school children was carried out.
- 2013: agreement to develop village regulation on coastal zone management (hence, regulation is not yet developed)

**Livelihood activities**

- May 2012: Training on the use of de-salination and biogas machines, honey packing and marketing, and compost making.
- June 2012: Training on duck and goat farming focusing on topics including selection of goat, cage building, food making, goat caring, disease control, sterilization, and marketing of products
- 2012: types of livelihood activities supported by WIIP
    - Financial cooperatives
    - Pig husbandry
    - Chicken husbandry
    - Goat husbandry
    - Dog rearing
    - Fisheries
    - Tailor

- 2014: demonstration site established for sorghum farming

**Planting**

- 2013: low rate of tree growth success due to soil quality (sand and rocky substrate) and big wind and waves.
- 2013: enrichment planting
- 2013: community group received 20 million Rp to help planting 5,000 seedlings in Gemo village in Ende.
- Total reforested area: 17.39 ha (+0.25 ha with support from CSR BNI Bank)

## *Project results*

**Table 14: Planting success of each community group (December 2013)**

| Group Name | # Agreed planting | | | # tree planting (June 13) | # enrich. planting (Dec13) | # tree planting (Dec.13) | % tree planting (Dec13) to Total | # Survived trees (Dec 13) | % Survived trees (to Dec 13) | % Survived trees to total agreed (Dec 13) | Remarks during this reporting period |

# Annex II. Overview outcome indicators and indices

This annex provides a detailed description about the used outcome indicators. In addition, it discusses the variables which were used to construct the outcome indicator indices. Please note that some of the indicators are constructed as indices from multiple questions. In the main text of the report, only the indices are reported for such indicators. However, this Annex reports on the outcomes of the components of the indices.

Outcome variables for the project were collected at household and community level. The outcomes are reported for treatment villages and comparison villages for the baseline and the endline surveys. The treatment as well as the control group each consists of 7 villages. For the household data, the sample size can differ between tables because the answer 'don't know' is changed to a missing value or because a respondent could skip a question if he/she had no knowledge about what was asked (answered 'no' to a previous question). This was the case if a respondent answered 'don't know' to a question with a scale, so it did not make sense to incorporate the answer in the scale. However, for questions where we were interested in the percentage of the sample that answered 'yes' to a question, it made sense to change the 'don't know' answers to 'no' so that we could use all data when reporting on the question.

### *Reforestation (uniform indicator)*

This information is collected on a community and household level.

- Number of villages with efforts at forest protection in the past 2 years: Data from the community survey are used for outcomes on effort at forest protection. It was asked whether activities have taken place in the village on efforts at reforestation, and if so when. Using the information on the year of reforestation, we constructed a binary variable indicating whether in the past 2 years (2010, 2011 and 2012 for baseline and 2012, 2013 and 2014 at the endline) there have been efforts at reforestation. This indicator is divided into two separate indicators focused on a) mangrove- and b) non-mangrove forests, where non-mangrove forests cover coastal- and upland forests. The information on forests is received by asking in 4 separate questions, first on mangrove forests, followed by coastal and upland forests, and last by lake areas. If the answer is 'No' for one of the forests, all following forest types are skipped, hence the sample size decreases for these type of indicators as the number of villages with missing values increases.
- Percentage of households that participated in reforestation efforts: Data from the household survey are used here. It was asked whether a household has (ever) been involved in reforestation efforts. If this question was answered with 'yes', the last time the activity occurred was reported. All households answering 'yes', independent of the date they mention, are counted as households that have been involved in reforestation efforts. Again using the information on the year of reforestation, we constructed a binary variable indicating whether in the past 2 years (2010, 2011 and 2012 for baseline and 2012, 2013 and 2014 at the endline) there have been efforts at reforestation.
- Number of planted seedlings: Following the previous question, it was asked how many seedlings have been planted as part of the last reforestation activity.

### *Management structure of forests*

For management structure of forests, data was collected on community level on the existence of a management structure as well as regulations on natural resources. Both indicators are again divided into two separate indicators focused on a) mangrove- and b) non-mangrove forests, where non-mangrove forests cover coastal- and upland forests. The information on forests is received by asking in 4 separate questions, first on mangrove forests, followed by coastal and upland forests, and last by lake areas. If the answer is 'No' for one of the forests, all following forest types are skipped, hence the sample size decreases for these type of indicators as the number of villages with missing values increases. For non-mangrove forests, it is possible that a management structure was in place for both types. These cases are not reported separately.

- Management structure in place: It was asked who is responsible for managing the different types of forests, where 'no management structure' is one of the possible categories. Based on this category, the dummy for this indicator was created.
- Village regulations on natural resources: It was asked whether regulations regarding the use of the different types of forests exist.

### *Condition of forest*

For information about the condition of forests, data was collected on the size of the forest areas, on whether it has increased or decreased since the baseline study and on the condition of the forests. All indicators are divided for mangrove and non-mangrove forests, where non-mangrove forests consist of dry-land (coastal and upland) forests. If villages report not to have a certain type of forest, all following forest types are skipped, hence the sample size decreases for these type of indicators as the number of villages with missing values increases.

- Size of forests: It was asked for the size of the area covered by the 3 different types of forests as well as by lake area (in ha). However, reported sizes were not reliable in baseline nor endline survey. Therefore, we only report on the qualitative measure whether the size has increased, decreased or stayed the same. This question was asked with a 10 year recall period at the baseline and a 2 year recall period at the endline in the community survey.
- Condition of forest: It was asked for the condition of the different types of forests. Answers could be given on a scale of 1 (very poor) to 6 (very good). The data come from the community survey,

### *Respondents' knowledge of mangroves*

Data was collected on the description and recognition of mangroves as well as the benefits of mangroves.

- Recognition of mangroves: The respondent was given a flashcard with 4 pictures of different types of trees to identify mangroves. 2 of the 4 pictures actually showed mangrove trees. The respondent had to identify the correct pictures showing mangroves. Three dummies were created from these answers. One dummy gives the percentage of respondents who exactly identified the two correct pictures. Another dummy gives the percentage of respondents who identified one of the two correct pictures (partially correct) and the third dummy gives the percentage of respondents that did not identify any of the pictures correctly or indicated an incorrect picture (even if they also indicated either or both of the correct pictures as well).

- To further test knowledge, it was asked what the benefits of mangroves are, where up to 5 benefits could be mentioned. Results are presented in dummy variables for each of the categories.

These questions relate to the knowledge of the respondent. Therefore, we only report on the change in these indicators if the (main) respondent was the same during the baseline and the endline surveys.

### *Income of households from sustainable use of the ecosystem (uniform indicator)*

For measuring the income from sustainable use of the ecosystem, the following data from the household survey is used:

- Contribution of mangroves to livelihood: It was asked how much mangrove forests contribute to the respondent's livelihood, answering on a scale of 1 (not at all) to 5 (completely).
- Income from forestry/livestock/fishing:
    - The questionnaire includes a separate subsection on the *income from forestry*. It is asked how much (in different possible measuring units) the household sold of 7 natural resources like wood, honey and bamboo in the past 3 months. The subsequent question asks for the amount of Rp received per unit of the natural resource. From these two measures the total *net* income from 'forestry' is calculated for the past three months. For income per household member per month, this amount is divided by the household size and the number of months (three).
    - The questionnaire includes a separate subsection on the *income from livestock.* If a household raised or owned any livestock, poultry or any other domesticated animal during the past three months, more detailed questions on the type and quantity of livestock were asked. For each livestock raised in the past 3 months, the quantity sold was multiplied with the median price for the corresponding animal in the village, sub-district or district. Which of these median prices were used, was decided by the number of available positive answers. For income per household member per month, this amount is divided by the household size and the number of months (three).
    - The questionnaire includes a separate subsection on the *income from fishing and aquaculture*. It is asked what amount the respondent earned in the past 3 months from fishing. To get the monthly income from fishing per household member, this amount is first divided by three, and then divided by the household size.
    - Based on the three indicators on income from forestry, livestock and fishing, a dummy is created which is 1 if the household has any income from at least one of the areas, and 0 if the household has no income at all from forestry, livestock nor fishing.
- Percentage of household income from forestry/livestock/fishing as a share of total income of household from these natural resources: To receive the share of the three different types of income, first the total income from forestry, livestock and fishing is calculated. Income from farm is excluded since only 1 observation has a positive income. The per capita share of (forestry/livestock/fish) income is then calculated by dividing the three measures by the total income.

### *Number of actions taken for disaster risk preparedness*

Respondents were asked about the efforts that the household has made to prepare for disasters and reduce their impact on the household. In total 15 efforts are described, where for each of them the respondent answers with 'yes' or 'no', depending on whether the actions have been taken. This indicator is further divided into four types of efforts: Information preparation, emergency preparation, saving preparation and participation in community preparations. For each of these four categories, the average number of measures taken is calculated. Additionally to the number of measures taken, we present dummies for all four indices which are 1 if at least one measure was taken, and 0 if no measures of a certain type where taken. The four types are defined as follows:

- Prepared with information:
  - Informed about possible hazards for your family/household
  - Checked whether house is located in disaster-prone area
  - Informed about warning signal
  - Informed about gathering point, route and evacuation point
- Prepared for case of emergency:
  - Prepared emergency food and water supplies
  - Prepared emergency lighting
  - Improved resistance of house
  - Built emergency family bunker
  - Planned what to take along in case of evacuation
  - Discussed actions in case of emergency with whole family
  - Prepared communication instrument and warning sign
- Saving preparation:
  - Made emergency savings
- Participated in community preparations:
  - Participated in evacuation tests/drills in village
  - Participate in alert teams of disaster
  - Volunteered to provide awareness information in village

### *Household livelihood*

For this indicator, data was collected on the per capita consumption and asset holdings of households as well as the self-reported well-being.

- Monthly household expenditure is calculated from a) monthly food consumption and b) monthly non-food consumption (both in 1000 Rp). For the monthly per capita consumption (pce), total household expenditure is divided by the household size.
  - Food consumption: The total food consumption of a household is calculated based on purchases but also on the value of self-produced items that were consumed by the household. First, it was asked about the household's expenses within the past week (including purchases, own production and gifts) for different types of food items like staple foods, vegetables and dried foods. To receive the monthly expenditure, this measure was multiplied with 52 (weeks) and divided by twelve (months). Second, the same procedure was done for the values of self-produced food items which the household consumed in the past week. For the per capita food consumption (pce food), the total value of all consumed food items that were purchased or self-produced is divided by the household size.

- Non-food consumption: The total non-food consumption of a household is calculated from a number of questions on household expenses. To get the monthly non-food consumption per household, yearly expenses are converted into monthly figures. Non-food expenses consist of the following:
  - Expenses on utilities (like water and electricity) and personal as well as recreational goods in the past month. Here two categories that were included in the baseline survey were not included in the endline survey ('arisan' and 'non-food items given to others/other parties outside the household'). Hence, they are not included in the analysis. In addition, the total value of these items consumed by the household that were self-produced or received from another source is also included.
  - Yearly expenses on items like clothing, household supplies, medical costs and taxes. Again, also the yearly value of these items that were consumed but self-produced or received from another source is taken into account.
  - Expenses on schooling for family members (schooling needs, transportation, registrations etc.) were asked separately for members outside and inside the household. Only expenses for family members inside the household are included in the calculation of non-food consumption.

  For the per capita *non-food* consumption we divide non-food consumption per month by household size.
- *Housing facilities index (PCA):* In order, that the housing facilities index in the MFS II projects have a meaningful interpretation, we calculate weights for the index components based on their predictive power for household expenditure. The weights are calculated using a population representative survey for Indonesia using regression analysis. We use the IFLS 2007 survey as a population representative sample. From the IFLS 2007 dataset we use aggregate expenditure data, asset ownership and sampling weights. As the aggregate expenditure variable the data analysis uses the logarithm of the monthly per capita expenditure (*lnpce*). The sampling weight used is the cross-sectional sampling weight adjusted for attrition. This weight should be representative of all households living in the IFLS provinces in Indonesia in 2007. Based on the KR section of the IFLS survey, we construct the housing variables that are the same in IFLS and the MFS II surveys. The variables used from the KR section of the MFS II surveys which are also the found in IFLS are: a. *kr01*, b. *kr02*, c. *kr04*, d. *kr07*, e. *kr10* and h. *kr13*. The corresponding variables in IFLS are: a. *kr03,* b. *kr13*, c. *kr16*, d. *kr20*, e. *kr11* and h. *kr24.* There are more variables which are the same between E6 and IFLS, however we wanted to construct a housing facilities asset variable which can be used by all MFS II surveys, thus the variables mentioned above are selected as they are common in most MFS II surveys. The first step is to recode the variables of MFS II surveys in order to have matching answer categories with the variables of IFLS; the same procedure is also followed for the IFLS variables. In addition, as the variable names are not the same among the two datasets, in the IFLS dataset we renamed the common variables as to have the same name with the MFS II variables. After, the aforementioned preparation the two datasets are combined into one dataset. Furthermore, dummy variables are created based on the answer categories of the chosen common variables. The

reason behind the construction of the categorical dummy variables is to include them in the regression of the logarithm of the monthly per capita expenditure on the housing dummies. Nevertheless, not all of the categorical dummies are used in the regression model. The regression does not include dummy variables whose variation is higher than 97% of the sample or lower than 3% of the sample. Moreover, after we performed the regression the next step was to calculate the fitted values by predicting the expenditure based on housing facilities for both the IFLS and MFS II sample. Finally, the last step was to rescale the predicted variable in order to have a zero mean for the IFLS sample by subtracting the mean of the fitted value from the fitted value itself.

Hence, we will be able to infer the livelihood of our survey participants compared to the Indonesian average in 2007: for example, if the value of the index is 0.10 (-0.10), on average, it implies that the sample is approximately 10% better off (worse off) than the average Indonesian household in 2007 based on the predictive power of housing facilities (like drinking water source) on household expenditure.

- *Asset index (PCA):* The construction of the asset index follows a similar procedure with the creation of the housing index, however in this case instead of the IFLS dataset the DHS 2012 dataset was used, as DHS includes more common asset variables with the MFS II surveys than the IFLS. Moreover, asset variables were chosen from the KR section of the MFS II surveys which are common with DHS variables. From MFS II dataset questions a. kr11 and b. kr12 were chosen while from the DHS dataset questions a. *hv207*, b. *hv208*, c. *hv209*, d. *hv243a*, e.*hv210*, f. *hv211*, g. *hv212*, h. *sh118c*, i. *hv243d* and j. *hv243c* were selected. The next step was to combine the two datasets and perform a factor analysis of the common variables in order to calculate the asset index. In addition, as mentioned above the 3% rule was also applied for the asset index, excluding from the factor analysis variables with small variation. Finally, the predicted asset index was normalized for the DHS sample (mean 0 and variance 1).

- For self-reported well-being is measured by two scales on a) happiness and b) current wealth status. Respondents were asked the following:
  - Taken all things together how would you say things are these days? The question was answered on a 4-point Likert scale from 1 (very happy) to 4 (absolutely not happy)
  - Please imagine a six-step ladder where on the bottom (the first step), stand the poorest people, and on the highest step (the sixth step), stand the richest people. On which step are you today? Here, all 'don't know' answers are replaced with missing values.

  These questions relate to the subjective judgement of the respondent. Therefore, we only report on the change in these indicators if the (main) respondent was the same during the baseline and the endline surveys.

### *Food security and vulnerability*

For this index three measures are taken into account.

- Percentage of households not able to cover their living costs/ have not enough to eat: It was asked whether it happened to the household in the past 12 months that the income did not cover the living costs.
- Current standard of living (daily needs covered): Possible answers were 1 (not enough to fulfil my daily needs), 2 (only enough to fulfil my daily needs), 3 (more than enough to fulfil my daily needs). Again, all that answered 'don't know' where replaced with a missing value.
- Current standard of living (food consumption covered): Possible answers were 1 (not enough to fulfil my daily needs), 2 (only enough to fulfil my daily needs), 3 (more than enough to fulfil my daily needs). Again, all that answered 'don't know' where replaced with a missing value.

# Annex III. Summary statistics of variables

**Table 16: Summary statistics of all the variables used**

| | Baseline | | Endline | | Change (EL-BL) | |
|---|---|---|---|---|---|---|
| | Sample Size | Mean | Sample Size | Mean | Sample Size | Mean |
| Number of household members | 320 | 5.07 | 320 | 5.82 | 301 | 0.71 |
| Percentage of households that have a female household head | 320 | 10.63 | 302 | 9.27 | 283 | 0.00 |
| Age of the household head | 320 | 45.45 | 302 | 47.42 | 283 | 2.07 |
| Highest level of education attended by the household head (%) | | | | | | |
| *No school/ attended Islamic school* | 320 | 5.63 | 301 | 5.98 | 282 | -0.35 |
| *Primary school* | 320 | 65.00 | 301 | 64.12 | 282 | 1.42 |
| *Secondary school* | 320 | 25.94 | 301 | 27.24 | 282 | 0.35 |
| *Higher education* | 320 | 3.44 | 301 | 2.66 | 282 | -1.42 |
| Number of assets owned | 320 | 1.98 | 320 | 2.31 | 301 | 0.27 |
| Housing facilities index | 320 | -0.39 | 320 | -0.29 | 301 | 0.09 |
| Asset index | 320 | -1.11 | 320 | -0.94 | 301 | 0.15 |
| Main source of income (%) | | | | | | |
| *Crop farming* | 320 | 60.31 | 320 | 60.00 | 301 | -0.66 |
| *Fishing* | 320 | 12.81 | 320 | 11.88 | 301 | -1.33 |

# Annex IV. Description of survey locations

Table 17 summarizes the villages selected for the survey. The description of the villages follows below. For the treatment villages, the activities of WIIP are discussed based on information from the bio-rights community group leaders (community group leader survey). Regarding the number of seedling planted, information from the community group leaders (CGL) is complemented with information from WIIP (see Table 14). Note, however, that the information from the CGLs is based on information from August 2014, while the information from WIIP is based on project documentation until end 2013. Therefore, differences between the numbers are possible.

In addition, for all villages we indicate the activities of other NGOs.

**Table 17: Sampled villages**

| Name of village | District | Sub-district | Treatment type |

## *Treatment villages*

### EA 01. DESA NANGAHALE

#### Village characteristics

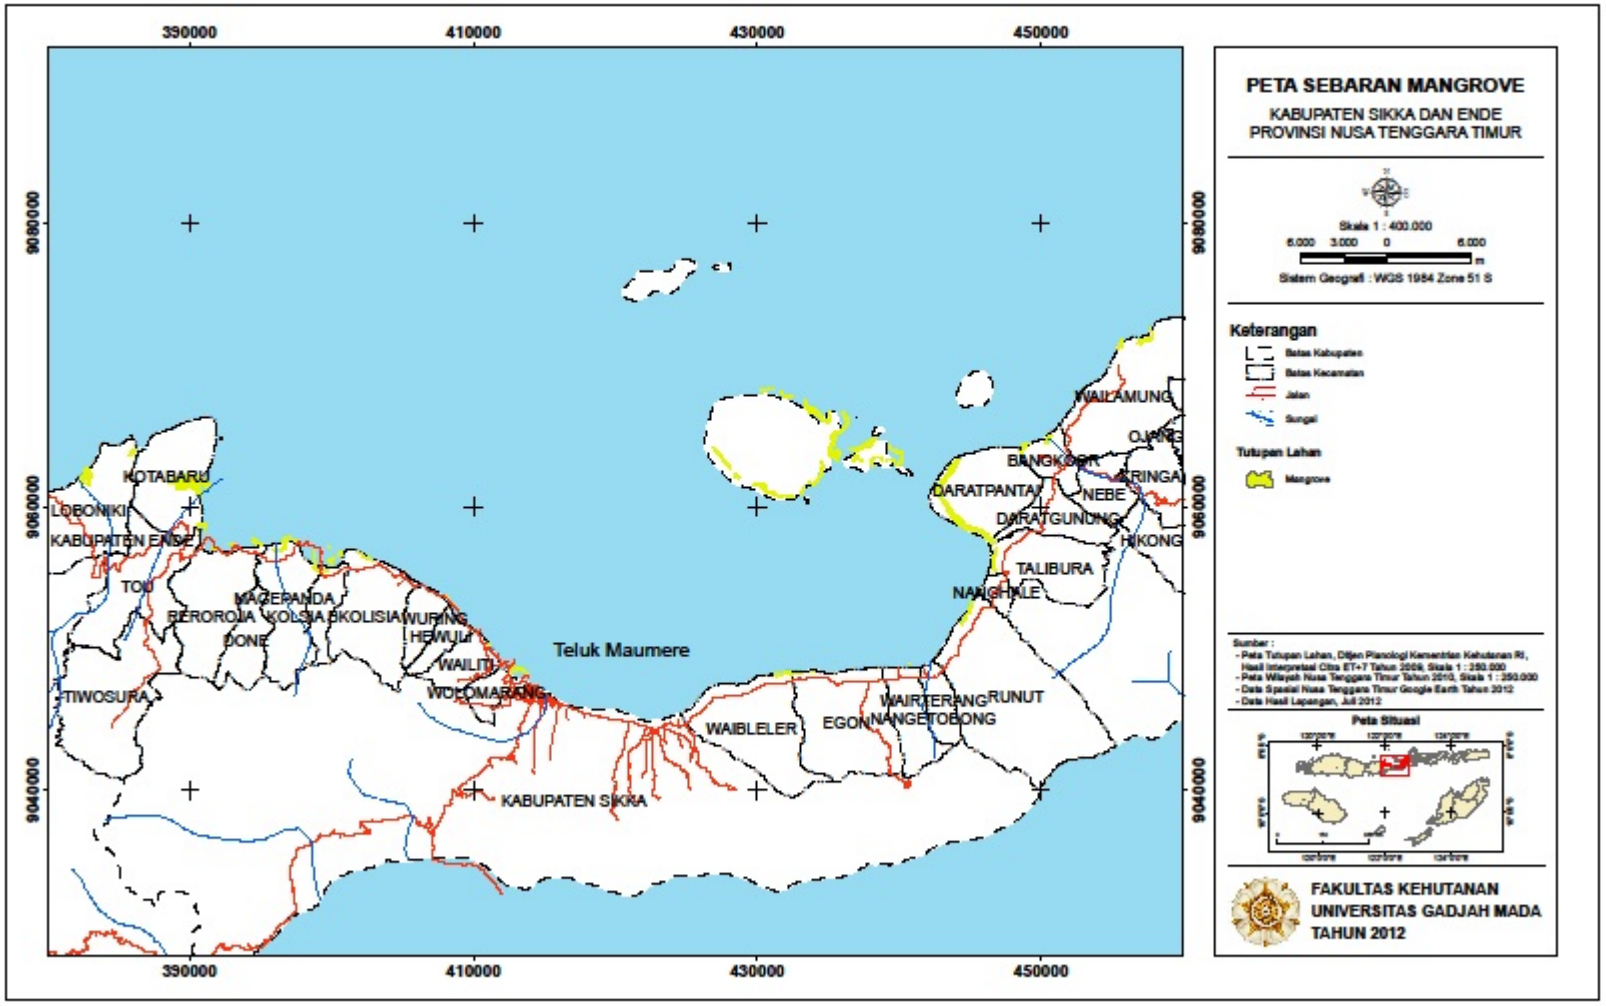
The village Nangahale is located in the sub-district Talibura (district Sikka Nusa Tenggara Timur), consisting of 4 dusuns (hamlets) namely Namandoi, Likong Gete, Wair Utan, and Nangahale. There are 3,382 people living in Nangahale in 985 households. The village's main roads are paved and there is a regular public transportation system connecting the village with the neighbourhood.

The drinking water comes from a protected well and in the dry seasons there has never been a shortage for drinking water. Electricity became available in 2000 and around 50 percent of the households are already using it. The available educational facilities in the village are elementary, middle and high school, and all can be easily accessed by the public. The available health facilities are Posyandu (integrated health service) and village midwives, the closest Public Health Centre lies outside Nangahale, the closest can be reached in about 3 miles.

The village has 445 hectares available for agriculture/plantation and has 150 hectares of forest. The majority of residents are farmers, growing corn, rice, and cassava with self-owned land. Most agricultural products are only for the personal consumption of the household. In addition to the farm income livestock is hold, mostly pigs, cows, chickens, and ducks. The residents and village officials welcomed the research team.

**WIIP activities**

Wetlands International has organised several activities in this community in the past years. Besides focusing on awareness raising towards natural resource management as well as natural hazards and risk reduction, WIIP also gave workshops and trainings on livelihood activities, financial management and resource management.



Regarding the planted number of seedlings by the community group of Nangahale (*Nangahale Lestari*), CGL reported a total of 80,000 mangrove trees and 20,000 coastal and highland trees. However, based on information from WIIP, only 74,354 mangrove trees have been planted by end 2013. WIIP provided this group with a grant of 69,000,000 Rp for the planting of seedlings, and a conditional grant of in the amount of 25,000,000 Rp in total.

If after three years the survival rate of the planted trees is beyond 75%, the loan from WIIP turns into a grant. Otherwise it has to be paid back in proportion with the survival rate of the trees. On top of the two grants, the community group received a loan of 6.000.000 Rp. from WIIP.

**Activities of other NGOs**

Besides Wetlands International, 'Plan International' and 'Dian Desa' have been active in Nangahale in the past 12 months before the endline survey. The activities implemented comprise activities focusing on education and health.

**Figure 3: Map of project area**

**EA 02. DESA TALIBURA**

**Village characteristics**

The village Talibura is located in sub-district Talibura (district Sikka Nusa Tenggara Timur), consisting of 4 hamlets. The population of the village of reaches 2,417, living in 648 households. The total area of Talibura is about 1,594 ha. The village's main roads are asphalted and accessible for 4 wheel vehicles and there is a regular public transportation system connecting the village with the neighbourhood.

The main source of water comes from a spring, which is connected to the village with a pipe. The pipe was installed with the assistance of Pamsimas in 2000. Since then, there has always been drinking water available (even in the dry season). Electricity was already available in Talibura since 1990 and the percentage of households used the electricity facilities is about 90%. The available educational facilities in the village are elementary and junior high school, all easily accessible by the public. A high school is available within the distance of about 3 km. The available health facilities are health centres, midwives and a Posyandu. In the hamlet there is a police station. The village has a weekly market which has become the economic transaction place for people to meet their daily needs.

The size of agricultural land is about 143,549 $m^2$. In addition, there is about 11,194,153 $m^2$ of arid land. The majority of residents are farmers growing crops like rice, corn, and green beans on self-owned land. Most agricultural products are only for the personal consumption of the household. Besides agriculture, the main source of income comes from livestock, namely cows, pigs, chickens, and goats. Apart from agricultural and livestock the community also sells woven products in the city or on order.

**WIIP activities**

In this community, Wetlands International has been very active in awareness raising towards natural resource management as well as natural hazards and risk reduction. Besides involving community members in the risk assessment for their villages, WIIP also implemented workshops and trainings on livelihood activities, financial management and natural resource management.

Regarding the planted number of seedlings by the community group of Talibura (*Klakat Indah*), CGL reported a total of 50,000 mangrove trees and 10,000 coastal and highland trees. Based on information from WIIP, 50,000 mangrove trees and 11,786 coastal and highland trees have been planted by end 2013. The number of planted seedlings in Talibura is slightly lower than in Nangahale, which might be related to the fact that their community group has not received any grant explicitly for planting seedlings, also not conditional on the survival of trees. However, according to the community leader, a transfer worth 75,000,000 Rp. was given by WIIP for the planting and maintenance.

**Activities of other NGOs**

Besides Wetlands International, only PMI has been active in this community in the past 12 months before the endline survey. The types of activities done by PMI cover disaster risk reduction.

**EA 03. DESA DARAT PANTAI**

**Village characteristics**

The village Darat Pantai is located in sub-district Talibura (district Sikka Nusa Tenggara Timur) and consists of three hamlets. The population of the village equals 1,294 people living in 367 households. The total area of the village contains 23.01 ha. The main roads are paved, but they are still quite dirty. Until now, public transportation to go in and out of the village is not available.

The main source of water used by the people is from a protected well. No problems are present with the availability of water during the dry season. Electricity facilities are currently not available in the village. Most households use a lamp for lightening, some use generators. The only educational facility is elementary education. For a middle school one has to travel over a distance of about 12 km, while for the high school level the closest one is in about 15 km. The available health facilities are available health centres, midwives and a Posyandu.

The village has an area of agricultural land of 300.37 ha and 5000 ha forest area. The majority of the residents are farmers growing crops as rice, maize, and cassava on self-owned land. Most agricultural products are only for personal consumption of the household. Besides agriculture the main source of income is livestock. Other natural resources that are important are nuts and coconut acid.

**WIIP activities**

In this community, Wetlands International has been very active in awareness raising towards natural resource management as well as natural hazards and risk reduction. Besides involving community members in the risk assessment for their villages, WIIP also implemented workshops and trainings on livelihood activities, financial management and natural resource management.

Regarding the planted number of seedlings by the community group of Darat Pantai (*Kembang Bakau*), the CGL reported a total of 75,000 mangrove trees and 8,000 coastal and highland trees. Based on information from WIIP, only 62,454 mangrove tree seedlings and 8,000 coastal and highland tree seedlings have been planted by end 2013. WIIP disbursed an (unconditional) grant for the planting of these seedlings which amounted to 50,000,000 Rp. Conditioned on the survival of the trees within 3 years after the planting, the community group received another grant of 50,000,000 Rp. On top of this, another 17,000,000 Rp. were granted by WIIP for project related works for the monitoring of the process.

**Activities of other NGOs**

Besides Wetlands International no other NGO has been active in this community 12 months prior to the endline survey. Hence, no other activities than those implemented by WIIP were done.

**EA 04 (DESA REROROJA)**

**Village characteristics**

The village Reroroja is located in the sub-district Magepanda (district Sikka) and is divided into three hamlets, but the study area includes only two hamlets. The village has a mangrove forest, reaching about 10 acres. The mangrove has been set up with some private initiatives after 1992, the year the tsunami hit the village. Investment activities continue to this day.

**WIIP activities**

Two community groups have been sampled in Reroroja, Sa'ate and Sabar-Subur. Hence, we discuss both groups separately.

For the first group (Sa'ate), Wetlands International focused on awareness raising towards natural resource management as well as natural hazards and risk reduction, and also gave workshops and trainings on livelihood activities, financial management and resource management. In this group, the CGL reported that they have planted a total of 30,000 mangrove seedlings and 26,500 coastal and highland tree seedlings. Based on information from WIIP, the group has planted 30,000 mangrove tree seedlings and 24,702 coastal and highland tree seedlings by end 2013. The community group received 5,000,000 Rp from WIIP for the planting of the seedlings and another 50,000,000 conditional on the survival of the trees in the first three years. Additionally to the two grants, WIIP disbursed another 15,000,000 Rp for other activities.

For the second group (Sabar-Subur), Wetlands International focused on the awareness raising as well, but also did some risk assessment involving the community members. Furthermore, workshops and training on financial management were organised. According the CGL, this community group also planted 30,000 mangrove seedlings but only 1,000 coastal seedlings. Based on information from WIIP, the group planted 56,820 mangrove tree seedlings and 1,000 coastal tree seedlings by end 2013. WIIP solely disbursed a conditional grant on the survival of the trees, amounting to 70,000,000 Rp.

**Activities of other NGOs**

In Reroroja, a number of other NGOs besides WIIP have been active in this community during the 12 months before the endline survey. 'Plan', 'Caritas' and WTM concentrated on livelihood activities, natural resource management as well as education and health activities.

**EA 05 (DESA DONE)**

**Village characteristics**

In the village Done there is one group present, planting tree species which are quite varied, ranging from cash crops such as cashew trees, and pecan to fruit trees like bananas. The group does not seek mangrove planting, because of the geographical location of their village on a mountain plateau. Planting activities are centred on the springs that are used by communities to meet water needs. According to them, the forest and planted trees sustain the springs even during the dry season.

**WIIP activities**

In this community, Wetlands International has been very active in awareness raising towards natural resource management as well as natural hazards and risk reduction. Besides involving community members in the risk assessment for their villages, WIIP also implemented workshops and trainings on livelihood activities, financial management and natural resource management.

Regarding the planted number of seedlings by the community group of Done (*Tedu Tembo*), the CGL reported that they have planted only 1,000 mangrove seedlings and 3,030 coastal/highland trees. However, based on information from WIIP, 56,349 highland seedlings have been planted by end 2013. Given that the village is not located at the coast, it is reasonable to assume that the CGL has misreported the planted number of seedlings. The community group received an (unconditional) grant amounting to 25,000,000 Rp for the planting of seedlings and another 45,000,000 Rp conditional on the survival of at least 75% of the trees in the first 3 years.

**Activities of other NGOs**

Besides Wetlands International, a number of NGOs have been active in this community during the 12 months before the endline survey. 'Plan', 'Caritas' and 'WPI' implemented micro-credit initiatives, and activities focused on natural resource management, disaster risk reduction, water and sanitation, as well as education and health.

**EA 06. DESA TOU TIMUR**

**WIIP activities**

Wetlands International organised a number of activities in this community, like awareness raising towards natural resource management and natural hazards and risk reduction. Furthermore workshops and training on livelihood activities and natural resource management were implemented.

According to the CGL, the community group (*Bowu Sare*) planted a total of 40,000 mangrove seedlings and 6,000 coastal and highland tree seedlings. Based on the information from WIIP, they planted a total of 56,000 mangrove tree seedlings and 6,000 coastal and highland tree seedlings. For this, the group received an (unconditional) grant of 70,000,000 Rp.

**Activities of other NGOs**

No other NGOs have been active in the past 12 months in this area, hence no other activities were done.

**EA 07. DESA KOTABARU**

**WIIP activities**

Compared to the other communities, Wetlands International implemented relatively little activities in Kota Baru. They mainly focused on workshops and trainings on livelihood activities and natural resource management. However, the CGL reported that the group (*Mae'Welu*) has planted 50,000 mangrove and 30,000 coastal/highland seedlings. Based on information from WIIP, this group planted a total of 90,349 mangrove and coastal tree seedlings by end 2013. WIIP disbursed in total

50,000,000 Rp for the planting of the seedlings, and another (conditional) 50,000,000 Rp in case a minimum of 75% of the trees survive the first 3 years.

**Activities of other NGOs**

No other NGOs have been active in the past 12 months in this area, hence no other activities were done.

## *Comparison villages*

### EA 08. DESA BANGKOOR

**Village characteristics**

The village Bangkoor is located in the sub-district Talibura (district Sikka Nusa Tenggara Timur), consisting of three hamlets. The population of the village equals 2,090 people living in 521 households. The total area of the village contains 11.5 ha. The main roads of the village are from asphalt, but there is no lighting at night. Public transport in and out of the village is available at a frequent level.

The main source of water comes from a protected well and even during the dry season the daily water needs are not impaired. Electricity has been available since 1993 but only 70% of the households are using electric facilities. The only available educational facility is an elementary education. A middle school can be found within the distance of about 1 km, while the closest high school level is 11 km away. The available health facilities are village midwives and a Posyandu. The nearest health centre lies within a distance of 1 km.

The majority of villagers are farmers growing crops as rice, maize, and cassava on self-owned land. Most agricultural products are only for personal consumption of the household. In addition, people also plant fruit-bearing crops such as cashew, cocoa and coconut. The products can be sold. Another source of income is provided by livestock, mostly cows, pigs, chickens, and goats. Some residents also left Bangkoor to work in the domestic industry of bricks and weaving.

**Activities of other NGOs**

In this community 3 NGOs, 'Plan', 'PMI' and 'Bethesda' have been active in the past 12 months, with types of activities focusing on (sustainable) livelihood, disaster risk reduction, education and infrastructure development.

### EA 09. DESA KOLISIA

**Village characteristics**

The village Kolisia is divided into two hamlets. The village is partly located at the coast, but there are also areas in a mountainous environment. Mangroves exist on the edge and around the beach, but there are not that many mangrove trees in the village and not many people are using the mangrove trees.

**Activities of other NGOs**

In this community 4 NGOs, among others 'Plan' and 'USAID' have been active in the past 12 months. They implemented activities focused on livelihood, natural resource management, water and sanitation, education and health, as well as infrastructure development.

**EA 10. DESA TIWUSORA**

**Activities of other NGOs**

In this village only one NGO has been active in the past 12 months, namely 'Swiss Contact'. This NGO focused mainly on sustainable livelihood activities.

**EA 11. DESA NDONDO**

**Activities of other NGOs**

No NGOs have been active in this village in the past 12 months.

**EA 12. DESA EGON**

**Village characteristics**

The village Egon is located in the sub-district Talibura (district Sikka Nusa Tenggara Timur), consisting of three hamlets. The population of Egon equals 4,028, living in 1,039 households. The main roads are paved but no street lighting at night is available. Public transport in and out of the village is available at a frequent level.

The main source of water comes from a spring, which is connected to the village with a pipe. The pipe was installed with the assistance of PNPM. In addition, there is also the water from a well. In the past year there has always been drinking water available (even in the dry season). Electricity became available in Egon since 1999. The available educational facilities are elementary and junior high school while there is a high school within the distance of about 5 km. All educational facilities can be easily accessed by the community. The available health facilities are health centres, Posyandu and village midwives. A postal security force also exists in the village. There is also a weekly market.

The village has an agricultural land area of 29.35 km and 1,370 ha forest. The majority of the residents are farmers who grow coconut, nuts and vegetables on own land. Most agricultural products are sold. In addition to the farm income is livestock are hold, mainly cows, horses, pigs, chickens. The research team received a good welcome in the village.

**Activities of other NGOs**

In this village, 4 NGOs have been active in the past 12 months, among others 'Dian Desa' and 'USAID', focusing on natural resource management as well as education and health related activities.

**EA 13. DESA WAITERANG**

**Village characteristics**

The village Waiterang is located in the sub-district Waigete (district Sikka Nusa Tenggara Timur), consisting of three hamlets. The population of the village equals 1,879 people living in 475

households. The total area of Waiterang is 2,934 ha. The main roads are paved, but no street lighting at night is available. Public transport in and out of the village is available.

The main source of water comes from a water sources and even during the dry season the spring was never impaired. Electricity became available in the village in 1994, but still only 50% of households are using the electrical facilities. The only available educational facility in the village is an elementary school. A middle school is available within a distance of 3 km, while a high school of the village is available in 10 km. The available healthcare facilities are Posyandu and village midwives. A health centre lies within a distance of about 3 km.

The village has an agricultural area of 1,061 ha and 700 ha forest area. The majority of residents are farmers who grow commodity crops like cashew, coconut and corn on one's own land. The harvest of cashew and coconut is most of the times sold, but maize is only used for their own household consumption. In addition to farm income, some people own livestock, such as chickens, goats, cows and pigs.

**Activities of other NGOs**

In this village only one NGO has been active in the past 12 months (Childfund), mostly focusing on education focused activities.

**EA 14 DESA WAILITI**

**Village characteristics**

The village Wailiti is divided into two areas, namely the highlands or mountains, and the beach area. In the coastal areas, there are quite a lot of coastal mangrove trees planted, about 500 m along the beach.

**Activities of other NGOs**

In this village, 'Plan' and 'Wailiti' have been active in the past 12 months, focusing on education and health related activities.

P-values are not defined for variables where there was no change.

# Annex IX. Report on the ecological condition of mangroves

## ECOLOGICAL SURVEY AND MEASUREMENT OF MANGROVE AREA IN ENDE AND SIKKA DISTRICT

## 1. Introduction

Mangrove forests grow in brackish water located around the coastline. It is a meeting area between land and ocean ecosystems. The mangrove area has specific environmental characteristics which are affected by sea water tides. It has a high salinity level with muddy soil condition and low pH level as a result of constantly being washed over by sea water tides.

The existence of mangrove forest ecosystem in Flores has provided a variety of benefits for the communities living around the coast. Some of these benefits are:

- Reduced abrasion caused by sea water tides
- Marine life habitat for growing and breeding
- Act as sea windbreak
- Source of food and medicine

The study of mangrove area in Flores is aimed to assessing the ecological condition of mangrove area as a result of the forest rehabilitation project of Wetlands International Indonesia Programme (WIIP). In this study, 10 indicators are used for determining the ecological characteristic of mangroves in Flores. These indicators are:

1. **Water Depth**
   Mangrove is an area affected by sea water tides. Therefore, it is important to know the water depth occurring in the mangrove area. This indicator can describe about the tidal conditions in mangrove forests.
2. **Mud Depth**
   A specific characteristic of mangroves is the muddy soil condition. Each mangrove type is characterised by different mud depth. Therefore, it is very important to know the level of mud depth in mangrove ecosystem.
3. **Soil Texture**
   The soil texture in mangrove forests indicate the level of erosion that occurred upstream on land. If the soil texture of the mangrove area is dominated by sand, it shows that there are high levels of erosion upstream.
4. **Soil pH**
   The soil pH represents the level of soil acidity. If the soil of mangrove is more acerbic, it indicates that there are more toxins in the mangrove substrate.
5. **Salinity**
   The level of salinity is closely related to the growth of mangrove vegetation. If the salinity is too low or too high, the vegetation of mangrove is not able to grow optimally.
6. **Dissolved Oxygen**
   The quantity of dissolved oxygen in mangrove area determines the type of fauna that can live in the mangrove forests.
7. **Stand Structure**

The pattern of stand structure is described by the number of seedlings, saplings and trees found in the mangrove forest. Therefore, it describes the dynamics of vegetation growth in the mangrove areas.

8. **Flora Distribution**
   The measurement of flora distribution is aimed at finding out the different types of plant species that live in the mangrove area.
9. **Flora Diversity**
   The level of flora diversity is an indirect parameter for assessing the balance of mangrove forest ecosystem. A higher flora diversity means that the condition of the mangrove forest is better.
10. **Fauna Condition**
    The measurement of fauna is aimed at finding out the kinds of fauna that live in the mangrove area.

## 2. Survey sites

Table 28 provides and overview of estimated mangrove areas in Sikka and Ende disticts. These figures were obtained combining data from field survey and satellite images (Google Earth) and others digital maps provided by Ministry of Forestry.
The data shows that there are wide variations of mangrove area in Ende and Sikka District. The table also indicates which villages have been part of WIIP's rehabilitation project (Treatment) and the villages that have been sampled as a comparison group (Control).[39]

**Table 28: Mangrove area estimation in Ende and Sikka District**

| District | Sub District | Village | Project treatment status | Area (ha) |
|---|---|---|---|---|
| **Ende** | Kotabaru | Hangalende/Ndondo | Control | 34.72 |
| **Ende** | **Kotabaru** | **Kotabaru** | **Treatment** | **2844.46** |
| **Ende** | Kotabaru | Loboniki/Tiwosura | Control | 3175.03 |

| **Total** | | | | **7964.32** |
| **Total in treatment villages** | | | | **3128.86** |
| Source: Combining result analysis of satellite image and ministry forestry data | | | | |

There are 3 type of sites that were surveyed in this study:

a. **Treatment Site**
   Treatment site is the location of WIIP's mangrove rehabilitation project. However, these sites are already existing mangrove forests, hence not part of the reforestation. It is a panel site meaning that it has been measured both in 2012 and 2014.
b. **Control Site**
   Control site is the location that is used for comparing the result of mangrove rehabilitation activities of the WIIP project. It is a panel site meaning that it has also been measured both in 2012 and 2014
c. **New Site**
   New site is the location of the mangrove rehabilitation efforts of the WIIP project where planting has been carried out between 2012 and 2014. The measurement of this site is done in 2014 only.

The ecological survey and measurement conducted in 2014 measured 41 transects and 123 plots to find out the ecological condition of mangrove area in Ende and Sikka District. The number of transects and plots are summarized in Table 29 by village.

**Table 29: Transects and Plots Distributions in Ende and Sikka District**

| Village | District | Identity of Site | Type of Site | Number of Transects | Number of Plots |
|---|---|---|---|---|---|
| **Nangahale** | Sikka | Panel Site | Treatment | 2 | 3 |
| **Talibura** | Sikka | Panel Site | Treatment | 3 | 9 |
| **Darat Pantai** | Sikka | Panel Site | Treatment | 12 | 41 |
| **Reroroja** | Sikka | Panel Site | Treatment | 1 | 4 |
| **Tou Timur** | Ende | Panel Site | Treatment | 1 | 3 |
| **Kotabaru** | Ende | Panel Site | Treatment | 2 | 7 |
| **Baang Koor** | Sikka | Panel Site | Control | 5 | 17 |
| **Kolisia** | Sikka | Panel Site | Control | 4 | 9 |
| **Neotonda (Ndondo)** | Ende | Panel Site | Control | 2 | 6 |
| **Egon (Egon + Waiterang)** | Ende | Panel Site | Control | 2 | 3 |
| **Nangahale** | Sikka | New Site | Treatment | 1 | 6 |
| **Talibura** | Sikka | New Site | Treatment | 1 | 4 |
| **Darat Pantai** | Sikka | New Site | Treatment | 1 | 3 |
| **Reroroja** | Sikka | New Site | Treatment | 1 | 4 |
| **Tou Timur** | Ende | New Site | Treatment | 1 | 1 |
| **Kotabaru** | Ende | New Site | Treatment | 2 | 3 |
| **Total** | | | | **41** | **123** |

## 3. Site Characteristics

Identification of the site characteristic is aimed at finding out the biophysical condition of mangrove area. These indicators were only measured in 2014. Based on the result of ecological survey and measurement, there are high variations of mangrove site characteristic in Ende and Sikka District. Table 30 reports detailed information on the mangrove site characteristics at the surveyed locations**.**

**Table 30: Mangrove site characteristics of Ende and Sikka District in 2014**

| Village | District | Identity of Site | Type of Site | Water Depth (cm) | Mud Depth (cm) | Soil Texture Fraction (%) | | | Soil Ph | Salinity ( $^{0}/_{00}$ ) | Dissolve Oxygen (ppm) |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | Sand | Silt | Clay | | | |
| **Nangahale** | Sikka | Panel Site | Treatment | 0 - 25 | 0 - 10 | 50 | 35 | 15 | 6.2 | 3.38 | 4.36 |
| **Talibura** | Sikka | Panel Site | Treatment | 0 - 32 | 0 -12 | 42 | 42 | 16 | 6 | 3.45 | 4.41 |

Source : Fieldwork measurement

Table 30 shows that there are different water depths in every mangrove area, which may occur because of differences in the heights of sea waves reaching the mangrove areas. In addition, Table 30 also shows variations in mud depth in the mangrove areas. The variation may occur due to differences in waterlogged conditions in the mangrove areas. Based on the proportion of soil texture, the sand fraction dominates in every mangrove area. It indicate the high level of erosion from the upstream.

Seen from the level of soil pH, all mangrove areas in Ende and Sikka District are in a healthy condition because the value of pH is slightly acid to neutral. It indicates that the toxic contents are relatively low. The level of salinity is also optimal (0 – 10 $^{0}/_{00}$) for supporting the growth of mangrove vegetation. In addition, the level of dissolved oxygen in mangrove area also allows marine life habitat such as fish, clams, crabs that need the level of dissolved oxygen to reach 3 – 6 ppm.

## 4. Stand Structure

The stand structure tells us about the dynamics of vegetation growth in the mangroves. This information is used to find out about plant competition and natural selection among the mangrove plants. Identification of the stand structure in this study is done by describing the pattern of vegetation stage. The stages are classified into 3 classes based on differences in the height and diameter of tree plants. The 3 classes are:

a. **Seedling**
   Seedling is the stage of vegetation life form that has a height of less than 1.5 m. It is called a young tree.
b. **Sapling**
   Sapling is the stage of vegetation life form that has a height of more than 1.5 m and a diameter of less than 10 cm. It is called a medium tree (adult tree).
c. **Poles and trees**
   Poles and trees are the stage of vegetation life form that have height more than 1.5 m with diameter more than 10 cm. It is called an old tree.

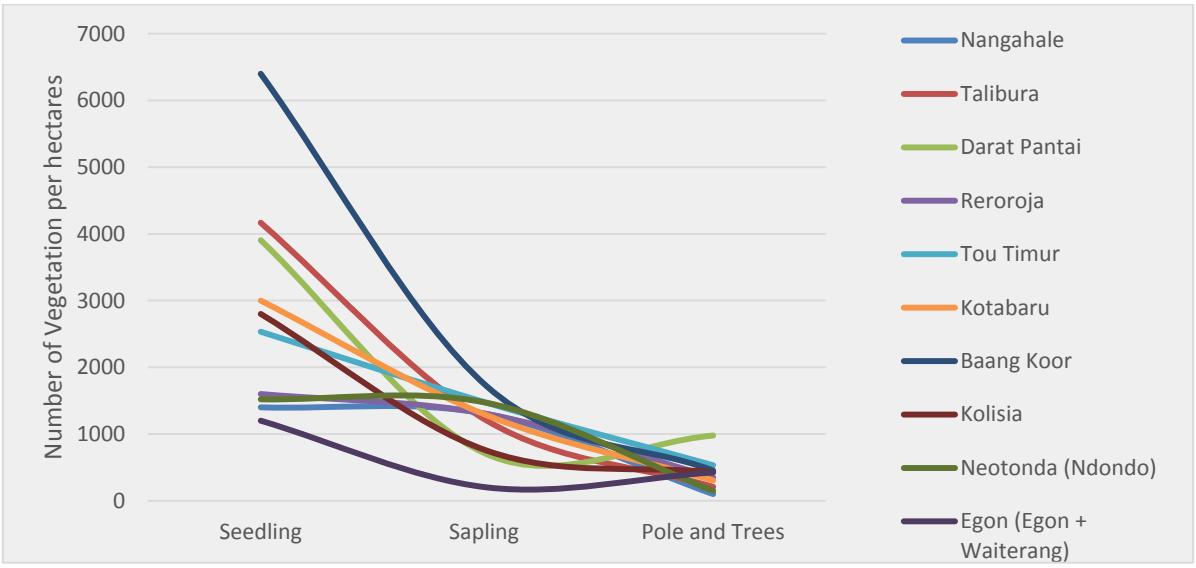

Figure 4 compares the stand structure in every panel site of mangrove area in Ende and Sikka district in 2012 and 2014. The figure shows a decline of vegetation from seedling to poles and trees for all sites. It indicates that as a result of natural selection and competition among the plants some seedlings died. Some of the seedlings that survive will grow up to become first saplings and then poles and trees. However, if we look further, we can observe a difference in the stand structure pattern and the number of vegetations between 2012 and 2014.

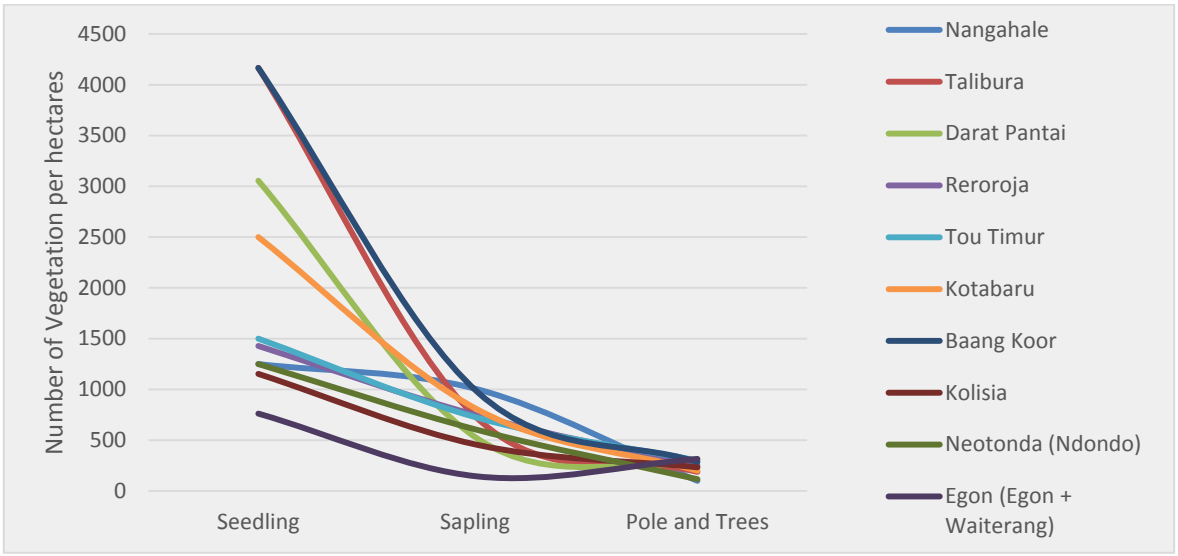
Table 31 shows the detail of the number of vegetations in every site, while Table 32 reports on the change in vegetation between 2012 and 2014. Based on the tables, there are 3 important observations:



- The number of vegetations in 2014 is lower than in 2012. This situation may have happened due to various factors. One of the factors identified by fieldwork observations is the presence of pest and diseases (Figure 5). Figure 4 shows the group means for the panel sites. The figures show that on average samplings are the most affected by the reduction of vegetation.

- Figure 6 also shows that there is a difference between the mean number of vegetation between treatment and control sites: the number of seedlings has not changed a lot in the control areas between 2012 and 2014, whereas it substantially decreased in treatment areas on average (note that this refers to mangroves existing prior to the WIIP project). The number of poles and trees has also dropped more sharply in the treatment areas. The number of saplings has dropped in both locations.
- Nonetheless, the mean number of vegetations remained higher in the treatment sites compared to the control sites.

**Figure 6: Comparison of stand structure between treatment and control sites**

(a) Comparison between treatment and control sites in 2012

(b) Comparison between treatment and control sites in 2014

Figure 6 shows that on treatment site, the mean number of vegetations are higher than on control site. It indicates that the mangrove rehabilitation gives a positive impact to the condition of mangrove ecosystem in Ende and Sikka District. But, this result can't be used to describe the age level of mangrove forest in Ende and Sikka District.

## 5. Flora Distribution

Mangrove vegetation species have the special characteristics that they are able to live in waterlogged areas with high salinity and low oxygen conditions. Based on the survey and measurement carried out in the mangrove areas in 2014, 10 vegetation species were identified in Ende and Sikka districts. The detailed information of flora distribution is presented in Table 34 for the Panel Sites and in Table 35 for the New Sites.

Based onTable 34 and Table 35, there are 3 important findings:

1. *Rhizhopora mucronata* has continuous pattern distribution in each mangrove area. It indicates that :
    a. The species has good adaptability to the site conditions found in all surveyed mangrove areas.
    b. It is the most dominant species of mangrove area in Ende and Sikka district.
    c. The species is most often used in rehabilitation programmes.
2. Among the surveyed areas, Darat Pantai has the highest number of species. This indicates that the level of biodiversity is the highest on this site.

**Table 33: Flora distribution of Panel Sites in 2012**

| Species | Distribution in Mangrove Area (Panel Site) | | | | | | | | | | Total Location |

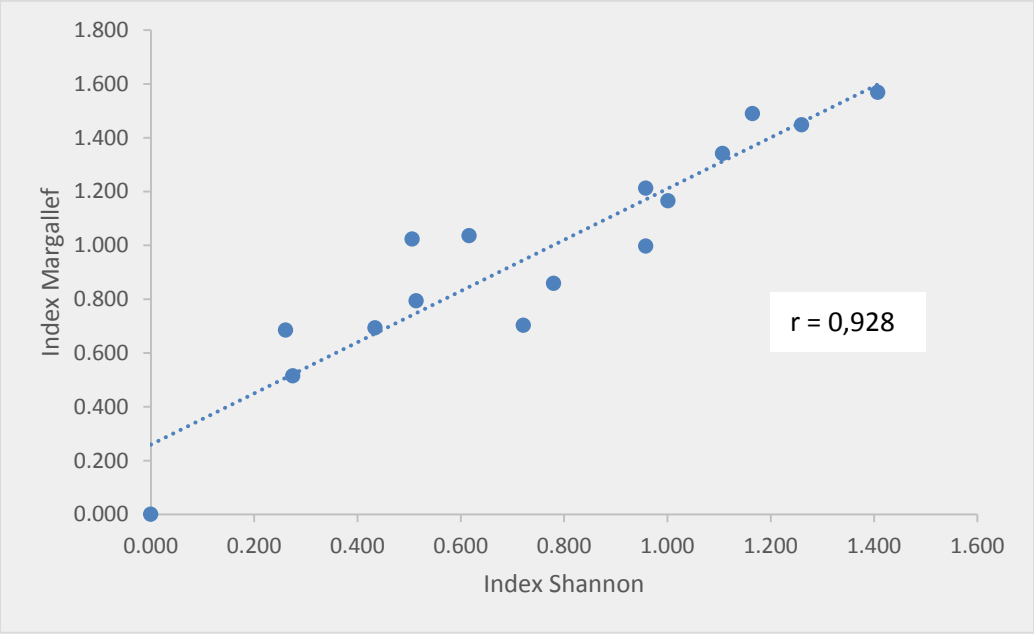
## 6. Flora Diversity

Flora diversity is a description of species richness and heterogenity in the ecosystem. It can be used as an indicator for the balancedness of the ecosystem. In this study, representation of species richness and heterogenity in mangrove areas is described by the Margalef[40] and Shannon[41] indices. The Margalef and Shannon indices have different functions: the Margalef Index describes the richness of ecosystem, while the Shannon Index represents the heterogenity of ecosystem. Despite their different meaning, there is a high positive correlation between them (r=0.928, see Figure 7). Table 36 presents the results for the flora diversity analysis at every surveyed mangrove area in Ende and Sikka districts.

**Table 36: Margallef and Shannon Indices in Each Mangrove Area**



| Village | District | Identity of Site | Type of Site | Margallef Index | | Shannon Index | |
|---|---|---|---|---|---|---|---|
| | | | | 2012 | 2014 | 2012 | 2014 |

Source: Data analysis

[40] The Margalef index is calculated as $IM = \frac{S}{lnN}$, where S is the number of species in the sample and N is the total number of vegetation.

[41] The Shannon index is calculated as $IDS = \frac{S}{N}\ln(S/N)$.

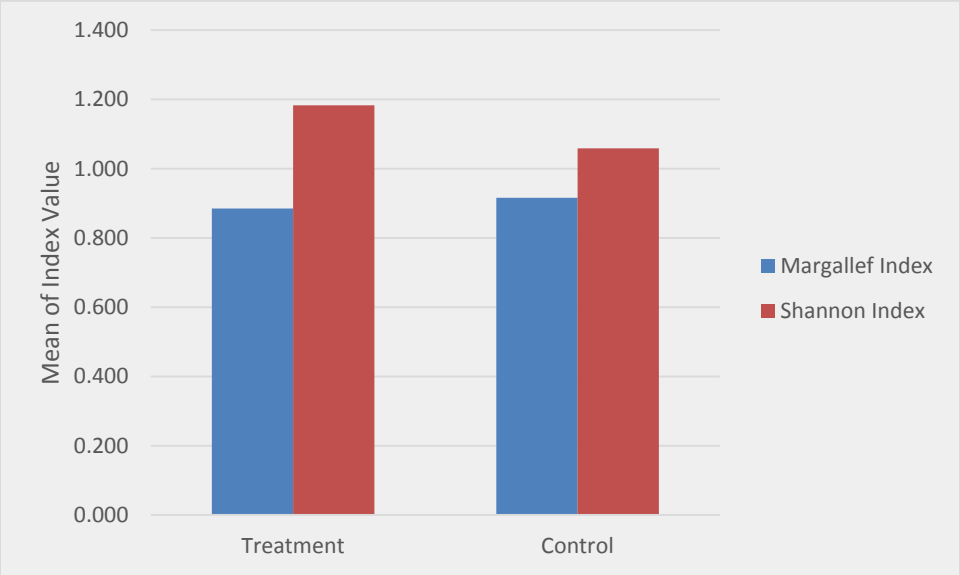

**Figure 7: Correlation Between Margallef and Shannon Index**

The data in Table 36 show that the mangrove area of Kolisia has the highest Margalef and Shannon indices. This indicates that the mangrove ecosystem in Kolisia has the best balance. In addition, the mangrove ecosystem in the new site of Tou Timur has the lowest Margalef and Shannon indices (zero). This indicates that only one species has been planted there.

Figure 8 shows the differences in the mean of value of the indices between the treatment and control (panel) sites in 2014. Interestingly, while the Shannon index of species heterogeneity is higher in the treatment areas, the Margalef index of the richness of the ecosystem is higher in the control sites. This situation could happen because of various factors such as stand dynamics process, human intervention through rehabilitation programmes, etc. However, in this study, the factors causing this difference have not been identified.

**Figure 8: Comparison of mean indices between treatment and control sites**

## 7. Modelling of Mangrove Vegetation

The modelling of mangrove vegetation can be used to predict the land cover in mangrove vegetation and its change. Data presented in Table 28 are based on the results of data analysis using modelling. In this study, regression analysis is used for the modelling of mangrove vegetation using data extracted from satellite information (MSAVI2: vegetation density index) and regressed on field observations (Basal Area: potential size of mangrove are formed based on vegetation growing process). Hence, the regression estimates the causality correlation between MSAVI2 in 2013 and 2014 as independent variables with Basal Area as dependent variable. The result of regression analysis show that the model for predicted basal area based on MSAVI in 2013 and 2014 is **Y = - 5.46 + 11.47 MSAVI2_2013 + 31.73 MSAVI2_2014** with **$R^2$ =0.96**. The detail information of regression analysis are presented in Table 37 and Figure 9.

**Table 37: Result of regression analysis**

## 8. Fauna Description

The characteristics of mangrove areas are not only determined by flora but also by fauna that live in the mangrove ecosystem. Based on the result of ecological survey and measurement, there are some animals species that can be identified of every mangrove area in Ende and Sikka district. These information is presented in Table 38.

**Table 38: Fauna description of mangrove area in Ende and Sikka District**

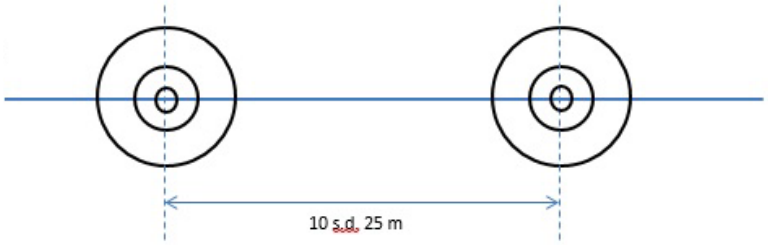
| No. | Species Name | Picture | Location Found | Description |
|---|---|---|---|---|
| 1 | *Scylla serrata* |  | Neotonda, Reroroja, Nangahale, Bangkoor, Kotabaru, Kolisia | It is a type of crab that has green skin. Usually, it can find in the morning. It lives in a hole on the floor of forest mangrove. |
| 2 | *Periopthalmodon sp.* |  | Neotonda, Nangahale, Kotabaru, Kolisia, Bangkoor, Reroroja | It is a type of fish that has black skin. It also has little size. It lives in the waterlogged in mangrove area. The movement is very active and rapidly. |
| 3 | *Telecopium telescopium* |  | Bangkoor, Darat Pantai, Neotonda, Kolisia | It is a type of mollusca. It lives in colony and has a conical shell. It has black skin. It can find on the floor of forest mangrove in the muddy condition. |
| 4 | *Cassiuda aurisfelis* |  | Bangkoor | It is a type of mollusca. It lives in colony and attached on the trunk of mangrove vegetation. It has a conical shell with green skin. |

| No. | Species Name | Picture | Location Found | Description |
|---|---|---|---|---|
| 5 | *Argipe sp.* |  | Kotabaru, Reroroja | It is a type of spider and life between the branch |
| 6 | *Dardanus calidus* |  | Reroroja, Talibura, Bangkoor, Darat Pantai, Nangahale | It has asimetris stomach and life in shell. It actives in the morning when the mangrove isn't waterlogged. |
| 7 | *Ceberus sp..* |  | Kolisia, Talibura | It is type of snake. It lives in water and has rapidly movement. It can find in low water depth level. |
| 8 | *Chrysopelea sp.* |  | Talibura | It is type of snake. It lives on branch and has slowly movement. It can find in the morning |
| 9 | *Macaca fascularis* |  | Bangkoor, Tou Timur | It is type of monkey. It has long tail and lives in a small group. It likes hanging in tree |

Source: fieldwork observation

## 9. Conclusion

Based on the result of ecological survey and measurement of mangrove area in Ende and Sikka District, there are some conclusions that can be obtained. They are:



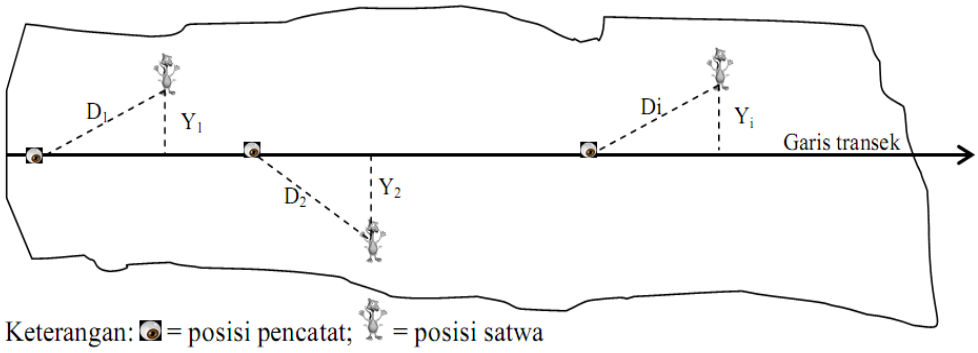
1. Mangrove area in Ende and Sikka district have good condition with high variation of site characteristic.
2. *Rhizophora mucronata* is the most adaptability species with continue distribution of Mangrove area in Ende and Sikka district.
3. The mangrove rehabilitation done giving a positive impact to the condition of mangrove ecosystem in Ende and Sikka District.
4. Despite dominated with young tree (seedling), mangrove area in Ende and Sikka district have good species diversity except Tou Timur.
5. The model to predict basal area is **Y = - 5.46 + 11.47 X1 + 31.73 X2**
6. There are 9 animal species that can be found in mangrove area in Ende and Sikka district.

## 10. Appendix on methodology

**a. Flora survey and measurement**

- The transects are taken from the baseline GPS locations
- For each transect, the sets of circular plots are created
- Each set of circular plots consist 3 plots with same centre and different area.

**Figure 10: Circular plots**



- Each set of plots, consist 3 circular sub plots for life form vegetation measurement, i.e. :
  - Seedling : plant with height < 1.5 m
  - Sapling : plant with height > 1.5 m and diameter < 10 cm
  - Poles and trees : plant with height > 1.5 m and diameter > 10 cm
- Sub plot 4 $m^2$ is for seedling, sub plot 25 $m^2$ is for sapling, and sub plot 100 $m^2$ is for poles and trees.
- In each transect, 3 plots at the end of the mangrove are taken from the baseline GPS locations
- In every plot we will also get the environmental data

**b. Fauna survey**

Fauna survey is done at the same location with flora survey. Nevertheless, the sub plot that used in fauna survey is only sub plot 100 $m^2$. The survey is done by taking a picture of fauna that can be found in the sub plot. It also conducted a qualitative description of the fauna behaviour like physical characteristic, time meeting, location meeting, and habitat condition in mangrove area. The illustration of fauna survey in the field is presented as follows.

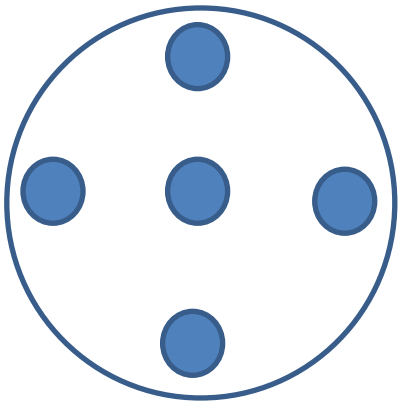


**Figure 11: Illustration of fauna survey in the field**

**c. Soil measurement**

- The sub plot 100 $m^2$ is used to soil measurement.
- On each plot, it conducted the measurement of water depth and mud depth by ruler. After that, the soil sample is taken from 5 positions in the sub plot systematically.

**Figure 12: Soil sample**

- Then, soil samples are mixed and put into plastic bag so that it can be brought out of mangrove location (*the waterlogged conditions of mangrove makes the direct measurement in the subplot is impossible*).
- After come out from the mangrove area, the measurement of soil characteristic is done by use soil samples that have been taken. The measurement is conducted based on the subplots code of soil samples.
- Before the measurement is done, soil samples are mixed in water with ratio (5 water : 1 soil)
- The measurement of soil characteristic is done by digital tools such as pH meter, refractometer, and digital soil kit test. The range of value from each indicators are :
  a. Range of pH level

**Table 39: Range of pH level**

| Soil pH | Desciption |
|---|---|
| **< 4.5** | very acid |
| **4.5 - 5.5** | acid |
| **5.6 - 6.5** | slightly acid |
| **6.6 - 7.5** | neutral |
| **7.6 - 8.5** | slightly alkaline |
| **> 8.5** | alkaline |

b. Range of salinity level

**Table 40: Range of salinity level**

| Salinity ($^0/_{00}$) | Desciption |
|---|---|
| **0 - 10** | normal |
| **10 - 30** | saline |
| **> 30** | high salinity |

c. Range of dissolved oxygen level

**Table 41: Range of dissolved oxygen level**

| DO (ppm) | Desciption |
|---|---|
| **< 1** | low |
| **1 - 3** | medium |
| **3 - 6** | high |

- The result of measurement is recorded from each sub plot. Then, make a mean for each village.

# 1. Introduction

## 1.1. Context project

The island of Borneo, or its Indonesian name Kalimantan, used to be famous for its dense tropical rainforest cover and rich variety of plant and animal species. The exploitation of forest resources started in the 1980s and 1990s first in Malaysia, then in Indonesia. By 2005, only about 50% of the island's forests still remained,[1] and between 2000 and 2010, 12% of the forest cover in Borneo has been affected by deforestation.[2] The loss of forest can be mainly attributed to logging, oil palm plantations, agriculture and mining.

Economic development in Kalimantan is dominated by these extractive industries, and it is threatening the livelihood of forest-based local communities and environmental resources. Planned expansion of oil palm is occurring at an unprecedented rate on the island. In West Kalimantan alone, there are plans to convert over 2 million hectares into additional oil palm plantations. This would mean expanding into indigenous territories and in pristine protected areas.[3] In East Kalimantan other than the expansion of oil palm plantations, coal mining has long had a serious negative effect on the ecosystem in the last decade.[4] These activities endanger eco-cultural values, while also bringing about a severe loss in biodiversity. In addition, the destruction of rainforests results in the scarcity of clean water, which in turn affects affect the survival of plants and animals in the forests. Even our informants in the project villages have reported that after forests have been converted to plantations, they suffered from the scarcity of clean water and they observed a reduction in fauna in their forests. Hence, the supposed economic development brought by the plantations is severely counterweighted by the loss of forest resources that constitute an integral part of the livelihood and culture of the indigenous Dayak people.

The forests to be converted are classified as 'forest area for other uses' by the government or APL. However, most of these areas historically belong to indigenous forest people, whose livelihood and culture is based on these forests. Therefore, a first step in conserving the remaining forests starts by securing the tenurial rights of indigenous communities. In addition, the indigenous culture of the people have to be strengthened and preserved in order to manage natural resources in a sustainable manner, and models of sustainable livelihoods have to be promoted based on the traditional culture to provide alternative livelihood sources.

The political environment is favourable: progressive local government officials raise the banner for sustainable livelihoods and eco-cultural conservation initiatives. In Sintang district of West Kalimantan province, the Head of District is known to welcome the protection of the remaining forests in the area. Sintang is also one of the regencies within the Heart of Borneo programme area, and thus focus on its conservation is well deserved. In East Kalimantan, Malinau district has also been declared as a conservation area in 2007, and the Head of District has issued a draft ordinance on indigenous peoples. This opens is a window of opportunity to work on empowering indigenous peoples in the area.

[3] World Agroforestry, unpublished report
[4] Borneo Research Bulletin, 2009

More recently, in May 2013 the constitutional court in Jakarta ruled that the customary forests of indigenous peoples should no longer be classed as falling in 'State Forest Areas' paving the way for a wider recognition of indigenous peoples' rights all over Indonesia (Forest Peoples Programme 2013). However, in reality, it turns out that the implementation of these new policies is problematic, as it is often difficult for the indigenous people to effectively prove their claims to ancestral lands on their own, and political dynamics (the frequent turnover of persons in charge of in the local government) often hinders the implementation of the policies.

Therefore, indigenous communities need outside help to promote their case. The project of Non-Timber Forest Product Exchange Programme (NTFP-EP) in Kalimantan seeks to empower such forest-based communities to use and manage their forest resources in a sustainable way. The project supports eco-cultural conservation initiatives to protect community forest areas from conversion, and sustainable community-based enterprises to improve the livelihood of indigenous people living from sustainable use of forest resources.

## 1.2. Evaluation objectives

This report evaluates the NTFP-EP project [5] as part of as part of the evaluation of the *Medefinancieringsstelsel* II (MFS II) in Indonesia under the Achievement of Millennium Development Goals (MDG) component. [6] The project has been selected under the goals on sustainable living environment, forests and biodiversity (MDG 7a and 7b). [7] In particular, the current evaluation focuses on the following research questions: how did the size of sustainably managed forest area change? How did the management structure of community forest areas change? How did the attitude and awareness of households change towards natural resource management? Do the communities feel more empowered to protect and manage their natural resources? Are the landscape models and conservation schemes in Sintang protecting ecological and cultural heritage in the community and restoring ecosystems? Finally, are landscape models recognised by the local government?

We investigate whether the project had a favourable effect on the above mentioned outcomes by looking at the changes in the outcome variables between the baseline and endline periods for the project beneficiaries. Regarding the sample, it has to be noted that originally we intended to survey all treatment villages in Sintang. Due to a misunderstanding about the project in Sintang, we sampled two additional communities in addition to the four actual project communities. These two communities are neighbouring one of the treatment communities. Therefore, they could indirectly benefit from the project (spillover). Hence, these locations cannot be regarded as a comparison group. In addition, the small sample size would not allow statistical analysis between the treatment and any comparison group.

Data was collected in four villages using structured community and household surveys in 2012, and the same respondents were re-interviewed in 2014 whenever it was possible. In order to validate the data from the quantitative surveys and to deepen our understanding of the project context and results, we

[5] The project is described in more detail in section 3.1.

[6] Please note that this project has been also evaluated under the Civil Society Strengthening component of the MFS II Evaluation.

[7] Based on the project objectives, the NTFP-EP project is also partially classified under the goal on poverty alleviation (MDG 1) and the theme of good governance and civil society building. However, the evaluation focuses on the impacts of the project with respect to MDGs 7a&b.

collected additional qualitative information at the project locations in the form of in-depth interviews with project stakeholders and community leaders, and using focus group discussions with men and women participating in project activities. The in-depth interviews were conducted with the Non-Governmental Organisations (NGOs) implementing the project (NTFP-EP, People Resources and Conservation Foundation or PRCF and Jasa Menenun Mandiri Cooperative or JMM) and local leaders who participated in the mapping process and other project activities. We have also interviewed NTFP-EP regarding the costs of the project.

As specified in the Terms of Reference for this evaluation, the report addresses five evaluation questions to assess the project outcomes:

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?
2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern partner organisations efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

## 1.3. Summary of findings

This report evaluates the impact of a forest mapping project in the district of Sintang, Kalimantan, Indonesia. This is one of the four locations that were supported by NTFP-EP (Southern Partner Organisation or SPO) through the International Union for the Conservation of Nature (IUCN) (Co-Financing Agency or CFA). We focus on this project location as this was the only one in which NTFP-EP was directly involved in the implementation along with local NGOs. In all other project locations, the work was subcontracted fully to local NGOs. The intervention consisted of forest mapping, to reach consensus on forest boundaries among stakeholders, and to seek legal status for these maps. This in turn, it was hoped, would result in more secure community ownership of the forest, and less land grabbing by oil palm companies. At the district level, it was hoped that the project's initiative would set an example of eco-cultural zonation aimed at the preservation of ecological and indigenous cultural values. Through a different funding source, the local NGOs involved in the project also provided training in sustainable forest bases income generation, in the hope it would improve welfare and generate an increased ownership of the natural forest among villagers.

We sampled four villages in which the project was implemented, and two other villages in the same area. The data consist of survey data conducted in October-November 2012 and October 2014, and a qualitative study carried out in April 2014.

The NTFP-EP project carried out participatory mapping activities over the period from March to September 2012. The baseline survey, conducted soon after the mapping activities, indicates widespread participation. 82 percent of the sampled villagers in the treatment villages heard of the mapping activities, and 45 percent participated. The qualitative study confirms that the process was carefully executed, with trained facilitators ensuring widespread participation, even from oil palm companies. The activity resulted in maps detailing the boundaries of community forest land.

Unfortunately, by the time of the endline survey, none of these maps had acquired the desired legal status. NTFP-EP did lobby with the district government, but in spite of several meetings with the district head, the formal legislation has not been forthcoming. The local NGOs remained active in the project villages. In all 4 treatment locations community leaders indicated that natural resource management activities had taken place over the evaluation period.

The community survey indicates that forest management is taken more seriously in treatment communities. While none of the spillover communities report any effort at forest protection, two out of the four treatment communities report there is a village protection and conservation programme active in the community. The villagers' responses on this topic do not give a clear picture. In both treatment and spillover villages, around 90 percent report that there are rules regarding the community forest and that people in the village keep those rules. Around 87 percent of villagers report that logging is regulated in the village. Again, both in treatment and spillover communities, villages show a positive attitude towards the sustainable use of forest land.

The objective of the training activities was to increase the sustainable use of the forest by villagers for income generation. A positive finding in this respect is that there has been a strong reduction (38 percentage points) in the fraction of households which reports to use wood from the forest for their family's livelihood. But it is not clear whether more sustainable uses of the forest were applied. There has been no increase in the use of the forest for natural dye material (a topic of the training), but villagers in treatment communities report an increase (18 percent point) in "other uses". In the spillover communities, the use of wood from the forest stayed the same over the evaluation period, while there was an increase in the use of the forest for food (32 percent point).

Another purpose of the mapping was to increase the security of community forests. While there have been no land conversions over the study period, the survey result indicate that land conflicts are still present. In both treatment and spillover communities, there has been a sharp increase in the fraction of villagers reporting land disputes with neighbouring villages and the business or industry. The rise has been somewhat sharper in spillover communities (around 45 percent point) than in treatment communities (around 25 percent point). The qualitative study indicates that the inter village disputes are usually solved peacefully. The conflicts with oil palm companies are mostly about land which was rented by the oil palm companies on a profit sharing arrangement, and communities feel like they did not get their fair share. In treatment communities, there is a continuous concern that forest can be converted to oil palm plantation among villagers.

Summarizing, this project has been implemented in areas where forest are under threat of conversion into oil palm plantations. NTFP-EP collaborates with NGOs which have long standing working relations with the communities. It seems like this has contributed to the awareness in the community regarding the importance of regulating the forest use, somewhat more sustainable use of the forest by villages, but no increase in security over forest land.

Finally, turning to project costs, by the end of 2014 the project has spent 83 percent of its budget, while the costs of the evaluated project activities in Sintang constituted 19.8 percent of the overall project costs. Unfortunately, we are not able to report on the cost-effectiveness of the project because the output of the project has not been finalized during the evaluation period.

### 1.4. Structure of report

The rest of this report proceeds as follows: section 2 describes the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1) till 4) in turn. Section 11 describes the relationship between the Civil Society Strengthening component to the MDG component. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. The planned project implementation is described in Annex I. Regarding the survey data, the construction of the outcome indicators and indices is summarized in Annex II. Annex III in turn describes the study locations, and Annex IV reports detailed descriptive statistics and explanatory variables of the sample; detailed figures on the change in outcome indicators is presented in Annex V. Finally, the results of the qualitative data collection are presented in Annex VI, and further details about the participatory mapping methods can be found in Annex VII.

## 2. Literature overview

Even though the existence of participatory mapping activities is very important in a country like Indonesia where an estimated 48 million indigenous people still depend on the forest for their livelihood, but where mining, logging and oil palm industry are destroying more than 1 million hectares of rainforest territory each year[8] (Telapak & Gekko Studio 2011), the academic literature on participatory mapping within specific Indonesian context is quite limited. This may, at least in part, have to do with the political sensitivities involved in mapping, that can be especially critical for Indonesian indigenous peoples that have since long had a particularly uneasy relation with government and, until very recently, had to cope with a severe lack of legal protection.

Despite the lack of scientific literature over participatory mapping, there was no lack of participatory mapping projects in Indonesia. In fact, over the past 1.5 decades, communities from nearly every region in Indonesia have been trained in the technical and facilitation skills required to undertake participatory mapping , and by 2009 1.5 million hectares of land had already been mapped by local communities (IFAD 2009: 22). The Indonesian community mapping network (Jaringan Kerja Pemetaan Partisipatif or JKPP), established by the mapping activists in 1996 in Bogor, West Java, has been instrumental in achieving these goals (IFAD 2009: 22). I.e. by forming an alliance with Aliansi Masyarakat Adat Nusantara or Alliance of Indigenous Movement in the Archipelago (AMAN) and the Forest Watch Indonesia to advocate for the customary maps to become officially recognized and fed into the "Ancestral Domain Registration Agency" (Badan Registrasi Wilayah Adat): The government's official national database of forest cover. In 2011 AMAN signed a Memorandum of Understanding (MoU) with the National Land Agency (Badan Pertanahan Nasional), which officially stated that "indigenous" maps would be integrated into governmental data (Harjati Sanmukri 2013: 123).

[8] Making Indonesia the fastest forest clearing nation in the world since 2012, and also the world's third largest emitter of carbon dioxide emissions, behind China and the United States (Telapak & Gekko Studio 2011).

Scientific evidence on the effectiveness of participatory mapping is also limited in the international context. Therefore, a large part of the remaining of this section discusses what participatory mapping is and how it is implemented in terms tools and methods. Finally, we present a short summary of reported impacts of participatory mapping. For further details on the development and methods of participatory mapping, and considerations about "good practice" the reader is referred to Annex VII.

Participatory mapping is a general term[9] used to define a set of approaches and techniques that combine the tools of modern cartography with participatory methods to create a map of a local community's habitat that represents this community's spatial knowledge (Rainforest Foundation UK 2014). "NGO's, from small local ones to large international ones, often play a crucial role as interlocutors, trainers, advocates and facilitators in these mapping activities" (IFAD 2009: 5).

Participatory mapping is used over the whole world, and the maps that are produced can take on many forms, and can be used to achieve various different purposes. Looking at the available literature and documentation on participatory mapping initiatives the most common aim of participatory mapping appears to be to help marginalized groups, in particular indigenous, pastoralist and forest dwellers, to claim and/or defend their (access to) ancestral lands and its resources, typically by working towards legal recognition of their land rights, using the maps as evidence of their continued residency. The maps can also serve as a tool for community land use planning and natural resource management, and can be used to bring resource-related problems, such as the impacts of logging, mining, and 'land grab' activities, to the attention of governmental authorities and decision makers (Chapin et al. 2005: 620; Di Gessa 2008; Rainforest Foundation UK 2014; Literat 2013: 200; IFAD 2009: 9-12, 39). Some indigenous groups are now using mapping to monitor and defend lands against deforestation, illegal timber extraction, prospecting, and colonization (Teague c. 2010: 10). Other purposes of participatory mapping activities include the strengthening of indigenous political organisation, economic development planning, the documentation of history and customs for culture preservation, education of indigenous youths and/or the general public (Chapin et al. 2005: 620), and support for conflict resolution in territory-related disputes (Di Gessa 2008).

What further distinguishes participatory mapping from traditional cartography and map-making is the process by which the maps are made (IFAD 2009: 4): Community members are involved (preferably) throughout the whole mapping process and recognized as capable research collaborators and experts on their own local surroundings and needs (IFAD 2009: 4; Pathways Through Participation 2010: 1). According to Fox *et al*. (2003, as cited in Wright *et al*. 2009: 261) the reasons for choosing a participatory mapping approach are usually not only practical (i.e. the actual production of the map and using it as evidence for land claims, or as community advocacy tools), but also intrinsic, as the communal aspect of the mapping process can enhance group awareness and cultural identity, facilitate the passing down of historical knowledge through generations, and build trust and communication between people.

[9] The numerous initiatives throughout the world aren't always referred to with the words 'participatory mapping', but can go by many different terms, including: "indigenous mapping" (IFAD 2009: 6) , "…"participatory land use mapping," "participatory resource mapping" (Mbile *et al*. 2003), "community mapping" (Bennagen & Royo 2000, Eghenter 2000, Fox 2002), "community-based mapping" (Flavelle 2002), "ethnocartography" (Chapin & Threlkeld 2001, Gonzalez *et al*. 1995), and "counter-mapping" (Peluso 1995, Kosek 1998, Hodgson & Schroeder 2002)…" (as cited in Chapin *et al*. 2005: 622-623).

Throughout the past decades, mapping has become increasingly popular and prominent (Pathways Through Participation 2010: 13), which "many commentators ascribe to the developments in Participatory Rural Appraisal (PRA) which emerged in the late 1980s in South Asia and combined insights from agro-ecosystem analysis with Rapid Rural Appraisal (RRA)" (Ibid: 2).

Looking at the implementation of mapping projects, they usually loosely follow the following steps:

1. "**Ground preparation**: before the project starts project leaders and indigenous leaders explain the objectives and importance of the mapping work to the community, the technical team is recruited and collaboration with NGO's and government agencies is sought;
2. **First workshop – orientation and training**: Project staff and indigenous leaders explain the objectives and methodology to the surveyors and technical team and data collection tools are developed;
3. **First fieldwork – gathering data and sketch mapping**;
4. **Second workshop – transcription of data onto new maps**;
5. **Second fieldwork** – **verification of collected data by the community**; and
6. **Third workshop** – **correcting and completing final maps**: Surveyors reunite with the cartographers to incorporate information that has been verified in the field and put the draft maps in final form

(Chapin & Threlkeld 2001; IFAD 2009: 30).

Turning to the effectiveness of participatory mapping projects, over the years, many researchers have noted the positive impacts that participatory mapping can have on a community:

> Participation in mapping seems to have encouraged some indigenous communities to demand title to lands (Toledo Maya Cultural Council, 1997; Leake, 2000; Herlihy, 2003; Herlihy and Knapp, 2003), to defend and claim their rights to control natural resources (Smith, 2003; Brown, 2006), and to design conservation and resource management plans that are compatible with local practices (Mohamed and Ventura, 2000; McCall and Minang, 2005; Brown, 2006; Bauer, 2009). Researchers have argued that, in addition to producing maps, when implemented with a stress on participation and with facilitation of discussions within communities, indigenous mapping empowers indigenous peoples in land and resource use rights against potential encroachers (Poole, 2003; Smith, 2003; Brown, 2006; Finley-Brook, 2007) (Reyes-Garcia *et al*. ca. 2012a: 2-3).

In addition to these positive effects, researchers have also observed negative consequences resulting from participatory mapping. For instance, Authors such as Mwangi, Hodgson & Schroeder, Fox, Bryant, and Roth have noted issues such as increased privatization of land, loss of indigenous conceptions of space, greater exposure of valuable natural resources, increased taxation by the state, and increase or intensification of conflicts, either within the village, with neighbouring villages, or with other external actors such as companies or governmental authorities (Reyes-Garcia *et al*. 2012b: 651). Increase of conflicts due to participatory mapping, is one of the most frequently reported drawbacks of participatory mapping. Researchers such as Offen, Peluso, Hale, and Vandergeest have argued that: "Participatory mapping might intensify internal conflicts because it might bring to light overlapping uses of land and resources or erode traditional ways of dealing with internal conflicts…" (Ibid). Furthermore, it has been reasoned by i.a. Peluso and Rundstrom that "…participatory mapping might increase the

number of conflicts with external actors, as the maps produced might challenge the maps made by state and corporate authorities" (Ibid).

Reyes-Garcia *et al*. have attempted to validate the theory that participatory mapping systematically increases the number of conflicts, using an experimental research design whereby 32 native Amazonian villages with and without conflicts with outsiders were randomly assigned to a treatment group (those where a participatory mapping project would be implemented by them) and a control group (those where a participatory mapping project would not (yet) be implemented by them[10]).[11] Contrary to others' previous findings, the results of their research show no statistically significant differences in the measured variables (i.e. number of conflicts, negative opinion, neutral attitude, and negative attitudes towards outsiders) between treatment and control villages (2012b: 656).

Reyes-Garcia *et al*. explain their deviating results by arguing that previous studies, which were based on direct observations rather than a randomized experimental design, might have been subject to selection bias, because the villages participating in participatory mapping projects are generally the ones that are chosen or volunteering to participate in participatory mapping due to the fact that they are expected to experience – or are already experiencing – conflicts over land rights and resources (2012b: 651, 656). Their results support the argument that mapping projects do not bring about conflicts per se, rather "…the process and the results of participatory mapping can help in conflict resolution or contribute to conflict generation or exacerbation depending on the political and socio-economic context in which they are conducted" (Ibid: 657).

# 3. The project

## 3.1. Project description

NTFP-EP is a collaborative network of NGOs and community-based organisations (CBOs) working for the common goal of empowering and increasing the capacity of forest-based communities to make use of and to manage forest resources in a sustainable manner. [12] The motivation behind NTFP-EP can be summarized as: "Do not ask the community not to do the destructive logging if we cannot afford to give them a proper alternative income from the forest which they live within this long..."[13] Usually partner organisations that have a strong connection with the local communities work directly with the forest-dependent communities, while NTFP-EP itself catalyses and supports activities that build up and strengthen the capacity of the partner organisations.

The 'Up-scaling sustainable, community-based forest livelihoods in Kalimantan' project of Non-Timber Forest Products Exchange Programme (NTFP-EP) funded by IUCN of Ecosystem Alliance - and selected

[10] For the sake of fairness, participatory mapping projects were also implemented in the control villages, but only after all research data for the post-intervention study had been collected (Reyes-Garcia *et al.* 2012b: 653).
[11] All these villages were located in Tsimane' territory. The Tsimane' are a native Amazonian society of foragers and farmers in Bolivia.
[12] Source: http://www.ntfp.org/sub.php?gosub=about-bg
[13] Source: http://www.ntfp.or.id/home_eng.html

for the MFS II evaluation – is implemented between 15 September 2011 and 30 June, 2015.[14] It worked with a group of implementing NGOs in four project locations in Kalimantan. The details of the sub-projects at the various locations can be found in Annex I.

The evaluation focuses on one of these areas, where NTFP-EP is directly involved in the project implementation: the promotion of Eco-culture in Sintang. In the first year, the main activity is participatory mapping for the protection of eco-cultural sites (from oil palm expansion) especially for the Jerenang and Enpait trees that are used for natural dyes (of weaving) in 4 priority sites in Sintang district (West Kalimantan province). Then, the maps will serve as an example and guidance for eco-cultural zone planning workshops with the local government. The expected end result is that community forests with high eco-cultural value will be acknowledged by the local government and preserved by the indigenous communities as they recognise the ecological and cultural value of the forests and its contribution to their livelihood through sustainable non-timber forest product (NTFP) production. Using the project sites as examples, NTFP-EP and its partners hope that a network of eco-cultural forest sites (scattered among the converted forest areas) can be established and preserved for future generations.

The project in Sintang is a collaboration of NTFP-EP, JMM[15], PRCF[16] and Kobus Foundation[17]. NTFP-EP provides the know-how on participatory mapping and consultations with the local government regarding eco-cultural zonation, while JMM and PRCF implement the mapping with the communities.

## 3.2. Project implementation

In Sintang, the project started with the selection of the 4 project sites selected for participatory mapping. The sites were chosen based on a number of criteria: the site has a great ecological function (watershed, species biodiversity, source of natural dye and medicines); the site has great cultural function (for example, sacred forest, area where cultural activities will take place); the site is in extreme danger of conversion (classified as APL); the site is located on peat land; the community needs the area to be protected and rejects oil palm plantations; and there is interest from the community to establish an area management unit.

The participatory mapping of the selected forest areas in the 4 project villages were carried out between March and September 2012. First, NTFP-EP trained facilitators of JMM and PRCF in the process of participatory mapping. Some community leaders have also participated in the workshop on how to take coordinates with a Global Positioning System (GPS). After the socialization of the project, the recording

[14] The project was supposed to end on 15 March 2014, but the project period was extended until 30 June, 2015 because the full project budget has not yet been spent (NTFP EP wants to use the remaining funds of about EUR 9.000 for among others the eco-certification trip – based on correspondence with IUCN NL). In addition, the frequent turnover of persons in charge in the local government made the project difficult to achieve.

[15] The name of JMM translates to 'Independent Weaving Services', and as it names says the cooperative works with approximately 400 weavers (women) in Sintang. It acts as a marketing node but it is also committed to quality improvement of the woven cloths, for example through the promotion of natural dye producing tree cultivation.

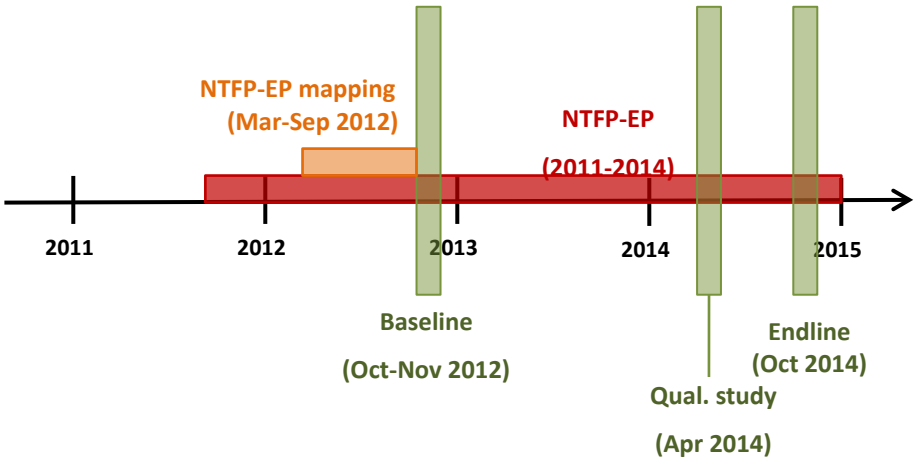
[16] PRCF is an NGO dedicated to the promotion of conservation, protection and wise use of natural resources through a sustainable social and economic development. It is also committed to developing and facilitating Dayak weaving activities in Sintang.

[17] Kobus Foundation is not directly involved in the participatory mapping activities, as it is a cultural foundation on promoting traditional (especially, weaving) culture. However, it contributes to the consultations on eco-cultural zoning in Sintang.

the coordinates of boundaries and other significant sites (for example, sacred sites and sites of natural dye trees) took place in July and August of 2012. The facilitators of JMM and PRCF were also actively involved in this activity helping the communities to record the coordinates. From the coordinates, digital maps were prepared by JMM and PRCF with the help of NTFP-EP. The maps were completed and ready for submission to the local government in September 2012. The size of the mapped forest is summarized in Table 1: the largest forest areas are found in Ensaid Panjang village. In the other villages, some of the forests have already been converted but the communities want to preserve their remaining forest areas.

**Table 1: Size of the mapped forests**

| Village | Size of mapped forests | Mapped by NGO |
|---|---|---|
| Ensaid Panjang | 202.39 Ha | PRCF |
| Karya Jaya Bakti | 3.08 Ha | JMM |
| Gemba Raya | 32.37 Ha | JMM |
| Empaha Kebiau Raya | 37.58 Ha | JMM |
| Source: interview with project stakeholders | | |



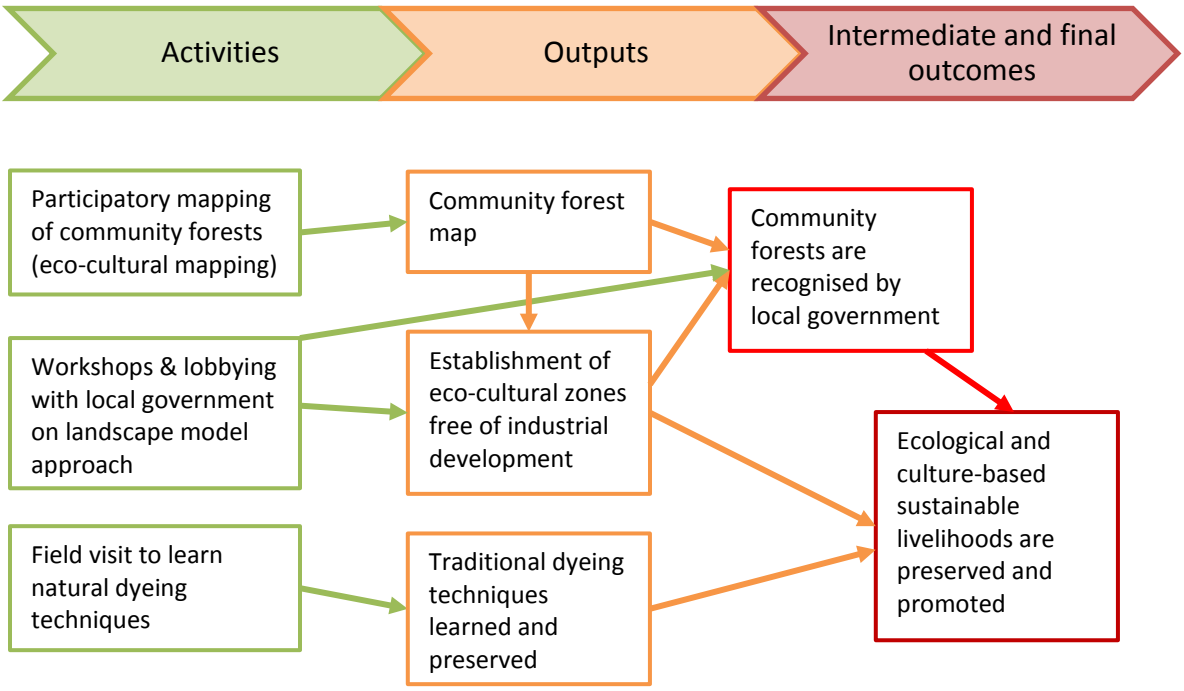
Since the completion of the maps, the main task of the project has been to get the local government on board for the planning and development of the eco-cultural zones. The communities are not involved in this activity as it is at a higher level. Meetings have been conducted at the district level with the government and NGOs related to eco-cultural zonation to seek opportunities of support for the initiative. However, NTFP-EP did not yet succeeded in securing the approval of the government for the mapped community forests until the end of 2014 due to the dynamics of local politics in Sintang. Also, the planned workshop with the government on the landscape model of eco-cultural zones for sustainable livelihood options have not yet been conducted for the same reason.[18] Hence, the project did not achieve its final objective during the project period. Nonetheless, the issue remains important for the implementing NGOs who will further promote this cause.

Turning to the promotion of sustainable livelihood activities in the project areas, the focus of the project is on the promotion of traditional weaving techniques. To this end, the project organised a field visit for the partner organisations to Sumatra to exchange knowledge and learn natural dyeing techniques. However, the project is not directly involved in training activities on sustainable livelihood activities in the communities. Such activities of JMM and PRCF are funded by another project.

Figure 1 summarizes the project periods and the evaluation activities. Further information about the implementation of the project in Sintang can be found in Annex VI containing the qualitative evaluation report of the NTFP-EP project.

[18] At local level, actually there are several activities done by the project, ie.: audience with district head on April 17, 2013. Project also had audiences with several head of offices to report the project activities and to get local government support on policy to protect eco-zonation.

**Figure 1: Timing of the intervention and the evaluation**



## 3.3. Result chain

A schematic representation of the result chain for the NTFP-EP project in Sintang is displayed in Figure 2. The figure is based on the interpretation of the project by the evaluation team. As mentioned before, the ultimate goal of the project is to empower forest-based communities to use and manage their forest resources in a sustainable way. In the project in Sintang this goal is achieved by establishing an example of a landscape level model of ecological and culture-based livelihood and conservation theme, and thus preserving and promoting eco-cultural sustainable livelihoods.

Three types of project activities working at different levels (community, NGOs and CBOs and government) bring forward the desired outcome. Firstly, participatory mapping of community forests results in a map of the threatened forest areas. Communities benefit from this map by having agreed on the boundaries with neighbouring villages and plantation companies. Hence, they may feel already more secure about their claims as it is recognised by their neighbours. In addition, the mapping process raises the community's awareness regarding the cultural and ecological values of their forests by mapping sites of cultural, ecological and economic value.

However, the tenure status of the communities is secured only when the government – who decides on the use of APL land – recognises the community forests. To achieve this outcome, the project needs to lobby at local government. This activity is part of the consultation and workshops with the local government on the landscape model approach, which is inter-linked with the results of the mapping process.

**Figure 2: Stylized result chain**

The motivation behind the landscape model approach is that "the mapping of the eco-cultural area will lead to improved awareness of the importance of the area for ecological and cultural significance. This will lead to discussions with other stakeholders such as companies which may have permits in the area and the government. As companies are required to have high conservation value forests (HCVF) off limits to conversion and ecological destructive activities, the project proposes that companies provide these areas to the communities who are already managing these areas through a signed agreement. In some of these areas, such a verbal agreement already exists. This signed agreement, to be confirmed by the local government, will strengthen the communities' tenure over the area and provide more long term incentive for forest management."[19]

At the margin, the project also involves the capacity building of the partner organisations (PRCF and JMM) in sustainable livelihood activities in the form of a field visit to Sumatra to learn about forest plants that provide natural dyes to be used in weaving. However, the project is not directly involved in sustainable livelihood trainings and workshops for direct beneficiaries (like a group of weavers).

## 3.4. Possible unintended impacts

Possible negative unintended effects of the project are that the discussions surrounding forest management brings out conflicts with other stakeholders which are then resolved in a way that counters the community's interests.

[19] Source: correspondence with NTFP-EP in 2012.

# 4. Evaluation questions and outcome variables

## 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. In the baseline report specific evaluations questions were specified. Table 2 shows these five questions and what it implies for this project.

**Table 2: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| 1 | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | A. How did the size of sustainably managed forest area change?<br>B. How did the management structure of community forest areas change?<br>C. How did the attitude and awareness of households change towards natural resource management?<br>D. Do the communities feel more empowered to protect and manage their natural resources?<br>E. Are the landscape models and conservation schemes protecting ecological and cultural heritage in the community?<br>F. Are landscape models recognised by the local government? |
| 2 | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Are the observed changes above attributable to the intervention? |
| 3 | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>• Does the project address an important issue for the beneficiaries?<br>• Satisfaction of beneficiaries (self-reported impact) |
| 4 | Efficiency: Were the development interventions of the Southern partner organisations efficient? | Was the intervention cost effective? |
| 5 | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

The evaluation questions are loosely linked to the result chain discussed in section 3.3 and the project logic. Question A and B relate to the sustainable management of forest at the villages, which is expected as a result of the mapping activity. These questions are investigated at the community level. Questions C and D investigate how the mapping has affected the general population of the project areas: do they feel more empowered and secure about their land? Are they more aware of the importance of their natural resources? Question E relates to the efforts to bring culture and sustainable use of forest closer together, mainly through the promotion of weaving using natural dyes. Finally, questions F relates to the project activities related to lobbying and consultations with the government. We investigate these questions though project reports and qualitative interviews with project stakeholders.

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators. The outcome indicators are split up into 6 sub-sections following the sub questions listed from A to F in Table 2. Note that in particular for question E, the outcomes related to cultural heritage, it is likely that the observed changes have also been affected by training activities related to traditional crafts. These trainings are also linked to MSF II funds, but only partly not through the NTFP-EP project under the Ecosystem Alliance (IUCN NL).[20] They formed an integral part of the strategy of NTFP—EP. Therefore, we decided to include these outcomes in the analysis.

Regarding the indicator on the number of people involved in traditional crafts, we expected that the project will work on sustainable livelihood activities. However, as discussed before, the NTFP-EP project does not directly work with individual producers. Therefore, any change in this indicator cannot be attributed to the NTFP-EP project.

Table 3 displays the outcome indicators of the main analysis, the scale of these variables and whether the indicator is a uniform indicator, while Annex II describes the outcome indicators in more detail and highlights the components per index. The uniform indicators are specified by the synthesis team for the goals on sustainable living environment, forests and biodiversity (MDG 7a and 7b). For all outcome variables 'the higher, the better' rule applies.

**Table 3: Overview outcome indicators**

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| **A. How did the size of sustainably managed forest area change?** | | | X |
| Number of villages that report that their forest size has [increased/stayed the same/ decreased] in the past 2 years] | (decrease;increase) | Community survey | |
| Number of villages with efforts at reforestation | (0;n) | Community survey | |
| Index for planning and forest protection | (0;n) | Community survey | |
| Number of villages with efforts at forest protection (protection of endangered species) | (0;n) | Community survey | |
| **B. How did the management structure of community forest areas change?** | | | |
| Existence of regulations about the use and protection of the community forests in the village | (0;n) | Community survey | |
| Percentage of forest area protected | (0-100%) | Community survey | |
| Regulated activities in the community forest | (0;n) | Community survey | |
| Meetings about community forest use and management in the past 12 months | (0;n) | Community survey | |

[20] Trainings on traditional crafts can be linked to Crafts Kalimantan (CK), which is a network which is facilitated by NTFP-EP Indonesia. The work of this network was funded by Cordaid (out of MFS II funds), through funds managed by Both ENDS. Furthermore, CK staff involved in training activities (for example, harvest protocols for natural dyes in Sintang) is partly funded by the EA – IUCN-NL.

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| Regulations are communicated by community meetings, signs at the forest, farmer group meetings or a letter | (0;n) | Community survey | |
| Regulations are communicated to all villagers (including women and children) | (0;n) | Community survey | |
| Regulations are taught at school | (0;n) | Community survey | |
| Percentage of respondents who report that there are any rules/regulations about the use of community forests in the village | (0-100%) | Household survey | |
| Satisfaction with regulations | (-2;2) | Household survey | |
| **C. How did the attitude and awareness of households change towards natural resource management?** | | | |
| Dependence on forest resources | (-2;2) | Household survey | |
| Index for positive attitude towards sustainable forest use | (-2;2) | Household survey | |
| Index for positive attitude towards sustainable forest use (community survey) | (-2;2) | Community survey | |
| Index for access to forest resources | (-2;2) | Household survey | |
| Percentage of respondents who think that an oil palm plantation in the village is/can be beneficial for him/her and his/her family | (0-100%) | Household survey | |
| Index for positive attitude towards oil palm plantations | (-2;2) | Household survey | |
| **D. Do the communities feel more empowered to protect and manage their natural resources?** | | | |
| Index for sense of control regarding their own life | (-2;2) | Household survey | |
| Index for sense of control regarding land | (-2;2) | Household survey | |
| **E. Are the landscape models and conservation schemes protecting ecological and cultural heritage in the community?** | | | X |
| Number of people involved in traditional crafts | (0;NM) | Community survey | |
| **F. Are landscape models recognised by the local government?** | | | |
| Number of villages where community forests have been approved by government | (0;n) | Interviews and project documents | |
| Notes: NM = no minimum/maximum, n is the number of villages in either the treatment group or the comparison group | | | |

# 5. Data collection

## 5.1. Survey instruments

We collected three types of data: quantitative, qualitative and financial. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

To analyse the impact of the programmes, two surveys have been conducted to collect quantitative data:

- Respondent survey: A short survey was administered with randomly selected community members regarding attitudes towards natural resources, land related conflicts and the respondents' sense of control.
- Community survey: the community survey was administered together with the household surveys both during the baseline and endline period. The head of the community or another local leader was interviewed regarding matters of the community.

The baseline data have been collected in the end of October and beginning of November in 2012; while the endline data was collected in the half of October 2014.

### *Qualitative data*

To gain more insight into the implementation and the impacts of the NTFP-EP project in Sintang qualitative field work was conducted in April 2014. In-depth interviews were conducted with the implementing NGOs (NTFP-EP, PRCF and JMM) and local leaders. In addition, focus group discussions have been conducted with men and women participating the project activities. The results of this study are summarized in Annex VI.

### *Financial data*

To collect information about the costs of the NTFP-EP project, we conducted a project cost survey with executive director and finance officer of NTFP-EP on 14 March 2014.

## 5.2. Sampling outcome

### *Sampling design*

For the evaluation we surveyed all treatment villages. At the time of setting up the evaluation, we expected that 6 villages will participate in the project. The sampling design has been made with this assumption. In each of the 6 villages, we conducted interviews with community leaders (community survey) and randomly selected community members (household survey).

For the respondent survey, 20 people per village were interviewed. Hence, the total sample size in the 6 villages in 120. The sample size was planned to be stratified by gender, involvement in the project activity and location: 7 respondents are randomly selected among the participants of the mapping activity. The remaining 14 respondents are stratified by gender (7 male and 7 female), and they are randomly sampled from the population of the communities involved in the project.[21]

[21] The reasons for stratification are that we were interested whether females and males benefit equally from the project, and whether the project was able to reach all villagers not only the ones participating in the mapping.

For the endline survey, we planned to re-interview the same respondents as much as possible. However, if some of the baseline respondents could not be interviewed, we replaced them by a randomly selected community member with similar characteristics in terms of gender and age.

### *Sampling outcome*

Due to a misunderstanding of project documents, we sampled 6 villages instead of the actual 4 project villages. Hence, we have two additional villages that could serve as a comparison group. However, these villages are neighbouring one of the project villages, therefore they can be better considered as areas that could indirectly learn and benefit from the project (spillover). Due to the small sample size (number of villages), we are not able to use statistical analysis between the treatment and spillover group.

Table 4 summarizes the sample sizes already taking into account the changes in the treatment status of villages. In both the baseline and endline period the planned number of households have been interviewed (120 in total). The last column of the table (panel sample) shows the number of respondents that were interviewed both for the baseline and endline survey. In the treatment villages, 71 (89%) of the baseline respondents were re-interviewed, while this number is 35 (86%) in the spillover villages.

In the treatment villages, 5 of the baseline respondents have moved out of the village and 2 were away working outside of the village. In the spillover villages, 2 of the baseline respondents were travelling, 2 moved out of the village and 2 were away of the village due to work.

**Table 4: Sampling outcome**

| Assignment group | Villages | Respondents baseline | Respondents endline | Panel sample |
|---|---|---|---|---|
| Treatment | 4 | 80 | 80 | 71 |
| Spillover | 2 | 40 | 40 | 34 |
| **Total** | **4** | **80** | **80** | **105** |

Source: Household survey E3, MFS II Evaluation Indonesia

In the data analysis, we use data from all respondents when discussing the baseline and endline outcomes separately. However, when reporting on the change in variables or performing statistical tests on the significance of the change, we only use the so called *panel sample*, respondents for we have two rounds of data.

# 6. Descriptive statistics

This section summarizes the main characteristics of the sample using the baseline and endline surveys. In addition, the exposure of villages to mapping and natural resource management activities is discussed.

## 6.1. Community characteristics

All project locations are small remote villages in Sintang district, West Kalimantan Province. The area is a transmigration area, therefore the local indigenous Dayak population is mixed with migrants from Java. The livelihood of people depends on rubber and rice farming. The villages are surrounded by oil palm plantations, where some of the villagers work in their free time. However, all project communities reject oil palm plantations as they realize that such plantations only damage environment and bring no advantages for the people. In fact, in one of the project villages (Karya Jaya Bakti) some forest plots have been converted to oil plantations but the companies failed to deliver their promises of building a school and health centre in the village.

In one of the project villages (Ensaid Panjang village) there still exists a traditional Dayak long house and some of the women are still involved in the tradition craft of weaving. This village also still has a large forest area because the community has rejected oil palm companies.

In the potential spillover locations, people also live from rubber, rice and corn farming. However, in these villages most of the community forests have been already turned to oil palm plantations, and only a small area of the forests still remain.

Further details about the project locations can be found in Annex III and in Annex VI for the 3 project villages where the qualitative field work was conducted.

## 6.2. Interventions in villages

Next, we turn to describing the type of project activities that have taken place during the evaluation period. We are particularly interested in activities related to natural resource management and land mapping.

Table 5 summarizes the number of villages that reported forest mapping activities and natural resource management related trainings and meetings in the past 2 years. As discussed in section 3.2, the mapping activities for the project have been finalized already before the baseline survey (September 2012). Therefore, it is not surprising that while all 4 treatment villages report forest mapping activities prior to the baseline, only 2 of the villages still report such activities after the baseline survey (October 2012). In both villages the mapping activities have been organised by PRCF and JMM in 2012 or 2013. In the spillover villages, while one village reported mapping by PRCF in 2011, no mapping activities took place over the past 2 years.

One treatment village (Ensaid Panjang) takes natural resource management very seriously observing the number of workshops and trainings organised in the village on the issue: workshop on sustainable use of natural resources was organised in 2011 by JMM and in 2014 by KOBUS, while awareness raising campaigns were organised by the village apparatus in 2011, 2012 and 2013. In addition, the village has organised trainings on eco-forestry with Wahana Lingkungan Hidup Indonesia or Indonesian Forum for Environment (WALHI), PRCF (endline survey) and other organisations (PLHD and TITAN) in 2012.

Only one other treatment village (Karya Jaya Bakti) received trainings on sustainable use of natural resources organised by JMM in 2013, while one potential spillover village organised an awareness raising campaign in 2013.

**Table 5: Trainings related to natural resource management and mapping**

| Assignment group | Treatment | | Spillover | |
|---|---|---|---|---|
| Sample size | (n=4) | | (n=2) | |
| Survey year | Base | End | Base | End |
| **Natural resource management related trainings and workshops in the last two years:** | | | | |
| *Forest/natural resource mapping* | 4 | 2 | 1 | 0 |
| *Awareness raising campaigns about use and protection of natural resources* | 1 | 1 | 0 | 1 |
| *Training on natural resource management* | 0 | 0 | 0 | 0 |
| *Training on sustainable use of natural resources* | 1 | 2 | 0 | 0 |
| *Training on eco-forestry* | 1 | 1 | 0 | 0 |

Source: Community survey E3, MFS II Evaluation Indonesia

In addition to the activities mentioned above, the community leader in Ensaid Panjang village further mentioned that PRCF has assisted the village in planting trees for natural dyeing material and organised meetings on land rights in 2012 and 2013. Other NGO's, such as WWF, TITIAN and SPKS Sintang, were involved in the planting of trees as well and they are excited about the project. Also Karya Jaya Bakti village indicated the PRCF and JMM organised land right workshops in the village in the past 2 years. Overall, in all 4 treatment villages community leaders indicated that PRCF, JMM or KOBUS organised natural resource management activities over the past 2 years in their village. In addition, also one of the potential spillover villages indicated that PRCF conducted activities related to natural resource management and sustainable livelihood in the village (the same village where mapping has been conducted in 2011). No other type of activities where organised by non-governmental organisations in the survey villages over the past 3 years.

Summarizing the above, it emerges that one treatment village (Ensaid Panjang) is very committed to protecting and preserving its natural resources. There are also many activities related to natural resource management organised in this village outside the scope of the NTFP-EP project, albeit implemented by the same local NGOs as this project. Our data shows that PRCF and JMM have been working with the project villages already for a longer time. While the NTFP-EP project focuses on the forest mapping activity, these local NGOs also assist the villages (including one of the potential spillover villages) in other natural resource management related issues. Hence, if we find an improvement in the outcome indicators it will show the impact of all the activities of JMM and PRCF in the villages and not only of the activities of the NTFP-EP project.

## 6.3. Respondent characteristics

To provide a better insight into the characteristics of the respondents, Table 6 displays their socio-economic characteristics including age, gender, the main economic activity of the respondent, and the distance from the household to forests.

The left side of Table 6 shows the characteristics of the respondents in the four treatment villages at the baseline survey (Base), at the endline survey (End), and for respondents that have been interviewed in both survey rounds (panel sample) the difference in their endline and baseline responses (Change). Therefore, the values in the change column can be different from the difference of the variables at the end- and baseline. The significance of the change is also reported (p-value) for the panel sample. The P-value shows the probability that the change in the variable is zero. Hence, if the p-value is small (say smaller than 5%), it indicates that the change is significantly different from zero (at 5% significance level).[22] The same statistics are also reported for the potential spillover group in the right side of the table. We do not compare the results of the treatment and spillover groups with each other.

In Table 6, we do not expect the distribution of characteristics to change between the baseline and endline period except for age: 2 years have gone by between the two survey rounds. This is quite precisely indicated in both treatment groups (1.9 vs. 2.1 years). No other significant changes in the socio-economic characteristics of the households are observed between the baseline and endline period.

However, an interesting developments in the project villages is that a significantly higher share of the respondents report that their household goes to the forest daily (39.2% at the endline vs. 12.5% at the baseline), and some of the respondents report to live closer to the forests at the endline than at the baseline.

**Table 6: General characteristics of the sample**

| **Assignment group** | **Treatment** | | | | **Spillover** | | | |
|---|---|---|---|---|---|---|---|---|
| **Reporting period** | Base | End | Change | p-value | Base | End | Change | p-value |
| **Sample size** | 80 | 80 | 71 | 71 | 40 | 40 | 34 | 34 |
| Gender (% female) | 32.5 | 31.3 | -1.4 | 0.787 | 47.5 | 45 | 0.0 | |
| Age | 36.3 | 38.1 | 1.9** | 0.012 | 32.8 | 35.6 | 2.1* | 0.073 |
| Religion (%) | | | | | | | | |
| *Islamic* | 3.8 | 0.0 | 0.0 | | 62.5 | 65 | 0.0 | |
| *Catholic* | 46.3 | 48.8 | 0.0 | | 12.5 | 10 | 0.0 | |
| *Protestant* | 50.0 | 51.3 | 0.0 | | 25 | 25 | 0.0 | |
| Marital status (%) | | | | | | | | |
| *Currently Married* | 87.5 | 85.0 | -2.8 | 0.206 | 90.0 | 87.5 | -2.9 | 0.518 |
| *Divorced* | 1.3 | 2.5 | 1.4 | 0.39 | 0.0 | 0.0 | 0.0 | |
| *Widowed* | 1.3 | 2.5 | 1.4 | 0.642 | 0.0 | 0.0 | 0.0 | |
| *Never Married* | 10.0 | 10.0 | 0.0 | | 10.0 | 12.5 | 2.9 | 0.518 |
| Highest level of education attended by the respondent (%) | | | | | | | | |

[22] In calculating the p-value, we used robust standard errors clustered at the village level.

| Assignment group | Treatment | | | | Spillover | | | |
|---|---|---|---|---|---|---|---|---|
| **Reporting period** | Base | End | Change | p-value | Base | End | Change | p-value |

Notes: Robust standard errors corrected for clustering at the village level are used to calculate p-values.
* p-value<0.10; ** p-value<0.05; ***p-value <0.01. P-values are not defined for variables where there was no change.

# 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured between the base- and endline survey (2012-2014) are grouped into 6 sub-sections: size of forests and number of villages with efforts at forest protection, management of natural resources, household's attitude towards natural resources, sense of control of villagers, number of people involved in traditional crafts and the number of villages where community forests were approved by the government. Some of the outcome indicators combine multiple variables into one index. The components of these indices are presented in Annex V.

Table 7 displays the results for the outcome indicators at the community level, while Table 8 displays indicators using the respondent surveys. For the tables at the community level, only the baseline and endline values are reported but not the change because of the small sample size (4 and 2 villages per treatment group).

At the respondent level, the changes in the outcome variables are reported as well (for the panel sample). The table structure is similar to the table on respondent characteristics with the exception that in Table 8 we also report on the standard error of the variables below the mean in parenthesis.

**Table 7: Outcome indicators at the community level**

| **Assignment group** | **Treatment** | | **Spillover** | |
|---|---|---|---|---|
| **Sample size** | (n=4) | | (n=2) | |
| **Reporting period** | Base | End | Base | End |
| **A. How did the size of sustainably managed forest area change?** | | | | |
| Number of villages that report that their forest size […] in the past two years | | | | |
| *Decreased* | 2 | 3 | 0 | 0 |
| *Stayed the same* | 1 | 1 | 1 | 1 |
| *Increased* | 1 | 0 | 1 | 1 |
| Number of villages with efforts at reforestation | 1 | 2 | 1 | 1 |
| Index for planning and forest protection | 0 | 1.5 | 0 | 0 |
| Number of villages with protection of endangered species | 2 | 2 | 0 | 0 |
| **B. How did the management structure of community forest areas change?** | | | | |
| Existence of regulations about the use and protection of the community forests in the village | 4 | 4 | 2 | 1 |
| Percentage of forest area protected | 57 | 100 | 25.9 | 98 |
| Regulated activities in the community forest | | | | |
| *Logging* | 4 | 4 | 2 | 1 |

### *How did the size of sustainably managed forest area change?*

Regarding the size of forests, unfortunately, most of the communities did not consistently report on the size of the forest area[23] Therefore, we are not able to quantify the changes in forest size in an indicator. Instead, we report on responses from community leaders on whether the community forest size increased, stayed the same, or decreased in the past two years. The results show more favourable trends in the spillover villages than in the treatment villages. Three out of 4 community leaders in the treatment villages report that forest size has decreased while one report that it stayed the same. In spillover communities no such negative reports are observed. These negative reports are confirmed in the qualitative study (conducted only in treatment villages). Respondents reported a "rapid decline in the number of native trees, plants and animals", and that "oil palm plantations cut down many trees and this created a water shortage" (see Annex III).

On the other hand, we see a small improvement in how sustainable the forests are managed. At endline, about 2 out of the 4 treatment villages reported efforts at reforestation, plan forest protection and protect endangered species. The result on forest protection is based on an index constructed from three variables related to whether there is a map on natural resources in the village, a special planning programme and a forest protection and conservation programme. At baseline, none of the treatment villages reported to conduct such planning, at endline (on average) 1.5 village did. In the spillover villages, we observed no change in how sustainable the forests were managed.

### *How did the management structure of community forest areas change?*

The main striking finding for the forest management outcome variable is the large increase protected forest in community leaders report. At endline, both in treatment and spillover communities, almost all of the forest lands are considered protected. This is in line with the findings on sustainable management on forest land, which also improved.

Further, there are no clear trends visible comparing the treatment and spillover groups. In all 4 treatment communities there were community meetings about forest land, both at baseline and endline. In the spillover communities, this only happened in half of the villages at endline. Logging is generally regulated. At the household level, villagers report that there are rules and regulations on the use of forest land. At endline, both in treatment and spillover communities, the large majority of villagers report that there are regulations regarding the use of community forests. For this variable, the increase has been the largest in the spillover communities.

[23] For the treatment villages, the size of two of the 15 community forest plots is not known at the baseline. In addition, the reported total area of community forests and the reported total size of community forest plots differ a lot, which should be the same (559.2 ha and 1366.5 ha respectively at the endline for the treatment villages). Also, one of the treatment villages reports on having no forest at the endline, while it says that it does have community forest plots. Perhaps the people who were interviewed for the evaluation, have not been involved in the participatory mapping in the EA project, or they may have misunderstood the question because in some villages other organisations had done mapping activities.

### *How did the attitude and awareness of households change towards natural resource management?*

Most attitude variables come from question posing statements, and asking respondents to indicate whether they agree or disagree on a -2 to 2 scale. The variables have been scaled so that +2 always refers to an outcome in line with project objectives (except for the index on oil palm plantations).

There are few remarkable changes in attitudes regarding natural resource management over time. Generally households have a somewhat positive attitude regarding the sustainable management of forests. The reports from the community leaders are more positive. They report a substantial increase in treatment villages and a small decrease in spillover villages. At endline, the levels were all rather high in the 1-2 range, on the -2 to 2 scale.

Regarding oil palm plantations, households in treatment communities are generally more critical compared to the households in spillover communities. Both in baseline and endline, around 38 percent of households in treatment communities think that oil palm plantations can be beneficial for their family, and the index towards oil palm plantation is clearly negative. Treatment communities on the other hand are more neutral about oil palm on plantations and at endline, the 48 percent thought oil palm plantations could be beneficial for their family.

### *Do the communities feel more empowered to protect and manage their natural resources?*

Two indices were constructed to assess the sense of control of villagers. The first related to their own life, and the second related to the village lands. For both indices, the indices have values around 1, indicating that households feel like they are in control of their lives, and land. There are no noticeable changes across treatment and spillover groups, not across baseline and endline.

### *Are the landscape models and conservation schemes protecting ecological and cultural heritage in the community?*

Table 7 reports the number of people involved in traditional crafts. While the use of natural dyes is substantially higher in treatment villages compared to spillover villages, both groups saw a decline in this art over the project period. According to community leaders, the number has decreased over the project period, both in treatment and spillover villages. In treatment villages the number of people is substantially higher, 274 people in treatment versus 55 in spillover villages. The villager survey confirms these patterns. Table 15 in Annex IV reports on how the forest contributes to the family's livelihood. The use for natural dye declined in both groups. At endline, in treatment villages 36 percent of households reported to use the forest for this purpose, while in spillover villages 3 percent did so.

There are however some other reports on the use of forest land which could indicate a positive impact of the project. Again referring to Table 15, the use of the forest for getting wood for building and manufacturing has declined by 31 percent in treatment villages, which could be both as a result of the declining size of the forest, or the increased conservation of remaining forest. At the same time, there is a substantial increase in the number of people who report to go the community forest almost every day (18 percentage point, see Table 6). But it is not so clear for what purpose this is. In the use of the forest questions (Table 15), the "other "category increased the most (18 percentage point).

***Are landscape models recognised by the local government?***

None of the forest maps had been recognized by the regional government. Only the four treatment villages have requested the approval of the government for the mapped community forests. Their application is supported by the forest management society supports the application. However, the project has not yet been successful in securing the approval of community forest areas due political dynamics at the sub-district.

It seems like that there is a positive attitude in villages on the sustainable use of community forests. People are aware of rules regarding forest use a

In addition, one of the potential spillover villages has also signalled its intention to preserve its community forests.

# 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

## 8.1. Methodology

We use before-after methodology for the evaluation of the NTFP-EP project complemented with a qualitative survey. We have not sampled any comparison villages because the small sample size would not allow statistical analysis of the differences between the treatment and comparison group. Instead, we opted for using mixed methods: complement the quantitative survey with in-depth interviews to understand the driving factors behind the changes in the outcome indicators.

In addition, we rely on the results chain discussed in section 3.3 to validate the impacts of the project on the outcome variables: only if the changes in the outcome variables are accompanied by improvements or accomplishment of the outputs and intermediate results of the project can we attribute changes to the project (necessary but not sufficient condition).

## 8.2. Results

The data indicate that the project has been implemented seriously. Over half of the respondents in treatment villages knew of participatory mapping, and over 40 percent participated. The qualitative study, however, indicates that the maps have not been used much in the villages.[24] Instead, the NGO has focused on getting maps legalized at the local government in order to obtain more land security for community forest. Unfortunately, to date, this strategy has not been successful. Despite the maps, land disputes with neighbouring villages are still common. This possibly could have been avoided if the NGO had given more attention to creating ownership of the maps among villagers. In addition, Table 20 shows that land disputes with businesses has increased during the evaluation period.

[24] One explanation for this could be that, at the community level, there could have already been clear maps and boundaries of the land before the mapping. However, this information is often ignored by oil palm companies and the government. That is the reason why the project is focusing on getting maps legalized by the local government in order to increase land security for communities.

We generally observe a quite high awareness among villagers on the importance of using the forest in a sustainable way. Most of the remaining forest land is considered protected. People are aware of rules regarding the use of the forest. This awareness raising was an objective of the project and seems to have been successful, although the levels did not change much over the evaluation period. Therefore, it can be argued that any impact that the project had on the attitude of villagers regarding natural resources has been already realized prior to the baseline survey. As a consequence, changes (between the baseline and endline period) in the communities' attitude and practice towards natural resource management cannot be attributed to the NTFP-EP project but rather to other activities of JMM and PRCF in the project communities.

Nonetheless, data from the qualitative study indicates that the mapping process has helped the communities to realize how dependent they are on their forest resources – on plants just as well as animals –, and it made them more aware of the importance of preserving their forests. Hence, qualitative data suggests that the project was partially successful in this dimension.

Unfortunately, the project has not been successful in protecting community forests. The treatment villages report decreases in forest land, which is confirmed by qualitative work. Also the reluctance of the district government to legalize the maps indicates the forces behind the expansion of oil palm plantations are still strong.

## 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular we look at the size of the impact and whether the project addresses an important issue for the beneficiaries.

Unfortunately, we do not observe a significant change in the outcome variables, which is due to the lack of project activities. However, the issue of recognition of indigenous peoples' sovereignty over their community forests addressed by the project are very important for the communities. However, only 15% of the respondents mentioned the conservation of traditional values and culture as one of the most important issues in their village in the endline survey, which is a marginally significant ($p=0.061$) increase compared to 6.3% at the baseline survey. Nonetheless, most respondents are mostly concerned about more urgent matters like education, health care, access to clean water and the road conditions/access of the village (see Annex IV).

The importance of the project can be seen, however, from a different perspective: the 4 project sites were selected as example cases for participatory mapping and eco-cultural zoning. Through the project, NTFP-EP has built the capacity of JMM and PRCF to carry out the participatory mapping activities. Based on information from these NGOs, participatory mapping is now in progress in many more villages in Sintang.

# 10. Evaluation question 4: Efficiency of project

This subsection will answer evaluation question 4: Were the development interventions of the Southern partner organisations efficient? Unfortunately, we are not able to evaluate neither the efficiency nor the effectiveness of the project because the output of the project has not been completely realized.

Nonetheless, we present the available cost information for the NTFP-EP project, and alternative ways of calculating the cost per unit are presented. We also provide benchmark for the unit costs of participatory mapping projects.

## 10.1. Project costs

In order to collect information on the project costs, we conducted a structured interview with the executive director and finance officer[25] of NTFP-EP on 14 March 2014 using the 'budget survey' as described in section 5.1. In addition, we consulted the annual finance and progress reports of NTFP-EP. The cost figures are based on actual expenditure data.

Table 9 summarizes the data on project expenditures for the project period 15 September 2011 – 15 March 2014 by year. Column 1 shows the number of project months per year; the total project costs per year are reported in column 2 in Indonesian rupiahs (IDR) and in column 3 in euros (using a yearly average exchange rate).[26] The total project budget was 1,627,206,000 IDR[27], from which only 61.1% has been spent until end 2013.[28] All project costs have been funded by IUCN.

Column 5 in Table 9 presents the project costs in Sintang as reported by Mr. Irawan, the local project coordinator. These costs include local staff costs (salary of Mr. Irawan), the costs of participatory mapping and consultation with the local government to approve the results the mapping and change the status of the mapped forest areas from agricultural land status to forest land status. The costs of JMM and PRCF related to these activities are included in column 5. However, other activities of PRCF (previous mapping activity) and JMM (savings and credit cooperative) are not accounted for. In addition, institutional costs[29] of the project are also not accounted for in column 5. Overall, the costs of the project in Sintang account for 18.4% of all costs between 2011-2013.

[25] The interview was conducted with Jusupta Tarigan, executive director, and Wiji Rahayu, finance officer. Additionally, we have also received information from the project coordinator of NTFP-EP in Sintang, Mr. Irawan.

[26] Unfortunately, we do not have information about the exchange rate used for the project. Instead we use the annual average exchange rate from http://www.oanda.com/currency/historical-rates/. The exchange rates used are 12,264 IDR/EUR in 2011, 12,087 IDR/EUR in 2012 and 13,923 IDR/EUR in 2013.

[27] Source: NTFP-EP Finance report 2013.

[28] The project budget was 135,210 EUR according to the NTFP-EP grant agreement with IUCN in 2011.

[29] Institutional costs are budgeted to be 13% of the total costs of the project.

**Table 9: Overview of project costs**

| Year | Nr. of project months | Total costs [IDR] | Total cost [EUR][1] | Percentage of costs funded by CFA | Project costs in Sintang [IDR] |
|---|---|---|---|---|---|
| **2011** | 3.5 | 88,021,903 | 7,177.26 | 100% | 49,418,467 |
| **2012** | 12 | 602,029,385 | 49,807.18 | 100% | 92,621,723 |
| **2013** | 12 | 303,614,154 | 21,806.66 | 100% | 40,602,635 |
| **2014** | 12 | N.K.[2] | N.K. | 100% | 45,139,991 |

Sources: Budget Survey and NTFP-EP Finance report 2013.
Notes:
1. Annual average exchange rate is used. Data is obtained from http://www.oanda.com/currency/historical-rates/
2. N.K.= not known

## 10.2. Unit costs of project

Next, we report on the unit cost of the project. The unit of the project could be considered as beneficiary households, villages or hectares of forests mapped. Table 10 reports on all these units in Indonesian rupiahs and in International dollars (Int$). International dollars at 2011 prices[30] are used for the cost per unit calculation because it takes both purchasing power parity and inflation into account that would not be the case if we reported the unit costs in euros. Hence, using Int$, the costs can easily be compared across time and countries.

First, looking at the cost per beneficiary households of the project component in Sintang, the project works in 4 hamlets of 4 villages covering a population of 1,018 people or approximately 275 households.[31] Based on this number, we calculated the cost per beneficiary households per year in column 1 and 2 of Table 10. The last row in the table shows that overall the project costs amount to 218.77 Int$ (2011) per household.

Columns 3 and 4 report on the costs per village accounting for the 4 project villages. The overall costs of the project per village were 15,040.63 Int$ (2011) per village.

Finally, columns 5 and 6 report on the costs per $km^2$. We estimate the size of forests using information from the baseline community survey. According to information obtained from the village leaders, the total forest size in the 4 treatment villages were 8,330 hectares or 83.3 $km^2$. Using this information, the project costs per $km^2$ amount to 722.24 Int$ (2011) for the total project period.

However, it has to be kept in mind when interpreting these data that participatory mapping activities were only conducted in 2012, while in the remaining project period the project activities were focused on lobbying at the district level and funding the salary of the local staff.

[30] The following exchange rates are used based on PPP conversion factor using the World Development Indicators: 3,606.57 IDR/Int$ in 2011, 3,636.38 IDR/Int$ in 2012, 3,682.25 IDR/Int$ in 2013 and 4,530.90 IDR/Int$ in 2014. Source: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#

[31] The number of households are estimated using the average household size in the project villages, which is 3.7 people per household.

**Table 10: Unit costs of project**

| Year | Costs per beneficiary HH | | Costs per village | | Costs per km$^2$ | |
|---|---|---|---|---|---|---|
| | [IDR] | [Int$] | [IDR] | [Int$] | [IDR] | [Int$] |
| **2011** | 179,704 | 49.83 | 12,354,617 | 3,425.59 | 593,259 | 164.49 |
| **2012** | 336,806 | 92.62 | 23,155,431 | 6,367.72 | 1,111,905 | 305.77 |
| **2013** | 147,646 | 40.10 | 10,150,659 | 2,756.65 | 487,427 | 132.37 |
| **2014** | 164,145 | 36.23 | 11,284,998 | 2,490.67 | 541,897 | 119.60 |
| **Total** | **828,301** | **218.77** | **56,945,704** | **15,040.63** | **2,734,488** | **722.24** |

Sources: E3 Budget, Household and Community Surveys and NTFP-EP Finance report 2013.

### 10.3. Cost-benefit

It is possible to calculate the costs per unit. However, given that the produced maps have not yet been approved by the local government, the output of the project is not yet completed in Sintang. Therefore, it is not very informative to report the cost per unit at the current stage of the project. In addition, the benefit of the project is difficult to quantify as discussed in section 8.

### 10.4. Benchmark costs

Regarding costs of participatory mapping projects in general, the Synthesis team found Dongus et al. (2007) which report the detailed costs of a community-based mapping procedure without electronic devices in the field for Tanzania.[32] The mapping activity was aimed at the surveillance of malaria mosquitoes' larval. However, the method of implementing the participatory mapping is similar to the NTFP-EP project. Synthesis team (2014) report that the costs of the mapping were 2,270.00 Int$ (in 2011 prices) per km$^2$.

## 11. Contribution of Capacity Development and Civil Society

The NTFP-EP project has also been selected for the Civil Society Strengthening component of the MFS II Evaluation. The findings in this report are supported by the findings of the civil society evaluation. In addition, the civil society report points a shift in NTFP-EP strategy from direct community interventions to policy advocacy engagement, which means that NTFP-EP is relying more on intermediary organisations to conduct community level work and this strategy is chosen as part of a strategy to strengthen local CSOs. NTFP-EP's project in Sintang is a good example of this new strategy. Nonetheless, the report points out that NTFP-EP and its partners need to work more politically and strategically in order to achieve the desired project results (approval of the produced maps and eco-cultural zones by local government). Finally, the results of the civil society evaluation suggest that NTFP-EP should have included a clear and focused lobby strategy for influencing government policies into the project design rather than assuming that local partner organisations are able to deliver results in this area.

[32] The procedure included the development of sketch maps by the community members, laminated aerial photographs as well as the actual GIS analysis.

# 12. Conclusion

The NTFP-EP project focuses on preserving forests with high eco-cultural value in order to conserve not only the forests but also traditional handicrafts relying on forest resources. One of the strongest features of this project is that it works with local NGOs which have a long term engagement with the communities. The project has been implemented in areas where forests are under threat of conversion into oil palm plantations. The activities are clearly relevant for the communities, and for the environment: the project served as an example as participatory mapping is now in progress in many more villages in Sintang. Hence, it seems that the project has been able to win the support from villagers and local leaders.

The collected data suggest that the project was only partially successful in delivering on its objectives. On the one hand, villagers are more aware of the importance of their natural resources (qualitative study) and sustainable forest management has improved in the project area (community survey). On the other hand, villages are not able to use the produced map (qualitative study) due to the ongoing efforts at legalizing the map by the local government. In both treatment and spillover communities, there has been a sharp increase in the fraction of villagers reporting land disputes with neighbouring villages and the business or industry.

Despite the (small) improvement in sustainable forest management, the project has not been successful in stopping forest conversion. A possible explanation would be that the conversion would have gone faster without the NGOs efforts. Another explanation is that the project has been implemented in areas where forests are under threat of conversion into oil palm plantations. .

The results of the NTFP-EP project are partly in line with the findings in the literature. While the literature shows both increases in awareness and in actual actions in the areas of natural resource- and land management, the NTFP-EP project only shows an increase in awareness and in sustainable forest management but not in the actual use of the map (e.g. formal legislation). Moreover, the support of villagers and local leaders regarding sustainable forest management was not enough to stop forest conversion. The findings with respect to the increase in land disputes are in line with the literature, where projects either show similar levels of or more land conflicts in treatment villages though these are probably due to selection bias just like in the NTFP-EP project.

Finally, the MFS synthesis team asked to score each project along a few indicators. Table 11 displays the indicators and the scores we deemed valid for the project.

**Table 11: Overall project scoring**

| Statement | Score | Comment |
|---|---|---|
| **1. The project was well designed** | 8 | The project worked with local NGOs who have a long working relation with the project villages. The project was designed to develop the capacity of these NGOs. The capacity of villages was developed to a lesser extent. |
| **2. The project was implemented as designed** | 7 | Project activities at the village level were implemented as planned, but lobbying at the local government was not successful. |
| **3. The project reached all its objectives** | 6 | The project did not achieve its final objective due to lack of sustained support from the local government. |
| **4. The observed results are attributable to the project interventions** | 7 | The local NGOs also worked with the project villages using other source of funding. Only mapping activities were financed by the project. |
| **5. The observed results are relevant to the project beneficiaries** | 8 | The project is relevant for the beneficiaries. However, unfortunately not all project results have been achieved. |
| **6. The project was implemented in the most efficient way** | 7 | Working and developing the capacity of local NGOs is efficient as they may be able to replicate the results of the project elsewhere (mapping). However, not all project results have been achieved, and the results of the mapping at village level may not be sustainable due to a lack of knowledge on how to use the maps. |
| Notes: Scores are on a scale of 1 to 10, with 1 being “no agreement at all” and 10 being “completely agree with statement”. | | |

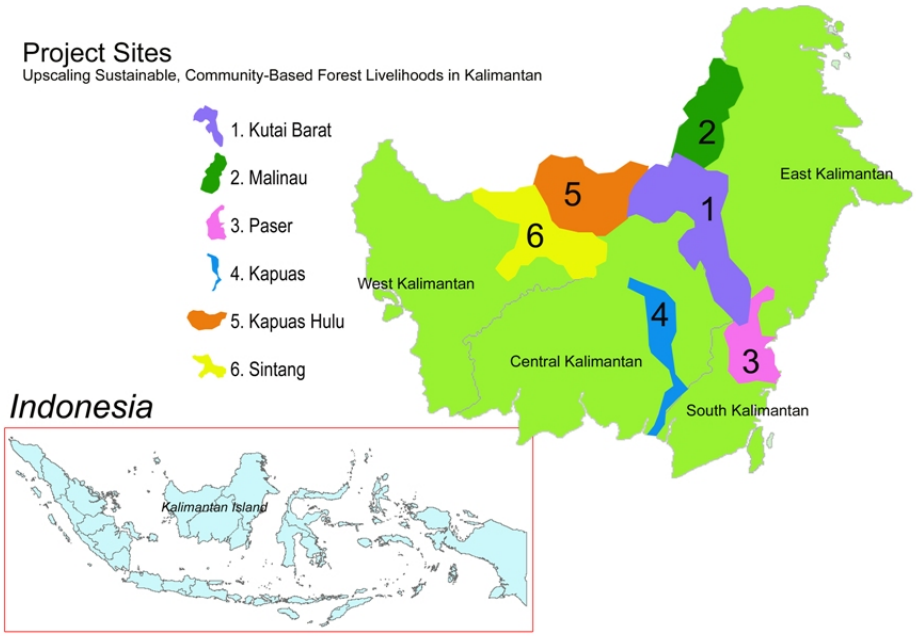
### *Project documents of NTFP-EP:*

- Finance report 2013



# Annex I. Project description

The final objective of the 'Up-scaling sustainable, community-based forest livelihoods in Kalimantan' project of Non-Timber Forest Products Exchange Programme (NTFP-EP) is to empower forest-based communities to use and manage their forest resources in a sustainable way. In particular, NTFP-EP focuses on sustainable use of non-timber forest products. The project works with local partner organisations in four areas of Kalimantan. Figure 3 shows the project locations. The objectives for the areas are:

- Up-scaling and ecologically "upgrading" community-based forest livelihoods (e.g. forest honey) in Kapuas Hulu and Paser.
- Introducing and testing community-based forest management and tenure schemes and participatory spatial planning towards more inclusive land use planning in Malinau.
- Promoting and better profiling an example of a landscape level model of ecological and culture-based livelihoods and conservation schemes in Sintang.
- Improve the leverage of NTFP producers through better organisation and through the exploration of market mechanisms (certification) in Kutai Barat and Kapuas.

To this end, NTFP-EP catalyses and supports activities that strengthen the capacity of local partner organisations that help communities to defend their rights and protect ecological and cultural sites to be free of extractive/industrial development; and that work on improving the position of local producers in competitive markets of non-timber forest products. However, the project activities are subcontracted to partner organisations.

**Figure 3: Map of project locations**

The project activities and expected outcomes are described below per project area:

### *Project in Kapuas Hulu and Paser*

**Activities**

The following activities are planned to be implemented by partner organisation Indonesia Forest Honey Network (*Jaringan Madu Hutan Indonesia*, JMHI):

- Assessment and training support to two new Kalimantan partners (KABAN, PADI) on honey sustainable harvest and hygienic honey processing.
- Field visits to mentor and monitor the trainees in the implementation of their new skills and knowledge in sustainable honey harvesting.
- Establishment of a pool of sustainable honey harvesting and hygienic honey processing trainers.

**Outputs**

It is expected that these activities will lead to the following outputs:

- Sustainable harvest and management of forest honey.
- The outreach by CSOs toward other communities is promoted.

**Outcomes**

The implemented activities work directly on the empowerment of forest-based communities. In Kapuas Hulu and Paser, the livelihood of households is expected to increase due to sustainable harvest and management of forest honey.

### *Project in Malinau*

**Activities**

The following activities are planned to be implemented by partner organisations LP3M and BEBSiC:

- Participatory community mapping and zoning.
- Learning visit Punan-Penan: sharing community mapping and conflict resolution techniques
- Cross visit to a recognised village forest (*hutan desa*).
- Workshops on village forestry (*hutan desa*) and community forestry (*hutan kemasyarakatan*).
- Workshops with government to overlay community maps with the existing spatial plans.

**Outputs**

It is expected that these activities will lead to the following outputs:

- Target communities are organised and empowered to manage and benefit from ecosystems and claim their rights on the utilisation of natural resources.
- A process of government recognition of Punan land use and livelihood systems (village forestry and community forestry) has started.

**Outcomes**

The workshops on participatory mapping and village/community forestry increase the control of target communities over their lands.

### *Project in Sintang*

**Activities**

The following activities are planned to be implemented by partners PRCF, JMM and KOBUS:

- Landscape models of sustainable livelihood: mapping and zoning orientation, and planning.
- Zoning preparation; village meeting, district level meetings.
- Field visit to Sumatra to learn natural dyeing techniques (cooperation with WARSI).
- Workshops with local government on landscape model approach and sustainable livelihood options.

**Outputs**

It is expected that these activities will lead to the following outputs:

- Target communities are empowered and organised to manage and benefit from ecosystems and claim their rights on the utilisation of natural resources.
- Establishment of ecological and cultural zones which are free of extractive/industrial development initiatives and where sustainable livelihood is promoted.

**Outcomes**

The workshops on participatory mapping and village/community forestry increase the control of target communities over their lands.

### *Project in Kutai Barat and Kapuas*

**Activities**

The following activities are planned to be implemented by partners KpSHK and RMU:

- Workshops for rattan eco-certification processes.
- Field trials to test standards and rattan eco-certification processes.
- Private sector dialogue to introduce the participatory certification process and to invite joint testing and acceptance of the same by private sector (IKEA, etc.).

**Outputs**

It is expected that these activities will lead to the following outputs:

- Establishment of National level rattan organisation of farmers to increase bargaining position with market and government players.
- Establishment of standards and initial market relations for alternative (participatory) certification.

**Outcomes**

The establishment of national level rattan organisation and community-based certification improves the livelihood of rattan farming households.

### *Overall project risks and assumptions*

The project proposal identifies the change of currently supportive political perspectives and agendas as risks faced in the implementation of the project. In addition, the project also relies on the committed engagement of the targeted communities in the project activities. Long negotiations with the communities could delay the project.

# Annex II. Overview outcome indicators and indices

This annex provides a detailed description about the used outcome indicators. In addition, it shows the variables which were used to construct the outcome indicator indices.

Data from the community survey as well as data from the household survey were used. The outcomes are reported for treatment villages and spillover villages for the baseline and the endline surveys. The treatment group consists of 4 villages whereas the comparison group consist of two villages. For the household data, the sample size can differ between tables because the answer 'don't know' is changed to a missing value or because a respondent could skip a question if he/she had no knowledge about what was asked (answered 'no' to a previous question). This was the case if a respondent answered 'don't know' to a question with a scale, so it did not make sense to incorporate the answer in the scale. The missing value due to a skip was kept missing if we only wanted to know the percentage of the respondents that knew about the topic of the question that answered 'yes'. If we were interested in the answers of the total sample, it made sense to change the 'don't know' answers to 'no' because that way the percentage of all the respondents that answered 'yes' could be reported.

The 'change' variable measures the difference between the baseline and endline outcomes is for respondents that were in the baseline as well as the endline. The p-value indicates whether this change is significant.

### *Panel A. How did the size of sustainably managed forest area change?*

For the size of the forest, the following data from the community survey is used:

- Change in forest size: the number of villages is shown that reported that their forest size has decreased, stayed the same or increased in the past two years.

Data from the community survey are used for outcomes on efforts at forest protection.

- Reforestation: it was asked whether activities have taken place in the village on efforts at reforestation. If this question was answered with 'yes', the last time the activity occurred was reported. If the activities had taken place in the last 2 years, they were included in the table.
- Index for planning and forest protection: this index contains three questions about plans and programmes for forest protection. If the answer was 'yes' to at least one of these questions, the village is counted in the table. Missing answers are considered as 'no'.
    - Is there a map/plan about natural resources in your village?
    - Is there a spatial planning programme in your village?
    - Is there a village forest protection and conservation programme in you village?
- Protection of endangered species: after the endangered species of flora and fauna in the village forests were reported, it is reported which villages have any regulations protecting these species.

### *Panel B. How did the management structure of community forest areas change?*

For management of natural resources, data was collected on the existence of a management structure and the level of satisfaction with the management structure.

- Existence: the table shows the number of villages that report to have any customary laws protecting the natural resources of the village.

- Percentage of forest area protected: per community forest plot it was asked whether there are regulations for the plot. If there are regulations for the plot, it is considered protected. This indicator is calculated by adding up the sizes of the protected community forest plots and dividing this by the total size of community forest plots (see Table 7) for the treatment villages and the spillover villages separately. At the baseline, the size of two of the 13 protected community forest plots is not known for the treatment villages, so the indicator should be higher.
- Regulated activities in the community forest: this indicator lists all the regulated activities in the community forest. If a regulated activity was not already listed in the survey, it was listed at 'other'. This is the case for 'sale of trees'. One village of the treatment group reported 'keeping the forest' as other regulated activity. This is reported under regulations for 'logging'. The number of villages is shown for which the activity is regulated in the community forest.

  The following four indicators show the number of villages that confirmed that it is applicable to the village:

- Meetings about community forest use and management in the past 12 months
- Regulations are communicated to the villagers by community meetings, signs at the forest, farmer group meetings or through a letter
- Regulations are communicated to all villagers (including women and children)
- Regulations are taught at school

Household level variables:

- Percentage of respondents who report that there are any rules/regulations about the use of community forests in the village: percentage of respondents in the household survey who know about the existence of rules/regulations about the use of community forests.
- Satisfaction with regulations (scale from -2 to 2): Satisfaction with regulations (scale from -2 to 2): level of agreement with the statement: 'Natural resources are not sufficiently protected by the village regulations' (scale -2 to +2): the respondents in the household survey could answer this question with 'strongly agree' with a weight of -2, 'agree' with a weight of -1, 'neither agree nor disagree' with a weight of 0, 'disagree' with weight 1, 'strongly disagree' with weight 2 or 'don't know'. The weights for agreement are negative and the weights for disagreement are positive, since agreement with the statement shows dissatisfaction with the regulations. The indicator provides the average of the weights for the treatment villages and for the spillover villages.
- Index for trainings on aspects of natural resource management: the number of villages that reported that activities had taken place in forest/natural resource mapping, awareness raising campaigns about use and protection of natural resources, training on natural resource management, training on the sustainable use of natural resources or training on eco-forestry.

### *Panel C. How did the attitude and awareness of households change towards natural resource management?*

The following indicators show the level of agreement with the indicated statement on a scale from -2 to +2, for which 2 is 'strongly agree', 1 is 'agree', 0 is 'neither agree nor disagree', -1 is 'disagree' and -2 is

'strongly disagree'. The average over the respondents is calculated for the treatment villages and the spillover villages. The indices are constructed by taking the average over the level of agreement with the included statements. Sometimes agreement with a statement indicates a negative attitude, while the index shows a positive attitude. Therefore, the scale for these statements were reversed, so that -2 means 'strongly agree' and +2 means 'strongly disagree'. That way those statements can be used in the average. They are indicated by (negative). One indicator reports on a percentage of respondents.

- Dependence on forest resources:
    - My family depends on the forest four our livelihood.
- Index for positive attitude towards sustainable forest use:
    - I take from the forest what my family needs without thinking about others (negative)
    - I think all villagers should use the community forest as they want (negative)
    - We have to use our forests with moderation and respect.
- Index for positive attitude towards sustainable forest use (community survey):
    - In this village, people have a strong sense of preserving the environment.
    - There is a need to raise the environmental awareness of the people in this village.
- Index for access to forest resources:
    - Villager's access to forest resources is fair in my community.
    - I'm satisfied with my family's share of forest resources in this village.
    - Out forests are abundant and luscious.
    - I feel that my access to forest resources is secure in this village.
- Percentage of respondents who think that an oil palm plantation in the village is/can be beneficial for him/her and his/her family
- Index for positive attitude towards oil palm plantations:
    - I'm afraid that our community forest can be converted into oil palm plantation (negative)
    - I'm in favour of oil palm plantations in our village.

We also wanted to report on the attitude towards disputed forest areas with neighbouring villages and the attitude towards disputed forest areas with local government/industry. However, in the baseline there was only one respondent that said that his/her village had any dispute or conflict about the ownership or use of forests with neighbouring villages and only two respondents said that their village had dispute with the industry. Conflicts turn out not to be an issue in this area. Therefore, the sample size is not sufficiently large enough to calculate the outcome indicators for the comparison group at the baseline.

### *Panel D. Do the communities feel more empowered to protect and manage their natural resources?*

The method of construction of the indices is the same as with the indices for households' attitude towards forests/plantations.

- Index for sense of control regarding own life

  - Often I feel that I have little influence over the things that happen to me (negative)
  - On the whole, I'm able to take charge of my life.
- Index for sense of control regarding land:
  - I think there is nothing we can do to keep our traditional lands against the government/industry (negative)
  - I'm confident that if we, the villagers, act together, we can make things happen for this village.
  - I think that our village has the right to our traditional lands.

### *Panel E. Are the landscape models and conservation schemes protecting ecological and cultural heritage in the community?*

For the number of people involved in traditional crafts, the following data is provided by the community survey:

- Number of people involved in traditional crafts: the number of people involved in weaving and natural dyes, rottan farming, pottery, rottan weaving, other handcrafts, forest honey gathering and traditional medicine were reported. It was also possible to fill in the number of people in other traditional crafts if this was the case. This indicator shows the total number of people involved in traditional crafts for both the early treatment and the comparison group by adding up the number of people involved in the different crafts in the two villages.

# Annex III. Description of the study location

This annex provides a description of the surveyed villages at the time of the baseline survey in 2012.

## *Treatment villages*

**DESA ENSAID PANJANG**

Ensaid Panjang village is located in the sub-district Kelam Permai (district Sintang). This village is located about 60 km away from Sintang and about 40 km from the capital city of the sub-district. This village is a transmigration destination, coming for example from Java. But at the same time a Rumah Betang the (the traditional long house of Dayak ethnicity) is still in place housing 28 families. Its uniqueness has attracted many tourists either local or international to stay in this house to experience and understand the pure custom and tradition of the Dayak. Electricity power is not available yet, but Rumah Betang has one electricity generator that is used for all during the evening.

The main livelihood of villagers is rubber. Aside from growing rubber trees, villagers also grow rice. They now apply more modern methods of farming by cultivating one land instead of cutting down the trees in the forest to open new farm and leave the old ones. They are now aware that their old method of farming is destructing the environment and they forbid it now. Women are still preserving the weaving tradition.

Like the other villages, Ensaid Panjang village has oil palm companies trying to operate in the village. However, villagers insisted that they would preserve their community forest and refused to converse them into oil palm plantation. Participative mapping of the forest have been done before with assistance of PRCF Indonesia. One of the purposes of forest mapping is to protect the plants that people use to colour their woven cloth.

**GEMBA RAYA VILLAGE**

The village Gemba Raya is located in Kelam Permai sub-district (Sintang District). Most of the villagers' houses are laid on the sideways of the main road, which is mainly of good quality. This village is about 42 km away from Sintang, and about 25 km away from the capital city of the sub-district. The majority of the villagers' ethnicity is Dayak. Electricity power has been available in this village for almost 2 years. In addition, the gas station provision is sufficient to support the daily economic activities.

Most villagers are rubber farmers. Almost all households in this village own their own rubber trees. Besides, most households also grow other plants such as rice or corn for their household daily consumption. Although rubber prices are quite high, daily needs' prices are relatively high as well and so saving is low and the wellbeing of the residents is still around average.

Villagers refused the offer from oil palm plantation companies to convert the forests. They were aware that oil palm plantation would only damage environment and bring no advantages for the people. Some participatory mapping has been done in the village in August 2012, assisted by JMM.

**KARYA JAYA BAKTI VILLAGE**

This village is about 60 km away from the capital city of the sub-district. All of the inhabitants are from the Dayak ethnic group. It is very difficult to access this village, particularly in the wet season because the road is then muddy and slippery. The road was built in 2007, since the oil palm companies have been

operating in that area. Before that, people used water transportation through the river to go in or out of the village. Since the area is remote and its location is hilly, electricity power is not available in this area.

The majority of villagers are rubber farmers. Some farmers however use their free time to work in the oil palm plantations. Though, many of them are complaining about the work and the accompanying reward. Other villagers plait plants or bamboos into handicraft in their free time. Some of the handcrafts are sold individually, and some are bought by KOBUS foundation and JMM.

The village has 2 major oil palm companies active in the neighbourhood; PT Grand Mandiri Utama and PT Agro Sentosa Lestari. Both companies' camps and branch offices are located in this village. The land of many people has been traded to be converted into an oil palm plantation with a deal of profit share 7:3 (i.e. the company will receive 70% of the total profit while land owner 30%). At first, companies promised the people to build public facilities for the villagers such as schools, a health centre, and a road. However, they have not fulfilled these promises yet except for part of the road as that was for their own advantage. Furthermore, the promise of sharing profit was unfulfilled either. In addition, several problems have occurred in the village since the operation of oil palm companies. One of the problems concerns water pollution due to the chemical waste coming from the oil palm. Even some of the springs have gone and villagers faced difficulties in attaining water.

Since the oil palm plantations are growing and expanding and people awareness to preserve community forests are increasing as well, they decided to conduct forest mapping. The mapping activity had been conducted only in one dusun and 2 forests have been mapped.

**EMPAKA KEBIAU RAYA VILLAGE**

The village Empaka Kebiau Raya is located in the sub-district Binjai Hulu with the capital city on about 80 km (district Sintang, 15 km away). This village is the result of an extension of the area in 2008. The access to this village is considered hard because the road is clay and it is very slippery during wet season. As the village can be easier reached with the use of its surrounding river Kebiau in the wet season each household has their own boat. However, this river is dried half a year during dry season. As electricity power is not available yet in this village, each household has their own generator or oil lamps for lighting.

Most of the villagers are rubber farmers but also work as freelancers in the oil palm plantations nearby. Besides that, people are growing rice and corn in their farm just to fulfil their household daily needs. In this village, the farming work is done in groups. They have 10 to 20 members per group to cultivate the land by rotation.

Just like the other villages, oil palm plantations are operating in this area. The companies owning the plantations are again PT Grand Mandiri Utama and PT Agro Sentosa Lestari.

### *Potential spillover villages*

**BANING PANJANG VILLAGE**

Baning Panjang village is located in Kelam Permai sub district and has 5 dusuns. This village is located about 50 km away from Sintang and 30 km away from the capital city of the sub-district. This village is one of a transmigration destination area; half of the inhabitants are originally from Java, the other half is local people of Dayak ethnicity. The condition of the main road is very poor, mainly caused by the trucks

passing by which transports palm oil. Electricity power is available. Most villagers are living from rubber farming, which makes a good income. Economic conditions seem more advanced seen the many stores and restaurants, and houses are well build.

Baning Panjang has lost most of the forest areas. Participative mapping on forest has never been conducted. There are 2 major plantations in this village, belonging to PT Grand Mandiri Utama and PT Agro Sentosa Lestari. Since the plantation is located quite far from where the residents live, only few of them are working in oil palm plantations.

**SUNGAI MARAM VILLAGE**

Sungai Maram village is about 65 km away from District Sintang and about 45 km from sub-district Kelam Permai. The village is a transmigration area, with migrants coming from Yogyakarta and East Java. People's dwellings are located in lower grounds, while the plantations are on higher grounds. The village has no electricity power yet, but it is planned for 2013. Most of the people in this village are rubber farmers, but also grow rice, corn and vegetables. Since the village is located nearby oil palm plantations, some of villagers work directly for the oil palm companies or indirectly when opening restaurants.

Community forests in this village have decreased a lot since they have been converted into oil palm plantation owned by PT Grand Mandiri Utama and PT Agro Sentosa Lestari. The only forest they have is shared with people of other villages. There has been no forest mapping conducted before.

# Annex IV. Descriptive statistics and explanatory variables

**Table 12: Most important community issues reported by respondents**

| Assignment group | Treatment | | | | Comparison | | | |
|---|---|---|---|---|---|---|---|---|
| **Reporting period** | Base | End | Change | p-value | Base | End | Change | p-value |
| **Sample size** | 80 | 80 | 71 | | 40 | 40 | 34 | |
| Percentage of respondents reporting that there is an oil palm plantation in the village | 77.5 (42.0) | 73.8 (44.3) | -4.2 (20.3) | 0.213 | 100.0 (0.0) | 100.0 (0.0) | 0.0 (0.0) | |
| Percentage of respondents reporting that there is any plan of forest conversion into oil palm plantation | 3.8 (19.1) | 22.5 (42.0) | 19.7 (46.7) | 0.209 | 22.5 (42.3) | 45.0 (50.4) | 17.6 (57.6) | 0.238 |
| Percentage of respondents that reports […] to be one of the three most important community issues | | | | | | | | |
| *A. Education/School in village* | 51.3 (50.3) | 38.8 (49.0) | -9.9* (72.0) | 0.083 | 47.5 (50.6) | 37.5 (49.0) | -8.8 (57.0) | 0.666 |
| *B. Healthcare* | 33.8 (47.6) | 37.5 (48.7) | 2.8 (58.5) | 0.667 | 42.5 (50.1) | 37.5 (49.0) | 0.0 (85.3) | 1.000 |
| *C. Access to clean water* | 42.5 (49.7) | 45.0 (50.1) | 4.2 (64.2) | 0.665 | 27.5 (45.2) | 65.0 (48.3) | 38.2 (65.2) | 0.179 |
| *D. Sanitation issues* | 0.0 (0.0) | 2.5 (15.7) | 2.8 (16.7) | 0.171 | 7.5 (26.7) | 0.0 (0.0) | -8.8 (28.8) | 0.238 |
| *E. Road conditions to the village/Access to village* | 77.5 (42.0) | 52.5 (50.3) | -23.9 (54.7) | 0.137 | 72.5 (45.2) | 77.5 (42.3) | 0.0 (65.1) | 1.000 |

1. This category contains using the forest for farming, burning the forest, selling forest products, the boundaries of the forest, planting back the forest, sanctions on common fields, theft from the forest and poisoning the river. These were all mentioned by the respondents themselves as regulated.
2. Sample size deviates, the number of observations, in order, are 78, 74, 65, 28, 37 and 20

# Annex VI. Qualitative report on the NTFP-EP project

## 1. INTRODUCTION

### 1.1. Context of the project

NTFP-EP (Non-Timber Forest Product Exchange Program) is a private organisation operating in South and South East Asia. NTFP-EP has a major concern in the management of non-timber forest products in Sintang Province District in West Kalimantan. The NTFP-EP project in Sintang seeks to organise and empower forest-based communities to claim their rights on the utilization of their forest resources and to manage their forest resources in a sustainable way. The project has been funded by IUCN (Ecosystem Alliance) from 2011 until 2014. The project is of great importance for the communities of Sintang, particularly the Dayak tribes, whose livelihood, economy, culture, and social lives are dependent on the forest. The NTFP-EP project is therefore known as an 'eco-culture project'.

The objectives of this project are; 1) to develop and improve the community's livelihood by making sure that they are empowered and organised to manage and benefit from their eco-systems and to claim their rights on the utilization of natural resources, and 2) to provide alternative sources of livelihood for the community to improve their income and welfare. It is expected that when the community's income from forest products increases, they will become more motivated to preserve their forest and its biodiversity, and defend themselves against land conversion by oil palm and mining companies.

The coordinator of NTFP-EP, named Mr. Irawan, stated that the project is focused on maintaining the raw materials that are used by the communities to produce woven cloth and natural dye, which are part of West-Kalimantan -and particularly Sintang- culture. Also, by protecting the forests, people's access to important cultural, historical and/or religious sites such as the old cemetery of the ancestors and the highest point of the hill can be ensured. Preserving the forests therefore also means preserving the community's local culture and traditions. The planned outcome of the NTFP-EP project is a map of the community's area that contains all the important locations in the village's forests. This map should then serve as guidance for eco-cultural zone planning in Sintang district. In the execution of its programme, NTFP-EP worked closely together with local NGOs JMM[33] and PRCF[34].

[33] JMM stands for *Jasa Menenun Mandiri* or 'Independent Weaving Services'. The cooperative is a point of sales for approximately 400 Dayak women weavers in twelve *kampung* (villages) in and around Sintang. The daily operations of the cooperative are managed by a representative body of the twelve villages. JMM's vision is "Sustainable Culture, Emerging Business, and Prosperous Society". JMM has been cooperating with NTFP-EP since 2011. At the moment of the interview they had 3 running programmes; Quality improvement of woven cloths by focusing on the organisations involved One of the objectives of this programme is to increase *mengkudu* (a small tree which root produces dyes) production; The "Kraft Kalimantan" programme which started 3 years ago has ended on June 2014; and the joint mapping project with NTFP-EP.

[34] The People Resources and Conservation Foundation (PRCF) is a non-profit, non-government, and non-membership organisation. They promote conservation, protection, and wise use of natural resources with sound social and economic development. PRCF is particularly interested in encouraging local communities to take over the management of natural resources available to them, with a view to managing them for sustainable harvest. PRCF's activities in Sintang are focused on Ensaid Panjang village. Since 1999 PRCF has committed itself to developing and facilitating Dayak weaving activities. They have run programmes such as the Dayak weaving programme, weaver quality improvement, and institutional development activities such as building weaving

According to Mr. Irawan, the NTFP-EP eco-culture programme was implemented in 4 villages in Sintang. 3 villages (Ensaid Panjang, Gemba Raya, and Karya Jaya Bakti) are located in Kelam Permai sub-district. The other village (Empaka Kebiau Raya) is located in Binjai Hulu sub-district.

The direct beneficiaries of the project are indigenous and otherwise forest-based NTFP[35] gathering and farming communities who are dependent on the forest and non-timber forest products for their livelihoods. In addition, the local government of Sintang can also be counted among the beneficiaries as they have roles in forest management planning.

## 1.2. Study area

Sintang District is located on the west side of West Kalimantan province and about 395 km away from Pontianak city. The district shares land borders with the Malaysian city Serawak. Sintang District consists of about 32.279 $km^2$ of land, most of which is hilly/mountainous and covered with oil palm plantations. The journey from Pontianak to Sintang is not an easy one as road conditions are very poor. Other facilities in Sintang district are likewise underdeveloped.

In Sintang District, mapping activities were conducted in 4 pilot villages that are members of the JMM cooperative. When the mapping activities turn out to be successful, NTFP-EP and JMM are planning to implement the mapping project in other villages that are JMM cooperative members as well.

> ... we start it bit by bit. We decided to start from the sacred sites, as we know that that's where our ancestors were buried. If we hadn't managed those areas, they would have been ruled by the companies. So, we took 4 out of 40 villages [more or less 40 villages are cooperative members] and if they are successful we will implement it to other villages. The other villages have requested for it too, but now we are focusing on the four villages first. We hope these villages will get the acknowledgement from the local government (Mr. Sugiman, Director of the JMM Cooperative).

Each village consists of multiple hamlets (*dusun*). For our evaluation we decided to focus on 3 the project villages, and one *dusun* per village, namely: Dusun Rentap Selatan of Ensaid Panjang village, Dusun Kelumbik of Karya Jaya Bakti village, and Dusun Ransi Panjang of Gemba Raya village.

## 1.3. Evaluation questions and report structure

Firstly, to provide a more detailed description of the context of the project villages, the following research questions were asked: What do the research communities look like? How are they governed? How do the communities use, manage and monitor their natural resources? What land right conflicts are there in the communities and how are they handled? Secondly, to determine the success of the NTFP-EP programme, the following research questions are discussed: How was the project implemented in the 3 villages? What was the project's impact on the lives of the community members and their ability to manage their natural resources in a sustainable way?

This report will be structured broadly along the lines of these research questions: Chapter 2 contains a description of the research villages. Chapter 3 provides more in-depth information about how the communities manage and monitor their natural resources, and Chapter 4 investigates land right

---

cooperatives. Before their cooperation with NTFP-EP, PRCF had already started with the development of community-based forest management and publicly promoting areas to become eco-cultural zones.

[35] NTFP is an abbreviation for non-timber forest product(s).

conflicts, both within and among the communities, and between the communities and outsiders. Turning to NTFP-EP's programme, Chapter 5 discusses the project implementation with a particular focus on the participatory mapping activities. In Chapter 6 we look at the impacts of the NTFP-EP programme on the lives of the community members. In particular changes in their awareness, attitudes and behaviour with regard to natural resource use, forest management, land rights, conflicts, and economic activities. Finally, in Chapter 7 we reflect on the project as a whole. Additionally, chapter 8 and 9 are added as an appendix to provide more background information on how the villages and the lives of the community members are governed, and the position that women and newcomers hold within those communities.

## 1.4. Evaluation methods

In order to evaluate the impact of the NTFP-EP project, qualitative field work has been conducted at the selected project locations in April 2014. In-depth interviews were conducted with a number of carefully chosen informants (listed in Table 21 below). Also, focus group discussions were held with male community members working as either self-employed rubber farmers or working at a rubber plantation, and female community members working in the most common traditional handicraft trade in their community. Almost all of these informants were participants in one or more of the NTFP-EP activities, and therefore knowledgeable about the NTFP-EP programme and other topics that were to be discussed during the interviews.

Unfortunately, not all the informants that we had originally planned to interview in the study design were available in the field. Also, other informants such as the village head of Gemba Raya and the female leader, could not provide significant information to answer all of our questions. The implementation of the focus group discussions proceeded relatively smoothly, with the exception of the focus group discussion with women in Gemba Raya that could not be held because no women could be found that had participated in the NTFP-EP mapping activities.

## 2. DESCRIPTION OF STUDY LOCATIONS

As mentioned previously, 3 villages were studied for our evaluation; Ensaid Panjang, Karya Jaya Bakti, and Gemba Raya. All of them are located in the same sub-district, Kelam Permai. In this chapter the village characteristics are discussed in more detail.

### 2.1. Ensaid Panjang Village

Ensaid Panjang village consists of three hamlets (*dusun* in Indonesian); Rentap Selatan, Ensaid Baru, and Ensaid Panjang. Together they count a total of 130 households and 522 inhabitants. Male inhabitants are in the majority with a 282: 240 male to female ratio. It takes about 1 hour to get to the village from the main road. The road that enters the village is stony, muddy, and very slippery during the rainy season. Nevertheless, this village is a tourist destination for both domestic and international tourists, as it is famous for holding on to its traditional Dayak culture and customs. People in the village for example still live in *Rumah Betang Panjang;* traditional long houses inhabited by multiple Dayak families at once.

In past years the forest area of Ensaid Panjang has greatly decreased as a result of the emergent oil palm industry, and the village is already surrounded by oil palm plantations. Ensaid Panjang's remaining forest lands are also under serious threat of being converted to plantations, as they are

located in the APL area[36] of two giant companies: PT. Wahana Plantation&Product (WPP) and PT. GMU (Grand Mandiri Utama). APL means *Area Peruntukan Lain*, or 'area for other allocation'. Land with an APL indication is government owned land that is allocated for non-forestry business.

Even though deforestation is already in an advanced stage, the people of Ensaid Panjang remain hopeful and are determined to preserve their remaining forest. The first forest area to be mapped was *Tawang Mersibung*. According to Mr. Cepi, the chairman of the community forest, it was important to map this forest area first because this is where visitors are usually brought first if they come to the village. At the time of the interviews, a total of 3 of Ensaid Panjang's forest areas had been mapped, i.e. *Tawang Mersibung*, *Tawang Semilas*, and *Tawang Sebesai.* Ensaid Panjang village also has a village forest group, led by Mr. Cepi, that helps to protect and preserve the forests.

## 2.2. Karya Jaya Bakti Village

Karya Jaya Bakti village consists of 4 *dusun*; Kelumbik, Beran, Jelawai, and Entalang. There are 892 inhabitants, divided over 224 households. The male to female ratio is 467 : 425.

The village's situation is quite similar to that of Ensaid Panjang village. Karya Jaya Bakti is also surrounded by oil palm plantations and located in an APL zone of the company PT. ASL (Agro Sentosa Lestari). The village is also difficult to access, and from all 3 project villages Karya Jaya Bakti is furthest away from Sintang city. Clean water is difficult to obtain and villagers are taking bad quality water directly from the river to fulfill their daily needs. According to some of our informants the scarcity of clean water occurred after many forests were converted into plantations. At the time of our research, only 2 forest areas could be accessed by the villagers of Dusun Kelumbik, namely *Hutan Selabang* and *Hutan Senibang*.

Just like in Ensaid Panjang village, the people of Karya Jaya Bakti are determined to preserve their remaining forests. Unfortunately, there is no special group to protect and preserve the village's forests.

## 2.3. Gemba Raya Village

Gemba Raya village consists of four *dusun*; Ransi Panjang, Ransi Pendek, Lanjing, and Terumbuk. Gemba Raya village has 243 households and 922 inhabitants of which 480 are male and 442 are female. The village is located at the edge of the main road leading to other districts and can be reached from Sintang city in approximately 1 hour.

What's special about Gemba Raya is that, even though it is located nearby the APL zone of PT GMU (Grand Mandiri Utama), no oil palm plantation companies have yet been able to take forest land from the village due to the ongoing rejections of their presence from the village head and the community. During the interview, the village head of Gemba Raya mentioned that he had been visited by representatives of oil palm companies several times, but that he refused each time, and never gave them permission to enter his village.

Unfortunately, Gemba Raya village has not been able to avoid the negative impacts of the presence of plantations in its neigboring villages. As a result the inhabitants of Gemba Raya are now also suffering from water scarcity and a decreasing number of fauna in their forests.

# 3. NATURAL RESOURCE MANAGEMENT

## 3.1. People's livelihood

Most of the people in the project villages work as farmers on rubber farms or plantations where they incise rubber trees to collect latex, usually between 3 am and 10 am in the morning. This work is often combined with work on the rice fields in the afternoons. Both jobs are done by men and women alike. Rubber and rice farming are the main sources of income for all 3 villages. However, over the past 2 years, crop failure due to a shortage of rain and a decrease in rubber latex prices (from Rp. 20.000 per kilo to only 8.000 per kilo) has caused a decline in income for the communities of both Gemba Raya and Ensaid Panjang. Dusun Kelumbik of Karya Jaya Bakti village was the only *dusun* that experienced a slight increase in income over de past 2 years, as a result of the money they earned from their work at the oil palm plantation.

In order to supplement the family income, a small number of villagers make crafts such as the typical Dayak weavings. Weaving is a women's trade. In Ensaid Panjang it is mostly done by mothers and elderly women who can't work at the rice fields. The men typically make craftworks from bamboo and rattan. In Karya Jaya Bakti village there are also still a few people left who make handicrafts from wood and bamboo carvings, but nowadays this is done merely as a hobby. Weaving-craftworks are still sold. They are made and decorated with the help of natural dyes that are taken from the forest. The raw materials used for dyeing are *Darum*, *Mengkudu*, *Gerbang*, *Empait*, and Rattan.

Lastly, a few villagers still earn their money by catching and selling animals from the forest. Dayak people have a reputation for loving to hunt animals for consumption or sale. However, as animals have become rarer and rarer in the past years, hunting activities have gradually decreased.

## 3.2. Availability and use of natural resources

In the village of *Ensaid Panjang* several species of flora and fauna can still be found both in the forest and in the villagers' farms. Types of flora that are still found in the forest are rattan, *meranti, kelansu, rengas, petir*, *rinsak,* and *kubah*. The types of flora that are planted or cultivated by the community are rubber, rice, coconut, sour fruit, banana, nuts, mango, *potersi*, etc. The raw materials for weaving are no longer found in the forests of Ensaid Panjang, with the exception of *empait*. The types of animals that can still be found in the forest are apes, orang utans, mouse deer, *berok*, wild boars, deer, elks, etc. The animals that are kept at people's houses and farms include chickens, cows, pigs, and dogs.

In the village of Gemba Raya, the only trees or plants that are cultivated by the community are rubber trees and rice. Rubber does not grow in the forest but is only grown in the fields owned by residents. Plants that do still exist in the forests and are important for the community are wooden ring, rattan, *empait, mengkudu, gerbang* and *inkatan*. Some of these plants, such as *mengkudu* and *empait*, are used by the villagers as natural dye for fabrics. Animals that can still be found in the forests are bears, squirrels, and several species of birds. Animals that are commonly kept by the villagers are pigs and chickens.

Even though there are still quite some native trees, plants and animals left in the 3 project villages, all of the communities have experienced a rapid decline in the number of these plants and animals, with some species disappearing all together. According to the residents of Gemba Raya and Ensaid Panjang, the oil palm plantations surrounding their villages have cut down many trees and

created a water shortage, which has caused the extinction of many animals that were previously living in their forests. Other animals that used to be abundant are now rarely seen. One of our informants said that: "The animals do not feel comfortable living in the forests like before".

The decline in the number of animals living in the forests is further exacerbated by the villagers' own habit of immediately killing all animals (such as monkeys, bears, squirrels, etc.) that damage the crops in their farm fields. A lack of awareness about the importance of animal preservation plays an important part in this. In the villages there are no clear rules about the protection and conservation of animals. The customary rules for the preservation of the forest that do exist are usually more related to wood and other plants.

Because the natural materials used for dyeing are also becoming increasingly scarce in the forests due to the failing of the forest ecosystem, the JMM cooperative has decided to run a special programme for the cultivation of *noni* as a natural dye product for fabrics. The programme aims to teach people how to cultivate *noni*, and has set up a cooperative through which the villagers can sell their craftworks[37].

## 3.3. Cultural resources

The people living in the project villages are starting to realize that their traditional customs and culture are slowly fading with the changing times. An informant of Dusun Kelumbik (Karya Jaya Bakti village) for example mentioned that the traditional customs of teeth sharpening, hair cutting rituals, and wearing traditional clothing during ceremonies are no longer being done in current times. Another cultural custom that is disappearing is the craft of weaving and carving. Nowadays it is almost exclusively done by the elderly. In Dusun Kelumbik, there are only 2 women left who still know how to weave. However, the youth of Dusun Kelumbik have made plans to learn to make carvings from the elders.

## 3.4. Rules for natural resource management

Data from our study revealed that there were no formal governmental rules for the management of natural resources present at either the village or regional level. The management of natural resources in the 3 villages is done according to long existing customary rules. Even though the exact customary rules may vary between villages, the content of those rules is very much the same for all three villages. In every village there are, for example, rules about the felling of trees in the forest, for example: Felling of trees in the forest is not allowed without the permission of the chairman and local village officials, and the wood from those felled trees may only be used to fulfil the needs of the community itself (such as for building homes) and cannot be sold to outsiders. People that violate these rules, either indigenous or outsiders, will be penalized according to the customary law. The severity of the penalty will be determined based on the number of trees that have been cut down. According to our informants, all the old customary rules are still conserved and enforced until today.

In Gemba Raya village the customary rules for the management of the forest and its natural resources have recently been documented. The documentation process was carried out by the traditional leaders, village head, and village officials without any help from NTFP-EP, JMM, and PRCF. The chairman of Gemba Raya stated that: "The customary rules have been memorized, they're written, and I've held them and all have been signed in 2014". However, the chairman could not show us any

[37] The cooperative purchases the craftworks from the villagers, and then resells it to third party customers.

evidence for the existence of these documentations. In Ensaid Panjang and Karya Jaya Bakti no customary rules have yet been documented. According to our informants the customary rules are anyhow well-known among the villagers because they are passed on from one generation to the next and enforced by every generation.

Of all 3 villages Ensaid Panjang has the most advanced forest preservation methods. They have the Twang forest group that is in charge of protecting and preserving the forest area from natural resource theft and other irresponsible actions of the people and operates as a civilian defence unit (known as *hansip* in Indonesia). They work closely together with the village security officers in carrying out their duties of arresting and even punishing the people that have entered the forest without having received permission from the forest security personnel. The Tawang forest group was already established in 1986, long before NTFP-EP started its mapping activities, and is thus not a result of the project.

In conclusion: Even though the communities of all 3 villages have increased the intensity in monitoring and managing their forest in response to the threat of land conversion, there have not been any great changes in natural resource management procedures in the past 2 years.

# 4. LAND CONFLICTS

## 4.1. Conflicts within the village

According to almost all our informants there have never been any serious conflicts over land boundaries between *dusun* or community members, both before and after the introduction of the participatory mapping programme of NTFP-EP. The reason for this can on the one hand be found in the strong kinship that exists between the people of the different tribes, and on the other hand in the strong reliance on traditional village institutions and customary laws that provide clear rules and an amicable approach in problem solving. The following statement of the traditional leader of Gemba Raya village illustrates this:

> In the village Gemba Raya there is a conflict almost every year. It is a common thing. Land conflicts occur because of a dispute between the heirs, but customary law is still applied here and things are settled amicably between family members.

## 4.2. Conflicts with outsiders

Even though no serious land-related conflicts have yet occurred between the villagers and outsiders, the potential for conflicts with oil palm companies that exploit forest resources and convert indigenous land into plantations is very much present. Ensaid Panjang and Gemba Raya still have most of their land, but feel the threat of the oil palm plantations that completely surround their territory. According to the villagers of Ensaid Panjang markers have appeared in their forest, without the knowledge and permission of the village apparatus. This has made the villagers extra anxious for the map to be finished and legalized, so they can use it to attain their land rights before they are outpaced by the companies. In Karya Jaya Bakti a lot of forest area has already been sold to an oil palm company, and over the years their lands have gotten smaller and smaller. The little space the villagers now still have left is crammed with their homes and their small remaining private rubber fields and forests.

Karya Jaya Bakti's indigenous land was sold to the company as part of the governmental plasma-core land division model (or 'People Nucleus Company Pattern' / *Pola Perusahaan Inti Rakyat,* abbreviated PIR). This model aims to increase farmers' welfare through oil palm development, by cementing a mutually beneficial partnership between the company (the Nuclues Estate or 'core plantation') and the farmers (the Smallholders or 'plasma members'). The core company serves to develop an economic unit consisting of core plantation and the mill, plasma members' plantation, housing for the plasma members and other public and social facilities.[38] The core company is obliged to buy the agreed upon percentage (in this case 20%) of the oil palm harvest from the farmers, and the farmers are obliged to sell that percentage of their harvest to the core company.

The plasma-core partnership in Karya Jaya Bakti does not run smoothly. The villagers of Dusun Kelumbik feel cheated because the company has received a cheap rental permit from the local government for a 25 year period for only 250.000 dollars, but has not fulfilled its promises to improve community facilities such as education and health care. Moreover, they say the company is fraudulent, because it will never give them a clear indication of the price per kilo when paying the farmers for the share of the harvest that they are obliged to sell to the company. According to the villagers of Karya Jaya Bakti the reason for a potential conflict is thus not so much the fact that land is sold to the companies (they say that the company won't insist if they don't want to sell their land), but rather the broken promises and the fact that people will gain less from the partnership than was initially agreed upon.

# 5. PROJECT IMPLEMENTATION

## 5.1. Cooperation with local NGOs

The implementation of the programme in the villages was not carried out by NTFP-EP itself, but by the staffs of JMM and PRCF. JMM provided a facilitator for the mapping process in Dusun Kelumbik in Jaya Karya Bakti village and Dusun Ramsi Panjang in Gemba Raya Village. The mapping process in Dusun Rentap Selatan in Ensaid Panjang village was guided by a facilitator from PRCF. The coordination of all the project activities in Sintang was carried out by Mr. Irawan, who was appointed by NTFP-EP itself.

NTFP-EP's project started with the socialization of the local NGOs. During this socialization NTFP-EP also consulted the local NGO's about criteria for the target areas[39]. After it was decided in which villages the project should be carried out, these villages were visited and discussions were held about the details of the mapping activities, when and where to start, which forests to be mapped, and about how to socialize the rest of the community.

Before the facilitators went out into the villages to start the mapping activities, they followed trainings, organised by NTFP-EP. During these trainings NTFP-EP taught the facilitators about the different stages of the participatory mapping process, how to properly socialize the community, how to use GPS technology, how to do map sketching, how to process the data, etc. PRCF facilitator Mr.

[38] Source: SHARP. *Desk Review. Smallholders Model in Selected Communities*, p. 7, viewed on 17-11-2014, http://www.sharp-partnership.org/sharp-programmes/objects/pdfs/smallholder-models-in-indonesia

[39] According to one of the facilitators, Mr. Sagiman, Dusun Kelumbik in Karya Jaya Bakti village was -for example- selected as a project location for the following reasons; 1) Dusun Kelumbik is a *dusun* with assistance from JMM, 2) Dusun Kelumbik is an area with many craftsmen and –women, 3) They attain the raw materials (natural resources) to produce their handicrafts from their forests.

Agustinus for example stated: "I joined a training for 3 days and I learned how to use the GPS in the forest and I also learned about the stages of participatory mapping process as well as the data management". Mr. Sagiman, a facilitator of JMM, said: "Before the mapping, we received a training from Mr. Irawan of NTFP-EP on how to use the GPS and the activities in the field like socialization, drawing the map, and legalization of the map". The GPS training was not only participated by the 3 facilitators, but also by some community representatives, such as Mr. Cepi, the head of the community forest of Ensaid Panjang.

## 5.2. The mapping process

### *5.2.1. Overview of stages*

The stages covered during the participatory mapping process were; socialization, determining the coordinate points, data management, map finalization, and map legalization. The table below summarizes the series of activities that have been conducted in the 3 villages of study.

**Table 22: Participatory Mapping Activities**

| Activity | Ensaid Panjang | Karya Jaya Bakti | Gemba Raya | Implementation Time | | |
|---|---|---|---|---|---|---|
| | | | | Ensaid Panjang | Karya Jaya Bakti | Gemba Raya |
| **Socialization** | √ | √ | √ | July 2012 | March 2012 | August 2012 |
| **Determining coordinate points** | √ | √ | √ | July 2012 | August 2012 | August 2012 |
| **Data management** | √ | √ | √ | unknown | unknown | unknown |
| **Map completion** | √ | √ | √ | September 2012 | September 2012 | September 2012 |
| **Map legalization** | | | | Not yet | Not yet | Not yet |

### *5.2.2. Socialization*

The first activity of the mapping process that was carried out was the socialization of the communities. According to the facilitator, Mr. Sagiman, the socialization workshop was attended by the village apparatus; the village head, the *dusun* heads, the village secretary and the traditional leader, and the general community members, both men and women. He also mentioned that the women in Karya Jaya Bakti were particularly enthusiastic about participating.

During the socialization workshops the purpose and process of the mapping were explained to the communities. The facilitators also further discussed with the communities what would be the best time for the activities to take place, which areas the communities thought should be mapped, and how the mapping teams should be formed. During the workshops it was decided that for Ensaid Panjang the forests *Mersibyang*, *Semilas*, and *Sebesi* should be mapped. For Karya Jaya Bakti the *Selabang* and *Senibung* forests, and for Gemba Raya only *Perauh* forest, which is quite large and located on the border of a neighbouring village. They also decided on who should become members of the pioneer teams

doing the GPS point collection. Village leaders and representatives as well as both male and female community members were chosen for this task.

After the workshop another important meeting was held with the village leaders and representatives of the neighbouring villages to the forest to be mapped. Ensaid Panjang village, for instance, has *Semilas* forest which lies adjacent to Empaci village of Dedai sub-district. Their meeting was attended by some representatives of Ensaid Panjang village, the NTFP-EP facilitators, and also the village apparatus and community leaders of Empaci village. The point of the meeting was to inform the community of Empaci village about the mapping plan in *Semilas* forest. Fortunately, both villages have a good relationship and no objections were raised to the implementation of the mapping activities in the area. The people of Ensaid Panjang village once even invited the community leaders of Empaci village to witness the mapping activities taking place, although the community leaders weren't able to accept the invitation due to previously made appointments.

Karya Jaya Bakti village also had a similar meeting to discuss the boundaries between two villages to be mapped. Their meeting was attended by the *dusun* head and other officers of Dusun Kelumbik, communities of several different *dusun* that lie directly adjacent to the forests to be mapped, the women group, and even some representatives of the oil palm company. During their meeting, agreements were made about the boundaries between the communities' lands, and the boundaries between the land of the oil palm plantation and the community's forest.

### *5.2.3. Determining the coordinate points*

The activity of determining coordinate points is known as *perintisan* (pioneering). Before the pioneering teams and facilitators went into the forest, the communities held a ritual called *Begelak*. *Begelak* is a traditional Dayak ritual to ask for protection from God when carrying out activities in the forest. This ritual is a common custom for Dayak people, and is performed every time they want to conduct an activity in a new location or a sacred place such as the old cemetery, nearby the big trees, etc. The *begelak* ritual for the pioneering activities took a full day to perform, and after its completion the pioneering teams went into the forest to collect the coordinate points. The activity of taking the coordinate points was a lengthy exercise. The teams needed more than 2 days to complete *Selabang* and *Senibung* forests of Dusun Kelumbik (Karya Jaya Bakti village), and 6 days for the forests of Dusun Ransi Panjang (Gemba Raya village) and the Emparu area.

Good practice for participatory mapping projects entails that after completion of the project the community members are empowered to independently undertake mapping activities without outside help. However, our data shows that not many of our informants have received training on how to use the GPS technology on their own. For example, Mr. Ayub (*dusun* head of Kelumbik), Mr. Ringkai (*tokoh masyarakat* of Karya Jaya Bakti village), and Mr. Thomas Dima (*Ketua Adat* of Gemba Raya village), all said that they hadn't received any training on how to use the GPS technology before participating in the pioneering activity. As part of the pioneering teams they went into the forest only to show the facilitators the land boundaries between private land and forest areas, important landmarks, etc. It was the facilitators themselves that were in charge of determining the coordinate points and recording the data with the help of the GPS device. The informants however mentioned that they thought this task was left to the facilitator for a reason, namely to get more accurate data by minimizing mistakes or missing recorded data due to inexperience of the pioneering team members. Additionally, all of the

participants of the focus group discussions in Gemba Raya village said that there had never been any trainings on the use of GPS technology prior to the mapping activities. However, one participant who happened to have studied forestry at college knew how to use a GPS device and had helped the pioneering team to operate the GPS device. Meanwhile, in the village of Ensaid Panjang, a training on how to use the GPS device was held once, and was attended by some of the community members and the head of the village. In Karya Jaya Bakti village no trainings were held, but luckily a lot of the community members had already gained experience using GPS technology, while working at the oil palm plantation.

It is interesting to note that representatives of the oil palm companies were also involved, albeit indirectly, in the pioneering stage of the mapping process, as can be learned from the following statement from Mr. Ringkai about the mapping activities conducted in Karya Jaya Bakti village:

> Mapping activities was started by socialization activity in the community. And then followed by mapping process using GPS by JMM officers. The mapping process was done in the forest which is surrounded by oil palm plantations owned by companies and we borrowed their vehicle to transport the people. When the map is done, village authority and the company approved it by signing it (Mr. Ringkai, interview April 2014).

### *5.2.4. Data management*

The next activity that was undertaken after the collection of the GPS points, was transferring all the recorded GPS data to the computer. During the pioneering activity, coordinate points were recorded both manually and automatically. Data recorded with the GPS device could be directly uploaded into the computer. Computer programmes suchs as Mapsource and Arcview were used to process the coordinate points and create a map of the communities' forests. The processing of the data is a difficult task, and all the facilitators that were charged with this task, needed help from NTFP-EP in order to complete the map.

Table 23 summarizes the forests' sizes, as measured during the mapping activities.

**Table 23: Forest size as measured during mapping activities**

| Forest Location | Ensaid Panjang | Karya Jaya Bakti | Gemba Raya |
|---|---|---|---|
| ***Selabang*** | | 1.342 Ha | |
| ***Senibung*** | | 1.738 Ha | |
| ***Mersibung*** | 53.983 Ha | | |
| ***Semilas*** | 42.778 Ha | | |
| ***Sebesi*** | 105.628 Ha | | |
| ***Perauh*** | | | 32.373 Ha |
| Source : JMM and PRCF, 2012 | | | |

### *5.2.5. Map finalization and legalisation*

The final stage of the participatory mapping process is to get the authorities to validate and approve the map, and collect the signatures of all the relevant stakeholders, such as the village heads, *dusun* heads, community leaders, traditional leaders, and representatives of NTFP-EP and the JMM cooperative or PCRF.

The communities have managed to get the map signed, and several copies have been made and spread amongst the community representatives and authorities. However, even though the map is finished, efforts still need to be made to legalize the map. Considering some of the mapped forest areas are located in APL zones the maps produced in the 3 villages need a special permit from the Regent in order to receive 'legal status'. Mr. Irawan, the coordinator of the NTFP-EP mapping programme in Sintang, is charged with the responsibility to get the maps recognized by local government:

> In keeping with my job about the eco-cultural development, I try to get permission. I need to be around until every permit needs to undergo the village regulations. The last product is the Permit of the Regent. We have been trying to get it for two years, but we can still see a chance (Mr. Irawan).

The process of acquiring the Regent's Permit has already been running for over two years. In October 2012 NTFP-EP managed to organise a meeting with the Regent of Sintang. As a result of this meeting the Regent issued a letter which stated that the community (and NGOs) needed to be helped, but in the end this did not result in the legalization of the map and the communities' rights over their lands. From then on NTFP-EP has continued to make efforts to gain recognition of the maps, assisted by JMM. In April 2014, for example, JMM had another consultation with Local Government about the issue.

The map legalization process is fully conducted by the facilitators and the NTFP-EP staff. The inhabitants of the project villages have not played any part in this. Our data suggests that, even though both the leaders from the village apparatus and the community members realize the importance of getting their map legalized, they have no idea what steps to undertake to get their land rights recognized. According to some participants of the focus group discussion in Dusun Kelumbik (Karya Jaya Bakti village), there had been a training to teach the villagers how to use the map. However, the chief of Dusun Kelumbik said that the map in his village had not been used after its completion, and also added that he had no clue about what to do next with the map. 3 female participants of the focus group discussions in Ensaid Panjang said that they had never even seen the map.

## 6. IMPACTS OF THE NTFP-EP PROGRAMME

NTFP-EP's main project activity in the villages of study has been participatory mapping. The desired result from this activity is a map of the village forests, which has been legitimized by the relevant authorities so that it can be used to secure the communities' rights over their forests and natural resources, and help them manage their natural resources in a sustainable way. In terms of achieving this goal, NTFP-EP's project has only been partially successful. Within all 3 villages participatory mapping has been carried out, and maps of the forests have been produced. However, the formal process of legitimizing the maps has not yet been completed, since there have been difficulties acquiring the last necessary certificate -the Certificate of *Perdas*/the Regent's Permit- from the government authorities. It

has already been 2 years since the project staff started their attempts to obtain the permit, and until now the process has been long and tortuous without results. This means that the resulting map is not yet legally enforceable, which makes it difficult to determine the full potential of NTFP-EP's mapping programme.

The data from our study suggests that the mapping activities as carried out in the project villages have not yet had a clear and concrete impact on the way the natural resources are managed, nor the communities' ability to generate more income from their forest products. Along this line, the Chairman of Gemba Raya village stated that: "the direct benefits of the maps have not been felt very well by the public".

One of NTFP-EP's other original project objectives was to provide alternative sources of livelihood for the community to improve their income and welfare. The intended strategy was based on the theory that communities would become more motivated to preserve and protect their forests and its biodiversity when their income from forest products would increase. Even though NTFP-EP itself has eventually not undertaken any project activities in this specific direction, and community income has decreased (or at its best only slightly increased) over the last 2 years, our data shows that the project has still succeeded in making the community members more aware about the importance of forest preservation and their rights over the forests. According to our informants, people have just recently come to realize how much they are actually dependent on their forests and the plants and animals, and how important it thus is for them to preserve and protect their forest from conversion.

> The benefit that can be gained in the future for the betterment of our children and grandchildren is that first everybody has the forest and second they are willing to preserve and protect the forest (Male informant from the focus group discussion in Dusun Kelumbik of Karya Jaya Bakti village).

> We don't want what belongs to people to get stolen. Such a thing happened in the past. It was about borders with other villages. Previously we did not yet know how extensive the forest that we have is. Then, after learning how large it is, we want the right to manage it so that it becomes the community forest (Male informant from the focus group discussion in Ensaid Panjang).

> This mapping will benefit the community because it can reduce potential conflicts over land ownership, either between villagers or companies (Mr. Yosef Ismail, village head of Gemba Raya, interview on April 2014).

The people also recognize ways in which the map can already be useful for them. Some informants mentioned that the map, signed by the relevant stakeholders, can help them to prevent conflicts over land, by serving as evidence of the previous agreements about boundaries. According to our informants, over the recent years the village borders have often changed due to the openings and expansions of oil palm plantations. The informants say that, as a result of the mapping activities, they have become more aware about the size and location of the forest area that is used by them, and they realize that the forest borders captured on the map can also serve as a reference point for them to monitor the borders of their land and notice if any unexpected changes occur. The following statement from Mr. Cepi, head of the community forest of Ensaid Panjang, shows that the communities also comprehend that the map can play a part in the protection of their traditional customs and culture:

> Mapping can be described as forest preservation for posterity in the future … In the future, the map is intended to be able to defend their territory. Mapping can also protect, preserve and maintain the existence of Rumah Betang since its materials come from the forest.

The people of Ensaid Panjang, Karya Jaya Bakti and Gemba Raya have expressed their hope that NTFP-EP will do a follow-up project in the villages to help them to legitimize their maps, secure their rights over their forest lands, and increase their earnings by building and strengthening their craft businesses.

## 7. REFLECTION ON THE PROJECT

Based on the findings above, we have formulated two important critical notes as a reflection on this NTFP-EP project:

Firstly, good practice dictates that mapping projects should be dedicated to achieving community empowerment. This means that the focus of the project should lie on teaching the community members how to read, interpret, produce, update, and use their maps, and project instigators should therefore let the community members take as much control and responsibility over the mapping process as possible.[40] Our data however suggests that in the execution of the project, NTFP-EP was more concerned with the outcome of the project (the final map), than with the process of teaching the community members how to independently execute all the stages of a mapping process themselves. Community members were made part of the pioneering team, but only few of them received training on how to use the GPS device, and in the end most of the coordinate point were taken by the facilitators instead of by the community members themselves. Also, none of the community members or village representatives were involved in the management and processing of the GPS data (transference of the GPS points to the map) which was fully done by the facilitators and NTFP-EP staff. Likewise, all attempts to legalize the maps are conducted by NGO staff members, without any community involvement. Our data shows that, as a result, the communities are still largely unable to manage their own maps or develop their own map-use strategies without the help of NTFP-EP, JMM and PRCF. This also means that the villages cannot be used as reference material, or "best practice cases", for the implementation of the project in the other villages in the district, as was the original intention of NTFP-EP.

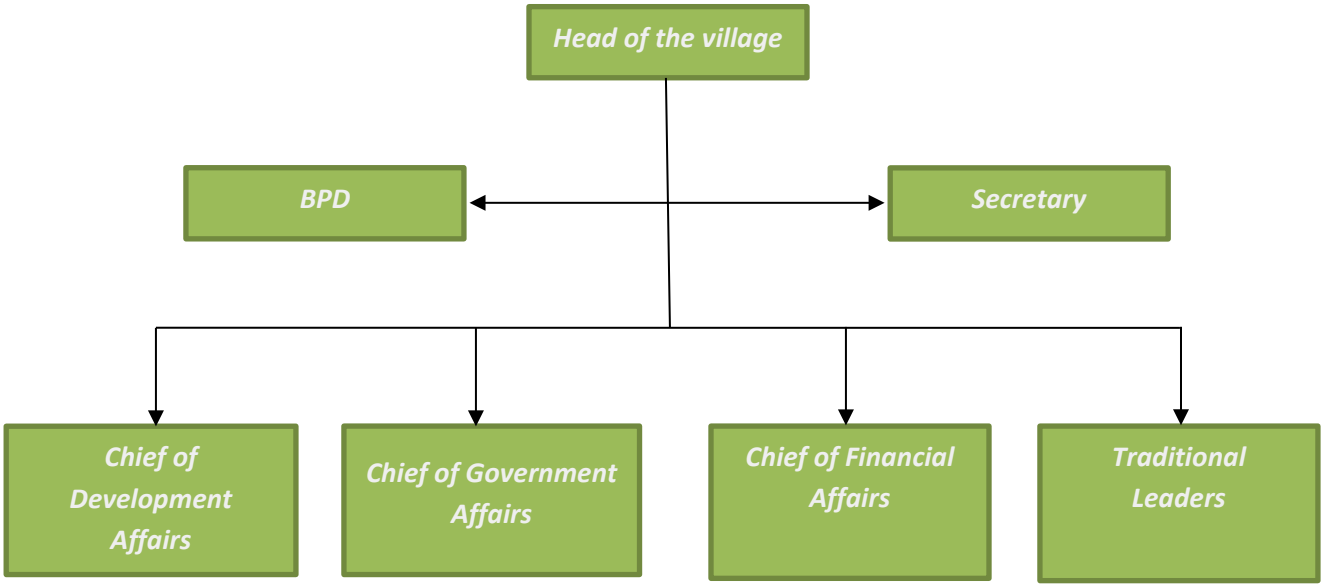
Secondly, the participation of female community members was quite low compared to that of male community members. The women only took part in the socialization stage. Some women of Ensaid Panjang village and Karya Jaya Bakti village did join the pioneering team into the forest, but only to provide food to the men. According to one of our female informants, Mrs. Rubiyah, the fact that no women in Gemba Raya were involved in the implementation of the project was due to the practical reason that the distance to the forest was too long, and so it was agreed that women should not take part in the implementation of the project.

> I was invited at the socialization. In the first socialization, they advised people about the importance of forests because in it there are plants for natural dye weaving, wood for making a loom and woven rattan

[40] Source: Chapin & Threlkeld 2001: 128; Di Gessa 2008: 15; IFAD 2009: 25.

> as raw material, so that citizens should no longer open fields in the forest. But I didn't come at the implementation stage since I had to walk very far to the forest (Mrs. Rubiyah from Gemba Raya village).

Lastly, the fact that the maps of the 3 villages' forests have not yet been formally approved and acknowledged by the district government with the issue of the Regent's Permit, means that the communities' forests are still not sufficiently protected against theft and land conversion by i.a. oil palm companies. It is therefore of the greatest importance that continuous efforts are put into attaining the acknowledgement of the communities' rights to manage their forests as an eco-culture zone.



# APPENDIX

## 8. VILLAGE GOVERNANCE AND COMMUNITY LIFE

In general, the government structure of the three villages of study is similar to the governance structures of other areas in Indonesia. The village government is headed by a village chief who is assisted by the BPD (the village assembly), a secretary, a chief of village development affairs, a chief of government affairs, a chief of financial affairs, and a chief of public affairs. The main task of the village government is to manage the village government's affairs, development, and community issues. In carrying out governance and development at the *dusun* level, the village head is assisted by the head of *dusun*. The village government is supplemented by traditional leaders that deal with indigenous issues at the village level. There is no overlap in village administration between the three project villages.

Broadly speaking, the village government structure can be described as follows:

**Figure 4 : Village Administration Structure**

One thing that distinguishes the village government structure in the project villages from those of typical Indonesian villages, is that the traditional leaders are chosen by the village head instead of the villagers themselves. According to the village head of Gemba Raya, this is because indigenous and social affairs are also part of the village head's responsibilities, so he needs to find someone with whom he can co-operate, whilst still considering the needs and wishes of the villagers.

The Dayak communities' are governed by customary rules that typically have been valid for many generations. These customary rules for example dictate the proper ways of marriage and

housekeeping, procedures before entering the forest, the ordinances of worship, childbirth, and gardening, etc. Some examples of specific Dayak customary rules are; Holding *Bagelak* rituals before undertaking activities such as mapping in the forest; Incoming guests in a *Betang* house have to enter through a specific door; Men are forbidden to weave like women; Women are forbidden to make the matting for the axes that are used for cutting wood; If there is an empty *Betang* house it may never be dark, the lights must stay on. Village officials usually report problems that are related to social customs to the traditional leaders. To solve these issues, traditional leaders usually use the mechanism of *musyawarah*—'sitting together' to find the solution.

# 9. MARGINAL GROUPS

## 9.1. Women

Women's roles in economic activities are not very different from those of men. Both work on the paddies in the rice fields or on the plantations. Mrs. Rubiyah for example mentioned that: "In agricultural activities the position of men and women is equal. Both go to the farm and do the same job in the processing of rubber". There are however some differences in task division between the 2 genders, which are dictated by customary law. For example, only women can weave and only men can produce wicker. With regard to domestic affairs, the husband is regarded as the household head. However, most informants claimed that the family decision-making is done jointly by husband and wife. The wife is deemed responsible for the management of the household, which entails cleaning, child care, education, and family finances. In community life, women typically take care of food and drinks while men take up work that requires physical strength. During customary events women likewise deal with cooking, cleaning, and traditional dress preparation activities. During community meetings women have the same right to speak up as men do. However, in reality not many women attend these meetings, as it is usually the husband that receives the invitation as head of the household. If the husband is unable to attend, his wife will go in his place. The under-attendance of women during public meetings was also noticeable during the socialization meetings for the mapping project.

## 9.2. Newcomers

There are not many recent newcomers in the communities of Ensaid Panjang, Karya Jaya Bakti and Gemba Raya, but migrants from Java have been living with the native inhabitants for decades. In Karya Jaya Bakti some newcomers are moving into the village to work on the oil palm plantation. Newcomers generally manage to blend into the community. Many of them for example participate in the traditional events held in the *Rumah Betang.* The people in the communities have an open attitude towards newcomers, as is confirmed by the following statement of Mr. Ringkai: "The newcomers in the village can adjust to the prevailing customary rules, and do not bring a potential conflict. The indigenous people in this village are very open to new people".

# Annex VII. Literature review on participatory mapping[41]

## *Introduction*

Even though the existence of participatory mapping activities is very important in a country like Indonesia where an estimated 48 million indigenous people still depend on the forest for their livelihood, but where mining, logging and oil palm industry are destroying more than 1 million hectares of rainforest territory each year[42] (Telapak & Gekko Studio 2011), the academic literature on participatory mapping within specific Indonesian context is quite limited. This may, at least in part, have to do with the political sensitivities involved in mapping, that can be especially critical for Indonesian indigenous peoples that have since long had a particularly uneasy relation with government and, until very recently, had to cope with a severe lack of legal protection. Luckily, a lot of additional information can be found in manuals, project evaluations, working papers, and online blogs, tutorial videos, etc. which are most often published in more recent years by the international organisations that implement the mapping projects in Indonesia. This literature review therefore draws on academic literature on participatory mapping both within and without Indonesian context, as well as other (mostly online) sources that are more specifically focused on mapping projects undertaken in Indonesia or Southeast Asia. It will cover the following topics: What is participatory mapping, what tools and methods are used, history and development of participatory mapping, reported impacts, and considerations about "good practice".

## *What is participatory mapping?*

Participatory mapping is a general term[43] used to define a set of approaches and techniques that combine the tools of modern cartography with participatory methods to create a map of a local community's habitat that represents this community's spatial knowledge (Rainforest Foundation UK 2014). "NGO's, from small local ones to large international ones, often play a crucial role as interlocutors, trainers, advocates and facilitators in these mapping activities" (IFAD 2009: 5).

Participatory mapping is used over the whole world, and the maps that are produced can take on many forms, and can be used to achieve various different purposes. Looking at the available literature and documentation on participatory mapping initiatives the most common aim of participatory mapping appears to be to help marginalized groups, in particular indigenous, pastoralist and forest dwellers, to claim and/or defend their (access to) ancestral lands and its resources, typically by working towards legal recognition of their land rights, using the maps as evidence of their continued residency. The maps can also serve as a tool for community land use planning and natural resource management, and can be used to bring resource-related problems, such as the impacts of logging,

[41] Please note beforehand that part of this text has been taken over into the main text of the report. In addition, this annex is also included as annex in MDG projects E2, E8 and E9.

[42] Making Indonesia the fastest forest clearing nation in the world since 2012, and also the world's third largest emitter of carbon dioxide emissions, behind China and the United States (Telapak & Gekko Studio 2011).

[43] The numerous initiatives throughout the world aren't always referred to with the words 'participatory mapping', but can go by many different terms, including: "indigenous mapping" (IFAD 2009: 6) , "…"participatory land use mapping," "participatory resource mapping" (Mbile *et al*. 2003), "community mapping" (Bennagen & Royo 2000, Eghenter 2000, Fox 2002), "community-based mapping" (Flavelle 2002), "ethnocartography" (Chapin & Threlkeld 2001, Gonzalez *et al*. 1995), and "counter-mapping" (Peluso 1995, Kosek 1998, Hodgson & Schroeder 2002)…" (as cited in Chapin *et al*. 2005: 622-623).

mining, and 'land grab' activities, to the attention of governmental authorities and decision makers (Chapin *et al*. 2005: 620; Di Gessa 2008; Rainforest Foundation UK 2014; Literat 2013: 200; IFAD 2009: 9-12, 39). Some indigenous groups are now using mapping to monitor and defend lands against deforestation, illegal timber extraction, prospecting, and colonization (Teague c. 2010: 10). Other purposes of participatory mapping activities include the strengthening of indigenous political organisation, economic development planning, the documentation of history and customs for culture preservation, education of indigenous youths and/or the general public (Chapin *et al*. 2005: 620), and support for conflict resolution in territory-related disputes (Di Gessa 2008).

Participatory mapping processes in general don't follow usual cartographic conventions. The maps that are produced often represent a socially or culturally distinct understanding of landscape and include information that is excluded from mainstream or official maps. The aim is to create a map that depicts local knowledge about the environment, and represents and serves the agenda of the community (IFAD 2009: 7). Participatory maps can present spatial information at various scales, from detailed information of village layout and infrastructure, to a more general depiction of large areas. Elements that can be included in a map are for instance: territorial land boundaries, land-use occupancy, hunting- fishing- and gathering grounds, the location/distribution of flora and fauna, important landmarks such as rivers, caves, roads, and location of houses, but also information on rainfall patterns, health patterns, wealth distributions, etc. Furthermore, the maps can depict places of social, cultural and/or historical significance, such as ancestral burial grounds, sacred areas, cultural sites and trails, and information on cultural customs, traditions, and mythology (IFAD 2009: 6-7).

What further distinguishes participatory mapping from traditional cartography and map-making is the process by which the maps are made (IFAD 2009: 4): Community members are involved (preferably) throughout the whole mapping process and recognized as capable research collaborators and experts on their own local surroundings and needs (IFAD 2009: 4; Pathways Through Participation 2010: 1). According to Fox *et al*. (2003, as cited in Wright *et al*. 2009: 261) the reasons for choosing a participatory mapping approach are usually not only practical (i.e. the actual production of the map and using it as evidence for land claims, or as community advocacy tools), but also intrinsic, as the communal aspect of the mapping process can enhance group awareness and cultural identity, facilitate the passing down of historical knowledge through generations, and build trust and communication between people.

### *Tools and methods*

Participatory mapping uses a range of tools and methods, of which some of the principles ones are:

**"hands on mapping"**, which is a basic method in which the community draws a map from memory on the ground (also called "ground mapping") or on paper (also called "sketch mapping");

**"Participatory mapping using scale maps and images"**, where local knowledge and information is added to a pre-existing image (such as an aerial or satellite image);

**"Participatory 3-D modelling (P3DM)"**, which is used for hilly or mountainous areas. Layers of elevation are cut out of cardboard in the shape and contours of the landscape and placed on top of each other, after which paint, pins and strings are used to show surface information and to indicate boundaries and conflict areas. Data depicted on such a 3-D model can also be extracted, digitized and incorporated into a Geographical Information System (GIS);

**"GPS based field mapping"**, in which geographical reference points of boundaries, landmarks, etc. are collected and are put on top of a map, often using GIS to store, retrieve and analyse the GPS data;
**"Computer based map making"**, where graphic software (such as Adobe Illustrator) and GIS are used to make geographically accurate maps, and;
**"Multimedia and internet-based mapping"**, which draws on Web 2.0 technology to create interactive, computer based maps that contain links to digital video, pictures, audio and written text (Pathways Through Participation 2010: 4). This increasingly popular method, makes it better possible to document the complexities and the oral and visual aspects of local knowledge (Di Gessa 2008: 6-9; IFAD 2009: 13-19; Rainforest Foundation UK 2011).[44]

The choice of methods to be used in a participatory mapping project is determined by many factors, such as the problems the community is facing and wants to resolve, the available resources (financial, and in terms of staff and equipment), and the community's physical context (is it hilly or plain) (IFAD 2009: 13) as well as its cultural context (norms, values, customs) (Rainforest Foundation UK 2011).

## *History and development*

### *Over the world*

Local people have been drawing maps of their territories to develop a sense of place and identity for centuries (Pathways Through Participation 2010: 2). However, mapping of indigenous lands as a participatory exercise and a means for "securing tenure, managing natural resources, and strengthening cultures", often facilitated by outsiders, is a more recent phenomenon (Chapin *et al*. 2005: 619).

According to Chapin *et al.* the first participatory mapping exercises started in Canada and Alaska in the 1960's (2005: 619). The rest of the world only followed much later, approximately 25-30 years ago, when participatory mapping projects started to rapidly proliferate from Southeast Asia through Central Asia, Africa, Europe, North-, South- and Central America to Australasia (IFAD 2009: 7).

"In the development literature, mapping is identified as having many different sources – from social anthropology to participatory action research and popular education" (Pathways Through Participation 2010: 2). Throughout the years, mapping has become increasingly popular and prominent (Ibid: 13), which "many commentators ascribe to the developments in Participatory Rural Appraisal (PRA) which emerged in the late 1980s in South Asia and combined insights from agro-ecosystem analysis with Rapid Rural Appraisal (RRA)" (Ibid: 2).

"The more technically oriented participatory mapping work began filling the field in the mid- and late 1990s, when computerized mapping technology became more widely available" (Chapin *et al*. 2005: 623). "Those engaged in participatory mapping are increasingly taking advantage of new, digital and web-based Technologies" (Teague c. 2010: 13), which are being developed and improved by large corporations such as Google (Google Maps and Google Earth), ESRI (developers of the principal GIS used

[44] More information on the different methodologies and their advantages, disadvantages, ways of implementation, suitable contexts, etc. can be found in the manuals of IFAD (2009) and Di Gessa (2008). For additional information on participatory 3-D modelling in specific also see Vandergeest (1996), Rubiano *et al.* (1997), Rambaldi & Callosa-Tarr (2000), Flavelle (2002), Hoare *et al.* (2002), De Vera *et al*. (2003), and Rhoades & Moates (2003) (as cited in Chapin *et al.* 2005: 623)

word-wide) and Garmin (producer of GPS hardware and software) especially for this purpose (Teague c. 2010: 13).

### *In Indonesia*

According to Peluso early forms of participatory mapping entered Indonesia in the 1980s via conventional (eco) conservation projects by international organisations such as the World Wildlife Fund (WWF), after which Indonesian activists took the opportunity to "… reinterpret this kind of mapping as a sort of resistance and counter-movement to state mapping, which did not consider people's rights but instead was a basis for exploitive development projects under the Suharto regime" (1995: 398-400, as cited in Hartjati Sanmukri 2013: 123).

Over the past 1.5 decade, communities from nearly every region in Indonesia have been trained in the technical and facilitation skills required to undertake participatory mapping, and by 2009 1.5 million hectares of land had already been mapped by local communities (IFAD 2009: 22). The Indonesian community mapping network (Jaringan Kerja Pemetaan Partisipatif or JKPP), established by the mapping activists in 1996 in Bogor, West Java, has been instrumental in achieving these goals (IFAD 2009: 22). I.a. by forming an alliance with AMAN and the Forest Watch Indonesia to advocate for the customary maps to become officially recognized and fed into the "Ancestral Domain Registration Agency" (Badan Registrasi Wilayah Adat): The government's official national database of forest cover. In 2011 AMAN signed an MoU with the National Land Agency (Badan Pertanahan Nasional), which officially stated that "indigenous" maps would be integrated into governmental data (Hartjati Sanmukri 2013: 123).

On May 16'th 2013 another important milestone for the recognition of indigenous peoples' ancestral land rights was reached, when – in response to a petition of AMAN - the constitutional court in Jakarta ruled that the customary forests of indigenous peoples should no longer be classed as falling in "State Forest Areas"[45] (Forest Peoples Programme 2013), officially giving customary forest its own status and position in the Forestry Law, and - at least in theory - returning the rights over the customary forests (seized by the state through UUK[46]) to its indigenous inhabitants (REDD-Monitor 2013). This development could greatly enhance the success rate of indigenous people's endeavours to lay claims to their lands and thereby protect their sources of livelihood in the future.

## *Reported impacts of participatory mapping*

Over the years, many researchers have noted the positive impacts that participatory mapping can have on a community:

> Participation in mapping seems to have encouraged some indigenous communities to demand title to lands (Toledo Maya Cultural Council, 1997; Leake, 2000; Herlihy, 2003; Herlihy and Knapp, 2003), to defend and claim their rights to control natural resources (Smith, 2003; Brown, 2006), and to design conservation and resource management plans that are compatible with local practices (Mohamed and Ventura, 2000; McCall and Minang, 2005; Brown, 2006; Bauer, 2009). Researchers have argued that, in addition to producing maps, when implemented with a stress on participation and with facilitation of

[45] The petition of AMAN (*Aliansi Masyarakat Adat Nusantara*), which was filed with the court some 14 months before the ruling, objected to the way the 1999 Forestry Act treats indigenous peoples' 'customary forests' as providing only weak use-rights within State Forest Areas" (Forest Peoples Programme 2013)

[46] UUK is the abbreviation for Undang-Undang Kehutanan: Act No. 41/1999 on Forestry, saying: "customary forest is STATE FOREST in indigenous territory" (IWGIA 2013). The new ruling has replaced this law.

> discussions within communities, indigenous mapping empowers indigenous peoples in land and resource use rights against potential encroachers (Poole, 2003; Smith, 2003; Brown, 2006; Finley-Brook, 2007) (Reyes-Garcia *et al*. ca. 2012a: 2-3).

In addition to these positive effects, researchers have also observed negative consequences resulting from participatory mapping. For instance, Authors such as Mwangi, Hodgson & Schroeder, Fox, Bryant, and Roth have noted issues such as increased privatization of land, loss of indigenous conceptions of space, greater exposure of valuable natural resources, increased taxation by the state, and increase or intensification of conflicts, either within the village, with neighbouring villages, or with other external actors such as companies or governmental authorities (Reyes-Garcia *et al*. 2012b: 651). Increase of conflicts due to participatory mapping, is one of the most frequently reported drawbacks of participatory mapping. Researchers such as Offen, Peluso, Hale, and Vandergeest have argued that: "Participatory mapping might intensify internal conflicts because it might bring to light overlapping uses of land and resources or erode traditional ways of dealing with internal conflicts…" (Ibid). Furthermore, it has been reasoned by i.a. Peluso and Rundstrom that "…participatory mapping might increase the number of conflicts with external actors, as the maps produced might challenge the maps made by state and corporate authorities" (Ibid).

Reyes-Garcia *et al*. have attempted to validate the theory that participatory mapping systematically increases the number of conflicts, using an experimental research design whereby 32 native Amazonian villages with and without conflicts with outsiders were randomly assigned to a treatment group (those where a participatory mapping project would be implemented by them) and a control group (those where a participatory mapping project would not (yet) be implemented by them[47]).[48] Contrary to others' previous findings, the results of their research show no statistically significant differences in the measured variables (i.e. number of conflicts, negative opinion, neutral attitude, and negative attitudes towards outsiders) between treatment and control villages (2012b: 656).

Reyes-Garcia *et al*. explain their deviating results by arguing that previous studies, which were based on direct observations rather than a randomized experimental design, might have been subject to selection bias, because the villages participating in participatory mapping projects are generally the ones that are chosen or volunteering to participate in participatory mapping due to the fact that they are expected to experience – or are already experiencing – conflicts over land rights and resources (2012b: 651, 656). Their results support the argument that mapping projects do not bring about conflicts per se, rather "…the process and the results of participatory mapping can help in conflict resolution or contribute to conflict generation or exacerbation depending on the political and socio-economic context in which they are conducted" (Ibid: 657).

[47] For the sake of fairness, participatory mapping projects were also implemented in the control villages, but only after all research data for the post-intervention study had been collected (Reyes-Garcia *et al.* 2012b: 653).

[48] All these villages were located in Tsimane' territory. The Tsimane' are a native Amazonian society of foragers and farmers in Bolivia.

## *Good practice*

### *How to organise a mapping process*

Considerations on how to successfully undertake a participatory mapping programme, in part focus on the question of "what constitutes as an ideal way to organise a mapping process". There are many philosophical and technical differences in implementing participatory mapping initiatives, and the fact that they are carried out in many different settings, makes it impossible to distinguish a single definitive blueprint process that proves successful regardless of context (Di Gessa 2008: 2; IFAD 2009: 30). It is, however, generally agreed upon that a structured approach to the mapping process is necessary for it to succeed.

In this regard, the International Fund for Agricultural Development (IFAD 2009) identified some broad steps that are typically adopted in the deployment of participatory mapping initiatives, i.e.: Preparing the community for the mapping activity; Determining the purpose(s) of making a map; Collecting information; Creating the map and determining the legend; Analysing and evaluating the information, and; Using and communicating the community's spatial information (IFAD 2009: 32-38). These steps correspond with Chapin & Threlkeld's "ethnocartography model": a coherent and structured methodology that provides a 6 step approach to the process of mapping indigenous lands. According to the IFAD (2009: 32) most mapping projects loosely follow the steps of this approach, which entail: 1. "**ground preparation**: before the project starts project leaders and indigenous leaders explain the objectives and importance of the mapping work to the community, the technical team is recruited and collaboration with NGO's and government agencies is sought; 2. **First workshop – orientation and training**: Project staff and indigenous leaders explain the objectives and methodology to the surveyors and technical team and data collection tools are developed; 3. **First fieldwork – gathering data and sketch mapping**; 4. **Second workshop – transcription of data onto new maps**; 5. **Second fieldwork – verification of collected data by the community**, and; 6. **Third workshop – correcting and completing final maps**: Surveyors reunite with the cartographers to incorporate information that has been verified in the field and put the draft maps in final form (Chapin & Threlkeld 2001; IFAD 2009: 30).

### *Ethical considerations*

In one of his later works, Chapin points out that in the past guidebooks about participatory mapping that have grown out of work in Southeast Asia, have focused mostly on the technical aspects of mapping, avoiding the more politically sensitive aspects and ethical considerations brought along by the mapping.[49] The first manual to actually focus on these matters within Indonesian context was "Mapping people's forests: the role of mapping in planning community-based management of conservation areas in Indonesia" by C. Eghenter in 2000 (Chapin *et al*. 2005: 627). Over the years the focus on ethical considerations about potential negative consequences of mapping and the moral responsibilities of the project instigators towards the communities that partake in the mapping projects has become more pronounced. More and more authors broach these kinds of issues in their articles, books and manuals, even if only in afterthought.

[49] Examples of these "technical" guidebooks on participatory mapping are: Drawing on Local Knowledge: A Community Mapping Training Manual (Momberg *et al*. 1995); Mapping Our Land (Flavelle 2002); and Manual on Participatory 3-Dimensional Modelling (Rambaldi & Callosa-Tarr 2000) (as cited in Chapin *et al*. 2005: 627).

In the literature, a prominent topic with regard to "ethical practice" is that of "empowerment". Projects should be dedicated to achieving community empowerment, meaning that cartographers should focus on teaching the indigenous people how to read, interpret, produce and use maps, and should let them take as much control and responsibility over the mapping process as possible, thereby ensuring that the community will also be able to update their map and develop their own map-use strategies after the project has finished (Chapin & Threlkeld 2001: 128; Di Gessa 2008: 15; IFAD 2009: 25). Good practice, in this regard, also (perversely) means that mappers sometimes have to deliberately disregard or simplify available technologies to make sure the community will be able to access, understand and use them in the future without outside help (Chapin *et al.* 2005: 259; Di Gessa 2008: 5). Ownership rights should also belong to the community itself, enabling them to protect their own interests by deciding for themselves which data they want to publicly disclose, and which (potentially sensitive) data they want to keep private (Chapin & Threlkeld 2001: 134; IFAD 2009: 27-28).

According to i.a. Chapin & Threlkeld (2001) and Teague c. (2010), good practice in participatory mapping exercises also requires a culturally sensitive approach on the part of the international project instigators (NGO's, CBO's, etc.) and staff involved in the mapping process. They should make an effort to view the world from the eyes of the indigenous community, respecting and prioritizing the community's needs, and "carefully considering the challenges inherent in translating indigenous knowledge (which is often based on different epistemologies and conceptions of space and time than their own) into Western Cartesian cartographic formats" (Teague c. 2010: 15). For instance, knowledge about boundaries can easily be misrepresented as indigenous peoples often have a "fluid sense" of their borders, which can be overlapping, incomplete, shifting and/or dependent on seasonal variations (Chapin & Threlkeld 2001: 133)

Another topic that is quite extensively covered in the literature is the project initiators' (perceived) ethical responsibility to ensure that the benefits of the participatory mapping exercise are evenly felt throughout the community. It is deemed important that the map should represent the views and wishes of all the different groups within the community, and consequently many authors highlight the fact that special effort should be put into making sure that the map reflects the perceptions and needs of (potentially) marginalized groups, such as women, the elderly, youth, or immigrants (Chapin & Threlkeld 2001: 127; IFAD 2009: 27-28). Furthermore, it is thought important that members of all groups (and not only the village elite) are encouraged to participate in the actual mapping process, among other things to make sure that pre-existing power structures favouring certain groups' access to land are not reinforced (Teague c. 2010: 14), and to prevent new power imbalances between the people that know how to use the advanced technology, and those who don't (Wright *et al*. 2009: 260). Conversely, authors such as Mei-Po Kwan and Diane Rocheleau, who write from a feminist perspective, note the importance of taking into consideration and addressing the disrupting effect that mapping can have on existing gender relations (Teague c. 2010: 14).

An interesting development is that, over the past years, a special interest seems to be taken in the issue of "who controls GIS and with what power" (Spiegel *et al*. 2012: 345). Authors such as Chapin *et al.* (2005), Di Gessa (2008), Spiegel *et al*. (2012), Teague (c. 2010), and Wright *et al*. (2009) raise concerns on how skill levels needed for the handling of GIS are often gendered and age based (Teague c. 2010: 13), and on how a lack of electricity and internet access in remote communities and the cost of the equipment, causes the knowledge and handling of the GIS technology and/or the processing of the

GPS data to remain outside of the community, in the hands of a small - already privileged - elite of experts, thus enhancing existing power structures (Chapin *et al.* 2005: 629; Di Gessa 2008: 14-15).

Other topics on "good practice" in participatory mapping that are less pronounced but still present in the literature are: The importance of ensuring the long term commitment and support to initiatives of external parties (NGO's, CBO's, universities, development partners, etc.) (IFAD 2009: 25); A good selection of the mapping team. For instance: Chapin & Threlkeld have provided a list of desirable characteristics for facilitators (2001: 127), and lastly; The responsibility to make the local community aware of potential risks of mapping (such as boundary conflicts, risks of documenting sensitive information) before the start of the activities, and to put an effort into mitigating negative impacts that occur in the wake of the process (Di Gessa 2008: 1,3; IFAD 2009: 28-29).

# 1. Introduction

## 1.1. Project context

Agricultural productivity has stagnated in Indonesia. Despite labour productivity remaining buoyant with the outflow of labour from agriculture, agricultural total factor productivity growth has been negative since the early 1990s, from annual gains of 2.5 percent in 1968-92 to annual contractions of 0.1 percent from 1993 to 2000 (World Bank 2006). This is also true for the rice sector. The figure below, copied from Simatupang and Timmer (2008), shows that since the financial crisis of 1997, rice productivity increases have been around 1.2 percent.

**Figure 1: Annual growth of rice production**

*Source:* Raw data from the Ministry of Agriculture.

Historically, Indonesia has intervened a lot in rice markets. The oil boom around 1973 resulted in a large inflow of resources for the Government, which were used to promote high-yield rice varieties and investments in irrigation systems. An important priority at the time was to reach self-sufficiency in rice production, which was shortly achieved in 1984. The years before that had seen an increase in yields of around 7 percent annually. The economic crisis is probably to blame for the lack of productivity since then. Public resources shrunk, and maintenance in irrigation systems was underfunded. Recently, another important reason is the shift of farmers out of rice into higher yielding crops, especially vegetables, which are demanded in the again rapidly growing cities (World Bank 2006).

Besides investing in rice production, government policies have also intervened in prices. Fertiliser subsidy has been important; over the seven year period from 1984 to 1990 this subsidy alone averaged 9% of the total development budget (OECD 2012). Until 1998, Bulog, the state logistics board had a monopoly in trading rice. With the Financial crisis, policies which are budgetary less costly have been pursued. To keep domestic prices high, supposedly to protect farmers, an import duty on rice of 30

percent was introduced along with the abolishment of the monopoly of Bulog. Import rates have fluctuated since then, and the average nominal protection rate was 17% from 1990 to 2000.

Indonesia is characterised by small farming households. The average landholdings are around 0.8 hectare per farming households to the 2003[1] agricultural census. According to Kuswara et al. (2009), over the past decades the farmers have become dependent on agricultural companies for agricultural inputs like fertilisers, pesticides and seeds. The government is also encouraging the use of chemical inputs to increase productivity as also indicated above. However, Kuswara et al. (2009) notes, many of the existing commercial seeds are not suitable to the local conditions and farmers' needs. In addition, the reliance on industrial inputs has resulted in the loss of farmers' knowledge about plant breeding and high genetic erosion of agro-diversity. PEDIGREA (Participatory Enhancement of Diversity of Genetic Resources in Asia) programme has started in 2003 to change this situation.

Indramayu is a district in West Java with a population of around 1.6 million people. It is a suitable place to grow rice. It has 239,698 hectares of rice fields that together produce 155,755 tons of rice. The average yield per hectare was 7.1 tons in 2013[2]. For comparison, the average yield in Indonesia as whole was 5.1 ton per hectare in the same year[3]. According to the Wikipedia, it "was known as Indonesian no 1 rice supplier in the early 1980s to late 1990s"[4] and it was the main target area for the government's Green Revolution in the 1970s (Kuswara et al, 2009).

FIELD has also chosen to implement PEDIGREA in Indramayu for the aforementioned reasons. The programme includes the Farmer Field School on participatory plant breeding on rice and vegetables, and animal improvement on goats. However, a certification is needed in order for the farmers to have the right to sell their seed varieties at the market. Without certification, farmers have no right to sell the seeds, as it must be through government institutions (BALITPA) or through private companies who pursue the right to sell seeds. The certification of the seed varieties is costly, as it has to be tested on multiple locations. FIELD is working on the development of a community registry and seed system for a participatory alternative for the state certification system. In addition, FIELD works with farming groups (FGs) to develop a joint marketing strategy to strengthen the position of farmers when selling their products.

## 1.2. Evaluation objectives

This report evaluates the 'Local Economic Development and Promotion of Local Seed System to Indonesian National Policy' project [5] of FIELD funded by Hivos as part of as part of the *Medefinancieringsstelsel* (MFS) II evaluation for Indonesia under the Achievement of Millennium Development Goals (MDG) component. The project works on the goals on poverty alleviation (MDG1) and partially on the goals related to sustainable living environment, forests and biodiversity (MDG 7ab). However, for the focus of the evaluation the project's effectiveness regarding the goals on MDG 1 was selected. In particular, the current evaluation focuses on the following research questions: How many

[1] World Bank (2006) "Making the new Indonesian work for the poor", Figure 2.1
[2] http://indramayukab.bps.go.id/index.php?hal=tabel&id=16
[3] Source: Bureau of statistics http://www.bps.go.id/tnmn_pgn.php?kat=3
[4] http://en.wikipedia.org/wiki/Indramayu
[5] The project is described in more detail in section 3.

households benefit from the savings and credit cooperatives (set up with the help of the project) as members? What is the amount of total outstanding loans? Do the farmers have better access to finance? Are the farmers able to sell their produce collectively on the market and get a better price for their produce? Most importantly, how did the livelihood of farmers change?[6]

We investigate whether the project had a favourable effect on the above mentioned outcomes using difference-in-difference methodology: we compare the changes in the outcome variables between the baseline and endline periods for the project beneficiaries (seed breeding farming group and credit cooperative members) to the changes in outcomes for a comparison group. In addition, because the project was already running for several years before the baseline with the same beneficiaries, we also estimate the effects of the project prior to the baseline survey by comparing the outcomes of the beneficiaries to the comparison group while controlling for pre-intervention household characteristics.

We surveyed 8 of 19 project farming groups involved in rice breeding and from 4 of 6 savings and credit cooperatives (in the same villages) established with the assistance of the project. In addition, 4 non-project farming groups in villages with cooperatives and 3 farming groups outside of the project area were surveyed in Indramayu. Overall, 225 households, 4 cooperatives and 13 farming groups have been interviewed using structured surveys at the baseline period. All of them have been re-interviewed at the endline except for 5 households, which are excluded from the data analysis. The survey households were selected randomly from the farming groups and cooperatives in the treatment villages. However, seed breeding farmers were given priority in sampling.

As specified in the Terms of Reference for this evaluation, the report addresses five evaluation questions to assess the project outcomes:

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?
2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern partner organisations efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

[6] Two additional questions assessed using project reports are: How many local seed varieties are registered in the community seed registry system, and how many community enterprises were established as a result of the intervention?

## 1.3. Summary of findings

The FIELD project ran between 2003 and 2014. However, the evaluation focuses on the project period between 2011 and 2014. During this period, the project focused on institutionalizing the community seed registry system, setting up credit cooperatives (6 in total) as sources of funding for community enterprises based on business potential in the seed sector, and continued assistance to the project farming groups (15 in total) in terms of seed breeding and sustainable farming practices.

Because most of the project activities at the farming household level (direct beneficiaries) have already been running for a while before the baseline survey, in the evaluation the project impacts prior to and during the evaluation period are assessed using regression analysis.

The results show limited impacts of the credit cooperatives on their members. At the time of the endline survey, the project was only effective in increasing the savings of member households (24 percentage points). However, no effects are found on the welfare and borrowing of households.

Most of the impacts are found through the project farming groups in terms of using organic fertilizers (23 percentage point) and pesticides and insecticides (12 percentage points), the yield of rice (0.6 t/ha or 13 percent) and food security (26 percentage point reduction in transient food insecurity). However, again no impact is found on the livelihood of households. Rather, due to a decrease in the price of rice particularly among the treatment households, their income from rice has decreased during the evaluation period (not significant). Related to this issue, almost all households sell their rice individually, and no collective arrangements existed at the endline.

Finally, in general, the farmers increased the use of both chemical and organic fertilizers. Unfortunately, chemical fertilizer use has also increased among seed breeding households (36 percentage points).

## 1.4. Structure of the report

The rest of this report proceeds as follows: section 2 describes the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1) till 4) in turn. Section 11 describes the relationship between the Capacity Development and Civil Society component to the MDG component. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. The project implementation and the SPO is described in Annex I. The construction of the outcome indicators and indices is summarized in Annex II, while Annex III provides the summary statistics on the data used. Annex IV provides a short description of survey locations. Annex V reports on the characteristics of the surveyed households. In turn, Annex VI and Annex VII contain additional tables on the outcome indicators related to the evaluation questions on the change in outcomes and attribution, respectively. Finally, Annex VIII reports further details explaining the results.

## 2. Literature overview

Despite the popularity (see below for references) of projects on participatory seed breeding and selection and farmer seed enterprises (FSE), little research has been done to assess the impacts of seed breeding projects. Therefore, the focus of this literature review is primarily on the best practices and recommendations for farmer seed enterprises based on evaluated projects. The effectiveness of projects is also reported when such information is available.

Neate and Guei (2010) lay out the key requirements for successful smallholder seed enterprise development based on the experience of the Food and Agriculture Organisation of the United Nations (FAO). These are 1) a conducive policy environment; 2) the existence of sustained demand for quality seed; 3) the availability of improved varieties and source seed from public sector breeding programmes or participatory breeding and on-farm testing programmes; 4) technical support and training in seed production as well as training in marketing and management; 5) access to low interest rate credit for purchasing inputs and equipment; 6) local ownership and profitability of seed enterprises to ensure sustainability; 7) subsidies or other related support and services for establishing seed enterprise infrastructure; 8) linkages between formal and informal sectors and 9) communications strategy, branding and marketing to thrive in a competitive world and to ensure a sustained market.

The above requirements are also acknowledged by Karanja et al. (2011), who described the success achieved in an ongoing pilot project, implemented in Kenya and Tanzania, aimed at validating and promoting farmer-led seed enterprise (FLSE) models for sustainable supply of quality seed of African indigenous vegetables (AIVs). They say that the success of the models is based on the development of technical capacities of seed producers as well as building strategic and functional linkages through public private partnership with institutions/organisations in the value chain. In a Ugandan context, also David (2004) found demand for seed, the availability of superior varieties, collaborative linkages and repeated training on seed production, management and marketing as being crucial for the sustainability of farmer seed enterprises. She draws on experiences of three farmer groups (IBFA, BKTWG and MWG) growing common bean in Uganda between 1994 and 1997 and adds close and regular field supervision to the requirements. Although earnings by the FSEs surpassed income from traditional activities (about US$1700 for IBFA, US$337 for BKTWG and US$272 for MWG), the BKTWG had stopped producing after 6 to 8 years and the other groups' level of production and sales had not increased significantly over the years (based on anecdotal evidence). By assessing the Farmer-Based Seed Multiplication (FBSM) programme in Ethiopia, undertaking Participatory Variety Selection (PVS) and Participatory Plant Breeding (PPB), Alemu (2011) confirms the earlier mentioned requirements by recognizing these as major challenges for the FBSM programme. He also finds that intensive supervision and capacity building made the strategy costly and the programme was dependent on the support of different organisations.

Beye and Margiotta (2008) carried out an impact evaluation of groundnut seed projects (Phase I and Phase II), implemented in Mali, Niger and Nigeria from 2003 to 2007. They found that none of the trained farmers' groups was able to evolve into organised seed enterprise ventures, mainly because of weak linkages between farmers, processors and traders and the lack of information on markets and prices. Seed producer associations expressed a need for linkages to national organisations to be able to

access that information. The projects used Farmer Participatory Varietal Selection (FPVS) and Community-based Seed System (CBSS) and the farmers received training in seed production, marketing and management. Although the projects were successful (the proportion of area planted under modern varieties has increased in and around selected pilot sites by 22% in Nigeria, 12% in Mali and 10% in Niger, with yield gains over local varieties of 31%, 24%, and 43% respectively, and the net income obtained by "adopters" compared to "non-adopters" was 66% higher in Mali, 73% in Niger and 111% in Nigeria), they were not sustainable because of the weak linkages.

Two seed producer group projects in Nepal are evaluated by Poudel et al. (2003) and Witcombe et al. (2010). The first one focuses on quality seed business, saving and credit and the second one focuses on building marketing skills for delivering new seed varieties. The projects were successful. Poudel et al. (2003) found an increase in annual income of 25% 9 years after the establishment and Witcombe et al. (2010) found a seed production increase from 1 t in 2001 to 137 t in 2006. However, both projects were financially very dependent on organisations and investors as well as on guaranteed purchases and marketing linkages established by the organisations. Moreover, they also conclude that the interpretations of technologies of smallholders should be heard at a much earlier design stage for higher adoption rates.

Singh et al. (2013) document the experiences of a farmer-participatory pigeonpea seed production project in two districts in India in 2007 and 2008, aimed at increasing productivity of pigeonpea through expanding the availability of quality seed of improved varieties to farmers. Farmers formed three registered cooperatives for seed production, processing and marketing at local level, in which they also got trained. In addition, two generator-operated mobile seed processing units were procured from project resources. After 10 farmer-participatory varietal selection (FPVS) trials, farmers preferred the long-duration variety NA 1, mostly because of its high yield. Using personal interviews and observation, the authors conclude that FPVS is an effective vehicle to identify farmer-preferred varieties and quickens the process of varietal replacement. Also, working together in the cooperatives enhanced the farmers' bargaining power. Compared to the local variety, NA 1 had a 118.63% higher yield and a 17.14% higher market price in 2008-2009. Despite a 46.03% higher cost of cultivation, net income was 199.59% higher than income from the local variety. It is not known whether the project is sustainable, but the cooperatives were advised to brand their seed produce for better marketing.

Summarizing, it is found that participatory seed breeding and farmer seed enterprises are successful in identifying varieties and the distribution of varieties if farmers are included in the process at an early stage. The projects result in an increase in income, at least in the short run. However, sustainability is a problem. Important constraints are seed enterprise infrastructure, linkages between the formal and informal sector and between farmers, trader and organisations and the dependency on support of organisations.

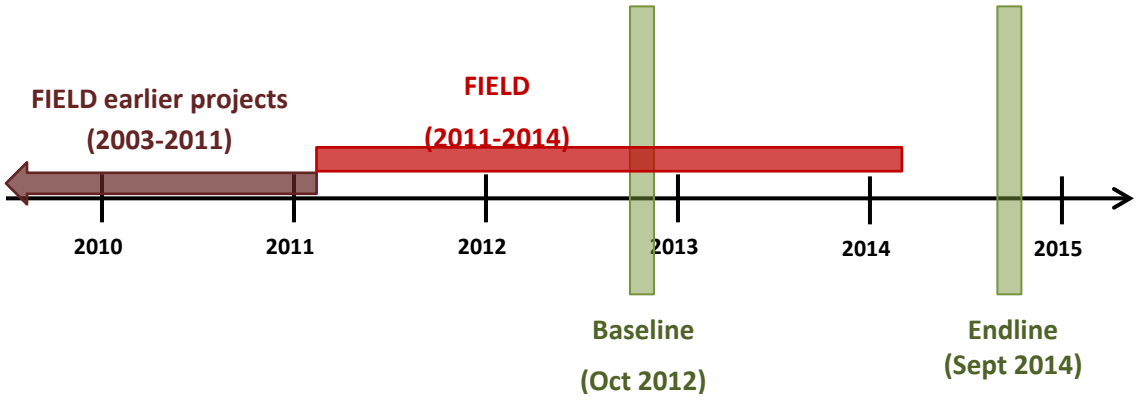
# 3. The project

## 3.1. Project description

The 'Local Economic Development and Promotion of Local Seed System to Indonesian National Policy' project of Farmer Initiatives for Ecological Livelihoods and Democracy (FIELD) is a long-standing initiative to build the capacity of small-scale farmers to select, grade and breed seeds using local seeds. The project started in partnership with PEDIGREA in 2003. Hivos supports the project since the beginning. The evaluated contract period started 28 February 2011 and ran until 28 February 2014. This is the last project period and the project activities have been designed as an exit strategy from the project areas after 10 years of project activities.

In the project, FIELD assisted farmers in breeding local seed varieties that are less reliant on fertilisers and pesticides. FIELD aims at facilitating farmers to get their local varieties certified through community seed registration system once it is approved by the local government. To improve the market position of the farmers, FIELD gave trainings to the farmers' cooperative on how to set up a credit cooperative, which is used to mobilise capital to be able to set up enterprises necessary to sell the products of the members collectively. The aim is to strengthen the market power of farmers producing local seed varieties.

## 3.2. Project implementation



In the project, 6 farmers' groups have set up a credit cooperative building on the previous project on seed breading in Indramayu. In these savings and credit cooperatives, members build up savings and they use the accumulated capital to provide credit for these members. FIELD selected participating villages for the activities on credit cooperatives based on the criteria that the villages having developed local seed varieties; farmers are dependent on income from agriculture; farmer group is well-organised; and the farmers in group have high commitment during seed breeding.

In addition, FIELD continued working with 15 farming groups on seed breeding and sustainable farming practices. Different farmers focused on different crops; however, the breeding of new rice varieties was done in all villages as Indramayu district is a main rice producing area. Therefore, the evaluation also focuses on rice breeding.

A major result of the project was that the Constitutional Court approved the establishment of community seed registry systems on 13 July 2013. In order to disseminate the results and prospects of this ruling in Indramayu, FIELD conducted audiences with government officials responsible for agriculture, animal husbandry and fisheries, consulted with the faculty of agriculture, and held meetings with farmers and a team of lawyers. In addition, in November 2013, a Field School training was organised with 33 farmer participants (both male and female) in Indramayu (Tenajar village). (FIELD Annual Review 2013)

Figure 2 displays the timing of the project and evaluation activities.

**Figure 2: Timing of intervention**

Further information about the FIELD project as well as a detailed description about the planned project activities is provided in Annex I.

## 3.3. Result chain

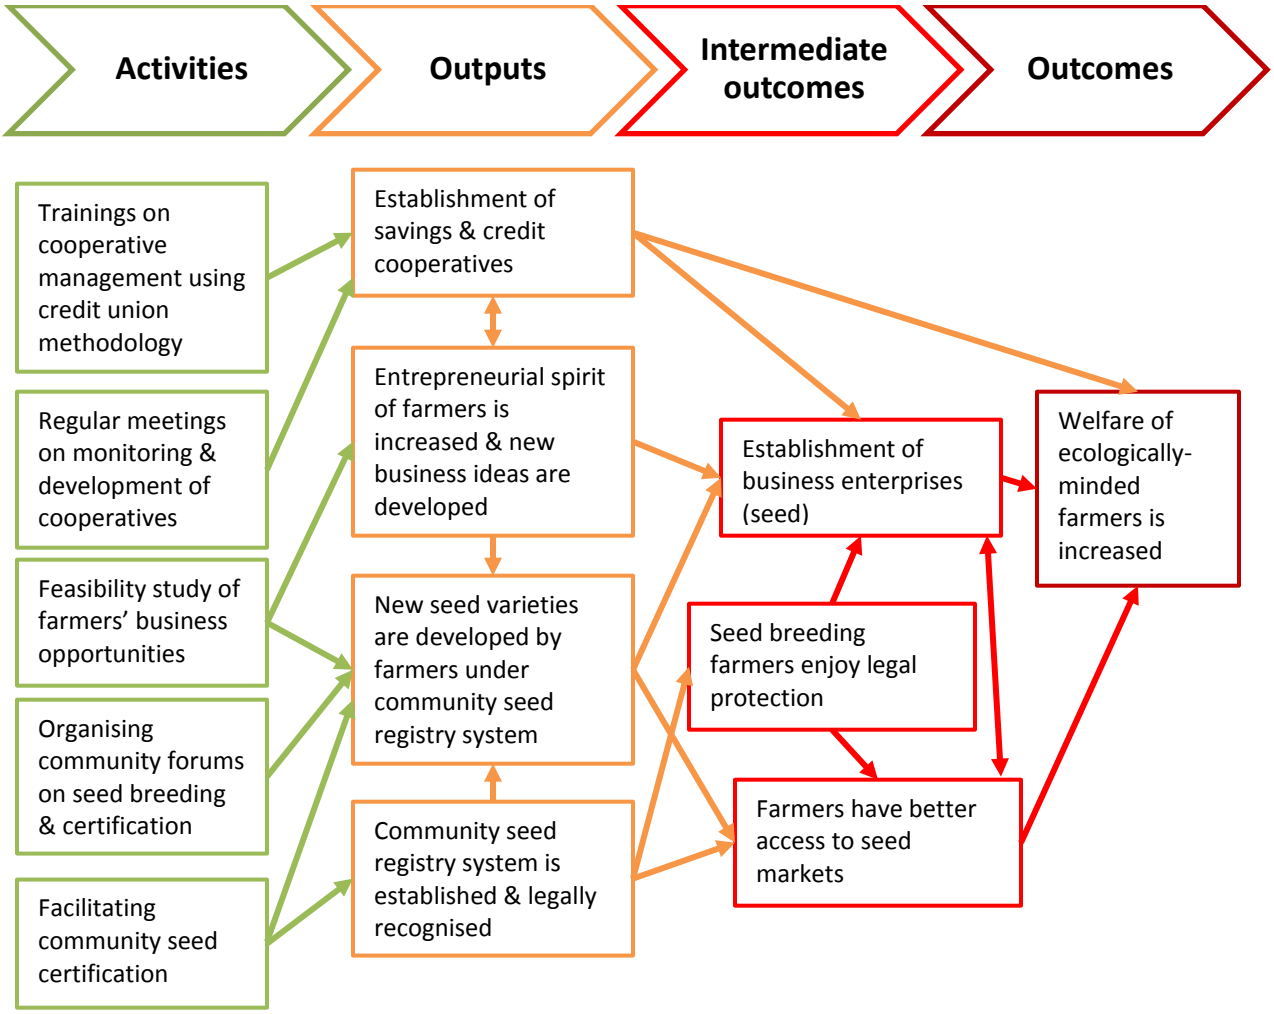
A stylized result chain of the FIELD project is displayed in Figure 3. The causal links in the graph are the interpretation of the evaluation team. For simplicity, we have omitted from the figure other factors that affect the project outcomes. Only project elements are indicated that are based on the detailed result chain of the project (see Annex I).

As mentioned before, the ultimate goal of the project is to increase the welfare of ecologically-minded farmers. The result chain indicates that FIELD approaches this objective through farmers' empowerment in providing and buying locally produced farming inputs (seed varieties) that are suited to local ecological conditions. FIELD has been working with local seed breeders in the project area already for a decade. However, the current project period focuses on developing a sustainable system for community-based seed breeding and marketing of seeds.

The project rests on three pillars: (i) the establishment of savings and credit cooperatives using the credit union methodology, which the project supported by socialization and development meetings and trainings on the management of cooperatives; (ii) the development of business plans for developing and marketing new seed varieties; (iii) the establishment and legal approval of community seed registry system. As a result of the three pillars, seed breeding farmers are able to establish business enterprises marketing local seed varieties. Specifically, savings and credit cooperatives provide the capital base, while the seed registry system provides the legal protection for setting up a business based on successful local seed varieties.

However, a fourth project pillar is implicitly assumed in the project, namely, that farmers are able to breed successful local varieties that are tested at multiple locations. FIELD has been working on this aspect of the project in the previous project periods with the assistance of IPPHTI. In fact, the project locations are scattered in Indramayu because this provides an ideal ground for the multiple locations testing.

Overall, as a result of the project outputs, farmers have better access to seed markets and are able to become independent of the large input supplying companies. They can better adapt to local circumstances and they can reduce their input costs. At the end, both the seed breeding farmers marketing local varieties and the farmers producing for consumption are better off, and their welfare is improved.



However, please note that the link to improved welfare is rather weak based on this project logic. Business opportunities will only benefit a handful of seed breeding farmers, while it is questionable to what extent the other farmers will benefit from better access to seed markets. Given that timeframe for developing the seed businesses and for the approval of the community seed system, it is rather unlikely that these benefits have been materialized by the time of the endline evaluation.

### *Other project effects*

Not mentioned in the project logic are the project's efforts to encourage sustainable farming practices. Specifically, during the seed breeding process the use of chemical inputs and irrigation is not allowed. However, the use of these practices may also benefit non-breeder farmers as well. Therefore, in the evaluation, we investigate both the use of organic farming practices and the yield of rice. The latter one could be affected both by the seed varieties cultivated and the farming practices used.

Please note that good farming practices are also encouraged by IPPHTI unrelated to the FIELD project.

**Figure 3: Result chain**

# 4. Evaluation questions and outcome variables

## 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. In the baseline report specific evaluations questions were specified. Table 1 shows these five questions and what it implies for this project.

**Table 1: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| 1 | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | • How many households benefit from the savings and credit cooperatives (set up with the help of the project) as members? What is the amount of total outstanding loans?<br>• Do the farmers have better access to finance?<br>• Are the farmers able to sell their produce collectively on the market and get a better price for their produce?<br>• How did the livelihood of farmers change? |
| 2 | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Are the observed changes above attributable to the intervention? |
| 3 | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>• Does the project address an important issue for the beneficiaries? |
| 4 | Efficiency: Were the development interventions of the Southern partner organisations efficient? | Was the intervention cost effective? |
| 5 | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

The first two questions relate to the savings and credit cooperatives set up with the assistance of the programme. The third question relates to the projects aim to set up business enterprises and jointly market the harvest of farmers. This is expected to lead to better bargaining position, and hence to better prices. The final question assesses the project's overall objective on the welfare of farmers.

Finally, the project's effect on using sustainable farming practices and the effects on yield (rice) were not included among the evaluation questions. However, these have been assessed at the baseline, and we also investigate these outcomes in the endline report.

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators. The outcome indicators are split up into 7 sub-groups: use of financial instruments; households using organic farming practices; yield of rice; selling price of rice; volume of rice sold; household income and livelihood; and food security and vulnerability. These factors are sequentially linked to the project result chain (see section 3.3) and to the evaluation questions presented in Table 1.

Table 2 displays the outcome indicators of the main analysis, the scale of these variables and whether the indicator is a uniform indicator as specified by the synthesis team for the goals on poverty alleviation (MDG 1). Annex II describes the outcome indicators in more detail.

**Table 2: Overview outcome indicators**

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| **A. Use of financial instruments** | | | X |
| Percentage of households that know a place to borrow | (0%; 100%) | Household survey | |
| Percentage of households involved in a financial institution | (0%; 100%) | Household survey | |
| Percentage of households that have savings in the form of savings in group, cooperative or bank | (0%; 100%) | Household survey | |
| Percentage of households that have borrowed in the past 12 months | (0%; 100%) | Household survey | |
| Total outstanding loans at the savings and credit cooperatives | (0; NM) | Saving and credit cooperative survey | |
| Number of members in savings and credit cooperatives | (NM; NM) | Saving and credit cooperative survey | |
| **B. Households using organic farming practices** | | | |
| Percentage of households practicing organic farming | | Household survey | |
| - Self-reported | (0-100%) | | |
| - Based on responses to questions (not using any chemical input) | (0-100%) | | |
| Percentage of households using chemical inputs | | Household survey | |
| - Using chemical fertilizer | (0-100%) | | |
| - Using chemical pesticides/insecticides | (0-100%) | | |
| Percentage of households using organic inputs | | Household survey | |
| - Using organic fertilizers | (0-100%) | | |
| - Using organic pesticides/insecticides | (0-100%) | | |
| **C. Yield of rice per ha** | (0; NM) | Household survey | X |
| **D. Selling price of rice** | (0; NM) | Household survey | |
| **E. Volume of rice sold (kg)** | (0; NM) | Household survey | X |

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| **F. Household income and livelihood** | | | X |
| Household revenue from sale of rice (1000 Rp) | (0;NM) | Household survey | |
| Total income per month (1000 Rp) | (NM; NM) | Household survey | |
| Total income per month per capita (1000 Rp) | (NM; NM) | Household survey | |
| Non-food consumption per capita (1000 Rp) | (0; NM) | Household survey | |
| Housing facilities index | (NM; NM) | Household survey | |
| Asset index | (NM; NM) | Household survey | |
| Percentage of households invested in business | (0%; 100%) | Household survey | |
| Percentage of households invested in new farming tools | (0%; 100%) | Household survey | |
| Overall happiness | (1; 4) | Household survey | |
| Current subjective wealth status | (1; 6) | Household survey | |
| **G. Food Security and vulnerability** | | | X |
| Percentage of households not able to cover their living costs | (0%; 100%) | Household survey | |
| Percentage of households have not enough to eat | (0%; 100%) | Household survey | |
| Nr. Of Months Could Not Cover Living Costs | (0; NM) | Household survey | |
| Nr. Of Months Could Not Enough To Eat | (0; NM) | Household survey | |
| Current standard of living: daily needs covered (only for panel respondents) | (1; 3) | Household survey | |
| Current standard of living: food consumption covered (only for panel respondents) | (1; 3) | Household survey | |
| Notes: NM = no minimum/maximum, n is the number of villages in either the treatment group or the comparison group | | | |

# 5. Data collection

This section describes the survey instruments and the sampling design and outcome in turn.

## 5.1. Survey instruments

We collected two types of data: quantitative and financial. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

To analyse the impact of the programmes, three surveys have been conducted to collect quantitative data:

- Household survey: was designed to collect information about socio-economic characteristics, involvement in financial institutions, farming practices and production focusing on rice, and the households' livelihoods.
- Farming group survey: a short survey was administered to the farming group leaders regarding the functioning and activities of the farming group.
- Cooperative survey: a short survey was administered to the project credit cooperative leaders regarding the functioning and activities of the cooperative.

The baseline data have been collected in October 2012; while the endline data was collected in September 2014.

### *Financial data collection*

To collect information about the costs of the FIELD project, we conducted a project cost survey with the finance manager of FIELD on 16 July 2013. We received additional financial information from Hivos in December 2014.

## 5.2. Sampling outcome

### *Sampling design*

From the 19 project villages participating in participatory breeding in Indramayu district,[7] we have sampled 8 farming groups in 8 villages. The choice of farming groups was stratified by the presence of savings and credit cooperatives in order to be able to utilise treatment intensity during the evaluation. In the sample, we selected 4 (out of 6) villages where there was already a cooperative functioning; and 4 villages where only breeding activity was done. For the comparison group, we have selected 3 comparison villages from sub-districts (one per each) where we sampled villages with saving and credit cooperatives. The comparison villages were selected to be comparable to treatment villages in terms of population and percentage of households living from agriculture based on census data.

[7] According to FIELD Annual Review 2013, only 15 farming groups participated in the project. The information on 19 project villages stems from an interview with the field facilitator of IPPHTI, who implements the project on FIELD's behalf. It is possible that IPPHTI works with additional villages that are not part of the project.

In the villages with a cooperative, we sampled three types of households: (i) households who were member of the project (seed-breeding) farming group (110 in total); (ii) households who were members of the project savings and credit cooperative (53 in total, of which 37 were also members of the project farming group); (iii) other farming households who lived in cooperative project villages but were not members of either the project cooperative or the project farming group but may indirectly benefit from the project (spillover, 54 in total). In the comparison villages we sampled farming households that were members of a randomly chosen farming group (45 in total). All households were randomly sampled within the sampling strata. However, in treatment farming groups we have oversampled seed breeding farmers (33 households in total) due to the focus of the project on these households.

At the endline, we aimed to re-interview all the 225 households, and the same respondents. In case it was not possible, the household was dropped from the final sample.

### *Sampling outcome*

There have been two complications in the sampling for the FIELD project: first, we had no prior information regarding the overlap of the farming group and cooperative membership in the villages. In some of the villages the overlap was perfect, while in other villages cooperative members were not members of a farming group. The numbers in the previous section indicate the sampling outcome with respect to farming group, cooperative and spillover group members.

The second complication we encountered was that data from the surveys and project documents indicate that not all sampled treatment farming groups have actually been part of FIELD's project.[8] As a result, the treatment status of 3 farming groups had to be changed (in 2 cases to spillover as another farming group in the village was served by FIELD,[9] and in one case to comparison farming group[10]). Regarding these changes see Table 11 in Annex IV and Table 19 in Annex VIII regarding the classification of farming groups.

Table 3 shows the sampling outcome taking into account both complications.[11] The number of treatment households was much lower at the baseline than originally planned due to the changes in treatment types (96 vs. 140). Among these treatment households, 71 were members of a project farming group and 53 were members of a project savings and credit cooperative (28 households were members of both).

At the endline, we successfully re-interviewed 220 of 225 households,[12] and in 200 household the same respondents.[13]

[8] This is due to the fact that we did not receive a list of project farming villages from FIELD. Instead, the survey team had to find out this information in the field. See also footnote 7 on page 18.
[9] This was the case for farming groups in enumeration area (EA) 7 and 10.
[10] Actually, IPPHTI was conducting trainings with this farming group (in EA 12) but we did not find indication in the project documents of FIELD that this farming group/village was part of the programme on seed breeding.
[11] Please note that in the baseline report we were not yet aware the second complication and information regarding the first complication was missing. Therefore, statistics in the baseline report are different from those in the endline report due to reclassification of households among treatment types.
[12] The remaining 5 households were not interviewed because they have moved out of their village.
[13] Reasons to interview a different household member were because the respondent was out of town (10), was ill (2), passed away (6) or other reasons (2).

**Table 3: Sampling outcome**

| Assignment group | Planned households | Baseline outcome | Endline outcome | Panel respondents |
|---|---|---|---|---|

| **Spillover group** | 40 | 69 | 67 | 58 |
| **Comparison group** | 45 | 60 | 59 | 56 |
| **Total** | **225** | **225** | **220** | **200** |

# 6. Descriptive statistics

This section summarizes the characteristics of the sample by treatment group. The farming group, cooperative and household characteristics are discussed below, while the village characteristics are described in Annex IV. In addition, the exposure of villages and households to the FIELD project activities is explored.

## 6.1. Credit cooperative characteristics and treatment exposure

The four surveyed credit cooperatives have been established between 2009 and 2011.[14] Their membership has doubled during the evaluation period from 35 members on average at the baseline to 76 members at the endline (Table 12 in Annex V). Hence, based on this data, we estimate the total number of credit cooperative members at 456. Also, the percent of female members increased from 21% to 41%, indicating that more than half of the new members are women.

In two villages the credit cooperative members are also members of (project) farming groups. However, in two villages (Ecosystem Alliances or EAs 8 and 9) about one third of the cooperative members had no membership in farming groups (at the endline). The percentage of seed breeding farmers is as high as 40% in one village, while about 10% in two villages, and no seed breeder members were found in one cooperative.[15]

Table 13 shows that the total outstanding loans at the cooperatives have on average tripled (to 71.3 million Rupiahs). However, only 3 cooperatives reported this information at the endline. Further details of the cooperatives are reported in Table 15.

Regarding the treatment exposure of the cooperatives, Table 14 shows the trainings carried out at the cooperatives by FIELD and other organisations. The data verify that FIELD organised trainings for all four cooperatives on financial management between 2010 and 2012. However, after 2012 only the two largest cooperatives continued to receive support from the project.[16] In both of these cooperatives

[14] The credit cooperative in Jengkok village (EA6) was established in 2009, in Kalensari village (EA9) in 2010, and in the other two villages (Tenajar and Wanguk, EAs 7 and 8) in 2011.

[15] No seed breeder members were found in the credit cooperative in Tenajar (EA 7), where we found also no indication of FIELD working with seed breeders among the sampled farming groups in the farming group survey.

[16] The cooperative in Wanguk (EA 8) had 150 members, while in Jengkok (EA 6) there were 63 cooperative members. The other cooperatives had 50 and 42 members at the endline.

trainings on sustainable farming practices were also organised. However, only one of them (EA 8) reported that FIELD delivered trainings on the marketing of crops.

## 6.2. Farming group characteristics and treatment exposure

In Annex V, Table 16 shows the size and activities of the surveyed farming groups. The table reports the baseline and endline averages for three types of farming groups: comparison (in comparison villages, in total 4), treatment (assisted by FIELD, in total 5) and spillover (other farming groups in FIELD project villages, in total 6).[17] The data show that the average number of members in the farming groups have somewhat decreased over the evaluation period in all farming group types (from 44-65 to 39-55). Further, the percentage of female members is the highest in the project farming groups (26% vs. 3-13% at baseline), and their share has increased during the evaluation period in the project farming groups (to 35%) but not in the other groups.

Seed breeding is practiced in all 5 project farming groups at the endline, while only in 2 of 6 spillover farming groups and in 1 of 4 comparison farming groups (Table 17).[18] On average, 3 farmers per farming group are seriously involved in seed breeding (they have bred varieties in F4 status or higher) in the project villages. These farmers have bred on average 8 new varieties. However, farmers usually only grow 4 varieties in total. In most farming groups, (ordinary) farmers can choose to try to cultivate the local varieties, and in 2 farming groups are the farmers given the seed varieties to grow.

Farming groups often organise saving and credit groups for their members with around one third of the members participating in them (Table 16). However, storing the crops of members and joint marketing is not commonly offered. At the baseline, 2 of 5 treatment farming groups offered joint marketing of crops, but none have done so by the endline.

Table 18 shows that the treatment farming groups have much more regular meetings than the other forming groups (35 vs. 9-12 meeting during the evaluation period). Good farming practices and seed breeding are the most often discussed topics at these meetings, but also social gatherings are organised in the treatment farming groups. Based on the reporting of the farming groups (Table 19), FIELD has organised trainings on sustainable farming practices in 3 of 5 treatment farming groups; on rice breeding in 2 of 5 farming groups; and on financial management in 3 of 5 treatment farming groups. FIELD's activities at these groups also continued during the evaluation period.

Overall, 3 of 5 treatment farming groups were more intensely assisted in sustainable farming practices and seed breeding by FIELD, while 1 of 4 comparison farming groups benefitted from such trainings as well (assisted by IPPHTI).

[17] The sample size is indicated below the means in brackets as not all questions have been answered by all farming groups.

[18] The seed breeding farming group in the comparison group is assisted by IPPHTI, the partner of FIELD. In fact, this farming group/village was sampled as a treatment location. However, we did not find either the village (Segeran Kidul) or the farming group (Tani Mulya) in the FIELD project report.

## 6.3. Household characteristics and treatment exposure

To provide a better insight into the general characteristics of the households in our sample, Table 4 displays the most important socio-economic characteristics including age, gender, education level of the household head, economic activities of the household, and membership of the household in farming groups and seed breeding. The data are reported separately for the comparison, treatment and spillover households. The variables are described at the baseline survey (Base) and the endline survey (End) for all households that have been interviewed in both survey rounds (panel sample). We also report on the significance of the change in the variables (p-value).[19] If the p-value is small (say smaller than 5%), it indicates that the change is significantly different from zero (at 5% significance level). The p-value for the difference between the groups at baseline is reported in Table 20 in Annex V, while the sample size for all variables is reported in Annex III.

The data show that the treatment, spillover and comparison households were fairly similar in terms of household size (3.7-3.9 members), main income source (87-90% crop farming) and gender of the household head (1-2% female) at the time of the baseline survey. However, the household heads of the treatment households were on average younger (45 vs. 51-53 years) and more educated (47% with secondary or higher education vs. 19-28%) compared to both the comparison and spillover groups.

In addition, treatment households were less likely to be a member of a farming group (because not all cooperative members were farming group members) and be a member of a savings and credit cooperative (50% vs. 2-9% in the other groups). However, no significant differences were found in terms of membership in savings and credit groups (6-10%).

During the evaluation period, we observe a declining trend in farming group membership, which is particularly pronounced for the comparison and spillover groups (from 100% to 63-67% vs. 88% to 81% in the treatment group). Hence, at the endline, a higher percentage of households are members of farming groups, despite the fact that the importance of crop income has declined in this group (from 87% to 78%). Membership in other groups/cooperatives has been stable over the evaluation period.

Regarding seed breeding, respondents were asked whether they practice in participatory seed breeding. At the baseline, 52% of the treatment households claimed to be involved in seed breeding compared to 17% and 14% in the comparison and spillover groups, respectively. During the evaluation period, the number of households involved in seed breeding has dropped to 24% in the treatment group (p=0.03) and to 7% and 5% in the comparison and spillover groups.

[19] P-values are calculated using standard errors corrected for heteroskedasticity and clustering at the village level. This means that the standard errors are allowed to have an arbitrary correlation for comparison or treatment respondents in the same village. In other words, we allow respondents in the same village in the same treatment group (comparison or treatment) to be more similar to each other than they are to a different randomly selected respondent in another village from the other treatment group.

Notes: Robust standard errors corrected for clustering at the village level are used to calculate p-values. P-values are not defined for variables where there was no change.

Table 5 reports on the project activities known and attended by the households. Many households in the comparison and spillover groups (47% and 60% at endline) and most of the treatment households (84%) have heard of the field farmer school. 66% of the treatment households heard of FIELD compared to 27-28% in the other groups. The knowledge of IPPHTI is similar to that of FIELD, while PEDIGREA is less recognised by the respondents.

Almost 40% of the treatment households reported to have participated in trainings on sustainable farming practices at both the baseline and endline, around 30% did so in the comparison group and 20% of the spillover group (during the evaluation period). At the baseline, 37% of the treatment group and 29% of the comparison group participated in trainings on rice breeding. During the evaluation period this number has dropped to 7% in the comparison group but remained at 29% in the treatment group.

In addition, 17% and 28% of the treatment households reported to have attended trainings on financial management and financial management of credit cooperatives at the baseline. In the other groups such trainings were not conducted.

Hence, the data shows treatment households were more exposed to both trainings on farming practices and on financial management compared to the other groups.

# 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured between the base- and endline survey (2012-2014) are grouped into 7 sub-groups: use of financial instruments; households using organic farming practices; yield of rice; selling price of rice; volume of rice sold; household income and livelihood; and food security and vulnerability.

Table 6 displays the results for all outcome indicators in a similar manner as the household characteristics were presented in Table 4. However, in Table 6, the standard error[20] of the outcome variables is displayed in brackets below the mean. The p-value for the difference between the groups at baseline is reported in Table 21 in Annex VI, while the sample size for all variables is reported in Annex III.

The results of Table 6 are discussed below by outcome indicator group.

### *Use of financial instruments*

Table 6 shows that almost all households can name a place where they can borrow money. The most often mentioned institution is banks: at the baseline, 88% of the households in the comparison group mentioned that they could borrow from banks, compared to 70-72% in the treatment villages (Table 23 in Annex VIII). However, the data suggests that banks have become more widespread in the treatment villages, as at the endline 93-97% of the households were aware of them (p=0.08 in treatment group and p=0.003 in spillover group). On the other hand, only 55% of the treatment households mentioned credit cooperatives as places to borrow at the endline, while this percentage was lower in the other groups (43-44%).

The involvement of households with financial institution was measured by households having savings or loans at a bank, cooperative or savings and credit groups. The data shows that as expected, the treatment households were more likely to have savings and/or loans at the baseline (63% vs. 27% in the comparison group, p=0.01). However, while the use of these financial instruments remained stable in the treatment group, it has somewhat increased in the comparison and spillover groups (not significant). This trend is substantial and significant in the spillover group for savings (from 9% to 39%, p=0.02) and loans (from 15 to 28%, p=0.09), separately. In contrast, 55% of the household had savings and 39% of them loans at the endline.

Looking at the source of loans, Table 23 shows that 27-40% (36-39%) of the households that took a loan in the last 12 months have obtained at least one loan from a bank at the baseline (endline). In addition, 57% (53%) of the treatment households also obtained a loan from a credit cooperative at the baseline (endline), while this form of loan was much less common in the other groups (5% at endline). In the comparison group, 31% of the households also obtained credit from their farming groups.

Regarding the use of loans, agricultural equipment (30-35% at baseline and 32-53% at endline), capital for business (31-50% at baseline and 11-42% at endline) and daily expenses (0-38% at baseline and 32-33% at endline) are the most common reasons to borrow.

[20] Standard errors are corrected for heteroskedasticity and clustering at the location level. See footnote 19 on page 23.

### *Households using organic farming practices*

Households were asked whether they practice organic farming. Based on this self-reported indicator, the percentage of households practicing organic farming has increased from 9% (8%) to 23% (23%) in the treatment (comparison) group. However, households were also asked about the type of inputs they use in farming. Based on this data, we find that almost all households use chemical inputs in farming, mostly pesticides and insecticides (94% of treatment households at endline), but also often fertilizers (82%). The use of chemical fertilizers has significantly increased in the treatment villages: at the baseline, only 68% of the treatment group and 73% of the spillover group used such inputs compared to 92% in the comparison group.

At the baseline, the use of organic fertilizers were substantially higher in the treatment villages, particularly in the treatment group where 68% of the households reported to use organic fertilizers, compared to the comparison villages (20%). During the evaluation period, we observe different trends for this variable: the use of organic fertilizers increased in the comparison areas to 39%, while it dropped to 35%in the spillover group (from 48%), and remained stable in the treatment group (61%). These data show that many households combine organic and chemical inputs in farming, and while farmers in comparison group added organic components, the treatment farmers added chemical inputs to making their soil more fertile.

The use of organic pesticides and insecticides are less common, but 28% (27%) of the treatment farmers used them at the baseline (endline), compared to 7% (20%) in the comparison group. Interestingly, the project did not seem to have a spillover effect in the use of organic pesticides, and the spillover effect on organic fertilizers was also only temporary.

The projects impact on using organic inputs is also supported by data from the farming group survey, which shows that the treatment farming groups were more likely to encourage their members to use organic farming practices, especially by making compost and by fitting seed varieties to soil conditions (Table 25 in Annex VIII).

Regarding rice cultivation, households grow on average 1.4-1.9 varieties of rice (Table 24) and harvest rice on average twice per year (Table 26). The most common sources of the planting seeds are from shops selling farming inputs: 67% of the comparison group, 57% of the spillover group but only 40% of the treatment group obtain their seeds from this source at the endline. Most of the remaining households use seeds from their harvest for planting, especially in the treatment group where the percentage of households retaining their seeds for planting has increased from 34% to 73% (p=0.06). We also observed a substantial increase in the spillover group (from 30% to 63%, p=0.08), and a small increase in the comparison group (from 41% to 47%).[21]

Finally, rice breeding farmers were also asked for the reasons of their participation. The most common reasons were: to learn about the crops and the environment, get a better crop quality and conserve biodiversity; which are in line with the objectives of FIELD.

[21] The percentage of households using their own seeds and buying them from shops was not significantly different among the groups at the baseline.

### *Yield and selling price of rice and volume sold*

Regarding the yield, we observe an increasing trend of the median yields during the evaluation period from 4.8-5.6 to 6.4-6.7 tons per hectare (Table 6). In general, the yields are higher in the treatment villages for both the treatment and spillover groups. However, due to the large variation of the indicator and some outliers, we reported the median value of the yield instead of the mean. Therefore, we are not able to report on the significance of changes over time. For information on the average size of plot planted and amount of rice harvest, see Table 26.

Almost all of the households sold at least part of their rice harvest (Table 30), while only 13-15% (24%) of the households sold other crops in the treatment (comparison) villages at the baseline, and these numbers were 12-18% (34%) at the endline. Most of the harvest of these other crops was sold if they were grown for sale. At the same time, the percentage of rice sold was lower but increased during the evaluation period from 51-60% to 60-70%.

Hence, rice is clearly the most important cash crop for the surveyed households. Looking at the volume of rice sold, Table 6 shows that households in the treatment villages sold on average substantially higher quantities of rice than in the comparison group: 7.0 (5.2) tons/year in the treatment (spillover) group compared to 2.6 tons/year in the comparison group. During the evaluation period, an increasing trend of the volume of rice sold is observed, in line with the increase in yield, however, these changes are not significant.

At the same time, the selling price of rice has decreased by 13% in the treatment (p=0.00), by 4% in the spillover (p=0.63) and by 7% in the comparison group (p=0.55). Hence, the treatment households were the most affected by the generally decreasing price level. We also observe a reduction in group selling of rice during the evaluation period, resulting in almost all rice being individually sold to traders and wholesaler at the endline (see Table 27, Table 28 and Table 29).

### *Household income and livelihood*

Despite the reduction in the price of rice, household income from the sale of rice has generally increased during the evaluation period in real terms (not significant) due to a larger increase in productivity.[22] However, per capita total real income has only increased in the comparison group (11%), while it decreased in the treatment (-21%) and spillover (-18%) groups, which is due to both a decrease in total income in real terms and an increase in the household size. In general, the share of transfers in total income increased during the evaluation period from 10% to above 20% (Table 31).

Other wealth indicators also support the finding that the welfare of comparison households improved more during the evaluation period compared to treatment households. However, despite this development, households in the treatment areas remained better off at the end of the evaluation period in both treatment and spillover groups (42% and 65% higher total income per capita, respectively).

[22] Income and consumption variables at the endline are reported in real terms (2012 prices) adjusted for inflation between 2012 and 2014. The CPI was 4.3% in 2012 and 8.38% in 2013, resulting in a 13.04% increase of consumer prices between the baseline and endline periods.

During the evaluation period, the percentage of households that expanded their business, purchased new equipment or started a new business increased by 23-36 percentage point, and the change is significant in all assignment groups. At the same time, the percentage of households that purchased new farming tools decreased by around 12 percentage points in all groups, indicating a general shift from farming to diversifying into non-farm business activities alongside farming.

### *Food security and vulnerability*

The food security of households has not changed substantially during the evaluation period. Overall, we find that despite the increase in per capita income in the comparison group, the percentage of households reporting to not being able to cover their living costs have increased by 31 percentage points. In the treatment villages (p=0.03), this number increased by around 15 percentage points (not significant). This finding indicates that households' expectations increased over time regarding their standard of living.

3. Prices are reported in 2012 real prices. Prices at the endline are deflated by the CPI for 2012 at 4.3% and for 2013 at 8.38% (total of 13.04%). Source: http://www.bps.go.id/eng/aboutus.php?inflasi=1

# 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

## 8.1. Methodology

We analyse the effects of the FIELD project on beneficiaries using regression analysis. The primary analysis uses difference-in-difference methodology: we compare the changes in outcome indicators between the treatment and comparison groups. We assume that in the absence of the FIELD project, on average, we would observe the same magnitude of changes in the treatment villages as in the comparison group.

However, because the FIELD project was running already before the baseline survey (since 2003), we also analyse the results of the project using a cross-sectional regression on the baseline data controlling for household characteristics. The results of these regressions tell us the early effects (at the baseline) of the FIELD project. Therefore, the total impact of the FIELD projects can be calculated as the sum of the early effects (at the baseline) and the effects found between the baseline and endline survey period (diff-in-diff). Hence, the current evaluation also informs us on the sustainability and enhancement of the project achievements.

Below we discuss the model used for the regression analysis in detail.

### *Treat effect on the treated*

Regression (1) represents the general model for estimating the treatment effect of the FIELD project.

(1) $$Y_{it} = \alpha_t + \beta FG_{it} + \gamma Coop_{it} + \delta Spillover_{it} + \zeta X_{it} + \eta_i + e_{it}$$

where $Y_{it}$ denotes an outcome variable from the list presented in section 4.2 (dependent variable) for household $i$ at time $t$; $FG_{it}$ is a binary variable with value 1 if household $i$ at time $t$ has been member of the treatment farming group and 0 otherwise; $Coop$ is a binary variable with value 1 if household $i$ at time $t$ has been member of the treatment credit cooperative and 0 otherwise; and $Spillover_{it}$ is also a binary variable indicating whether household $i$ at time $t$ has been living in a treatment village but not member of either the treatment farming group or the cooperative (indirect beneficiary). Please note that a household could be member of both the farming group and cooperative at the same time.

In general, because the treatment and comparison groups were not randomly selected, there could be differences in the characteristics of the treatment and comparison villages and of the households sampled in these villages. If some of these characteristics also affect the outcome of $Y_{it}$ and we do not control for these characteristics, we could mistakenly interpret the effect of these characteristics on the outcome variable as an effect of the project. Therefore, in (1) we include $X_{it}$, a set of observable control variables that affect the project outcome but they are not affected by the outcome itself (predetermined). In addition, we also include household fixed effects ($\eta_i$) that pick up unobservable time invariant household specific characteristics; and a time varying trend ($\alpha_t$) in the outcome variable. The remaining residuals ($u_{it}$) are clustered at the village level.

Finally, turning to the variables of interest: we are interested in the estimates of $\beta$ and $\gamma$, the coefficient of the treatment effect on the bio-rights group and spillover group, respectively.

### *Early treatment effect on the treated at the baseline*

First, we adapt (1) to estimate the effect of the WIIP project at the baseline:

(2) $$Y_{i1} = \alpha + \beta FG_{i1} + \gamma Coop_{i1} + \delta Spillover_{i1} + \zeta Z_{i1} + u_{i1}$$

Note that the control variables in (2) were adjusted. First, it is not possible to estimate the individual fixed effects using only one observation per household; and second, the set of control variables, $Z$, satisfies the additional condition that it represent the situation of households prior to the start of the FIELD project (not effected by the project). In regression (2), it is important to control for all observable village and household characteristics that differ between treatment and comparison villages.

### *Treatment effect on the treated between baseline and endline*

We use difference-in-differences methodology to estimate the treatment effect of the FIELD project between the baseline and the endline survey. We take the first difference of (1):[23]

(3) $$\Delta Y_{i2} = \alpha + \beta FG_{i2} + \gamma Coop_{i2} + \delta Spillover_{i2} + \zeta \Delta \mathrm{W}_{i2} + \Delta u_{i2}$$

The time-invariant household fixed effect disappears in (3) due to the differencing, along with some of the control variables in $X$ with $\Delta \mathrm{W}_{i2}$ containing the change in the remaining control variables. Only variables where the change is significantly different between the treatment and comparison groups are included in $\mathrm{W}$. In addition, we denote the average change of the outcome variable in the comparison group by $\alpha$.

Note that we omitted the change sign (Δ) from the treatment variables $FG_{i2}$, $Coop_{i2}$ and $Spillover_{i2}$. In principle, taking the differences of the binary variables would be zero due to the project already running at the baseline period. However, there were several project activities occurring between the baseline and endline period. In addition, for some activities that occurred before the baseline it may take longer to affect the outcome variables, such as crop yield and income. These activities are summarized by $FG_{i2}$, $Coop_{i2}$ and their effect on the indirect beneficiaries by $Spillover_{i2}$.

We report the regression results for the treatment effects, $\beta$ and $\gamma$, with and without control variables (W).

### *Treatment effect on seed breeders*

Finally, for the outcome variables on farming practices and rice cultivation, we also estimate the FIELD project's effect on seed breeders, as this group of farmers is the focal point of FIELD's project. Hence, we estimate regression (2) and (3) with an additional term, $Breeder_i FG_{it}$, which as a value of 1 if household $i$ participates in seed breeding and is member of a treatment farming group, and zero otherwise. Regression (3) then becomes:

(4) $$\Delta Y_{i2} = \alpha + \beta FG_{i2} + \gamma Coop_{i2} + \delta Spillover_{i2} + \theta Breeder_i FG_{i2} + \zeta \Delta \mathrm{W}_{i2} + \Delta u_{i2}$$

The results of regression (4) are presented in Annex VII.

[23] Hence, $\Delta Y_{i2} = Y_{i2} - Y_{i1}$ and so forth.

## 8.2. Results

Table 7 reports the regression results for the outcome indicators in the same order as in section 7. The first column of the table contains the mean value of the variable in the comparison group at the baseline. This serves as a reference point for assessing the size of the project impact on the variables. The next three columns report on the project's impact on the project farming group members: column 2 reports the early treatment effect using regression (2) on the baseline data, column 3 reports the difference-in-difference (DD) regression results of regression (3) without the controls, and column 4 shows the regression results including controls. As mentioned above, the overall effect of the project on the direct beneficiaries should be assessed as the sum of the baseline effect (column 2) and the DD effect (column 4).

In the regression using the baseline data (columns 2 and 5), the education and age of the household head, the cultivated land size, the household's main income source, and the subjective wealth status of the household 5 years prior to the baseline are used to control for differences between the households. In the diff-in-diff regression (columns 4 and 7), the change in the same household level variables are included. In addition, we control for the change in household size.

The regression results for the credit cooperative members are reported in columns 5-7 in the same order as for the farming group members in columns 2-4. Again, the overall effect of the FIELD project should be assessed as the sum of the early effects (column 5) and the DD effect (column 7). In addition, the results for the indirect beneficiaries (spillover) are reported in columns 8-10.

The standard error of the coefficient estimates are calculated correcting for heteroskedasticity and clustering at the village level, and they are reported below the coefficients estimates in brackets (columns 2-10). The significance of the coefficient estimates is denoted by stars next to the coefficient estimates.[24] Note that the sample size for the regressions is not reported but can be inferred from Annex III.

### *Use of financial instruments*

The credit cooperatives set up with the assistance of FIELD are expected to encourage both saving and borrowing among their members. The regression results in Table 7 show that the credit cooperatives indeed had a significant effect on the percentage of households that have savings in a bank, cooperative or farming group before the baseline survey: as a result of the early effect of the project 24 percentage point more households had savings accumulated in these organisations (controlling for household characteristics). However, during the evaluation period, savings have also increased in the comparison villages, and the treatment households' advantage disappeared in this indicator by the endline. Regarding credit, membership in the project credit cooperatives did not make borrowing more likely among the treatment households.

As expected, membership in the project farming groups alone did not result in an increased use of financial services. Also, the cooperatives have not yet reached out to many other households in the

[24]The probability that the coefficient estimates are not significantly different from zero is indicated by stars: * denotes that this probability is smaller than 10%, ** is used if this probability is less than 5% and *** if it is less than 1%. Hence, the more stars indicate a higher probability that the effects are significantly different from zero.

village, hence, the results verify our expectations that no significant treatment effect is found in the spillover group.

### *Households using organic farming practices*

As a result of the trainings on sustainable farming practices at the project farming groups, treatment household who were members of a project farming group were 42 percentage point more likely to use organic fertilizers and 27 percentage point more likely to use organic pesticides and insecticides at the baseline (early treatment effect). During the evaluation period organic fertilizers become more commonly used in other areas, and as a result the project's impact was reduced by 29 percentage point. However, the overall impact of the project on the use of organic inputs is still positive for the farming group members (23 percentage point for organic fertilizers and 12 percentage points for organic pesticides and insecticides).

The regression results also show that in the spillover group, the project had an early effect, but it was not sustainable throughout the evaluation period, as many households stopped using organic inputs. In addition, no significant impact of project credit cooperatives is found on organic farming practices.

Finally, we investigate whether seed breeders are more likely to practice organic farming, which is a requirement for developing new varieties. Table 22 in Annex VII shows that seed breeders were not significantly more likely to use organic farming practices compared to other farmers in the treatment farming groups. In fact, we find that seed breeders are the main adopters of chemical fertilizers during the evaluation period: they are 36 percentage points more likely to use chemical fertilizers at the endline than other treatment farming group members, who did not significantly increase their use of chemical fertilizers (coefficient of -5 percentage points, insignificant). However, seed breeders are less likely to use chemical pesticides and insecticides at the endline (-15 percentage points) compared to other treatment farmers.

### *Yield and selling price of rice and volume sold*

Through the farming groups, the project had a positive effect on the yield of rice: the project farming group members obtained 0.6 ton per hectare or 13% higher yields compared to the comparison households at the baseline. This advantage has not changed over the evaluation period. On the other hand, project cooperative members have on average consistently lower yields than the comparison group. As a result, households who are members of both the cooperative and the farming group lost their advantage in the yield of rice during the evaluation period. Interestingly, the productivity of the spillover group was similar to the treatment farming group members at the baseline, but their productivity has decreased compared to the comparison farmers by the endline.

The interpretation of these findings is not straightforward. Productivity differences could be partially explained by regional differences such as soil quality and local weather conditions as the number of locations in each groups are small,[25] and we observe the same trend for the cooperative and spillover group members who are mostly living in the same villages.[26]

[25] Differences in one village could play a substantially influence the outcome.

[26] The same trend for the cooperative and spillover group members could be explained by location specific trends as households in these two groups mostly living in the same villages.

The regression results for the volume of rice sold are similar to the results on yield, as most households sell the majority of rice harvested. However, the negative trend during the evaluation period for the cooperative members and the spillover group is more muted.

Regarding to the selling price of rice, we do not find any impact of the FIELD project.[27] Given that farmers are more likely to sell their produce individually than collectively at the endline (Table 28 in Annex VIII), this is not unexpected.

We do not find a more pronounced effect of the project on seed breeders regarding these indicators (Table 22).

### *Household income, livelihood and food security*

The FIELD project did not affect households' income and wealth during the evaluation period. However, though the farming groups, it improved the self-reported food security of households: 26 percentage point reduction in the share of households in the project farming groups reported that they could not cover their food needs or living costs at the endline compared to the comparison villages and controlling for household characteristics. These household on average reported almost 0.8 month reduction in the number of months per year when they had not enough to eat.[28] No similar impacts are found for the cooperative member group.

[27] No impact was found using the group average selling prices per village. However, we find a negative effect on prices using the self-reported prices among the cooperative members. However, we deem the latter indicator less reliable.

[28] These results are partially driven by increasing self-reported food security in the comparison areas.

# 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular we look at the size of the impact, and whether the project addresses an important issue for the beneficiaries.

## 9.1. The size of the impact

The project had a minimal impact on the welfare of the beneficiaries, which was the final objective of the project. However, the project was effective in motivating farming households to use organic farming practices in the project villages. This effect remained the most significant for the project farming group members. In addition, the project also had a positive effect on the yield of rice and the food security condition of these households.

For the cooperative members, the only benefits of the project were in terms of having more savings. Hence, most results are driven by activities initiated before the current project period.

## 9.2. Does the project address an important issue for the beneficiaries?

Farmers' participation in seed breeding has declined during the evaluation period from 52% to 24% in the treatment group. However, only a handful of successful local seed varieties are necessary to adapt the varieties used to local conditions. Hence, it is sufficient if only a handful of farmers are engaged in seed breeding per village. In that respect, the number of direct beneficiaries of the project is limited. However, their successes enable all farming households in the region to be able to use better adapted seed varieties. According to the FIELD Annual Review 2013, 9 of the 15 project farming groups were successful in breeding new rice varieties (30 in total). Finally, our data shows that the percentage of households that retain seeds from their harvest for next season's planting has doubled during the evaluation period.

# 10. Evaluation question 4: Efficiency of project

This subsection will answer evaluation question 4: Were the development interventions of the Southern partner organisations efficient? To answer this question we will describe the cost effectiveness of the programme. First, the calculation of cost per beneficiary is discussed. Second, these costs are compared to the project effects per beneficiary. Finally, the findings on cost effectiveness are compared to achievements of similar projects.

## 10.1. Costs per beneficiary

A first step to estimate the cost effectiveness of the programme is to calculate the project cost per beneficiary. To collect this information, we conducted a structured interview with the finance manager of FIELD[29] on 16 July 2013 using the 'budget survey' as described in section 5.1. We have also asked Hivos to provide us with an update on the cost information for 2013 and 2014. The cost figures are

[29] The interview was conducted with Novi Setiabudi, finance manager, and Endang Sutaria, programme staff member.

based on actual expenditure data. In addition, we consulted the Annual Reviews of FIELD to find out the number of beneficiaries.

Table 8 summarizes the available cost information and the number of beneficiaries per year. The total project costs are presented in Indonesian rupiah (IDR) (column 2) and in euros (using average exchange rate over the year, column 3). Based on the rupiah amounts, the project between 2011-2013 has spent approximately 92% of the available budget in euros (or 102% in IDR).[30] In 2014, there were no project costs related to the project activities, only the costs of audit.

The project costs related to activities with the direct beneficiaries, were in total 66,906,850 IDR (or 4,983 EUR[31]) for the development of the credit cooperatives, which is 5% of the total project budget as planned; and 283,308,450 IDR (or 20,871.51 EUR) for the activities related to the smallholder' seed system and certification, which is close to the planned 20% in the overall budget. In addition to these costs, FIELD and the communities also contributed 913,900,000 IDR to the total costs of the project, hence they have spent 107% of the budgeted amount.[32]

We calculate the cost per beneficiary for two groups of beneficiaries: cooperative members and seed breeders. At the beginning of the project, the 6 savings and credit cooperatives established with the assistance of the project had total of 161 members. Based on the endline data, we estimate the total credit cooperative membership at 456. The project works with 15 farming groups, the total number of members and the number of seed breeding farmers is estimated at 897 (874) and 75 (45),[33] respectively, based on baseline (endline) information from the surveyed locations.

Based on these data, we have calculated the direct project costs per cooperative beneficiary household per year in column 6 in Indonesian rupiahs and in column 7 in international dollars (Int$). International dollars at 2011 prices[34] are used for the cost per unit calculation because it takes both purchasing power parity and inflation into account that would not be the case if we reported the unit costs in euros. Hence, using Int$, the costs can easily be compared across time and countries.

The results show that the setting up the credit cooperatives cost 60.45 Int$ per member. However, the unit cost of seed breeding should be calculated per successful seed variety. Unfortunately, we do not have information about the total number of seed varieties bred under the project, therefore, we are not able to calculate the unit cost for this.

[30] The total budget for the project was 1,343,999,999 IDR or 112,000 EUR (using 12,000 IDR/EUR). Source: FIELD Partner Contract with Hivos, signed on 7 April 2011.

[31] Unfortunately, we do not have information about the exchange rate used for the project. Instead we use the annual average exchange rate from http://www.oanda.com/currency/historical-rates/. The exchange rates used are 12,264 IDR/EUR in 2011, 12,087 IDR/EUR in 2012 and 13,923 IDR/EUR in 2013.

[32] According to the project budget, FIELD and the participating communities cover an additional 70,975 EUR or 851,700,000 IDR (suing 12,000 IDR/EUR).

[33] According to Hivos, the 52 seed breeders benefited from the FIELD project, in particular the community seed registry system, which is in line with the information from the survey data.

[34] The following exchange rates are used based on PPP conversion factor using the World Development Indicators: 3,606.57 IDR/Int$ in 2011, 3,636.38 IDR/Int$ in 2012, 3,682.25 IDR/Int$ in 2013 and 4,530.90 IDR/Int$ in 2014. Source: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#

**Table 8: Overview of the costs and number of beneficiaries**

| Year | Total costs [IDR][1,2] | Total cost [EUR, current prices][3] | Cooperative development costs [IDR] | Percentage of costs funded by CFA[1] | Number of cooperative members[4] | Cost per beneficiary per year [IDR] | Cost per beneficiary per year [Int$ 2011][5] |
|---|---|---|---|---|---|---|---|
| **2011** | 162,668,750 | 13,263.92 | 18,283,800 | 100% | 161 | 113,564 | 31.49 |

| **2013** | 914,582,600 | 65,688.62 | 48,623,050 | 100% | 456 | 106,629 | 28.96 |

Source: Budget survey and FIELD Annual Reviews.
Notes:
N.K.= not known

1. Only the project costs covered by Hivos are included. FIELD and the communities contributed an additional 913,900,000 IDR during the project period. However, we do not have information about the annual division of these costs. Therefore, they are not included in the table. Accounting for these project costs, Hivos has contributed 60% of the project costs overall (in IDR).
2. Annual average exchange rate is used. Data is obtained from http://www.oanda.com/currency/historical-rates/
3. Annual average exchange rate is used. Data is obtained from http://www.oanda.com/currency/historical-rates/
4. The number of cooperative members for 2012 is estimated using baseline survey data, while for 2013 and 2014 the endline data is used to estimate the members.

PPP conversion factor to 2011 international dollars is calculated using the World Development Indicators: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#.

## 10.2. Cost-benefit

At the time of the endline survey, the credit cooperatives have not resulted in any impact on the welfare of member households. We also do not yet observe any effect for the community seed registry system. However, both of these activities may take much longer before any benefit can be measured.

## 10.3. Cost effectiveness

Finally, we compare the costs of the FIELD project to other similar projects based on the benchmark cost provided by the Synthesis team. Based on a study on Indian self-help groups, Harper (2002) estimates that the costs for establishing such a self-help group to be within the range of 105-1,242 Int$ per cooperative. Another study by Isern (2007) puts the unit cost of self-help group focused only on lending ranges to 188 Int$ per cooperative.

At the same time, the unit costs of the FIELD project for establishing credit cooperatives were 3,045.72 Int$ per cooperative, which makes the project very expensive.

Unfortunately, we do not have any benchmark costs related to the establishment of a community seed registry system. However, Fahim, et al. (1998) estimates the costs of breeding a new seed variety to range between 12 and 259 Int$ per rice variety depending on the methods used.

## 11. Contribution of Capacity Development and Civil Society

FIELD has also been selected for the Civil Society Strengthening component of the MFS II Evaluation. The findings of this report are in line with those of the civil society evaluation, which found evidence that the establishment of the cooperatives and their increased institutional capacity (for example, financial management) can be attributed to FIELD's interventions. However, the trainings provided by the FFS and later through the cooperatives were also critical to strengthening farmers' productive capacities. At the time of the endline, FIELD had no close relation to the cooperatives anymore.

We are not aware that MFS II funding was used to improve the capacity of FIELD to strengthen civil society, and specifically the project cooperatives and seed breeder groups, between 2012 and 2014.

## 12. Conclusion

Due to the time frame of the project and evaluation, the current evaluation was focused on the sustainability and enhancement of the project achievement. Hence, we estimated the medium to long run effects (2003-2014) for the FIELD project.

The FIELD project was successful in raising the awareness of farmers regarding the importance of using locally adapted seed varieties. At the baseline, as much as 52% of the households in the project farming groups have participated in seed breeding. Farmers' involvement was halved by the endline; however, farmers were still more likely to use organic fertilizers than other farmers. During the evaluation period, other farmers in comparison areas also started using more organic inputs, while at the same time, FIELD's farmers started using more chemical inputs. Unfortunately, this trend among treatment farmers is the strongest for seed breeders who are not supposed to use chemical inputs while breeding new varieties. Hence, while the FIELD project was effective in motivating farming households to use organic farming practices in the project villages, the drop in seed breeding participation and the increase in the use of chemical fertilizers between baseline and endline indicate a decline on the positive effects of the project during this period.

However, the project did not manage to reach its objectives through the credit cooperatives: the welfare of households did not improve compared to comparison households, and only in terms of savings do we observe significant impacts.

The findings - minimal impact on the livelihood of households and the recoil of seed breeding activities and organic farming practices - are compatible with the (limited) findings in the literature on the long run effects of seed breeding projects. Whereas the literature review showed that seed breeding projects can improve poverty status in the short run, it also showed that sustainability of the project activities and its impact is a problem.

Finally, the MFS synthesis team asked to score each project along a few indicators. Table 9 displays the indicators and the scores we deemed valid for the project.

**Table 9: Overall project scoring**

| Statement | Score | Comment |
|---|---|---|
| **1. The project was well designed** | 8 | The participatory seed breeding component was well-designed, and it is based on more widely used model. Access to finance is important in setting up new businesses related to seed breeding. However, savings and credit cooperatives may not be the optimal tools, as it takes long for members to accumulate enough savings to be able to lend for setting up a business, and banks were often already functioning in the project areas. |
| **2. The project was implemented as designed** | 8 | The project was mostly implemented as designed. The project period was extended with one year due to underspending of the budget. |
| **3. The project reached all its objectives** | 7 | All project outputs have been accomplished, but the main objective in terms of the welfare of farmers have not yet been materialized. |
| **4. The observed results are attributable to the project interventions** | 7 | Most results are attributable to the project. |
| **5. The observed results are relevant to the project beneficiaries** | 7 | The project beneficiaries are farmers. Therefore, it is relevant for them to learn about sustainable farming practices, and also to be less dependent on the corporations in buying inputs. |
| **6. The project was implemented in the most efficient way** | 6 | The project costs are on the expensive side. |
| Notes: Scores are on a scale of 1 to 10, with 1 being “no agreement at all” and 10 being “completely agree with statement”. | | |

# Annex I. SPO and project description

## *SPO description*

Farmers' Initiatives for Ecological Livelihoods and Democracy (FIELD) was established on June 1st, 2001. FIELD was established by staff members who had previously worked with the Food and Agriculture Organisation (FAO) ASIA, which focused on providing technical assistance for the Integrated Pest Management (IPM) Programme for farmers in Asia between 1998 and 2002.[35] After the FAO projects finished, these staff were working informally to support the small farmers in Indonesia. FIELD aims to develop farmer and rural community movements in order to enhance democracy, justice and a healthy environment. They aim to reach this long-term goal by strengthening farmer and rural community movements by means of participatory education, action research and network building. The focus of FIELD is on providing technical assistance for farmers, utilising vast experience of their staff regarding integrated pest management.

The FIELD Foundation has been part of the creation and application of widely praised approaches such as the Farmer Field School, Farmer-to-Farmer training and Farmer Action Research Facilities. FIELD has also trained 26,000 people, both men and women, as Farmer Trainers who are experienced in facilitating and supporting others farmers in a variety of activities such as Field School, Participatory Planning, Field Studies, Farmer's Media Development, Action Research, and advocacy. At the moment, FIELD is supported by several donors on a project basis such as IIED, CGN, and AFFA.

FIELD began operating in 2002, with a project entitled, —The Participatory Enhancement of Diversity of Genetic Resources (PEDIGREA). The PEDIGREA project was started in Indramayu, West Java. Indramayu was chosen because it is the area that produces the largest share of rice in Indonesia. Indramayu is located in the lowlands, about 160 km to the East of Jakarta. Another consideration in choosing Indramayu was because it was the target area of Government's Green Revolution Programme in 1970. Two main components of the PEDIGREA programme are the FFS and Participatory Market Development (PMD). The FFS focuses on Participatory Plant Breeding (PPB) for rice and vegetable and also on participatory on animal improvement (goats).

Regarding the PPB activities, FIELD has trained 60 farmers as facilitators for farmer breeders, of which 34 deal with rice farmers, while 26 deal with vegetable farmers. Regarding the FFS, as of December 2008, FIELD has seen the graduation of many farmers, including 264 rice farmers and 257 vegetables farmers.

The target population of the FIELD project are small farmers in the District of Indramayu, West Java, and Lampung. As the livelihoods of their target groups are prone to suffering due to natural disasters, FIELD has adopted disaster risk reduction (DRR) perspective in their programme, including projects on providing relief; an example of which is an earthquake response effort in Ciamis, West Java in collaboration with HIVOS.

[35] Interview, Mr Adit, Programme Manager, August 28, 2012; See www.field.org/profil/

**IPPHTI**[36]

IPPHTI is the partner organisation of FIELD in Indramayu, they are active in Indramayu since 1999. It is a national grass root organisation, members are graduates from SLPHT (Sekolah Lapang Pangendalian Hama Terpadu = Field School for Pest Control). SLPHT had a contract with FAO and when FAO left and FIELD was founded they continued the cooperation with FIELD.

IPPHTI works in 138 districts in 11 provinces in Indonesia. Since its establishment in 1998 IPPHTI has organised a farmer-to-farmer movement, strengthened farmer-led research, and conducted advocacy on issues such as farmer rights.

The website of IPPHTI is http://suksesorganik.com/ipphti/.

### *Project description*

The following project description is based on discussion with Mr. Masroni of IPPHTI during our field visit to Sliyeng Lor village. IPPHTI is the implementing partner organisation of FIELD in Indramayu district.

In Indramayu FIELD is active in 24 farmer groups in 19 sub-districts.[37] Rice breeding is in every group, however, some of the farmer groups are also engaged in local vegetable breeding or animal breeding. The animal breeding was first focused on chicken, however, due to the Avian flu focus shifted to goats.

In all farmer groups there are 2-5 breeders and the other members are farmers. The farmer groups usually meet twice a year (3 members per group) before and after harvest to discuss their activities. The reason for spreading out the programme in a large area is that the harvest seasons are different in the villages. This speeds up the breeding process, because seeds can be planted more frequently. The farmer groups in the programmes were selected by IPPHTI based on 1) female role, 2) group activity level and 3) the response from the group to the programme. According to Mr. Masroni, there is no seed breeding in the other villages in Indramayu.

FIELD's programme has 4 components: 1) Breeding, 2) Soil management, 3) Marketing and 4) Credit cooperative. However, IPPHTI has additional focus on sustainable farming practices, which is not in the FIELD programme. They encourage the use of *nimba* leaves against pests, compost making from fermented fruits and the use of rain water (no irrigation) for organic farming. Seed breeders have to use organic practices, but farmers mix chemical and organic methods. Irrigation is not allowed for organic practices because the river coming from the south contains chemical fertiliser components. Exchanging seed types also reduces the probability of pests, because growing many seed varieties reduces the chance of pests.

Farmers grow on average 5-10 different rice varieties but only one type on a single plot. Rice is planted 2-3 times per year. In the dry season vegetables like sponge gourd, bitter gourd, squash, water melon or chilli are grown.

[36] Interview with Mr. Masroni of IPPHTI.

[37] However, based on the FIELD Annual Review 2013, the project was only working with 15 farming groups. It is possible that IPPHTI was working with the remaining villages and farming groups through a different project.

FIELD rents land for multiple location testing of the seed varieties. They are working on developing a community seed system instead of certification, which is very expensive.

### *Project result chain*

The section above described the implementation of the project in the field. Hence, it is more detailed at the farmer level than the overall project objectives of FIELD but misses some key elements of the project. The result chain below describes the planned project outcomes based on the project proposal to Hivos.

**Activities**

In order to achieve the four sub-goals, the following activities are envisaged.

First, the development of credit cooperatives:

- Discussions with farmer group representatives to motivate them to run credit cooperatives and establish a core board (year 1)
- Basic training on cooperative management (year 1)
- Organising meetings with prospective cooperative members to establish the credit union (year 1)
- Monthly meetings to further develop cooperative (year 1,2,3)
- Regular monitoring and internal evaluation activities (year 1,2,3)
- Special training for officers and members of the credit cooperative to develop skills (year 1,2,3)

Second, establishment of business enterprises:

- Conducting feasibility study of business opportunities in village (year 1,2)
- Personal Business Enterprise implementation (year 1, 2,3)
- Establishment of community enterprise (year 3)

Third, seed certification:

- Organising regular community forums
- Facilitating multiple location testing of selected seed varieties
- Facilitating seed certification
- Establishing community registry and seed system

Fourth, exit strategy in Lampung:

- Form a group responsible for strategically planning the institutionalisation of organic agriculture and community seed systems, institutionalizing community seed systems (year 1)

**Outputs**

The sub-projects have the following outputs:

- 5 credit cooperatives established using credit union methodology.
- 3 business enterprises established in 5 villages.
- Seed legalisation:
    - Community registry and seed system established.
    - 300 new farmers participate in the community registry system.
    - 14 farmer line varieties identified and selected.

  - 15 farmer breeders involved.
  - 6 new seed varieties developed by farmers under community registry system.
  - 1 seed variety certified.
- Exit strategy devised.

**Outcomes**

The final objective of the project is to increase the welfare of ecologically-minded farmers. Accordingly, sub-objectives of the current contract are to facilitate the institutionalisation of rural businesses by establishing credit cooperatives; stimulating the 'entrepreneurial spirit' of farmers and the village community by stimulating the development of new business ideas and opportunities; providing legal protection of farmers who engage in plant breeding to ensure legal recognition of their products through certification.

As a result of the project, the rural economy is given a boost through the institutionalisation of rural business and new business initiatives. Small-scale farmers see their livelihoods improved after getting better access to seed market and to formal seed quality system.

**Risks and assumptions**

Finally, the proposal assumes the following setting and conditions for the project:

- Stable macroeconomic situation
- Absence of natural disasters
- Well-functioning Credit Cooperative
- Public knowledge of business opportunities in rural areas
- Communities open to business diversification
- Community and government support
- Seed-breeding farmers are able to pass the certification test
- Farmers understand the principles of the credit union
- Availability of sufficient capital to run the business of credit cooperatives
- Society agreed to establish community seed systems

# Annex II. Overview outcome indicators and indices

This annex provides a detailed description about the used outcome indicators. In addition, it discusses the variables which were used to construct the outcome indicator indices. Please note that some of the indicators are constructed as indices from multiple questions. In the main text of the report, only the indices are reported for such indicators. However, this Annex reports on the outcomes of the components of the indices.

Outcome variables for the project were collected at household, farming group and cooperative level. The outcomes are reported for treatment, spillover and comparison groups for the baseline and the endline surveys. For the household data, the sample size can differ between tables because the answer 'don't know' is changed to a missing value or because a respondent could skip a question if he/she had no knowledge about what was asked (answered 'no' to a previous question). This was the case if a respondent answered 'don't know' to a question with a scale, so it did not make sense to incorporate the answer in the scale. However, for questions where we were interested in the percentage of the sample that answered 'yes' to a question, it made sense to change the 'don't know' answers to 'no' so that we could use all data when reporting on the question.

### *Meetings at the farming group*

- Average number of meetings of farming group in past 12 months (baseline)/ 24 months (endline)
- Number of farming groups which discussed […] in the past 12 months: This indicator is based on a question in the farming group survey asking for the topics that have been discussed in the meetings in the past 12/24 months. Respondents could choose from a number of topics and specify other topics that are not listed. For each of these topics a separate sub-indicator was created which equals 1 if the household mentioned it and 0 if he didn't. Hence, the sub-indicators are the following: Good farming practices, Seed breeding, financial management, savings and loans, processing, marketing, social gathering or 'other' topic.

### *Saving and credit cooperative indicators*

- Total outstanding loans at the savings and credit cooperatives: this indicator is based on the question in the savings and cooperative survey on how big the total amount of outstanding loans is (divided by 1000 Rp).
- Number of members: This includes all members, female and male.

### *Use of financial instruments (uniform indicator)*

- Access
    - Households that know a place to borrow money: In section JK (Use of Financial Services) of the questionnaire it was asked whether the respondent or any other household member know of a place where they can borrow money. The question has 3 answer categories: 'Yes', 'No' and 'Don't know'. In order to generate a binary variable 'Don't know' answers were recoded to missing values.
- Membership

  - Households involved in financial institutions: This indicator is constructed using section JK (Use of Financial Services) of the household questionnaire. The dummy is created by combining answers of 2 different questions; jk06 and jk14. All households that answered to have savings in a bank account or in a savings and credit cooperative are counted as households that are involved in a financial institution. Furthermore, all households which were able to get a loan from: a. private commercial bank b. cooperative c. government/semi-government bank d. agricultural bank/SAPRODI or e. non-bank financial institution are counted as households that are involved in a financial institution.
- Savings
  - Percentage of households with savings in bank account, savings and credit cooperative or savings and credit group: Section JK in the endline survey records each of these three types of savings separately. In order to compare the results to the baseline (where all three saving types are grouped in one category), we created a dummy which equals 1 if a household has at least one of the three saving types.
- Borrowing
  - *Households that have borrowed in the past 12 months*: All information in order to construct the dummy variable was taken from question *jk13* for all households which replied that were successful in securing a loan in the past 12 months. Answer categories `don't know' were replaced by missing values.

### *Households using organic farming practices*

- Percentage of households practicing organic farming (this indicator is measured from self-reported information as well as based on responses to questions on chemical inputs for farming)
  - Self-reported: This variable is measured based on responses to the question whether a household practices organic farming. If answers were 'Partially' we recoded them to 0 ('No').
  - Based on responses to questions (not using chemical inputs): Based on three questions on farming practices, it is assessed whether a household practices organic farming, i.e. does not use chemical inputs. The first question asks about the household's soil management for rice cultivation. If the household does not use any chemical fertilizer, it is classified as organic soil management. The second question asks about how the household protects its rice seeds from insects and diseases. If the household does not use any pesticide or chemical herbicides, it is classified as organic farming. The third question asks whether the household used among others any chemical fertiliser or chemical pesticides for cultivating rice in the past year. If the answer is yes to either of these two questions, the household does not exclusively use organic farming practices. Hence, the answers to the three questions are collected into one indicator which indicates whether the household used any chemical input at all.
- Percentage of households using chemical inputs

  - Percentage of households using chemical fertilizers: This indicator is again based on the first question mentioned above whether the household uses any chemical fertilizer to keep the soil for rice cultivation fertile.
  - Percentage of households using chemical pesticides/insecticides: This indicator is again based on the second question mentioned above whether the household uses any pesticides or chemical herbicides to protect its rice cultivation from insects and diseases.
- Percentage of households using organic inputs
  - Percentage of households using organic fertilizers: This indicator is again based on the first question mentioned above whether the household uses 'manure' or 'composting' to keep the soil for rice cultivation fertile.
  - Percentage of households using organic pesticides/insecticides: This indicator is again based on the second question mentioned above whether the household uses bait to attract insects, plants special plants, do crop rotation, plants resistant crop types or uses organic/herbal pesticides/herbicides to protect its rice cultivation from insects and diseases.

### *Percentage of households involved in farming*

This indicator looks at the share of households that are involved in farming of any type of crops. For the baseline all households answered with 'Yes', at the endline around 3% of the households have not grown any crops for sale.

### *Yield of rice per ha (uniform indicator)*

This indicator is calculated per ha (kg/ha). Section UTB of the household questionnaire asks about harvest and sale of all crops that were grown by a household. We concentrate only on rice for now. The section is divided into information about a. the last harvest period, b. the second last harvest period and c. the one before last harvest period where we mostly focus on the first two. For each period, the questionnaire asks for the area that was planted with rice ($m^2$) and the amount of rice that was harvested. For the area we sum up the values and divide them by 10,000 to get values in ha. For the amount harvested, the unit was not predefined in the questionnaire, hence all values are converted into kg. The kg rice harvested as well as the area used for rice cultivations are each summed up for the last and second last period. If values exist for both periods, the sum is divided by 2, hence we get the average for the two periods. Finally, the yield is calculated by dividing the kg harvested by the area used to cultivate rice. Due to a large variation in the yield outcomes, we used the median per treatment type instead.

### *Selling price of rice (average per household)*

This indicator is calculated using two different methods. The first, a bit more complicated method, calculated the average price of the different periods. The second variable uses the average price of the past 12 months mentioned by the household.

- Calculated price: This indicator is calculated as an average of the price received for selling rice a. immediately after harvest and b. later after harvest (in the last harvest period only). Since we calculate the average price for the two periods, we weigh them by how much was sold in each

of them. Hence, we divide the kg sold in each period by the total kg sold in both periods and multiply this with the price of each period. Since the units for prices are not predefined in the questionnaire, we covert them so they are all in Rupiah per kg. This value is then divided by 2 to receive the average price received for rich immediately after harvest and later after harvest. In the endline the price for each of the two periods (immediately and later after harvest) is further divided into price for collectively selling and selling individually. Hence, we also calculate the average price for these two sale types.

- Self-reported price: This indicator simply represents question on the average price households received for selling rice in the past 12 months.

### *Volume of rice sold (t) (uniform indicator)*

The total volume of rice sold is calculated from the volume sold in the last harvest period, the one before the last harvest period and two before the last harvest period. In each of the three harvest periods we collected information on the volume sold immediately after harvest and later after harvest. As mentioned above, the units were not predefined in the questionnaire so all values are converted into kg before adding them up. To receive the total volume of rice sold for each of the three periods, the volumes sold immediately and later after harvest are added up. Last, the total amounts for the three periods are added up to receive the total volume sold. Last, we divide the volume of rice sold by 1,000 to receive our measure in tons.

### *Household income and livelihood (uniform indicator)*

For this indicator, data was collected on the (per capita) consumption and asset holdings of households as well as the self-reported well-being.

- Household income is calculated from a) household revenue from sale of rice, b) total income per months and c) total income per capita per month (all three in 1000 Rp.).
    - Household revenue from sale of rice per month (1000 Rp): This indicator is calculated by multiplying the self-reported average price for rice (see above) with the total volume of rice sold in the last 3 harvest periods (see previous indicator). To receive the revenue per month in 1000 Rp., this value is divided by 12 (months) and 1,000 (Rp.).
    - Total income per month (1000 Rp): The questionnaire includes separate sub-sections for income generated from: a. Crops, b. Livestock (net profit), c. Non-Farm activities (net profit) and d. Money transfers (net income). The total income variable is created by the sum of income generated by the different income sources mentioned above. In particular, we sum the 'total income per month from livestock per household' (based on self-reported price), the net profit per month from non-farm business per household, the income per month from crop other than rice per household, household revenue per month from sale of rice and the total amount of transfers (includes different types of assistance, i.e. in cash or in-kind) received per month per household.
    - Total per capita income per month (1000 Rp): For the monthly per capita income, total income is divided by the household size.

- Per capita expenditures of households (

- Non-food consumption per capita per month (1000 Rp): The total non-food consumption of a household is calculated from a number of questions on household expenses. To get the monthly non-food consumption per household, yearly expenses are converted into monthly figures. For the per capita *non-food* consumption we divide non-food consumption per month by household size. Non-food expenses consist of the following:
  - Yearly expenses on items like clothing, household supplies, medical costs and taxes. Again, also the yearly value of these items that were consumed but self-produced or received from another source is taken into account.
  - Expenses on schooling for family members (schooling needs, transportation, registrations etc.) were asked separately for members outside and inside the household. Only expenses for family members inside the household are included in the calculation of non-food consumption.

- Asset holdings of households
  - Housing facilities index: In order, that the housing facilities index in the MFS II projects have a meaningful interpretation, we calculate weights for the index components based on their predictive power for household expenditure. The weights are calculated using a population representative survey for Indonesia using regression analysis. We use the IFLS 2007 survey as a population representative sample. From the IFLS 2007 dataset we use aggregate expenditure data, asset ownership and sampling weights. As the aggregate expenditure variable the data analysis uses the logarithm of the monthly per capita expenditure (*lnpce*). The sampling weight used is the cross-sectional sampling weight adjusted for attrition. This weight should be representative of all households living in the IFLS provinces in Indonesia in 2007. Based on the KR section of the IFLS survey, we construct the housing variables that are the same in IFLS and the MFS II surveys. The variables used from the KR section of the MFS II surveys which are also the found in IFLS are: a. *kr01*, b. *kr02*, c. *kr04*, d. *kr07*, e. *kr10* and h. *kr13*. The corresponding variables in IFLS are: a. *kr03,* b. *kr13*, c. *kr16*, d. *kr20*, e. *kr11* and h. *kr24.* There are more variables which are the same between E6 and IFLS, however we wanted to construct a housing facilities asset variable which can be used by all MFS II surveys, thus the variables mentioned above are selected as they are common in most MFS II surveys. The first step is to recode the variables of MFS II surveys in order to have matching answer categories with the variables of IFLS; the same procedure is also followed for the IFLS variables. In addition, as the variable names are not the same among the two datasets, in the IFLS dataset we renamed the common variables as to have the same name with the MFS II variables. After, the aforementioned preparation the two datasets are combined into one dataset. Furthermore, dummy variables are created based on the answer categories of the chosen common variables. The reason behind the construction of the categorical dummy variables is to include them in the regression of the logarithm of the monthly per capita expenditure on the housing dummies. Nevertheless, not all of the categorical dummies are used in the regression model. The regression does not

include dummy variables whose variation is higher than 97% of the sample or lower than 3% of the sample. Moreover, after we performed the regression the next step was to calculate the fitted values by predicting the expenditure based on housing facilities for both the IFLS and MFS II sample. Finally, the last step was to rescale the predicted variable in order to have a zero mean for the IFLS sample by subtracting the mean of the fitted value from the fitted value itself.

Hence, we will be able to infer the livelihood of our survey participants compared to the Indonesian average in 2007: for example, if the value of the index is 0.10 (-0.10), on average, it implies that the sample is approximately 10% better off (worse off) than the average Indonesian household in 2007 based on the predictive power of housing facilities (like drinking water source) on household expenditure.

- Asset index: The construction of the asset index follows a similar procedure with the creation of the housing index, however in this case instead of the IFLS dataset the DHS 2012 dataset was used, as DHS includes more common asset variables with the MFS II surveys than the IFLS. Moreover, asset variables were chosen from the KR section of the MFS II surveys which are common with DHS variables. From MFS II dataset questions a. kr11 and b. kr12 were chosen while from the DHS dataset questions a. *hv207*, b. *hv208*, c. *hv209*, d. *hv243a*, e.*hv210*, f. *hv211*, g. *hv212*, h. *sh118c*, i. *hv243d* and j. *hv243c* were selected. The next step was to combine the two datasets and perform a factor analysis of the common variables in order to calculate the asset index. In addition, as mentioned above the 3% rule was also applied for the asset index, excluding from the factor analysis variables with small variation. Finally, the predicted asset index was normalized for the DHS sample (mean 0 and variance 1).

- Investment into business or farm equipment
  - Percentage of households invested in business: This indicator is based on the question whether a household expanded its family business, purchased new equipment or started a new business in the past 12 months. From this we created a dummy which is 1 if the answer to this question is 'Yes', and 0 if the answer is 'No'.
  - Percentage of households invested in new farming tools: This indicator is based on the question whether a household purchased new farming tools in the past 12 months. From this we again created a dummy which is 1 if the answer to this question is 'Yes', and 0 if the answer is 'No'.

- For self-reported well-being is measured by two scales on a) happiness and b) current wealth status. Respondents were asked the following:
  - Taken all things together how would you say things are these days? The question was answered on a 4-point Likert scale from 1 (very happy) to 4 (absolutely not happy).
  - Please imagine a six-step ladder where on the bottom (the first step), stand the poorest people, and on the highest step (the sixth step), stand the richest people. On which step are you today? Here, all 'don't know' answers are replaced with missing values.

These questions relate to the subjective judgement of the respondent. Therefore, we only report on the change in these indicators if the (main) respondent was the same during the baseline and the endline surveys.

### *Household income and livelihood (uniform indicator)*

For this index four measures are taken into account.

- Percentage of households not able to cover their living costs/ have not enough to eat: It was asked whether it happened to the household in the past 12 months that the income did not cover the living costs.
- Number of months households were not able to cover their living months/have not enough to ear.
- Current standard of living (daily needs covered): Possible answers were 1 (not enough to fulfil my daily needs), 2 (only enough to fulfil my daily needs), 3 (more than enough to fulfil my daily needs). Again, all that answered 'don't know' where replaced with a missing value.
- Current standard of living (food consumption covered): Possible answers were 1 (not enough to fulfil my daily needs), 2 (only enough to fulfil my daily needs), 3 (more than enough to fulfil my daily needs). Again, all that answered 'don't know' where replaced with a missing value.

All of these four indicators above, besides the second one on the number of months, relate again to the subjective judgement of the respondent. Hence, we only report on the change in these indicators if the (main) respondent was the same during the baseline and the endline surveys.

# Annex III. Summary Statistics

**Table 10: Summary Statistics Table**

| | Baseline | | Endline | | Change | |
|---|---|---|---|---|---|---|
| | Sample size | Mean | Sample size | Mean | Sample size | Mean |
| Average size of household | 220 | 3.81 | 220 | 4.25 | 220 | 0.44 |
| Percentage female hh-head | 219 | 1.37 | 210 | 1.43 | 209 | 0.00 |
| Average age of hh-head | 219 | 48.75 | 210 | 49.92 | 209 | 1.67 |
| Highest level of education attended by the household head (%) | | | | | | |
| *No education* | 219 | 10.96 | 210 | 10.00 | 209 | -0.48 |
| *Primary education* | 219 | 55.25 | 210 | 56.19 | 209 | 0.96 |
| *Secondary education* | 219 | 28.77 | 210 | 29.05 | 209 | 0.00 |
| *Higher education* | 219 | 5.02 | 210 | 4.76 | 209 | -0.48 |
| Size of cultivated land (ha) | 219 | 8,687.68 | 201 | 9,433.46 | 200 | 284.68 |
| Subjective wealth status five years ago (scale 1-6) | 220 | 2.59 | 217 | 2.63 | 217 | 0.04 |
| Main source of income (%) | | | | | | |
| *Crop farming* | 220 | 88.18 | 220 | 82.27 | 220 | -5.91 |
| *Livestock* | 220 | 0.45 | 220 | 0.91 | 220 | 0.45 |
| *Non-farm business* | 220 | 5.91 | 220 | 5.00 | 220 | -0.91 |
| *Salary, wage* | 220 | 5.45 | 220 | 10.91 | 220 | 5.45 |
| *Transfer, remittances* | 0 | | 220 | 0.91 | 0 | |
| Percentage of households with membership in […] | | | | | | |
| *Farming group* | 220 | 95.00 | 220 | 71.82 | 220 | -23.18 |

| 12 | SEGERAN KIDUL | JUNTINYUAT | Breed | Comparison |
| 13 | CANGKINGAN, BLOK SEDONG | KEDOKAN BUNDER | Breed | Breed |

Breed = FIELD seed breeding activity in farming group, members sampled
Coop = FIELD credit cooperative members sampled
Spill = non-participant households sampled in FIELD treatment village

### *DESA KASMARAN*

In desa Kasmaran farmers plant and harvest paddy only twice a year. In between there are farmers planting other crops or they work in the building sector. In this village there are 3 farming groups: Srigaman 1, Srigaman 2, and Srigaman 3. These three farming groups are formed by the official and get assistance in the growing season. The membership is based on the width of the rice field owned by farmers. Also people from neighbouring villages have become a member of the farming group.

### *DESA TENAJAR KIDUL*

In Desa Tenajar Kidul the majority of the people are farmers and in this one year they only plant rice. Here there are 4 farming groups. The farming group meets 3 times in the growing season. There is a long dry season but farmers can still harvest twice a year, although the result of second season is less than before.

### *DESA RANCAHAN*

Desa Rancahan is divided into 4 blocks, and one of them is Plasa block. Plasa block has the most villagers. The majority of people are farmers, and there are two farming group i.e. Farming group of

Guru Tani and Farming group of Sri Ayu. In the village the distance of among respondent's houses is quite far.

### *DESA WANGUK*

In Desa Wanguk the majority of the people are farmers, but there are also teachers, people selling sembako or daily needs, people selling food vendors, toys, people providing labour at buildings etc. The road condition is not too bad, but not too good as well.

### *DESA KALENSARI*

In general, farmers in desa Kalensari plant and harvest paddy only twice a year due to a lack of water in the third season. In the third season some plant crops, some make bricks, and some other leave for working at other areas when providing labour for building. In desa Kalensari there are 3 (three) active farming groups i.e. 1) Ruwart Remaja 2) Tani kita satu, and 3) Tani kita dua. The first group is founded by the villagers assisted by IPPHTI, while the other two are found by the official of agriculture or by the government.

### *DESA CANGKINGAN BLOK PLAWAD*

In Desa Cangkringan the majority of the people are farmers, but besides they also have work when selling sembako, selling cooked food (vegetables, fried snack, nasi rames etc), working as teachers, having rice mill business, having paddy mill business, or make cakes. In the village the people's houses are close each other. The road to access the village is not very good.

### *DESA MULYASARI*

Again, the majority of the people are farmers, which plant and harvest paddy twice a year due to the lack of water in the third season. In the third season they plant crops. In the village there are two farming groups, 1.Karya bakti, and 2. Mulya bakti. Membership of both farming groups is based on the living place of the farmers.

### *DESA SEGERAN KIDUL*

In Desa Segaran Kidul, there is farming group "TANI MULYA" where farmers besides paddy also plant crops (pumpkin, chilli, cucumber, pare and watermelon). Farmers at Jati Gentong have high spirit to develop the agriculture by doing plant crossing to get an optimal result.

### *DESA CANGKINGAN, BLOK SEDONG*

Again, the majority of the people in this village are farmers. But there are also teachers, people selling sembako and people selling cooked food (nasi rames, fried snacks, vegetables, ketoprak etc). Although there are limited number of public transports and must wait for long time, the road condition is good.

# Annex V. Descriptive statistics

### Table 12: Size of saving and credit cooperatives

| | Base | End |

# 1. Introduction

## 1.1. Project context

Micro, Small and Medium Enterprises (MSME)[1] play an important role in Indonesia's economy. MSMEs represent the largest part of the Indonesian business community, and contributed 55.6% to the total national GDP in 2011.[2] Therefore, small businesses provide large number of employment opportunities: absorbed almost 90% from the total employment in the Indonesia's industry in 2008.

Despite their importance, MSMEs still face obstacles in terms of legality, human resources, low productivity, and in particular access to capital.[3] Therefore, one of the main cluster strategies in alleviating poverty in Indonesia is the empowerment of micro and small enterprises (MSE) with the goal to increase the saving and to maintain sustainability of micro and small businesses, for example through the micro finance programme *Kredit Usaha Rakyat* (KUR) and other technical assistance programmes.[4]

Especially the provinces of Central Java and Jakarta have large numbers of Small and Medium Enterprises (SMEs) focusing on garment products. As a labour intensive industry, the sector employed about 3.5 million people directly and indirectly based on data from 2004. The textile and garment apparel industry is expected to remain a major contributor to Indonesia's economy. One of the leading reasons is that Indonesia still has a comparative advantage for labour-intensive industries and the sizable domestic market, given the nation is home to 240 million people.

In addition, Indonesia is still regarded as a high quality producer of basics and high-end fashion, and the Ministry of Trade, National Agency for Export Development (NAFED) included textile as one of ten sectors where Indonesia has comparative advantages, and handicraft was recommended as one of the ten sectors with high growth potential during the 2001-2009 period. Therefore, Indonesian textile and garment industry has become one of the most significant sectors that directly contribute to economic growth. Textile, together with leather goods, contributed up to 14.6% Indonesia export in 2008. Growth in exports of Textiles and Clothing Indonesia sky rocketed in 2010 to reach 21.2% or U.S. $ 11.32 billion.

Despite the economic growth, 31 million people or 13.3% of the population in Indonesia still lived under the poverty line in 2010.[5] The poverty rate in central Java was above national average at 16.6%. Meanwhile, in Jakarta, the capital of Indonesia, the poverty rate was 3.4%.

Hence, addressing the challenges faced by SMEs could help improving the economic conditions of poor female micro-entrepreneurs. Taking the opportunity to achieve this objective, HIVOS and SwissContact

[1] The Government of Indonesia defines the following characteristics for MSMEs: Micro industries have net assets up to 50 million Indonesian rupiahs (IDR) or have annual revenue from sales up to 300 million IDR; Small Industries have net assets between 50-500 million IDR or have annual revenues from sales between 300-2,500 million IDR; and Medium industries have net assets between 0.5-10 billion IDR or have annual revenue from sales between 2.5-50 billion IDR. [4] Other strategies are social aid and protection with the goal to reduce the expenditure burden of poor families, and people's empowerment with the goal to improve income and prosperity of poor people.

Indonesia launched the project Garment for Economic Empowerment (GREEN) with the aim to reduce poverty by increasing income of women through people's empowerment, and improving the competitiveness of micro-small enterprises. The project was implemented in the provinces of Jakarta and Central Java[6] through workshops on a joint vision on purchasing, production and marketing. The project identified and addressed a key challenge of micro and small entrepreneurs in Indonesia: namely the low quality and outdated product designs coupled with insufficient access to input, output and financial markets.

## 1.2. Evaluation objectives

This report evaluates the GREEN project of Hivos with SwissContact Indonesia[7] as part of as part of the *Medefinancieringsstelsel* (MFS) II evaluation for Indonesia under the Achievement of Millennium Development Goals (MDG) component. The project has been selected under the goals on poverty alleviation (MDG 1). In particular, the current evaluation focuses on the following research questions: How did the skills of female entrepreneurs in the garment sector change? Are the small-scale enterprises better linked to the market? Do small-scale enterprises have better access to financial services? How did the capacity of ASSPUK and PPSW as business development service providers change?

We investigate whether the project had a favourable effect on the above mentioned outcomes for the project beneficiaries. To measure the project's effects, we intended to use difference-in-difference methodology: comparing the changes in the outcome variables between the baseline and endline periods for the project beneficiaries to the changes in outcomes for a comparison group. Hence, at the baseline period structured interviews have been conducted with a total of 50 possible project beneficiaries and 50 respondents for the comparison group, and the same respondents have been re-interviewed at the endline. However, before the endline survey we learned that only 1 respondent in our sample has benefitted from the project intervention. Therefore, we interviewed 5 additional beneficiaries who did not take part in the baseline survey.[8] As a consequence, the impact on the beneficiaries is assessed using cross-sectional data from the endline. Nonetheless, we report on the changes in outcome variables for the potential beneficiary group.

In addition to the surveys, focus group discussions were conducted with project beneficiaries and in-depth interviews with project stakeholders to deepen our understanding of the project implementation and the project results. The results of this qualitative study are presented in Annex VI. Information about project costs was obtained from SwissContact Indonesia.

As specified in the Terms of Reference for this evaluation, the report addresses five evaluation questions to assess the project outcomes:

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?

[6] More specificly, the project focuses on 4 regencies: sub-district Tambora of West Jakarta Regency, Sukoharjo and Surakarta Regency and the sub-district of Pringapus of Semarang Regency.
[7] The project is described in more detail in section 3.

2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern partner organisations efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

## 1.3. Summary of findings

On the one hand, the project is aimed at building the capacity of two associations for female entrepreneurs (PPSW and ASPPUK) in providing business development services to their members. These organisations are the primary beneficiaries of the project. On the other hand, the project uses case studies of linking entrepreneurs to markets and enhancing their skillset using groups of beneficiary craftswomen, whom we refer to as final beneficiaries. The evaluation focuses on the project's impact on the final beneficiaries (training participants). The evaluation of the GREEN project's effectiveness in capacity building of the primary beneficiaries (organisations) is beyond the scope of this evaluation.

In the qualitative study of the evaluation, we found that the project encountered some challenges during the implementation, which has led to delays and the modification in the implementation strategy due to limitations posed by the contract period. However, this did not directly affect the project implementation at the final beneficiary level.

Despite the obstacles encountered in the quantitative study, we arrived at similar findings from both the qualitative and quantitative studies regarding the project's impacts at the final beneficiary level: (1) the trainings provided relevant skills for the participants, related to their previous livelihood activity; however, (2) only 25% of the participants of the first training on *kanzashi* technique at the Melati cooperative decided to make use of the acquired skills in their livelihood activities as a part-time activity taking up on average 24% of their working time; (3) the success of the project in opening new marketing opportunities for the final beneficiaries remained limited; and (4) the project did not have a significant effect on the profits and earnings of the project participants.

## 1.4. Structure of the report

The rest of this report proceeds as follows: section 2 describes the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1 till 4 in turn. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. The project implementation and the SPO is described in Annex I. Regarding the survey data, the construction of the outcome indicators and indices is summarized in Annex II, while Annex III reports on the summary statistics of for all variables used in the analysis. Annex IV describes the survey locations. Further tables on explaining the project outcomes are presented in Annex V. Finally, the results of the qualitative data collection are presented in Annex VI.

# 2. Literature overview

At the final beneficiary level, the GREEN project provides handicraft trainings in the garment sector for craftswomen and links them to the market. In general, the objectives of the GREEN project can be related to vocational and entrepreneurship trainings. Below we summarize the literature on the effectiveness of such trainings and the types of projects implemented. We note in advance that most of these focus on trainings for youth and unemployed, which are not directly comparable to the GREEN project. Nonetheless, the overview may help readers contextualize the GREEN project in relation to other projects aimed at improving vocational and entrepreneurial skills.

### *Vocational trainings*

Typically, vocational trainings are used as an instrument to improve participants' labour market outcomes and as a consequence decrease a nation's (youth) unemployment (Maitra & Mani, 2012; McKenzie, 2012). There are a number of studies in developed countries on the effectiveness of vocational training on these components (for example, Hebbar, 2006 or Budria, 2009).[9] Results are, however, mixed. While vocational trainings can be effective for the participants in a number of aspects, such as employment, job-related skills and earnings, the effectiveness of training programmes varies with the type of trainings and with trainee characteristics such as pre-education level (Bartlett, 2009; Heckman et al., 1999; Maitra & Mani, 2012). However, in the context of developing countries, the literature on the impact of vocational trainings is scarce (McKenzie, 2012). In general, the existing evidence suggests a positive impact of training on participants' labour market outcomes[10] (for example, Attanasio et al., 2011; Maitra & Mani, 2012), which is more often found in terms of the generated income of the employed than in increasing the probability of employment (for example, Card et al., 2011; Hirshleifer et al., 2014).[11] However, the context (for example, Attanasio et al., 2011 and Card et al., 2011 focus on youth) and duration (on average 6 months of training) of these trainings are not directly comparable to the current study.

There are also some projects that are more similar to the GREEN project in the sense that they focus on the skills of women in designing and producing handicraft products; increase their knowledge on the value chain; link them with markets; provide guidance on how women can work in groups; and develop women into effective business managers and organisational leaders (BWBA, 2012; Mendoza and Palma, 2012; www.dastkar.org). Unfortunately, most of these projects were not (yet) rigorously evaluated. One exception is Maitra & Mani (2012), who investigate the economic and social returns of a subsidized, six month long training programme in stitching and tailoring offered to women between ages 18 and 39 years by two local NGOs in New Delhi, India. Using an experimental framework, they found modest positive results for the trainings in terms of employment (5 percentage points), looking for a job (6 percentage points), hours worked (2 additional hours) and wage earnings (69 percent increase).

[9] Or see Department for Employment and Learning (2003) for an analysis of several different vocational training programmes in Northern Ireland.

[10] In addition, the impact estimates are larger in developing countries than in the United States and Europe (Maitra & Mani, 2012).

[11] Most of these studies use experimental designs to evaluate the effectiveness of the training programmes.

However, the implementation of all these projects is more intensive than in the case of the GREEN project, taking up to 10 months (BWBA, 2012) and most projects address the problems at hand in different ways than the GREEN project. Hence, while the content of the projects are similar to the GREEN project, the implementation differs to such an extent that we cannot use these projects as a benchmark for the GREEN project.

#### *Entrepreneurship trainings*

In general, the literature on entrepreneurship trainings shows a positive effect of entrepreneurship trainings on the entrepreneur's performance (Glaub & Frese, 2011). According to an overview paper of the International Labour Organisation (ILO) on women entrepreneurship training during the last decade in low income countries (Patel, 2014), there are usually five types of women entrepreneurship interventions: "1) access to finance; 2) business development services (BDS), which include business training, business advice or mentoring, technology transfer, business incubation services, business formalization services and strengthening of women's entrepreneurial associations; 3) improving market access for women's firms; 4) creating favorable business enabling environments; and 5) efforts to enhance women's agency and empowerment." (Patel, 2014, p.2). While some projects focus entirely on one component, other projects make combinations; for example micro-credit is often combined with business trainings (for example, World Bank, 2014). The evaluated literature provides little evidence that either business training alone or access to finance alone lead to sustained business growth. Instead, business training combined with follow-up technical assistance or business grants seems to be more effective in supporting the business growth of existing women's microenterprises. In addition, projects that combine business trainings with access to finance may be more effective in supporting women's business start-up. Since combined projects are more costly, they are not necessarily more cost-effective. Hence, the ILO concludes that entrepreneur trainings should address more barriers to women's entrepreneurship beyond limited access to finance and business skills.

However, the body of literature on the effectiveness of these programmes is scarce and tends to be methodologically weak (Glaub & Frese, 2011; Patel, 2014; Robb, 2014). For example, the World Bank states that "much more fine-grained analysis needs to be done, particularly with regard to the validity of Entrepreneurship Education and Training' as an antipoverty intervention as well as its direct connection to improving business performance in terms of enhanced profits and prospects for firm growth" (Robb et al., 2014, p.2).

# 3. The project

## 3.1. Project description

The GREEN project was implemented between 1 July 2011 and 31 August 2013, however, project costs were incurred until October 2013.

The final objective of the GREEN project was to improve the livelihoods of female micro-entrepreneurs in selected project areas. In the project, SwissContact provides technical assistance for two Hivos

partner organisations: PPSW in Jakarta and ASSPUK in Central Java province.[12] Both of these organisations are a network of Non-Governmental Organisations focusing on the empowerment of female entrepreneurs. The project involves the development of these organisations into business development services (BDS) provider centres. The capacity building is implemented using the garment industry as the theme of the project. SwissContact had a successful project in the garment sector before (Cipulir project), which initiated Hivos to start a similar project.

The first step in becoming a BDS provider is to identify stakeholders and jointly develop and implement a joint vision for growth. That is followed by implementing promotional measures related to purchasing, production and marketing.

Prior to the project a feasibility study was implemented by SwissContact, which identified the groups of beneficiaries in four regions: in Surakarta region the focus of the project is on batik making and the beneficiaries are members of JARPUK; in Sukohardjo region the focus is also on batik making and beneficiaries are members of Yayasan Krida Paramita (YKP); in Semarang region (Pringapus sub-district) the focus is on doormat/rug making and the beneficiaries are members of the Melati cooperative. The project activities in the above regions are supported by ASSPUK. Finally, in Jakarta region (Tambora sub-district) the focus is on laundry ventures specialised in jeans attire and the beneficiaries are SMSEs that are members of PPSW.

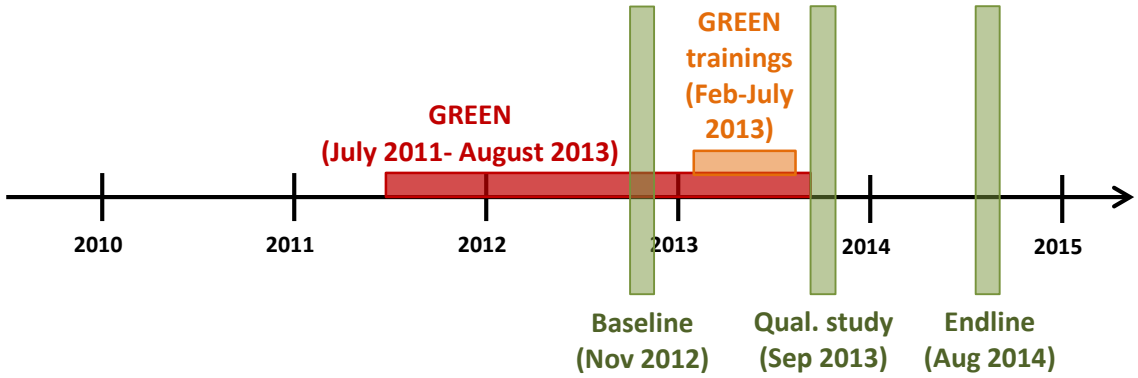
The evaluation focuses only on one of the regions. We have selected the Semarang region as the location of the evaluation.

## 3.2. Project implementation

The project implementation was not in line with the expectations. The qualitative study presented in Annex VI discusses the actual implementation of the project in detail. Overall, the strategy to build the capacity of PPSW and ASPPUK as BDS providers faced two major challenges:

1. The project period proved to be too short to change the mind-set of the NGOs to the business world according to SwissContact.
2. There has been a change in the SwissContact project staff, which led to delays in the project implementation and some confusion at the NGOs based on the observation of the evaluation team.

As a consequence, half-way through the project, the stakeholders decided to change the strategy of the project: SwissContact shifted the focus directly to the female entrepreneurs, and looked for a market opportunity to link them to a buyer. As a result, three women groups received trainings on batik and *kanzashi* techniques between February-July 2013. Batik craftswomen linked to ASPPUK received trainings on batik as planned. However, for the beneficiaries in Tambora (linked to PPSW) and for the members of the Melati cooperative, *kanzashi* making was identified as a new market opportunity. The average number of participants per training is summarized in Table 1 based on the daily attendance list of the trainings.



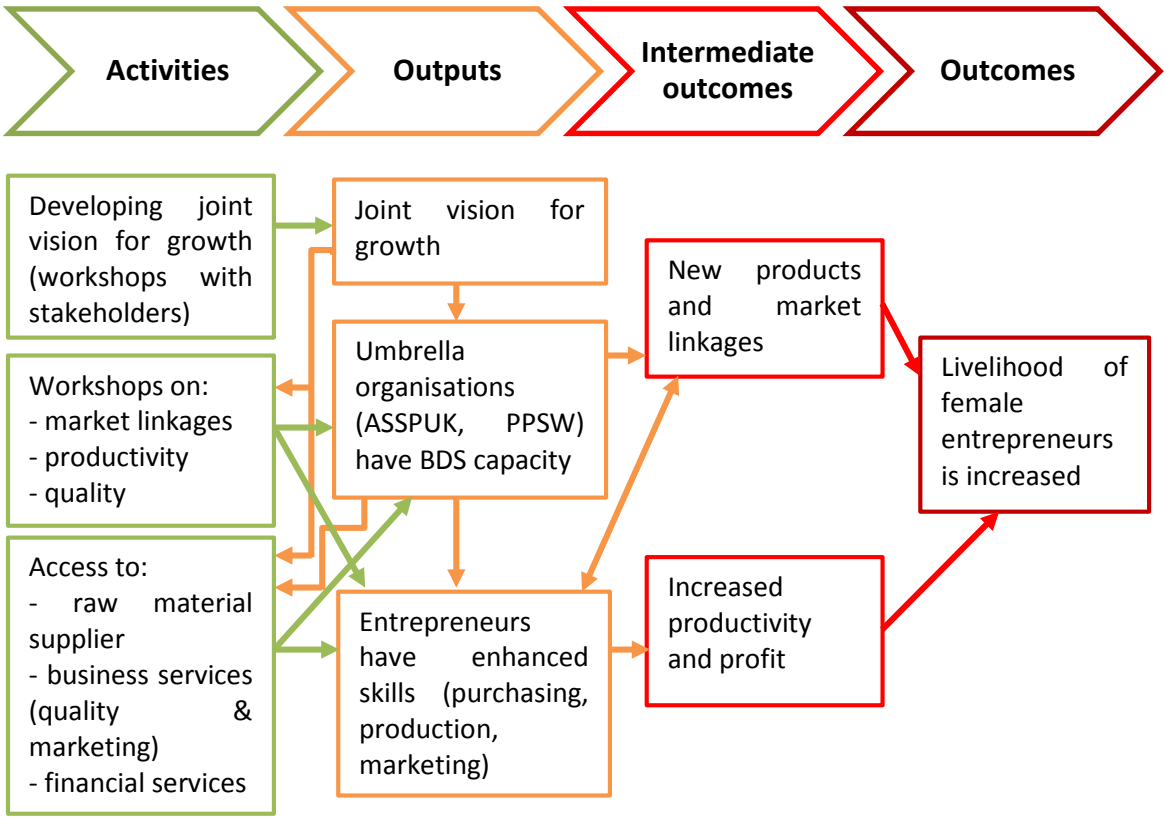
[12] See Annex I and Annex VI for a description of ASPPUK and PPSW.

**Table 1: Number of participants in project workshops**

| Workshop | Nr. Beneficiaries | Febr - June 2013 | | July 2013 | | Febr - July 2013 | |
|---|---|---|---|---|---|---|---|
| | | Nr. training days | Average number of participants per training day | Nr. training days | Average number of participants per training day | Nr. training days | Average number of participants per training day |
| **PPSW** | 30 | 12 | 8.4 | - | - | 12 | 8.4 |
| **ASPPUK** | 50 | 2 | 50 | 2 | 25 | 4 | 37.5 |
| **Melati** | 45 | 2 | 49 | 2 | 14 | 4 | 31.5 |

Source: Attendance sheets of workshops and Progress Report May-October 2013.
Notes: The number of average participants is calculated based on the daily attendance sheets of the trainings. Unfortunately, it was not possible to calculate the total number of participants using this data because the names were not always eligible.

**Figure 1: Timing of project activities and evaluation period**



The timing of the project implementation and the evaluation period is displayed in Figure 1. The figure shows that due to the delays in the project implementation, the trainings with the direct beneficiaries took place after the baseline survey. However, at the time of the baseline survey it was not yet clear what project activities were to take place at the selected evaluation location.

## 3.3. Result chain

The stylized results chain based on planned implementation of the project is displayed in Figure 2 based on the interpretation of the evaluation team. The detailed list of planned activities, outputs and outcomes is included in Annex I.

Despite the changes in the project implementation, we discuss the project logic based on the planned implementation because, in principle, the same project results could be achieved also after the changes. Originally, the capacity building of PPSW and ASPPUK were at the centre of the project with linking beneficiary groups to market as case studies for PPSW and ASPPUK. In the actual implementation, SwissContact looked for markets and buyers for the women's groups and organised the training activities; while in the original planning PPSW and ASPPUK were supposed to take the lead on these activities with assistance from SwissContact. Hence, in reality, only the degree of involvement of PPSW and ASPPUK changed, and as a consequence the degree of their capacity development.

**Figure 2: Result chain**

Turning to the project logic presented in Figure 2, as mentioned before, the final objective of the project is to improve the livelihood of female entrepreneurs. At the level of these project beneficiaries, it is expected that the project, on the one hand, creates new market linkages for them (intermediate outcome in original plan, but output of the actual implementation); and on the other hand, it increases their skills in purchasing (inputs), production and marketing (output). The increased skillset of the female entrepreneurs will in turn lead to increased productivity and profits, while the new market opportunities will increase their revenues. Hence, both of these channels contribute to increased incomes to the female entrepreneurs, which will translate into improved livelihoods.

At the institutional level, before the activities affecting the final beneficiaries can take place, the project needs to develop a strategy for achieving its objectives: in the GREEN project this is called the 'joint

vision for growth', which is developed through workshops with key market players (producers, buyers, banks, etc.) and the organisations representing the producers (PPSW and ASPPUK), and which is facilitated by SwissContact.

According to the planning, only after the 'joint vision' or strategy is developed, can the project work on creating new market linkages with the identified market segments (both for raw material and final products) and the entrepreneurs, and conduct workshops on quality and productivity, which will result in the enhanced skillset of the entrepreneurs.

Through the implementation of these project activities, PPSW and ASPPUK will learn how to replicate these results and their capacity to provide business development services to other groups of entrepreneurs will be increased.

# 4. Evaluation questions and outcome variables

## 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. In the baseline report specific evaluations questions were specified. Table 2 shows these five questions and what it implies for this project.

**Table 2: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| 1 | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | 1. How did the skills of female entrepreneurs in the garment sector change?<br>2. Are the small-scale enterprises better linked to the market?<br>3. Do small-scale enterprises have better access to financial services?<br>4. How did the capacity of ASSPUK and PPSW as business development service providers change? |
| 2 | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Are the observed changes above attributable to the intervention? |
| 3 | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>• Does the project address an important issue for the beneficiaries? |
| 4 | Efficiency: Were the development interventions of the Southern partner organisations efficient? | Was the intervention cost effective? |
| 5 | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

We investigate the first 3 evaluation questions with both quantitative and qualitative methods, while the last evaluation question is only addressed in the qualitative study. The next section discusses the indicators used in the quantitative evaluation. The results of the qualitative study are reported in Annex VI.

The evaluation questions are linked to elements of the results chain presented in Figure 2: the output on enhanced skills of entrepreneurs, and the outcomes on new products and market linkages including input, output and financial markets.

The outcomes on increased productivity and profits, and on increased livelihood were not included among the evaluation questions in the baseline report. However, the outcome indicators presented in the next section also take these into account.

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators. These indicators are linked to the first 3 evaluation questions in Table 2, but they mostly correspond to the results chain presented in Figure 2. As a result, the outcome indicators are split up into 6 groups: use of financial instruments; household income and livelihood; skills, time allocation and profit; links to market; volume of traded goods; and food security and vulnerability. Most of these also correspond to uniform indicators specified by the Synthesis team.

Table 2 displays all the outcome indicators used and the scale of these variables. Annex II discusses the construction of these indicators in detail.

**Table 3: Overview of outcome indicators**

| Outcome indicator | Scale (minimum; maximum) |
|---|---|
| **A. Use of financial instruments** | |
| Percentage of households that know a place to borrow | (0%; 100%) |
| Percentage of households that have borrowed in the past 12 months | (0%; 100%) |
| **B. Household income and livelihood** | |
| Total income per month (1000 Rp) | (NM; NM) |
| Housing facilities index | (NM; NM) |
| Asset index | (NM; NM) |
| Overall happiness | (1; 4) |
| Current subjective wealth status | (1; 6) |
| **C. Skills, time allocation and profit** | |
| Nr. of simple patterns | (0; NM) |
| Nr. of figurative patterns | (0; NM) |
| Nr. of *Kanzashi* patterns | (0; NM) |
| Nr. of hours worked per week | (0; NM) |
| Profit per hour (from all activities) | (NM; NM) |

| Outcome indicator | Scale (minimum; maximum) |
|---|---|
| **D. Links To Market** | |
| Percentage of households buying inputs from cooperative/group | (0%; 100%) |
| **E. Volume of traded goods** | |
| Value of Sold Rugs per Month (1000 Rp) | (NM; NM) |
| Percentage of households that have small business | (0%; 100%) |
| Net profits from Small Business Monthly (1000 Rp) | (NM; NM) |
| **F. Food Security and vulnerability** | |
| Nr. Of Months Could Not Cover Living Costs | (0; NM) |
| Nr. Of Months Could Not Enough To Eat | (0; NM) |
| Percentage of households have emergency savings for at least one month | (0%; 100%) |
| Current standard of living: daily needs covered (only for panel respondents) | (1; 3) |
| Current standard of living: food consumption covered (only for panel respondents) | (1; 3) |
| Notes: NM = no minimum/maximum | |

# 5. Data collection

This section describes the survey instruments and the sampling design and outcome.

## 5.1. Survey instruments

We collected three types of data: quantitative, qualitative and financial. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

Structured household surveys were conducted with members of the Melati cooperative and non-member households involved in rug making as livelihood activity. The questionnaire was focused on socio-economic characteristics of the household, the skills of the respondents and their income from different economic activities. The baseline data have been collected in November 2012; while the endline data was collected in August 2014.

### *Qualitative data*

The implementation of the GREEN project and its impact on the beneficiaries has also been evaluated using a qualitative study. Project stakeholders (SwissContact, ASPPUK, PPSW, Melati cooperative and a buyer) were interviewed using in-depth interviews, while participants of the trainings on production (batik and *kanzashi*) were surveyed using focus group discussions. The study took place in September 2013, after all the project activities have been implemented. The results of this study are reported in Annex VI.

### *Financial data*

To collect information about the costs of the GREEN project, we conducted a project cost survey with the project manager and the external consultant responsible for the project implementation on 15 July 2013.

## 5.2. Sampling outcome

The evaluation focuses on the impact of the GREEN project on the direct beneficiaries at the Melati cooperative. At the baseline period, it was not yet clear what activity the GREEN project has or was going to implement with the members of the Melati cooperative. Therefore, we have randomly sampled among the active members of the Melati cooperative and the Anugrah rug making group, and non-member rug makers in the same villages. Before the endline period, we learned about the trainings conducted by the GREEN project and additionally interviewed all project beneficiaries who were members of the cooperative.

The following sub-sections discuss the selection procedure for the survey respondents (sampling design) and the results of its implementation (sampling outcome).

### *Sampling design*

As mentioned above, in the evaluation the members of the Melati cooperative were selected as the beneficiaries of the project. The members of Melati cooperative live in several villages around the cooperative. We selected the two largest villages (in terms of membership) to sample from. From these villages, we randomly sampled 50 cooperative members in total (25 from each). The comparison group was selected from the same two villages: we have randomly sampled them from the doormat/rug makers in these villages who did not join the Melati cooperative. Hence, these non-members could actually be regarded more as indirect beneficiaries of the project, as they could decide to join the cooperative or the project activities or indirectly learn from the project (spillover effects). In addition, doormat/rug making women have self-selected themselves into treatment and comparison groups.

At the endline survey, the same respondents were planned to be re-interviewed. In case the baseline respondent or in her absence the household head or a household member knowledgeable about the rug making activity could not be interviewed (due to refusal, moving out of village or another reason), the household was dropped from the endline survey without replacement.

### *Sampling outcome*

Due to the change in the intervention, the treatment respondents in our sample are not, as was planned, automatically benefit from the GREEN project. Only respondents who participated in the *kanzashi* trainings actually benefit from the project. Melati cooperative provided us with a list of respondents who participated in all *kanzashi* trainings. Only these participants are able to make *kanzashi* according to the management of the Melati cooperative. In addition, the participants of the final training were selected from the 50 participants of the first training who continued making *kanzashi* after the training (see Annex VI).

Table 4 shows the list of participants in the final training sorted by management, non-members, members before baseline, and members after baseline. In total, 14 women participated in the final

training on *kanzashi*, which was conducted in July 2013. According to the Melati cooperative, only one of the 14 women was not actively making *kanzashi* anymore at time of the endline survey. In principle, however, the participants of the trainings could teach other women as well (spillover effects). Note that non-members could also follow the trainings provided by the Melati cooperative.

**Table 4: Number of participants in the final *kanzashi* training**

| Type of participant | Number of participants |
|---|---|
| Management | 2 |
| Non-members | 3 |
| Members before baseline (2012) | 7 |
| Members after baseline (>2012) | 2 |
| **Total** | **14** |
| Source: Administration Melati Cooperative | |

From the 14 women who participated in the final training, and are thus expected to be benefited from the project, we only interviewed 1 respondent at baseline. At the endline, we expanded the sample size to include an additional 5 participants of the final training who were already member at baseline into the sample.[13] The choice to include only those participants in the training was based on methodological reasons; for this group we were able to match endline observations to baseline observations using administrative data from the Melati cooperative regarding bonuses received from the cooperative (only available for members).

Because of the above mentioned change in the project implementation, we present the outcomes of the survey by three groups: 1. Non-members at baseline (2012), the original comparison group; 2. Members of Melati cooperative at baseline (2012), the original treatment group; and 3. Treatment group, the members who participated in all project trainings conducted at Melati cooperative. Table 5 reports the sampling outcome by the three assignment groups. The table shows that all baseline respondents could be re-interviewed at the endline. The total sample size at the endline is 105 respondents including the 5 'treatment' respondents sampled only at the endline.

[13] In additional participant of the final training who was also a member of Melati cooperative already at the baseline could not be interviewed because another member of her household was already interviewed for the baseline survey. The protocol of the sampling did not make it possible to interview more than one household member. In fact, the same person was attempted to be interviewed at the baseline, but was replaced by another respondent because of the same reason.

**Table 5: Sampling outcome**

| Assignment group | Baseline planned | Baseline outcome | Endline outcome | Panel respondents |
|---|---|---|---|---|
| Non-member at baseline | 50 | 50 | 50 | 50 |
| Member at baseline[1] | 50 | 50 | 49 | 49 |
| Treatment | - | - | 6 | 1 |
| **Total** | **100** | **100** | **105** | **100** |

Source: Household survey E5, MFS II Evaluation Indonesia
Notes:
1. One of the respondents in the "member at baseline" group turned out to be a "treatment" respondent. Therefore, this respondent was moved to the "Treatment" row at the endline.

Despite the changes in the planned project beneficiaries, we still report the changes in outcomes for the non-member and the member groups as originally planned to show general trends among the population of potential beneficiaries. However, only the respondents in the third group were expected to benefit directly from the GREEN project. Hence, we discuss the findings for evaluation question 2 regarding the attribution of changes to the GREEN project only for the 6 respondents directly benefitting from the trainings organised by the GREEN project.

# 6. Descriptive statistics

This section summarizes the main characteristics of the three assignment groups using the baseline and endline surveys. Unfortunately, for the actual project beneficiaries (treatment group) we are only able to provide information from the endline survey.

First, the socio-economic characteristics of the sample is summarized, which is followed by discussing the characteristics of the respondents with respect to the rug making activity and their self-reported project exposure measured as participation in hand craft trainings.

## 6.1. Respondent and household characteristics

To provide a better insight into the general characteristics of our sample, Table 6 displays a number of general characteristics of the respondents like gender, age, being a household head and education, while Table 7 describes household characteristics regarding household size, main income source and membership in groups and cooperatives.

The columns of the tables contain a lot of information the different groups and time periods. The first four columns of the table are about the non-member group and the following five columns are about the member group: column 1 and 5 show the mean value of the variables at the baseline for the respective groups, and column 2 and 7 display the mean values at the endline, while column 3 and 8 report on the change between the baseline and endline again for the respective groups. In addition, column 4 and 9 report on the probability that this change is zero (p-value). Hence, for example, if the p-

value is below 0.05 we say that the change in the variable is significantly different from zero at 5% significance level.[14]

Further, column 6 reports whether the baseline value of the member and non-member groups is significantly different from each other indicated by a p-value below 0.05 for 5% significance level.

Only the final column (10) of the table reports on the actual beneficiaries of the project: the endline means are reported for this group which contains only 6 respondents. Statistical comparison of this group to the other groups is omitted because of the small sample size. In general, the sample size of the variables is not reported in the tables but can be inferred from Annex III, which provides the sample size and means of all variables used in the analysis.

Table 6 shows that the average age of the respondents is in their late 30s and early 40s with an average age around 39-41 years depending on the group at the endline. Respondents in the treatment group are almost a year older than the average Melati cooperative member, but on average a bit younger than the comparison group. Overall, there is no significant difference between the ages in the groups.

The respondents are most often not the heads of their household, and the percentage of respondents who indicated to be a household head dropped between the baseline and endline for both group. None of the respondents in the *kanzashi* treatment group are the heads of their households.

Regarding education, most women have at least primary education, with around one third of the respondents in the two membership groups having secondary education, while all *kanzashi* group members have attained a secondary education.

[14] The p-values are calculated using standard errors corrected for heteroskedasticity and clustering at the location level. This means that the standard errors are allowed to have an arbitrary correlation for comparison or treatment respondents in the same village. In other words, we allow respondents in the same village in the same treatment group (comparison or treatment) to be more similar to each other than they are to a different randomly selected respondent in another village from the other treatment group.

P-values are not defined for variables where there was no change.

Looking at household characteristics, Table 7 shows that the average household size is around 4 in the two membership groups, while the *kanzashi* group members have a somewhat larger household with on average 5 members.

Regarding the main source of household income, wage income is the most common income source, followed by non-farm business. The importance of wage income increased over the whole sample to 55-67% at the endline. Agriculture is not an important income source among the surveyed households. Therefore, it is not surprising that very few households have membership in farming groups and cooperatives.

Membership in savings and credit cooperatives is only 20% in the non-member group, while 84% among the members and 100% among the *kanzashi* group at the endline. This finding is not surprising given that Melati cooperative functions as a savings and credit cooperative (and not as a hand-craft cooperative based on the answers of the respondents). Similar figures are observed for membership in a hand-craft group, with the Anugrah rug making group dominating the membership for the respondents in the membership group (see Table 9).

Notes: Robust standard errors corrected for clustering at the village level are used to calculate p-values.
P-values are not defined for variables where there was no change.

Finally, Table 8 reports on doormat/rug making: except for one non-member respondent at the endline, all respondents make rugs both at the baseline and endline.[15] Most women already had 8-10 years of experience in rug-making at the time of the baseline (this question was not asked at the endline). On average, the member group was able to make a larger variety of doormats/rugs compared to non-members. While this activity contributed to about three-quarters of the respondent's income at the baseline, this share has dropped to a value close to half of their income at the endline for both groups. Interestingly, at the endline rug-making still contributed to 63% of the income of the *kanzashi* making group. However, the changes in the incomes of the respondents are discussed in section 7 in more detail.

[15] Note we do not have information in Table 7 about whether the 5 new respondents in the *kanzashi* group made rugs at the baseline. However, they were all members of the Melati cooperative already at the baseline, and based on information from Melati cooperative, they were making rugs already at that time.

## 6.2. Treatment exposure

Next, in Table 9 we investigate the knowledge and participation of the respondents in the activities of Melati cooperative and the Anugrah rug making group, which are the organisations that gave space for the GREEN project's training on *kanzashi* making.

**Table 9: Knowledge, membership and participation in trainings**

Notes: Robust standard errors corrected for clustering at the village level are used to calculate p-values.
P-values are not defined for variables where there was no change.

1. This question was asked with a 12 months recall period at the baseline and a 24 months recall period at the endline.

The table shows that most non-members have heard of Melati cooperative (70% at endline), and that some of the non-members became members of both the cooperative (16%) and rug making group (18%) between the baseline and the endline, while the membership among the membership group is very high in both groups, with all respondents being members of at least one of the two organisations. Further, 29% of the non-member and 78% of the membership group buys raw material for making the doormats/rugs from Melati cooperative.

Regarding trainings, most of the non-member respondents did not receive any trainings related to rug-making or *kanzashi* making, while 57% of the membership group reported to have participated in at least one training on rug-making between the baseline and endline periods. Most of these trainings

were related to the design of the rugs (91% at baseline and 61% at endline in the membership group) and financial literacy (52% and 25%). However, some of the respondents also mentioned trainings focusing on learning to make other crafts (24% and 29%). At the endline survey, *kanzashi* making was explicitly included as a response category, and 43% of the respondents who participated in any trainings indicated this as a topic of the trainings. Hence, in total 14 respondents in the two membership groups[16] and the 6 respondents in the *kanzashi* treatment group participated in trainings on *kanzashi* making, most likely organised by the GREEN project.

# 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured between the base- and endline survey (2012-2014) are grouped into 6 categories: use of financial instruments; household income and livelihood; skills, time allocation and profit; links to market; volume of traded goods; and food security and vulnerability.

Table 10 displays the results for all outcome indicators. The table is organised similarly to the table on the respondent characteristics (Table 6), except that the significance of the difference between the membership groups at baseline (P(1v5) in Table 6) is not reported. However, below the means of the indicators, the standard error is reported in brackets.

The following paragraphs discuss the levels and changes in the outcome indicators in order.

### *Use of financial instruments*

We have asked households whether they know a place to borrow money and whether they have borrowed in the past 12 months. Table 10 shows that almost all households know a place to borrow money (no change at endline). Borrowing has increased in the non-member group (from 32% to 40%) but decreased in the member group (from 69% to 55%). None of these changes are significant though. The different patterns could be explained by the fact that most of the respondents in the member group are members of a saving and credit cooperative (Melati cooperative). It is possible that some respondents joined the cooperative in order to borrow or, in general, these members have easier access to credit when needed. Table 9 showed that some of the non-member respondents have joined Melati cooperative by the endline. Hence, it is possible that these respondents have taken loans at Melati cooperative. Table 15 in Annex V confirms this claim: the percentage of households in the non-member group that took their loan from a cooperative increased from 25% to 50%, while loans from banks lost from their share (from 56% at baseline to 20% at endline). In general, households at the endline were about twice as likely to borrow from a cooperative as from a bank (Table 15). Finally, borrowing was the most common in the treatment group: two thirds of these households have taken loans in the past 12 months.

[16] The 14 respondents are calculated based on 50x6%x67%= 2 respondents in the non-membership group and 49x57%x43%=12 respondents in the membership group.

### *Household income and livelihood*

The income of the respondents in both membership groups increased in real terms[17] between the baseline and endline on average, albeit the change is not significantly different from zero. However, Table 17 in Annex V shows that the share of income from rug/doormat making has significantly decreased in the composition of the respondents' income: from 78% to 57% in the non-member group, and from 76% to 55% in the member group. At the same time, the share of wage income has increased by 12-15 percentage points on average, and at the endline it constituted almost one third of the respondents' income.

Table 17 also highlights that the composition of income is similar between the membership groups (55-57% from rug making and 31-32% from wage, 4-8% from own business and 6-7% from crop and livestock), but different compared to the treatment group. Women involved in *kanzashi* making make most of their living as handcraft entrepreneurs: rug making (63%) and *kanzashi* making (22%). Only 7% of their income comes from wage income compared to 31-32% for the other groups. This clearly suggests a selectivity effect: women who are not able to get a wage contract prefer to make *kanzashi*. This hypothesis is supported by the finding in Table 16, which shows that wage employment offers the highest profit per hour for the respondents.

However, turning to the values of the respondents' total income (Table 10), we observe that while the average income was lower in the member group compared to non-members at the baseline, at the endline the average income of the member group is higher (not significant). In addition, respondents in the treatment group have the highest income on average. This finding seems to contradict that these respondents pursue activities with lower profitability than the other groups (rug making and *kanzashi* making compared to rug making and wage employment) as discussed above. However, the higher income is a result of more working hours per week (Table 10).

The wealth indicators reported in Table 10 verify that the livelihood of households increased during the evaluation period: both the housing conditions and household assets have significantly increased. These indicators are standardized to zero for the average Indonesian household.[18] Hence, the table shows that at the baseline the sampled households were on average slightly poorer than the average Indonesian household in terms of their asset holdings.[19] In terms of overall happiness and the current subjective wealth status, the respondents place themselves in the middle of the scale. Only the member group reports that their current wealth status has increased over the evaluation period.

Finally, the wealth indicators also verify that households in the treatment group are better off compared to the other groups at the endline. However, we do not have information on these households for the baseline, and we cannot determine whether their situation has improved the most since the baseline or their initial wealth status was already higher at the baseline.

---

[17] Monthly income for the respondents is reported in 2012 prices. Prices at the endline are deflated by the CPI index for 2012 at 4.3% and for 2013 at 8.38% (total of 13.04%).

[18] The asset index is standardized to zero for the average Indonesian household in 2012 based on the DHS 2012 survey. The housing facilities index is standardized to zero for the average Indonesian household based on the IFLS 2007 survey. See Annex II for further details.

[19] The housing facilities index is based on 2007 data. Therefore, it is possible that also for that indicator the respondents' households were below the Indonesian average.

### *Skills, time allocation and profit*

We do not observe substantial changes in the rug making skills of the respondents based on the number of patterns they can make. Overall, the member group can make one complicated pattern more compared to the non-member group. In terms of the number of doormat patterns, the treatment group is more similar to the non-member group. However, the *kanzashi* treatment respondents have learned to make two types of *kanzashi* patterns due to the training.

Regarding the time allocation, there is also no substantial change in the number of hours worked per week: women in the non-member and member groups work on average between 52-56 hours per week. Table 19 in Annex V shows the average number of hours worked per week by activity type, while Table 17 shows the average share of these activities in the time allocation of the respondents. The tables show that while the number of hours spent on rug making has increased, its share in the time allocation of women has decreased. Hence, those women have worked more on rug making who have already worked longer working hours.

The treatment group has the highest number of hours worked per week is at 72 hours per week at the endline. These women spend 66% of their time on rug making, and only 24% on *kanzashi* making. As mentioned before, the higher income for these women is a consequence of the long working hours they make.

Taking into account the working hours of the women, Table 10 also reports on the hourly profit the respondents obtain from all their livelihood activities combined. The hourly profits in 2012 prices have increased by 27% in both the non-member and member groups (not significant). Again, the treatment group reports the highest profit rate. Table 16 shows that the *kanzashi* making women obtain similar profits from rug making (3,640 Rp/hour) and rug making (3,753 Rp/hour). But most women report lower profit rates for rug making (2,150 Rp in the non-member group and 3,001 Rp in the member group) on average at the endline. The highest hourly rates are obtained from wage employment with on average 6,579 Rp per hour (Annex III). However, wage employment appears to be scarce and it accounts for only about one fifth of the time spent working.

### *Links to market*

Most women obtain their inputs for rug/doormat making from the Melati cooperative. This is also true for some of the non-member women (30% at baseline and 46% at endline). These results cannot be related to the GREEN project activities.

### *Volume of traded goods*

The value of the doormats/rugs sold has decreased by 30% in the non-member group, while it increased in the member group by 82%. However, the *kanzashi* treatment craftswomen received the highest revenue from doormats, which follows from their specialization on handcrafts and the amount of time spent on making doormats/rugs.

The table also shows that more of the respondents started up a small business during the evaluation period. However, the contribution of this activity to the incomes of the women is not substantial.

These results are also not related to the GREEN project activities.

### *Food security and vulnerability*

The food security situation of the surveyed households has not changed substantially during the evaluation period. About half of the sampled women encountered periods during the year when they could not cover their living costs, but most households did not encounter situations when they had not enough to eat. Again, the situation for the treatment households is better than for the other groups. These women work hard to improve the livelihood of their households.

Notes: Standard errors given in parentheses. Robust standard errors corrected for clustering at the village level are used to calculate p-values. P-values are not defined for variables where there was no change.

1. Prices are reported in 2012 real prices. Prices at the endline are deflated by the CPI for 2012 at 4.3% and for 2013 at 8.38% (total of 13.04%). Source: http://www.bps.go.id/eng/aboutus.php?inflasi=1

# 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

## 8.1. Methodology

In the baseline report we described that we want to analyse the impact (attribution) of the GREEN project on craftswomen making doormats/rugs using difference-in-differences methodology. However,

at the endline we learned that only one respondent in from the baseline survey has actually followed all the activities organised by the GREEN project at the Melati cooperative.

Therefore, we had to adjust our evaluation methodology: we sampled additional project beneficiaries at the endline. Because no baseline data is available for these beneficiaries, we use cross-sectional regressions using data from the endline survey. Hence, we are not able to use fixed effects to control for observed and unobserved respondent characteristics that are constant over time (as done in a difference-in-difference analysis). Controlling for respondent- and household-specific characteristics is important in a cross-sectional analysis, where differences in the distribution of the characteristics of treatment and comparison groups can drive observed differences in the outcome variables. Therefore, we use observable characteristics of the interviewed women (for example, the age and education) as control variables in the regression analysis.

Using regression analysis, we estimate the Average Treatment Effect on the Treated (ATET). The ATET is calculated by comparing the outcome variables of respondents participating in the *kanzashi* trainings organised by the GREEN project (treatment) to respondents who did not participate in the GREEN project. Hence, we estimate the following regression equation using the endline data:

(1) $$y_i = \alpha + \beta GREEN_i + \gamma X_i + u_i,$$

Where $y_i$ denotes the outcome indicator for respondent $i$, $X_i$ represents the group of control variables, $\alpha$ is the mean of the reference group and $u_i$ is the error term. Most importantly, $GREEN_i$ is a binary indicator which has value 1 if the respondent $i$ participated in the trainings organised by GREEN and 0 otherwise; and $\beta$ is the coefficient measuring the treatment effect of the GREEN project on the beneficiaries (ATET).

As mentioned above, due to the use of cross sectional data, controlling for confounders in the regression analysis is important. Confounding variables are selected based on three criteria: (1) the distribution of the variable is significantly different between the comparison and treatment students; and (2) the variable is not influenced by factors influencing the outcome (predetermined);[20] and (3) the outcome indicator is influenced by the variable. Using these criteria, we control for the age and education of the respondents and the main income source of the household in the regressions (Column 2 in Table 11). In addition, in a second set of regressions we also control for the membership of the respondents in saving and credit groups, saving and credit cooperatives and handcraft groups to capture the selectivity of the respondents in participating in the *kanzashi* making activities (Column 3 in Table 11).

## 8.2. Results

The regression results are reported in Table 11 following the same groups of outcome indicators as in the previous section (Table 10). The table reports the coefficient estimates for the treatment effect ($\beta$) for each outcome indicator. The standard error of the estimates is reported in brackets below the coefficient estimates. The significance of the estimates is denoted by stars: one star indicates that the

[20] The second condition is important for the selection of valid control variables because the intervention has started already before the baseline data was collected.

treatment estimate is significant at 10% significance level (p<0.1), two stars indicate a significance level of 5% (p<0.05), and three stars indicate a significance level of 1% (p<0.01).

Below, we discuss the GREEN project's effect on these outcome indicator groups in turn.

### *Use of financial instruments*

The *kanzashi* treatment households were on average more likely to borrow during the past 12 months by 21 percentage points. However, controlling for membership in saving and credit groups (column 3), the difference is not significantly different from zero.

We could imagine that starting up with the *kanzashi* making activity needs initial investments. However, given that the respondents already were making doormats, this investment appears to be small and cannot explain the higher percentage of borrowing in the treatment group. Hence, we conclude that the differences are not driven by the GREEN project.

### *Household income and livelihood*

On average, the *kanzashi* treatment group members obtain 19% higher incomes. However, this impact is not significantly different from zero. Overall, there is no indication that the project has significantly increased the livelihood of the beneficiaries.

### *Skills, time allocation and profit*

Due to the GREEN project, participating craftswomen learned to make brooches using *kanzashi* technique, and they are now able to make two different patterns on average.

The *kanzashi* craftswomen also work 27 hours longer per week than the comparison group (48%) but this result is not significantly different from zero due to the high variation of working hours observed in the comparison group. Unfortunately, we do not have information whether the longer working hours are due to the new livelihood activity promoted by the project, or these women have already worked longer hours in other activities prior to the project.

However, the qualitative data presented in Annex VI indicates that the craftswomen find *kanzashi* making a less demanding activity (that is even possible to make in front of the TV) than rug making. This finding could suggest that the craftswomen spend extra working hours making *kanzashi* compared to before the training.

### *Links to market*

The GREEN project did not contribute to linking the women to input markets because the craftswomen already had a source of raw material from the Melati cooperative. The qualitative study (Annex VI) indicates that the marketing of the *kanzashi* is still challenging, and the craftswomen mostly sell the *kanzashi* brooches through their own network. Melati cooperative also provides a marketing channel through providing space for the *kanzashi* products at exhibitions and markets.

Hence, the GREEN project did not contribute much to linking the craftswomen to market at the Melati cooperative. Based on the qualitative report, GREEN has worked on linking craftswomen to output markets at the other training locations (batik craftswomen in Sukohardjo and *kanzashi* craftswomen at Tambora). However, these attempts were also not fully successful partially due to capacity problems of the craftswomen entrepreneurs.

### *Volume of traded goods*

Unfortunately, we do not have good measures of the project's effect on the volume of traded goods. The outcome indicators reported cannot be linked to the GREEN project.

### *Food security and vulnerability*

Given the limited impact of the project on the livelihood of the craftswomen, it is not very surprising that we do not find any impact of the project on the food security situation of the project participants.

1. Controls included in regressions are the education and age of the respondent and the main income source of the household.
2. Controls included in the regression are the same as under 1. In addition, we also control for the respondent's membership in a saving and credit cooperative, in a saving and credit group and in a handicraft group (separately).
3. Prices are reported in 2012 real prices. Prices at the endline are deflated by the CPI for 2012 at 4.3% and for 2013 at 8.38% (total of 13.04%). Source: http://www.bps.go.id/eng/aboutus.php?inflasi=1

# 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular, we look at the size of the impact, and whether the project addresses an important issue for the project beneficiaries, whom we defined as the participants of the handcraft trainings organised by the project.

## 9.1. The size of the impact

In the evaluated project area, only 12 of 47 (49 participants – 2 management) participants of the *kanzashi* training at the Melati cooperative continued to produce *kanzashi* as a livelihood activity after

the trainings. In addition, except for one beneficiary, all of them produce *kanzashi* only as a side activity, while still retaining their other economic activities, including their main activity of doormat/rug making.

The results of the focus group discussions with the batik craftswomen participating in the GREEN project indicates that the women have partially adopted the new techniques learned, but it did not have an impact on their earnings.

Hence, the GREEN project only had a minor impact on the livelihood of the craftswomen.

### 9.2. Does the project address an important issue for the beneficiaries?

At the level of the craftswomen, the project increases the skills of the craftswomen in terms of production and product design, which are useful for these female entrepreneurs but not all of them ended up adopting the new skills in their livelihood activities (see above). In addition, all project participants already had a livelihood activity prior to the project that they kept as their main activity also after the project. These data seem to suggest that the project did not address an urgent issue for the beneficiaries.

On the other hand, the project could indirectly address an important issue for the beneficiaries through increasing the capacity of the craftswomen's associations in providing business development services for them in the future.

## 10. Evaluation question 4: Efficiency of project

This subsection will answer evaluation question 4: Were the development interventions of the Southern partner organisations efficient? To answer this question we will describe the cost effectiveness of the programme. First, the calculation of cost per beneficiary is discussed. Second, these costs are compared to the project effects per beneficiary. Finally, the findings on cost effectiveness are compared to achievements of similar projects.

### 10.1. Costs per beneficiary

A first step to estimate the cost effectiveness of the programme is to calculate the project cost per beneficiary. We conducted a structured interview with the project manager and the external consultant responsible for the project implementation[21] on 15 July 2013 using the 'budget survey' as described in section 0. In addition, we used the annual financial reports and progress reports of the project to Hivos to complete the information reported in this section. Hence, the cost figures are based on the actual costs reported by SwissContact.

Table 12 summarizes the collected financial information for years 2011-2013, and reports the estimate of the costs per beneficiary for 2013, when the training activities for direct beneficiaries have taken place.

[21] `The interview was conducted with Aldi Surianingrat, external consultant leading the project implementation (and deputy executive director of SwissContact Indonesia until December 2011), and Dedi P Hutahaean, project manager at SwissContact Indonesia.

The yearly total project costs are calculated based on the detailed expenditure data indicating the financial accounting date of the costs. The financial report provides information for a 12 or 13 months period starting in June/July.[22] The total costs of the project between June 2011 and October 2013 were 1,555,451,773 Indonesian rupiahs (or 116,412 EUR using yearly average exchange rate).[23] This amount is 82% of the approved budget of 141,263 EUR (or 1,695,150,000 IDR).[24,25]

From the total project budget, Hivos funded 1,295,150,000 IDR (or 107,929 EUR) for the costs of SwissContact, or 76% of the budget. The remaining project budget is funded by ASPPUK and Melati cooperative, and these it is used for the expenses of field officers and transportation costs.

Based on the cost information of SwissContact until June 2013, the majority of costs incurred by SwissContact (and funded by Hivos) cover personnel costs (70%) and administration costs (13%). The activity related costs are the costs of meetings with project stakeholders for the capacity building of PPSW and ASPPUK (7%), costs of activities related to product development (4%) and travel related project costs (6%).

Hence, only part of the total costs is directly related to activities attended by direct beneficiaries. These are the product development costs (workshop costs), part of the travel costs and fees for the external consultant giving the trainings (accounted under the capacity building costs). We calculated these costs by selecting the cost items related to the workshops (by date and name of consultant and project manager who gave the trainings). The total workshop related costs amount to 259,058,865 IDR (or 18,606.54 EUR) in 2013 (as reported in column 5 of Table 12). This is 17% of the total project costs. However, the costs incurred by ASPPUK and Melati cooperative are not included in these figures. In addition, the calculated costs include only directly related project costs and exclude the share of personnel (fees of the project manager) and administration costs.

[22] This allocation of costs between the years may be not completely accurate if the fees for staff are accounted in the end of the reporting period for the full reporting period.

[23] Unfortunately, we do not have information about the exchange rate used for the project. Instead we use the annual average exchange rate from http://www.oanda.com/currency/historical-rates/. The exchange rates used are 12,264 IDR/EUR in 2011, 12,087 IDR/EUR in 2012 and 13,923 IDR/EUR in 2013.

[24] Source: correspondence with Hivos project officer Miranda Rustam. The exchange rate used is 12,000 IDR/EUR.

[25] The project budget in euros is used to calculate the percentage of budget spent due to the exchange rate fluctuations of the Indonesian rupiahs to euros.

**Table 12: Overview of the costs and number of beneficiaries**

| Year | Number of months[1] | Total costs [IDR] | Total costs [EUR, current prices][2] | Costs of workshops [IDR] | Percentage of costs funded by CFA (through MFS II) | Number of direct beneficiaries | Cost per beneficiary per year [Int$ 2011][3] |
|---|---|---|---|---|---|---|---|
| **2011** | 7 | 156,089,768 | 12,727 | - | 62% | - | - |
| **2012** | 12 | 291,265,896 | 24,097 | - | 77% | - | - |
| **2013** | 10 | 1,108,096,109 | 79,587 | 259,058,865 | 92% | 125 | 562.8 |
| **Total** | **29** | **1,555,451,773** | **116,412** | **259,058,865** | **86%** | **125** | **562.8** |

Sources: 1st and 2nd Annual Financial Report to Hivos and Progress Report May-October 2013.
Notes:
1. Number of months covered in the financial report.
2. Annual average exchange rate is used. Data is obtained from http://www.oanda.com/currency/historical-rates/
3. PPP conversion factor to 2011 international dollars is calculated using the World Development Indicators: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#.

The table also reports on the unit cost of the project. The unit of the project could be considered as the number of participants benefiting from the trainings. Based on project information, there are 125 such beneficiaries (column 7 in Table 12). Table 12 reports on the cost per beneficiary in International dollars (Int$). International dollars at 2011 prices[26] are used for the cost per unit calculation because it takes both purchasing power parity and inflation into account that would not be the case if we reported the unit costs in euros. Hence, using Int$, the costs can easily be compared across time and countries.

Column 8 in Table 12 reports that the costs per direct beneficiary amount to 2,072,471 IDR or 562.8 Int$ per beneficiary. This number is calculated for the workshops on average. In fact, 3 separate workshops have been organised with 3 groups of beneficiaries at 3 different locations. However, the total number of days attended by beneficiaries is similar among the workshops for the reporting period (Febr-June 2013) as can be seen in Table 1 (101 days in Tambora, 100 days in Sukohardjo and 90 days in Ungaran).

## 10.2. Cost-benefit

As the next step, the unit costs of the project are compared to the benefits derived from the GREEN project.

Unfortunately, our measures of the project's benefits are not very precise due to the small size of the female entrepreneurs reached by the project in the selected study area. However, both the qualitative and the available quantitative data suggest that the project was successful in increasing the skillset of the participants. However, this did not significantly impact the livelihood of the beneficiaries. It is

[26] The following exchange rates are used based on PPP conversion factor using the World Development Indicators: 3,606.57 IDR/Int$ in 2011, 3,636.38 IDR/Int$ in 2012, 3,682.25 IDR/Int$ in 2013 and 4,530.90 IDR/Int$ in 2014. Source: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#

difficult to say whether the present value of the total benefits from the project outweigh the costs of the trainings.

It is even more difficult to infer the monetary value of project's benefits on the female entrepreneurs' associations (ASPPUK and PPSW). This task is beyond the scope of this report.

### 10.3. Cost effectiveness

Unfortunately, we are not able to compare the costs of trainings in the GREEN project to the costs and benefits of similar projects. Based on Lyby (2001) the Synthesis team (2014) report the unit cost of trainings on handicrafts (needlework) to be between 27.66 Int$ per person in the context of providing the trainings in a refugee camp in Tanzania with a low budget.

However, we cannot consider these costs as representative for Indonesia, and for the GREEN project in particular, as the GREEN project comprehensive strategy for increasing the livelihood of entrepreneurs (linking entrepreneurs to markets) is certainly more costly.

## 11. Contribution of Capacity Development and Civil Society

SwissContact was not selected for the evaluation of capacity development of the SPO and civil society strengthening.

## 12. Conclusion

The GREEN project does not serve as an ideal case study for the evaluation of the effectives of projects aimed at poverty alleviation at the final beneficiary (households) level. Firstly, the GREEN project intended to primarily build the capacity of associations providing assistance to female entrepreneurs in terms of their business development assistance. Hence, the main focus of the project was not on the final beneficiaries in the short term.

Secondly, providing business development services means to link a group of entrepreneurs to the market demand and assisting them in obtaining the raw materials, making attractive designs, increasing their skills of production and marketing, etc. This activity is likely to be implemented at a small scale, as the number of planned training participants (25-50) also showed, due to the scale of the organisations.

Third, the timing of the evaluation was also misaligned, as it happened before the actual project participants have been identified.

With these considerations in mind, the quantities evaluation was complemented with a qualitative evaluation. Both surveys support the findings that (1) the trainings provided interesting new skills for the participants (*kanzashi* and batik techniques); (2) the uptake of these trainings in the daily livelihood activities of the participants was low: only 25% of the participants of the first training on *kanzashi* technique at the Melati cooperative decided to make use of the acquired skills in their livelihood activities as a part-time activity, taking up on average 24% of their working time; and (3) the project did not have a significant effect on the profits and earnings of the project participants.

These results cannot be put into perspective since similar projects have not been evaluated in the literature (yet). One possible explanation for the lack of impact of profits and earnings for the GREEN project could be the length of the trainings. Compared to the trainings evaluated in the literature the trainings of the GREEN project were very short.

Moreover, all project beneficiaries already had other livelihood activities. Hence, it is a matter of preference how they allocate their working hours among different activities. Given that *kanzashi*s do not result in a higher profit for the women, the project was unlikely to result in a livelihood impact for the beneficiaries. However, on the positive side, participants of the *kanzashi* trainings have a greater flexibility in pursuing livelihood activities that they like or find convenient.

Finally, the MFS synthesis team asked to score each project along a few indicators. Table 13 displays the indicators and the scores we deemed valid for the project.

**Table 13: Overall project scoring**

| Statement | Score | Comments |
|---|---|---|
| **1. The project was well designed** | 8 | The project incorporated an earlier successful project of SwissContact with its objective to build the capacity of longer time HIVOS beneficiary organisation. The idea was based on making the results sustainable and possible to replicate in other areas. |
| **2. The project was implemented as designed** | 6 | There have been some challenges in the implementation: the implementing staff at SwissContact changed, and the progress with ASPPUK and PPSW was slow in carrying out the project, which has led to the adjustment of the implementation. |
| **3. The project reached all its objectives** | 6 | The project reached less direct beneficiaries than planned and had only a limited impact on their livelihoods.<br>In addition, at the level of PPSW and ASPPUK, they have not yet shown their abilities in carrying BDS activities. |
| **4. The observed results are attributable to the project interventions** | 7 | The livelihood of most respondents has increased during the evaluation period independent of the project. |
| **5. The observed results are relevant to the project beneficiaries** | 8 | Based on the take up rate of the beneficiaries, the projects activities were only directly relevant for a fraction of the beneficiaries.<br>However, the techniques learned during the trainings covered relevant skills for the beneficiaries. |
| **6. The project was implemented in the most efficient way** | - | We are not able to compare this project to similar projects. |

Notes: Scores are on a scale of 1 to 10, with 1 being “no agreement at all” and 10 being “completely agree with statement”.

# Annex I. SPO and project description

### *Swiss Contact*

SwissContact (SC) is an international development organisation with its head office in Switzerland. SC focuses on the development of small enterprises in developing countries.[27] In the 1960s, SwissContact built up the first vocational training projects in Africa, Asia and Latin America. Later, in the 1980s, it developed the first small and medium-sized enterprises (SMEs) support concepts, as there was a great need in this domain, especially for graduates from vocational schools. SMEs find it very difficult to get inexpensive operational and investment loans, which is why programmes were developed to help overcome these problems. As regards environmental protection, SwissContact has mainly been involved in developing methods to combat air pollution. SwissContact specialises in project management, focusing now on Vocational Education and Training, SME Promotion, Financial Services and Resource Efficiency. SC has been working in Indonesia for over 30 years. SC has its country office in Jakarta, and a field office in NTT.

### *PPSW*[28]

PPSW is the Indonesian abbreviation of Women's Association for Resource Development Centre, which is a women's Non-Governmental Organisation (NGO) assisting and developing women's groups since its establishment in 1986. Currently, more than 14,000 people joined in 457 groups that are distributed over 6-Provinces: DKI Jakarta, Banten, West Java, West Kalimantan, Riau and Aceh. PPSW's main objective is the empowerment of women, especially those in the lowest socio-economic strata of society. Hivos works together with PPSW in improving professionalism of microfinance programmes in Jakarta, West Java and Banten provinces. Besides providing assistance in microfinance, PPSW also provides assistance in economic activities of women groups.

### *ASPPUK*[29]

ASPPUK is the Indonesian abbreviation of Women's Association of Small Enterprises, which is a network of NGOs which work towards the empowerment of women's small micro enterprises. Women groups in each district are usually assisted by a local NGO. Hivos has worked together with ASPPUK in Central Java since the end of 2005.

### *Melati cooperative*[30]

The Melati cooperative is a women's cooperative located in the Prinagpus area. The cooperative was established in 1999 and currently has 600 members. With the assistance of ASSPUK, a local NGO that works in the area, the turnover of this savings and loan cooperative is more than IDR 60 million. 90% of the cooperative members are craftspeople specialised in house appliances such as mats, table cloths and other products based on garment production waste. The Cooperative board has is considering to

[29] See above.
[30] See above.

expand its business by increasing the number of members, develop new products, and improve the quality - quantity and the market channel.

### *Project result chain*

Below the GREEN project is described in terms of the planned project activities, outputs and outcomes.

**Activities**

The project consists of three types of activities.

First, development and implementation of a joint vision for growth by stakeholders, which includes the following activities:

- Identifying actors/players in the sector.
- Establishing local forum to provide enterprises with access to information and dialogue.
- Organising workshops on developing a joint vision to improving dialogue among players in the area, and establish and document a road map and strategy.

Second, enhancing skills related to purchasing, production and marketing of micro-enterprises through the following activities:

- Organising field visits to improve market linkages, business productivity and quality and access to business information and facilities.
- Organising training session to improve market linkages, business productivity and quality and access to business information and facilities.
- Organising coaching sessions to improve market linkages, business productivity and quality and access to business information and facilities.
- Providing access to raw material supplies.

Third, capacity building for business support by organising activities which grant the garment sector access to key services. This is supported by the following activities:

- Promoting and improving access to business services related to quality improvement and market access.
- Promoting and improving access to financial services.
- Improving access to public services.

**Outputs**

Based on the abovementioned activities, the project has the following three outputs:

- Joint vision for growth is developed for the garment sector in the selected project areas
- Skills of micro-enterprises are enhanced in the areas of purchasing, production and marketing.
- Capacity of micro-enterprise umbrella organisations (ASSPUK and PPSW) is developed into becoming BDS providers.

**Outcomes**[31]

As a result of abovementioned activities, micro-enterprises in selected areas are more competitive through improved supply, improved market linkage and improved productivity and product quality. As a result:

- Enterprises profit increase by 15% per annum.
- Increase productivity increase by 20%.
- New market linkages established.
- Increase in new products developed.

These will lead to the improvement of livelihoods of the female micro-entrepreneurs, due to increases in incomes and creation of new jobs.

### *Project implementation*

The project implementation is described in detail in Annex VI. For the evaluation, we are interested in the workshops organised for the direct beneficiaries. Therefore, below we only summarize data about these workshops.

The workshop were organised in 3 locations:

- Sukoharjo (ASSPUK):
  - 1st training on batik coloring on t-shirt material for 50 batik women entrepreneurs in Sukoharjo and Bantul. (2 days in May 2013)
  - 2nd training on batik coloring for 25 batik women entrepreneurs who have implemented skills possessed from the first training. (2 days in July 2013)
- Ungaran (Melati cooperative):
  - 1st Training on brooch making using *Kanzashi* techniques for 45 floor mat women entrepreneurs of Melati Cooperatives in Ungaran. (2 days in June)
  - Enhancement training on brooch making using *Kanzashi* techniques for 15 women entrepreneurs of Melati Cooperatives who have produced brooch after participating in the first training. (2 days in July 2013)
- Tambora (PPSW):
  - Training on brooch making using *Kanzashi* techniques for the Sahabat Wanita Cooperatives (12 days in February-May 2013)

[31] SwissContact-Access project (2011).

# Annex II. Overview outcome indicators and indices

This annex provides a detailed description about the used outcome indicators. In addition, it discusses the variables which were used to construct the outcome indicator indices. Please note that some of the indicators are constructed as indices from multiple questions. In the main text of the report, only the indices are reported for such indicators.

Outcome variables for the project were collected at household level. The outcomes are reported for treatment and comparison households for the baseline and the endline surveys. The sample size can differ among outcome variables because the answers 'don't know' and `refused' are changed to a missing value or because a respondent could skip a question if he/she had no knowledge about what was asked (answered 'no' to a previous question). 'Don't know' responses were also changed to missing if the question had a scale of responses (for example from 1-4). However, if we were interested in the percentage of the households that answered 'yes' to a certain question, it made sense to change the 'don't know' answers to 'no'. All binary (dummy) variables were recoded so that 'No' is 0 and 'Yes' is 100[32]. The mean and total sample size of the indicators is reported in Annex III.
The outcome variables are discussed below one by one.

***Access to (micro) credit, financial services (uniform indicator)***

- *Access*
  - *Households that know a place to borrow money*: In section JK (Use of Financial Services) of the questionnaire it was asked whether the respondent or any other household member know of a place where they can borrow money. The question has 3 answer categories: "Yes", "No" and "Don't Know". In order to generate dummy variable "Don't know" answers were recoded to "No".
- *Borrowing*
  - *Households that have borrowed in the past 12 months*: All information in order to construct the dummy variable was taken from question *jk13* for all households which replied that were successful in securing a loan in the past 12 months. Answer categories `don't know' were replaced by "No".

***Income and livelihood (uniform indicator)***

- *Respondent Income*
  - *Total income per month (1000 Rp)*: The questionnaire includes separate sub sections for income generated from: a. Rug-making, b. *Kanzashi* making (only in endline), c. Other Income Sources (Crops & Livestock, Wages, Own business). The total income variable is created by the sum of income generated by the different income sources mentioned above. Among these, total rug-making income is calculated by multiplying the total amount of patterns created (*rm20*) with the amount received for each pattern (*rm21*). The price is the mean price of each pattern for each separate treatment group

[32] 100 is used instead of 1 in order to report the dummy variables in percentages

(1.Member at baseline, 2. Non-member at baseline, 3. Treatment). The questionnaire captures also input costs for each piece of pattern (*rm22*), the sum of whom is subtracted from the value of the rugs sold; hence the total rug-making income is reported as net income. The total *Kanzashi*-making income is created by multiplying the total amount of patterns created (*km20*) with the amount received for each pattern (*km21*). Total crop&livestock income, total wage income and total own-business income derive from section IS (Other income sources and time allocation) of the questionnaire. Total crop&livestock income is calculated by multiplying the household's net profit (*is06*) with the share of the respondent's working hours *(is02/is02+is04)* as we want to capture the income on a respondent level. Moreover, total wage income derives from question *is09* where the respondent is asked to provide the total income from working for a wage. Total income from own business is calculated by multiplying the household's net profit (*is015*) with the share of the respondent's working hours *(is12/is12+is14)* as we want to capture the income on a respondent level. Furthermore, the total income is divided by 3 (months) in order to report in monthly values. Finally, the total income per month is divided by 1000 as to report in 1000 Rupiah.

- *Asset holdings of households*
  - *Housing facilities index:* In order, that the housing facilities index in the MFS II projects have a meaningful interpretation, we calculate weights for the index components based on their predictive power for household expenditure. The weights are calculated using a population representative survey for Indonesia using regression analysis. We use the IFLS 2007 survey as a population representative sample. From the IFLS 2007 dataset we use aggregate expenditure data, asset ownership and sampling weights. As the aggregate expenditure variable the data analysis uses the logarithm of the monthly per capita expenditure (*lnpce*). The sampling weight used is the cross-sectional sampling weight adjusted for attrition. This weight should be representative of all households living in the IFLS provinces in Indonesia in 2007. Based on the KR section of the IFLS survey, we construct the housing variables that are the same in IFLS and the MFS II surveys. The variables used from the KR section of the MFS II surveys which are also the found in IFLS are: a. *kr01*, b. *kr02*, c. *kr04*, d. *kr07*, e. *kr10* and h. *kr13*. The corresponding variables in IFLS are: a. *kr03,* b. *kr13*, c. *kr16*, d. *kr20*, e. *kr11* and h. *kr24.* There are more variables which are the same between E6 and IFLS, however we wanted to construct a housing facilities asset variable which can be used by all MFS II surveys, thus the variables mentioned above are selected as they are common in most MFS II surveys. The first step is to recode the variables of MFS II surveys in order to have matching answer categories with the variables of IFLS; the same procedure is also followed for the IFLS variables. In addition, as the variable names are not the same among the two datasets, in the IFLS dataset we renamed the common variables as to have the same name with the MFS II variables. After, the aforementioned preparation the two datasets are combined into one dataset. Furthermore, dummy variables are created based on the answer categories of the chosen common variables. The reason behind the construction

of the categorical dummy variables is to include them in the regression of the logarithm of the monthly per capita expenditure on the housing dummies. Nevertheless, not all of the categorical dummies are used in the regression model. The regression does not include dummy variables whose variation is higher than 97% of the sample or lower than 3% of the sample. Moreover, after we performed the regression the next step was to calculate the fitted values by predicting the expenditure based on housing facilities for both the IFLS and MFS II sample. Finally, the last step was to rescale the predicted variable in order to have a zero mean for the IFLS sample by subtracting the mean of the fitted value from the fitted value itself.

Hence, we will be able to infer the livelihood of our survey participants compared to the Indonesian average in 2007: for example, if the value of the index is 0.10 (-0.10), on average, it implies that the sample is approximately 10% better off (worse off) than the average Indonesian household in 2007 based on the predictive power of housing facilities (like drinking water source) on household expenditure.

- *Asset index:* The construction of the asset index follows a similar procedure with the creation of the housing index, however in this case instead of the IFLS dataset the DHS 2012 dataset was used, as DHS includes more common asset variables with the MFS II surveys than the IFLS. Moreover, asset variables were chosen from the KR section of the MFS II surveys which are common with DHS variables. From MFS II dataset questions a. kr11 and b. kr12 were chosen while from the DHS dataset questions a. *hv207*, b. *hv208*, c. *hv209*, d. *hv243a*, e.*hv210*, f. *hv211*, g. *hv212*, h. *sh118c*, i. *hv243d* and j. *hv243c* were selected. The next step was to combine the two datasets and perform a factor analysis of the common variables in order to calculate the asset index. In addition, as mentioned above the 3% rule was also applied for the asset index, excluding from the factor analysis variables with small variation. Finally, the predicted asset index was normalized for the DHS sample (mean 0 and variance 1).

- *Self-reported well-being*
  - *Happiness:* This is a scale variable which is reported only for panel respondents. A panel respondent indicates that the questionnaire was answered by the same respondent between baseline and endline. The variable using a Likert scale takes values from 1 (very happy) to 4 (absolutely not happy). All the information used for the construction of the Happiness variable is taken from question *sw03* of section SW. (Subjective wellbeing) of the questionnaire.
  - *Current wealth status:* This is a scale variable which is reported only for panel respondents. A panel respondent indicates that the questionnaire was answered by the same respondent between baseline and endline. The variable takes values from 1 (poorest) to 6 (richest). All the information used for the construction of the Happiness variable is taken from question *sw04* of section SW. (Subjective wellbeing) of the questionnaire.

***Skills, time allocation and profit***

- *Number of patterns (rug)*
    - *Number of simple patterns (round, square, oval) :* All information in order to construct the variable were taken from question *rm19* for all households which gave as an answer categories: 1. Small ordinary round, 2. Small heart motive, 3. Mango motive, 4. Medium ordinary round, 5. Medium heart motive, 7. Big ordinary round, 8. Big heart motive, 13. Small round with semi-motive, 16. Medium round semi motive, 19. Big round with semi motive, 25. Small ordinary square, 28. Big ordinary square, 32. Small ordinary oval, 34. Big ordinary oval.
    - *Number of figurative patterns (turtle, fish, elephant figure) :* All information in order to construct the variable were taken from question *rm19* for all households which gave as an answer categories: 6. Micky motive, 9. Telletubies motive, 10. Jumbo ordinary round, 11. Sitting Panda motive, 12. Cat motive, 14. Walking panda motive, 15. Balem, 17. Chicken motive, 18. Tablecloth motive, 20. Elephant motive, 21. Calligraphy motive, 22. Jumbo round semi-motive, 23. Tortoise motive etc.
- *Number of patterns (Kanzashi):* All information in order to construct the variable was taken from question *km19* by summing together the types of *Kanzashi* patterns which were created for each household.
- *Number of hours worked per week:* The total number of hours worked per week is created by summing questions *rm23, is02, is08, is12, km23,* after they were earlier divided by 13 (weeks) as the questions capture a 3 month period.
- *Profit per hour of work (Rp):* The profit per hour of work is actually 6 different variables 1. Profit per hour of work for all activities, 2. Profit per hour of Rug making, 3. Profit per hour of *Kanzashi* making, 4. Profit per hour of cultivating crops and raising livestock, 5. Profit per hour of working for a wage and 6. Profit per hour of working in small business.

***Links to market***

- *Inputs from cooperative/group:* All information in order to construct the dummy variable was taken from question *rm10* where the respondent was asked where he/she gets the input material; if among the answers given were *A. Bought from cooperative Perempuan Melati* or B*. Bought from rug making group,* then the dummy variable takes the value of 1.

***Volume of traded goods (uniform indicator)***

- *Value of sold rugs per month (1000 Rupiah):* The variable is calculated by multiplying the number of patterns created in the past 3 months (*rm20*) by the mean price of rugs sold[33]. Furthermore, the value of sold rugs is divided by 3 (months) in order to report in monthly values. Finally, the value of sold rugs per month is divided by 1000 as to report in 1000 Rupiah.
- *Percentage of households that have small business:* All the information for the construction of the dummy variable was taken from question *is10* where the respondent was asked to provide

[33] The mean price is the average price of rugs sold by treatment group and rug type.

information whether during the past 3 months, did the respondent work in a family-owned, non-farm business like trade/retailing or been self-employed in a non-farm enterprise.

- *Net profits from small business (1000 Rupiah):* The variable is created by diving the respondent's total income from own business with 1000 as to report in 1000 Rupiah. For the calculation of the respondent's total income from own business the same procedure as mentioned before (total monthly income) is followed.

***Food security and vulnerability***

- *Households that have emergency savings for at least one month:* All information in order to construct the dummy variable was taken from question *kk03* for all households which replied that have set aside emergency or rainy day fuds that would cover their expenses for one month, in case of sickness, job loss, economic downturn or other emergencies. Answer categories `refused' and `don't know' were recoded to zero.
- *Households not able to cover their living costs/ have not enough to eat:* All information in order to construct the dummy variable was taken from question *jk02* where the respondent was asked if sometimes people find that their income does not quite cover their living costs during the last 12 months. Answer category `don't know' was recoded to zero.
- *Current standard of living (daily needs covered):* Scale variable asked to panel respondents taking values 1 (not enough to fulfil my daily needs), 2 (only enough to fulfil my daily needs), 3 (more than enough to fulfil my daily needs). Answers 'don't know' where replaced with a missing value. All the information was taken from question *sw01*.
- *Current standard of living (food consumption):* Scale variable asked to panel respondents taking values 1 (not enough to fulfil my daily needs), 2 (only enough to fulfil my daily needs), 3 (more than enough to fulfil my daily needs). Answers 'don't know' where replaced with a missing value. All the information was taken from question *sw02*.

# Annex III. Summary statistics of variables

**Table 14: Summary statistics**

| Variable | Baseline | | Endline | | Change (Endline-Baseline) | |
|---|---|---|---|---|---|---|
| | Sample | Mean | Sample | Mean | Sample | Mean |
| **Respondent characteristics** | | | | | | |
| Female (%) | 100 | 100.0 | 105 | 100.0 | 100 | 0.0 |
| Household Head (%) | 100 | 17.0 | 105 | 8.6 | 100 | -8.0 |
| Age | 100 | 38.3 | 105 | 39.6 | 100 | 1.4 |
| Education (%) | | | | | | |
| *No/Islamic* | 100 | 5.0 | 105 | 6.7 | 100 | 2.0 |
| *Primary* | 100 | 61.0 | 105 | 58.1 | 100 | 0.0 |
| *Secondary* | 100 | 34.0 | 105 | 34.3 | 100 | -3.0 |
| *Higher* | 100 | 0.0 | 105 | 1.0 | 100 | 1.0 |
| Subjective well-being 5-years ago | 100 | 2.5 | 100 | 2.4 | 100 | -0.1 |
| **Household characteristics** | | | | | | |
| Household (HH) size | 100 | 3.9 | 105 | 4.2 | 100 | 0.2 |
| Female HH head (%) | 100 | 17.0 | 105 | 8.6 | 100 | -8.0 |
| Main income source (%) | | | | | | |
| *Crop Farming* | 100 | 16.0 | 105 | 14.3 | 100 | -1.0 |
| *Non-farm Business* | 100 | 30.0 | 105 | 23.8 | 100 | -6.0 |
| *Wage* | 100 | 44.0 | 105 | 58.1 | 100 | 13.0 |
| Membership in […] (%) | | | | | | |
| Farming Group | 100 | 13.0 | 105 | 12.4 | 100 | 0.0 |
| Farming Cooperative | 100 | 0.0 | 105 | 0.0 | 100 | 0.0 |
| Saving & Credit Group | 100 | 11.0 | 105 | 18.1 | 100 | 5.0 |
| Saving & Credit Cooperative | 100 | 43.0 | 105 | 56.2 | 100 | 11.0 |

# Annex IV. Description of survey locations

Wonorejo and Wonoyoso villages are located in Pringapus sub-district, Semarang district. Wonorejo village consists of 5 dusun, namely Lengkong, Sambiroto, Wonorejo, Durenan and Mranak dusun. While Wonoyoso village consists of 6 dusun, they are Dawung, Kawah, Larangan, Rejosari, Sambeng and Wonoasri. These two villages are located at the border of industrial areas where garments and clothing factories are.

The area around the two villages tends to be hilly and most of the land is used for farming. The villages are not too far from the main road which connects Semarang province with Yogyakarta. The access to get this village is relatively easy. We can either drive our own vehicle or take public transportation called Colts (mini bus).

Most people in both villages are working in the farming sector, and are either land owners or farming labourers, or they work in factories around the villages which specialise in handicrafts, furniture, mats, mattresses, clothing, and plastic waste recycling. Since the number of garment and clothing factories is so high in thes areas and material waste is abundant, home industries which make use of the rags are flourishing. One of these home industries is rug making, which is mostly done by women and housewives. Rug making is not costly, it is easy to learn and can be done as a side job.

The rug making industry in these villages began in 1998, when Indonesia faced an economy crisis and many factories in the Pringapus sub-district were closed down and unemployment soared. Therefore, the rug making home industry was greatly welcomed by villagers, particularly the women. Nowadays, the number of rug makers per village is very high, and the designs are becoming more advanced as the makers become more skilled and creative. Also, there are plenty of cooperatives and social organisations which can give advice to these small micro-enterprises if needed.

P-values are not defined for variables where there was no change.

# Annex VI. Qualitative Report on the GREEN project

## 1. Introduction

### 1.1. Context of the project

Garment and textile industries are the largest contributors to non-oil-and-gas exports in Indonesia. Within the garment industry, Small and Medium Enterprises (SME) generate a large share of total income. Although both the domestic and the export markets in Indonesia are promising for textile products, SMEs continue to have challenges because of their limited capacity at being competitive in these markets. The following reasons can be thought of:

- The procedure: the lack of knowledge in relation to productivity and standard quality
- Producer: the lack of knowledge in relation to design and trend
- The high cost of raw materials
- The limited knowledge in relation to business management and financial records
- The limited access to and information about the market
- The weak organisation and coordination among SMEs and other market participants

Therefore, a programme to improve SME competitiveness is highly needed. The Garment for Economic Empowerment (GREEN) project of HIVOS and SwissContact aimed to address these issues and to improve the competitiveness of SMEs. (Progress Report of GREEN PROJECT, July 2012 to April 2013, SwissContact).

### 1.2. GREEN project

The main purpose of GREEN was to decrease poverty by increasing the income of female entrepreneurs through social empowerment and improving SME competitiveness, with a special attention to women groups of small producers living in rural areas.

SwissContact received a mandate from HIVOS to implement the GREEN project in Central Java Province and Jakarta. The project aimed to improve the capacity of Women Association for Resource Development Centre (PPSW) and Women Companion Association of Small Enterprises (ASSPUK) as Business Development Service (BDS) suppliers for their members. The beneficiaries were patchwork accessories (*kanzashi*) craftswomen in Tambora West Jakarta, patchwork doormat craftswomen in Pringapus, and handwriting batik craftswomen in Polokarto and Sukoharjo. After a feasibility study at these locations, the GREEN project ran between 31 May 2011 and 30 June 2013.

### 1.3. Project activities

The activities of the GREEN project were grouped around 3 strategies:

1. Development and implementation of visions (incorporation of visions) for stakeholders, including the following activities:
    - Identifying actors in this sector
    - Creating a local forum to provide information and dialogue

- Organising workshops on vision development to improve dialogues among actors in the sub district/region and to set and document a road map and a strategy

2. Improving skills in relation to purchasing, producing, and marketing of small businesses through the following activities:

    - Organising field visits to improve market relation, business productivity, as well as quality, information access and facility of doing business.
    - A training session of organising to improve market network, business productivity, as well as quality, information access and facility of doing business.
    - Providing access to raw material supply.

3. Improving capacity to support businesses with the following activities:

    - Promoting and improving access to business services in relation to quality improvement and market access.
    - Promoting and improving access to financial services.
    - Improving access to public services.

Based on the preceding activities, the project had the following expected outputs:

- A joint vision of the stakeholders for the growth of the garment sector in their areas for sustainability
- Improved skills of SMEs in purchasing, producing and marketing through i.a. better bargaining skills which empower the women in both financial and non-financial ways
- Improved capacity of SME Associations (ASSPUK and PPSW) as BDS suppliers through better resource management, Corporate Social Responsibility (CSR), prices based on social performance and being fair (Progress Report of GREEN PROJECT, July 2012 to April 2013, SwissContact).

### 1.4. Location of the project

The GREEN Project worked with PPSW in Jakarta and ASSPUK in Central Java. Related to PPSW, the beneficiaries of the project were accessories craftswomen in Tambora West Jakarta. In relation to ASSPUK, the beneficiaries were craftswomen of handwritten batik in Polokarto Sukoharjo. In addition, doormat craftswomen (the members of Melati cooperative) in Pringapus were also included in the project.

### 1.5. Objectives of the study

The objective of the GREEN Project Qualitative Study is to know the effects of the organisational capacity improvement of the SME Associations as BDS suppliers and the effects on businesswomen as the beneficiaries. Please note that the in the study only stakeholders and beneficiaries related to the project's activities with ASPPUK were interviewed.

# 2. Methodology

## 2.1. Data collection method

The GREEN Project Qualitative Study was carried using in-depth interviews and focus group discussions (FGD). The in-depth interviews were held with the project management of SwissContact, the management of Melati cooperative, the management of ASPPUK and a trader/buyer.[34] The FGDs were held with patchwork doormat craftswomen (members of Melati cooperative) and with handwriting batik craftswomen. The data collection took place between August and September 2013 (see Table 22).

**Table 22: Schedule of data collection of GREEN study**

| Date | Data Collection Method | Informant | Total number of informants |
|---|---|---|---|
| **29-08-2013** | In-depth interview | SwissContact Indonesia | 2 |
| **02-09-2013** | In-depth interview | Melati Cooperative | 1 |
| **02-09-2013** | Focus Group Discussion | Members of Melati Cooperative | 7 |
| **05-09-2013** | In-depth interview | ASPPUK | 1 |
| **05-09-2013** | Focus Group Discussion | Handwriting Batik Craftswomen in Polokarto | 7 |
| **10-09-2013** | In-depth interview | Buyer | 1 |

During the in-depth interviews, the discussion focused on the following topics: the incorporation of vision, the trainings for purchasing, producing and marketing, the improvement of the institutions as BDS suppliers and the replicability of the project. Topics for the FGDs were focused on the trainings for purchasing, producing and marketing, and the benefits of the project.

## 2.2. The location of the study

The study was conducted at the office of the Melati cooperative in Pringapus and at the office of ASPPUK in Solo, Central Java.

## 2.3. Informants of the study

The selection of the informants was done by the Melati Cooperative and ASPPUK based on the criteria provided by the evaluation team. The criteria for the FGD participants were that the informants had to participate in the training organised by SwissContact on batik and patchwork brooch (*kanzashi*) making, and in addition they had to be members of ASPPUK and Melati cooperative, respectively. All of the participants were women. Information in this report about PPSW and the accessories craftswomen in Tambora West Jakarta is based on information attained from SwissContact.

# 3. General description of project stakeholders

## 3.1. SwissContact Indonesia

SwissContact was asked by HIVOS to implement this project because SwissContact had previous projects related to garments in Jakarta. These projects were quite successful in connecting producers with export companies. After HIVOS visited the Cipulir project of SwissContact, they were interested to replicate the

[34] SwissContact provided a list of two buyers, from which the evaluation team managed to interview only one.

project results in other areas. The GREEN project's idea was that SwissContact could not assist SMEs in Indonesia forever, so improving the capacity of local institutions like ASPPUK and PPSW in the field of entrepreneurship would increase the sustainability of the project.

### 3.2. ASPPUK

The Women's Association of Small Enterprises (ASPPUK) was founded in the beginning of the 1980s by 15 NGOs that had the same concerns regarding the situation of women, such as the lack of attention from the government to SME Businesswomen. ASPPUK focuses on the reinforcement of SME businesswomen as a legal and non-political organisation. ASPPUK assists SMEs in sectors of food production, household crafts (batik, weaving), trade, services and agriculture. ASPPUK has been involved in policy advocacy, in particular by supporting policies related to SMEs. It also had an initiative to strengthen women by advising them to support each other when one felt weak, which was taken up well by the members. ASPPUK also has partner organisations called Small Business Women's Network (JARPUK) at the district level. The management of these JARPUKS is done by the member NGOs. In fact, every NGO has a JARPUK in each district where they operate with 64 JARPUKs in total. These are special units with the purpose to assist female entrepreneurs for example through trainings and workshops, saving and credit groups, regular meetings and advocacy. JARPUK Java has also established a Financial Institution for Women (LKP) in 2011 with a focus on business development. LKP also received exhibition facilities from the government.

ASPPUK is active in Sumatra, Java, Kalimantan, West Nusa Tenggara and Sulawesi. ASPPUK Java consists of ASPPUK West Java, ASPPUK Central Java and ASPPUK East Java. The GREEN project works with ASPPUK Central Java. The secretariat of ASPPUK Central Java has 5 staff members. According to the secretariat, the small number of staff members and the lack of funding are obstacles in carrying out their activities.

In order to circumvent the problems caused by insufficient funding, ASPPUK developed a Business Development Centre (BDS) called *Mitra Perempuan Usaha Kecil* (MPUK). It has its own management but its office is located in the same place as that of ASPPUK. ASPPUK had just started MPUK and the only activity conducted so far was to facilitate the market, such as handling the demand for products from Jakarta. However, MPUK has not been able to finance its own activities. If MPUK becomes successful, this could support the sustainability of ASPPUK and provide experience in doing business. This experience is important because the NGOs they accompany had more business capacity than ASPPUK itself.

### 3.3. Batik Craftswomen

Handwritten batik has been one of the surviving clothing products from Central Java since centuries. The sale of handwritten batik is affected by the preferences of patterns and colours in the market, so the entrepreneurs should always know the trends.

Handwritten Batik Craftswomen as an organisation has existed for a long time. Women make the batik/paint the batik, while men do the colouring with a batik cap (copper block stamp). Since the women got their skills from their ancestors, it is without a doubt that they can do this batik painting really well. Although many people regard doing batik painting as easy and an old profession, there are still some youngsters doing batik painting willingly. Women usually do the batik painting individually but

sometimes they work together on orders from large companies. It is possible to work on batik after finishing with the household chores, but patience is essential for the batik painting.

### 3.4. Melati Cooperative

Melati Cooperative and Anugerah doormat making group is led by Bu Roh Prihati and is located in Pringapus. It was established in 2003 and has 600 housewives as members. Due to the 1998 monetary crisis there were many unemployed people in Pringapus. At the same time, there were a lot of garment wastes in the form of textile pieces. Bu Roh Prihati invited the local residents to make doormats of these textile remains to increase their income. Doormat craftswomen were given some series of training to improve the quality of their doormats, as well as to improve the colour combinations and designs, so they could be sold at better prices. Some of these trainings were held by government institutions.

The cooperative purchases all the doormats made by its members, independent of quality, and markets the products. However, members can also sell their products outside of the cooperative. In practice, Melati cooperative and the craftswomen have faced challenges in relation to the marketing of the products. To market the products, the cooperative have used the strategy of direct offering and brochure distributing. In general, the cooperative management uses every opportunity to offer the products, including participating in exhibitions.

### 3.5. PPSW

Women Association for Resource Development Centre (PPSW) is an NGO for women in Indonesia that assists and develops women groups since 1986. There are approximately 18,622 women joining 572 Resource Development Women Groups (KWPS) developed by PPSW in 6 Provinces: DKI) Jakarta, Banten, West Java, West Kalimantan, Riau and Nanggroe Aceh Darussalam. PPSW consists of four independent institutions. Those are PPSW Jakarta, PPSE Pasoendan, PPSW Borneo and PPSW Sumatra. Its main purpose is empowering women, especially those who have the lowest socioeconomic status within the society. PPSW focuses on economic, health and education problems by carrying out activities such as giving trainings and workshops. In addition, it also conducts research and gives seminars and workshops to support the activities done together with the poor women.

## 4. Implementation of the GREEN project

The GREEN project was initiated on 31 May 2011 and ended on 30 June 2013. The implementation of the project was divided into two periods: June 2011 – September 2012 (first period) and September 2012 - July 2013 (second period), as seen in Table 23. The activities in the first period were incorporation of vision about BDS with ASPPUK and PPSW, strategy and direction making, inviting partners such as the Indonesian Bank (BI) and the Department of Cooperatives, and advising ASPPUK about their BDS. The activities in the second period were incorporation of vision, and product and marketing trainings to SME businesswomen in Tambora, Pringapus and Solo.

**Table 23: Schedule of incorporation of vision held by SwissContact**

| Time | Place | Participant | Objective | Period |
|---|---|---|---|---|
| **July 2011** | Surakarta | ASPPUK, SwissContact | To incorporate vision about the BDS concept | 1 |
| **December 2011** | Jakarta | ASPPUK, PPSW, SwissContact | - To incorporate vision about the BDS concept<br>- To give a description about SME as the market target of BDS<br>- To review the planned services<br>- To improve services<br>- To organise Action Planning Services | 1 |
| **Sept 2012** | Central Java | SwissContact, ASPPUK | Stakeholder Relationship, The role of ASPPUK in the future, Business or Companion Services, model of business. | 2 |
| **October 2012** | Jakarta | ASPPUK, PPSW, SwissContact | To equalize the understanding about GREEN Project, as well as a to have a briefing about the organisation of TA activity planning TA for BDSP" | 2 |

Sources: SwissContact Documents and interview with informants.

## 4.1. First period

### *Inception*

As mentioned before, ASPPUK had already established a BDS called MPUK. ASPPUK realized that it had problems with MPUK, since it usually does not do business. MPUK needs capacity strengthening and consultation to change the paradigm of an NGO being a business commodity. SwissContact understood that ASPPUK was an institution committed to advocacy. A SwissContact facilitator found out that the project, as contracted between HIVOS and ASPPUK, was aimed at increasing businesswomen's income. This is different from the focus on advocacy, since this aim needs business development. For reaching this aim, the BDS needs to be open to the market. This acquires the mind set of ASPPUK to be open. However, ASPPUK said that it wanted to avoid big capital and that prices have to be suited with the cost of production. This requires high prices, while the quality of the production had not been good. Consequently, it was possible that the products could not be sold well. The BDS can strengthen the institution and make it sustainable. As SwissContact stated:

> *"If they do not open their mind sets, they will only be pitied by the donors, they will only get the money. If this happens on and on, the economy cannot be strong. Once the donors*

> *stop giving money, it seems strong from outside, but it is really fragile inside, they have a big billboard but they have no production. It will be futile" (D).*

So, the first thing suggested by SwissContact was to change the mind set of ASPPUK.

### *Vision*

In the first period (before September 2012), a workshop on incorporation of visions was done in Surakarta and Jakarta. According to ASPPUK, there had been two meetings with SwissContact in Surakarta. In the meetings, ASPPUK and some NGOs discussed how to build concepts and how to achieve major goals with BDS. Based on photographic documents and modules by SwissContact, there was a workshop on introduction to BDS and opportunities of BDS, done on 26-27 July 2011, which was facilitated by Ade Swargo Mulyo (Project Manager SwissContact), Miranda Rustam[35] (Project Officer SwissContact) and Noorwahyudi (Founder of Detro Consulting-BDS). While there was a vision difference about BDS before the meeting, it seemed that this meeting had reached a bright spot on the BDS concept to develop. ASPPUK was in line according to SwissContact about the concept of BDS.

ASSPUK stated that there was nearly no communication between SwissContact and ASPPUK for one year. ASPPUK did not know why,[36] as there has been a bright point between two parties about the BDS concept in the meeting. Even though the communication between SwissContact and ASPPUK was interrupted; ASPPUK still continued its ideas since they had already started a BDS. According to its management, this BDS only needed to be finalized.

### *Impact*

Changing the vision of ASPPUK needed longer time than expected, as stated by a SwissContact facilitator:

> *"The process of understanding needs a long time and it is longer than expected. I told HIVOS that we can prepare the BDS in 3 months, but in fact it takes more than 6 months."*

According to the mandate given by HIVOS, SwissContact had to strengthen and advise the companion NGOs, so that they would give their direct assistance to small entrepreneurs for sustainability. Since the project time was limited to 2 years, some attempts were made to find a solution to continue the GREEN project. The solution agreed by ASPPUK was directly strengthening the entrepreneurs in marketing, production and skills instead of advising the NGOs. This method was easier, because it had been applied in other projects.

## 4.2. Second period

### *Vision*

After no communication in a year, the SwissContact team came back to ASPPUK and PPSW in September 2012. This period is called the second period of GREEN. In this period, SwissContact and some members of the management of ASPPUK had two meetings.

[35] Miranda Rustam is Project Officer at Hivos since 2012.

[36] The interruption of the project partially happened due to changes in the staff of SwissContact: both Ade Swargo Mulyo and Miranda Rustam left SwissContact at the end of 2011.

In the first meeting in September 2012, ASPPUK and PPSW were informed about the new plan for business strengthening, which had been stated in the first period. SwissContact expressed its interest in batik and *kanzashi* development. During the meeting, it appeared that there had been miscommunication between SwissContact and ASPPUK. According to the management of ASPPUK, the new SwissContact facilitators did not tell them that ASPPUK got the GREEN Project, as stated by one of the ASPPUK management:

> *"If I am not mistaken SwissContact has been to Klaten, but whether it had something to do with GREEN, we did not know. They never talked about GREEN verbally. They just said we were asked by HIVOS as a business consultant, and they never mentioned GREEN (Y)"*

So ASPPUK misunderstood the concept, with which it agreed before. ASPPUK clarified this to SwissContact. The facilitators did not think that it was an important matter, but it could have a great impact on the implementation of the project itself. The meeting was followed by a field visit to ASPPUK by SwissContact.[37]

In October 2012, SwissContact held a meeting in Jakarta (see Table 24). This meeting aimed at equalizing understandings about the GREEN Project, as well as giving a briefing about the plans for Technical Assistance (TA) to BDS. Participants of the meeting were 4 people from SwissContact, 3 from PPSW and 3 from ASPPUK.

Finally, it was decided that the GREEN project would directly strengthening the 3 groups of female entrepreneurs in marketing, production and skills. In Tambora, the trainings were to focus on *kanzashi*[38] making for members of PPSW, while in Sukoharjo, the trainings were to focus on batik on T-shirts for members of ASSPUK. In addition, for members of the Melati cooperative in Pringapus, trainings on *kanzashi* making were also envisioned.

[37] The evaluation team also interviewed ASPPUK and the facilitator of SwissContact during this field visit at the office of ASPPUK.

[38] *Kanzashi* is an accessory in flower shape, originating from paper origami. Like doormats, it is also made from textile pieces, which could originate from garment waste.

**Table 24: Meeting on Understanding Equalization about GREEN in Jakarta**

| Schedule | Activity |
|---|---|
| **11 Oct 2012** | - A meeting with Mrs. Ade Kartika and Riana (of Alleira Batik)<br>- A visit to Alleira outlet in Senayan City.<br>- A meeting with Mr. Rajendran in Cibinong area, where there was a discussion on the possibility of cooperation plan to supply batik to Jakarta |
| **12 Oct 2012** | An open discussion about the understandings of GREEN Project, roles, positions and responsibilities of the stakeholders as well as determination of the following steps by ASPPUK – Central Java and PPSW – Jakarta |

### *Impact*

ASPPUK stated that it needed a strengthening of its BDS both in management and skills if it wanted to be a business consultant for its members and SwissContact was willing to strengthen the BDS institutionally. ASPPUK understood this and saw it as a big opportunity. The meetings also clarified to ASPPUK that it has to keep strengthening the SMEs after they meet buyers, because they cannot take them for granted. MPUK, the BDS, has its own staff and one of its activities is facilitating the market for its members. Even though the capacity development had not been done yet, ASPPUK hopes that MPUK can support its operational activities in the future. ASPPUK said that SwissContact planned to give training to 15 NGOs in Central Java, but it has not been implemented yet.

The two parties agreed to do a strengthening of the BDS, to strengthen batik craftswomen and to facilitate a market for the products of the members. At this stage, ASPPUK and SwissContact had a lot of communication. Sukoharjo was chosen for the trainings on batik as it is the centre of handwriting batik craftswomen, so it is easy to manage. There was a difference in opinion on the decision of training materials. ASPPUK held its principle that the batik should be produced with natural colouring/dyeing, while SwissContact thought that business had to follow the taste of the market, which required chemical colouring/dyeing. Also, chemical inputs are cheaper and easier to obtain. Although ASPPUK is not an environmental institution, they still have a commitment to the environment. In the end, ASPPUK agreed with the chemical dye.

## 5. Trainings in Sukohardjo

### 5.1. Inception

According to SwissContact, the initial idea was to build a small garment industry in Solo, because there were many big companies, such as Pan Brothers,[39] who were willing to establish a cooperation or employment contracts, lend out sewing machines and give training so that standardized products would be achieved. SwissContact had offered to facilitate ASPPUK to contact the Pan Brothers, but this was not successful because the idea to collaborate with big industry was not accepted by ASPPUK. SwissContact contacted the company, but it did not attend the meeting in September 2011 and there was no continuation.

[39] Pan Brothers is a company in the textile industry, whose main products are clothes.

SwissContact also tried to cooperate with Alleira Batik. It is a batik brand that was founded in 2005. Alleira Batik has its own concept of colouring/dyeing, which made their products shinier than others. SwissContact wanted to discuss about the colouring process, how it is influenced by water content and other things. There had been a discussion with Alleria Batik about possible cooperation and plans to supply batik to Jakarta. However, the cooperation did not go through due to the limited capacity of the target group. SwissContact had to look for another opportunity, which turned out to be trainings on batik design on T-shirts.

## 5.2. Trainings on producing

Training on batik was done twice in Sukoharjo. For incorporating marketing opportunities, SwissContact invited a designer from the Bandung Institute of Technology (ITB) before the trainings to visit the batik centres in Sukoharjo to assess what could be improved. The initial suggestion from the designer was making bags or accessories, but the samples did not meet the criteria of the buyer. The next idea was to dye/colour T-shirts with a batik cap (copper block stamp). Since the participants of the training have done batik painting generation to generation, they already possessed good skills. Yet, they still used traditional ways. Therefore, SwissContact attempted to increase their increase their income by giving them knowledge about modern techniques.

The training was done twice: 27 – 28 May 2013 and 25-26 July 2013.

### *Trainings on 27-28 May 2013*

The expected results of this training were improved skills in dyeing/colouring, using the batik cap on T-shirts and in designing. It was expected that this would result in an increase in the income of batik craftswomen.

The participants of the training were as many as planned: 50 participants. Most participants were from Sukoharjo, while Bantul and Surakarta craftswomen participated in order to increase the access to the knowledge in the society. The criteria for choosing the participants were being craftswomen of a productive age and being able to draw.

Participants were asked to draw. After making drawings, the best drawer was chosen as the leader of her group. The 50 participants were divided into 10 groups. After drawing on papers, they were asked to draw on T-shirts. Each group expressed their own ideas on the drawings. The participants got trained in how to colour/dye with a batik *cap* using chemical dye.

### *Trainings on 25-26 July 2013*

The expected results of this training were a standardized batik technique and synthetic dyeing/colouring process on T-shirts, a colour catalogue (colour gradation quality) and agreement on the communication process of Purchase Orders (PO) between the buyer and ASPPUK.

There were 25 participants attending the training, in line with what was planned. Those 25 participants were selected from the 50 participants of the first training. The reason of fewer participants in the second training was to make them more focused. Some participants from Surakarta and Bantul also attended this training. The chosen participants were expected to organise when there was a contract/an order.

The speaker of the second training was a buyer candidate from Bandung. If the colour catalogue and the colouring production were in line with the buyer's taste, the participant would get a sub-contract.

### 5.3. Impact

Regarding the first training, participants of the FGD stated that it was interesting but not really suitable for women, as the *cap* tool was too heavy. Therefore, *cap* working was done by men. The benefits from the training were knowledge about making patterns, using the *cap*, and batik dyeing/colouring on T-shirts. FGD participants have not used the *cap* in their business, they still preferred handwritten batik.

After the second training, there has not been any sub-contract with the buyer. However, there were benefits from the second training. The participants now know how to mix the colours with the correct formula so they could produce great colours. In addition, the training participants could make interesting colour combinations, so the products were sold well. However, there was no new market or increased selling price after the training. Still, the chemical batiks sold quicker than before the training because of the better colours and colour combinations. Before the training the products could be sold after a week of the production process, while after the training they were sold in only 3 days after the production process.

The price of naturally coloured batik is higher than the price of chemical batik due to the difference in quality. However, naturally coloured batik has some shortcomings: longer soaking time, repeated process in order to make the colour spread evenly, and strong smell of the soaking. In addition, the chemical inputs are cheaper and easier to obtain than the natural inputs. The batik craftswomen have tried to apply their own natural colouring, but the result was not satisfying. Hence, there should be a breakthrough to reduce the shortcomings of natural colouring, including the raw materials supply of the natural colours. The preceding things have been told to SwissContact, but there was no solution yet.

## 6. Trainings at the Melati cooperative

### 6.1. Inception

SwissContact had two successes in marketing for the Melati Cooperative. First, it linked the cooperative to the Indonesian Bank (BI). BI gave sewing machine assistance, but it is not clear whether this was the result of the activities of SwissContact since the cooperative had been in contact with BI before. Second, SwissContact connected the Melati Cooperative to Surya Citra Television (SCTV). SCTV recorded the activities in the Melati Cooperative because it was interested in SME. This way, the Melati Cooperative became known by the society. SwissContact also tried to contact accessories buyers from Yogyakarta. There had been some communication, but no actions followed yet.

Considering the marketing of *kanzashi*, the Melati Cooperative did not have enough funding to buy all the *kanzashi* from its members, as it did with the doormats. In addition, a place to store the products was not ready yet. As a consequence, the *kanzashi* was marketed individually. Some members sold it at schools, some in working places and some got orders. The cooperative did facilitate its members to join an exhibition of *kanzashi* products as a way of marketing. Also SwissContact helped with the exhibition by providing tools and funding. This was very successful for some, but not so successful for others dependent on the time of the exhibition. The unsold products were put in the cooperative office, so they could be sold when a group was visiting the cooperative.

Some of *kanzashi* craftswomen did a survey to malls to see the latest trend of the accessories, so they could make the products up-to-date. There were always orders of *kanzashi*, so when there were too many orders, they would ask for a help from their sisters/brothers/relatives. The craftswomen trained them themselves.

### 6.2. Trainings on producing

SwissContact facilitated two trainings on accessories making using the *kanzashi* technique for the Melati Cooperative: one on 11-12 June 2013 and one on 22–23 July 2013 in Sambeng village, Pringapus, exactly next to the building of the Melati Cooperative.

#### *Trainings on 11-12 June 2013*

49 of the 50 participants came to the training. The first training was offered to members of the Melati Cooperative and members of the Anugrah Group who were interested in making accessories/brooches. To expand the benefits, some craftswomen who are not member of the Melati Cooperative or the Anugrah Group could join the training. 3 non-members joined.

The participants were introduced to *kanzashi* technique after which the training started. The first training was about making brooches with cotton cloth materials. Participants were divided into 10 groups, each consisting of 5 people. The facilitator supervised by walking around the groups. There was homework given on the first day, which was checked on the second day.

#### *Trainings on 22 – 23 July 2013*

The second training had 13 participants, which were women who had produced *kanzashi* since the first training. This, and the results, were checked with a survey by SwissContact. These participants were interested in knowing more about the *kanzashi* technique.

Lessons in the second training were how to cut clothes and especially satin clothes, how to choose and use good and strong glue, how to use a certain sewing technique and how to choose good clothes to close the back of the brooch. During the training, the women made brooches using satin clothes, so the difficulty level was higher than in the first training. After the first day of training, participants were given homework to make pieces that were going to be checked on the second day. Other things that the women learned to make were headbands, hairpins and rings.

### 6.3. Impact

The benefits of *kanzashi* making were the use of fewer materials and a better selling value than doormats. In addition, the women learned to make more difficult *kanzashi*. Since making *kanzashi* does not require much effort, the women felt lucky to earn money without leaving their home and duty as housewives.

> *"I think this is better. I can take care of my children, and lead them to study. It is only a matter of health. If we are healthy, there will be more results to come(I)"*

From the FGD it was found that all the entrepreneurs that were at the discussion felt optimistic about *kanzashi*. The raw materials were available. The doormat entrepreneurs who had followed the training made *kanzashi* craftworks as their side job. Only one of them made *kanzashi* as her main job, because she was not strong enough to sew with a sewing machine. She was been ill and she had to take care of her parents.

> *"I have done doormats sewing for almost 10 years. I just stopped this year; I just can't make it because I'm often sick. I felt lucky because of this kanzashi training. I felt that this is easier to do, I can do it all the time, and I can sell it easily as well"(Ibu T)"*

The other women kept making doormats since the Melati Cooperative would always buy their produce, giving them a steady income. Since the women make *kanzashi* next to their regular jobs, it increased their income.

Although the training has been finished, SwissContact still visited the entrepreneurs' houses.

> *"It feels great they came to us and they saw our products. I was told that I liked making this model other than models that have been taught to me. I like doing experiments on making other models, and buyers like them anyway", "I got an order of 150 brooches from my cousin"(Ibu T, A)*

# 7. Trainings in Tambora

## 7.1. Inception

In the Mid Term Report of the GREEN Project (July 2011-September 2012) it was stated that the activities done for PPSW in the first period were BDS training in Jakarta, training and facilitating market access in the Tambora sub district and training on crafts making with cloth material for some beneficiaries in the Tambora sub district. At the field visit of SwissContact to Tambora in September 2012 (second period), there were no clear results on the production. The products could not be sold well due to lack of quality. As a solution SwissContact chose an expert in accessories making, a graduate from Bandung Institute of Technology (ITB), for finding a special product in the market and a design for that product. For this, they took a look at the beneficiaries in the field and did sewing tests to housewives. They came to an agreement on making *kanzashi* and SwissContact was going to give training in *kanzashi* making.

## 7.2. Trainings on production

According to the activity report about the training and assistance programme for SMEs, trainings were given between 15-19 February, 21-26 February and 26-28 March 2013. Even though SwissContact planned on providing the training to 50 women, the first training was participated by 11 women, the second by 10 women and the third by 9 women. As a reason for this PPSW said that there were many orders from factories for cutting clothes, so most members did not have time. At the training Ibu Meriam (from ITB), Pak Dedi and other staff from PPSW were present. On the first day of the training the women were taught about the theory and practice of making *kanzashi*, after which they were mentored by the facilitator.

According to the activity report, the activities were as follows:

1. On February 15$^{th}$ 2013, the women learned a sewing technique, how to combine colours for big, medium, and small size patterns and how to make *kanzashi* with round petals, sharp petals, and oval petals. They also learned how to add beads, buttons, and stones for accessories and the finishing methods to improve the quality of the product in order to be able to market them.

2. The women learned how to combine products in order to meet the market demand particularly for teenagers and children and how to modify products to make them more interesting, like certain colour patterns.
3. They learned to combine colours based on the materials, how to replicate the sample products and how to explore the ideas to develop the products to meet the market demand.

The women made brooches, hairpins, headbands and hair sticks with *kanzashi* technique.

For the sake of marketing, SwissContact also invited a buyer candidate from Bandung, a lecturer from Universitas Parahiyangan who is also an entrepreneur. Before the products were brought into the free market, SwissContact wanted to bring the products to a controlled market first. Therefore, bringing a candidate buyer was intended so that the participants could gain experience in marketing. He thought that the design, colours and material were not interesting enough. This is mainly due to patchwork mafias that are active in the area of Tambora. They buy the good quality garment waste from the factories, so that the women in the sample could only get low quality raw material. PPSW urged SwissContact to help with the resource and market problems, so a facilitator made a meeting with a buyer from Bu Endang, an online accessories shop, via email. Bu Endang made an order of 1500 accessories per week. The raw material for *kanzashi* was provided by SwissContact, but the craftswomen could only make 70 pieces a week. This was a great lesson for PPSW. It realized that it had to adapt to the market.

The biggest problem faced in the companion programme by PPSW was the lack of access to good quality raw materials. PPSW is expected to assist in finding the materials, but it was not done as planned as stated by a facilitator of SwissContact:

> *"The system used is still PO, as it is hard to find the raw materials. I hope PPSW is able to accompany and find the best solution to the easy access to find the raw materials, but they (PPSW) did not do it well" (D).*

SwissContact also wanted to create a BDS in PPSW. People that have a business mind set were hired, so they were not hired for advocacy reasons. No further information about the impact of the BDS is available.

## 8. Impact on replication of BDS

The time limit had changed the project strategy of GREEN from NGO capacity development to the direct strengthening of the entrepreneurs. This was aimed at giving real experiences to the NGOs on how to give services to the SMEs they would assist, especially in the garment sector. ASPPUK, PPSW and the Melati Cooperative were always involved in the trainings and provided coordination. The strategy change had a positive impact on the implementation of this project, because it could give the NGOs additional experience.

ASPPUK now welcomes the SwissContact plans to give a companion programme as well as institutional capacity development. Although the planned capacity development was in the garment industry, the method could also be applied to companion programmes in other sectors, such as the food sector. One staff member of ASPPUK said:

> *"It is OK, Mas Dedi. It is fine that we get the batik training. Hopefully this batik training can be applied to small entrepreneurs and food products, for me that is not a big deal. If this batik training is successful, we can learn a lot from this. So finally (they chose) batik"(Y).*

From the discussion with ASPPUK it is found that, although ASPPUK has not replicated this project in another place yet, it expects that it can replicate the project in another one of their assisted regions.

# 1. Introduction

## 1.1. Project context

Despite that Indonesia has quite an advanced banking and financial system, financial services do not reach to all parts of the country. In more remote areas, communities have to rely on informal money lenders, which in Indonesian are called "*Rentenir*", if they need to borrow money to cover their living costs. Most affected are uneducated people who have illiquid assets (in the form of land) but whose land tenure is not registered. Therefore, they are not able to apply for credit at the banks even when banks are present in the villages.

In the absence of formal financial institutions, informal arrangements in saving and credit groups provide a way for people to commit to accumulate savings that they can use when it is their turn to receive the payments. This mechanism is useful for small scale savings and expenditures. However, formal institutions are needed to help smooth consumption and income patterns of farming or seasonal employment, and to borrow larger amounts.

The Seed capital project of Hivos works with savings and cooperatives that provide their services to rural communities in Central Java. Most people in these communities still face credit constraints because they are not able to fulfil the requirements of commercial banking and the banks do not provide micro-loans (loan less than IDR 3 million). In addition, in many communities the literacy rate is low, and people have limited collateral when applying for credit. Given the limited access to credit, the project's savings and credit cooperatives encourage low and middle class households to accumulate savings in order to prepare for future larger expenditures. The cooperatives provide loans to members only after members have saved a sufficient amount.

## 1.2. Evaluation objectives

This report evaluates the Seed capital project of Hivos with Koperasi Simpan Pinjam - Qaryah Thayyibah (KSP-QT)[1] as part of as part of the *Medefinancieringsstelsel* (MFS) II evaluation for Indonesia under the Achievement of Millennium Development Goals (MDG) component. The project has been selected under the goals on poverty alleviation (MDG 1). In particular, the current evaluation focuses on the following research questions: do the members have better access to financing? Do the members manage their financial flows better? Did the livelihood of members improve as a result of better access to financing?

We investigate whether the project had a favourable effect on the above mentioned outcomes using difference-in-difference methodology: we compare the changes in the outcome variables between the baseline and endline periods for the project beneficiaries (cooperative members) to the changes in outcomes for a comparison group. We sampled cooperative members that joined the cooperatives in different years between 2010 and 2012 so that we can investigate the longer term impact of the cooperatives on the member households.

[1] The project is described in more detail in section 3.

The sampled beneficiary households were members of either KSP-QT or Koperasi Serba Usaha-Gardu Tani Gedong Songo (KSU-GTGS) (two of the three project cooperatives), and we estimated the impacts of the cooperatives separately for the two cooperatives using regression analysis. Data was collected for a total of 290 beneficiary and comparison households that were interviewed both at the baseline and endline.[2] Beneficiary households were randomly sampled from the membership list of the cooperatives in selected villages with the largest number of members. Comparison households were randomly sampled in selected comparison villages. Therefore, the treatment group is a representative sample of the cooperative members, while the comparison group is a representative sample of the comparison communities. To adjust for the differences in the characteristics of the treatment and comparison households, we control for different socio-economic characteristics of the households during the data analysis.

As specified in the Terms of Reference for this evaluation, the report addresses five evaluation questions to assess the project outcomes:

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?
2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern Partner Organisations (SPOs) efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

## 1.3. Summary of findings

Firstly, it is important to point out some obstacles in the evaluation: the Seed capital project ended shortly after the baseline survey (31 December 2012). In addition, the project did not directly work with the cooperative members, whom we regard as the beneficiaries in the evaluation. Instead, the project developed the financial and social performance of the project savings and credit cooperatives (KSP-QT, KSU-GTGS and Koprasi Simpan Pinjam Mentari Dana Mandiri or KSP-MDM) through trainings to the cooperatives' staff, funding office infrastructure and providing seed capital for borrowing. The project also introduced the importance of family finance trainings for prospective members. Hence, the evaluation focused on the effectiveness of the cooperatives after the capacity building has taken place. We are not able to separate the effect of the project from the cooperatives themselves. However, many cooperative members could not have been reached without the project. Therefore, we consider all the impacts of the cooperatives to be driven by the Seed capital project.

Overall, we find a substantial positive impact of the project on the use of financial services, which is not surprising given the nature of the project and the sampling design. During the evaluation period, 32 (27) percent of the cooperative member households quit their membership in KSP-QT (KSU-GTGS), and only 56 (71) percent of the households still had savings at the cooperatives down from 90 (82) percent at the

[2] In addition, 6 households were only interviewed at the baseline.

baseline. The results suggest that household often quit the cooperative after the repayment of their loans, hence they only accumulate savings as a requirement for borrowing. Nonetheless, the involvement of household in financial institutions (saving and/or borrowing) in the past 12 months was less affected by changes in cooperative membership: 78 (84) percent of the treatment households were still utilizing the services of financial institutions. This is due to the fact that household quitting KSP-QT changed to saving on a bank account instead of the cooperative (29% at endline from 14% at baseline). Hence, KSP-QT opened these households to the regular financial sector. No similar changes occurred among KSU-GTGS members. In the comparison group, financial involvement (25% at endline) and savings accumulated in a bank account (20% at endline) did not change significantly over the evaluation period.

In addition to savings, more cooperative members have borrowed in the past 12 months. This is particularly true at the baseline, which explains the membership in the cooperatives. However, the percentage of households taking a loan at the endline decreased to 54 (47) percent.

Unfortunately, we do not find clear cut impacts of the cooperatives on financial knowledge and skills (except for the increase in savings) and household livelihood/wealth. However, as a result of the increased savings, more households had emergency savings at the endline, and the current standard of living of households also increased during evaluation period in terms of daily needs covered.

### 1.4. Structure of the report

The rest of this report proceeds as follows: section 2 describes the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1 till 4 in turn. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. The project implementation is described in Annex I. Regarding the survey data, the construction of the outcome indicators and indices is summarized in Annex II, and Annex III presents summary statistics of the variables used in the analysis. Annex IV in turn describes the study locations, and Annex V reports detailed descriptive statistics of the sample. Annex VI reports on additional regression results using an extended specification. Finally, Annex VII provides additional tables that are used to explain the findings.

## 2. Literature overview

In Indonesia, one of the strategies to decrease poverty has been envisioned through the development of microfinance industry. For-profit state-owned and private commercial banks have played a dominant role in this strategy in Indonesia, in contrast to microfinance pioneer countries such as Bangladesh and Bolivia, where Non-Governmental Organisations (NGOs) play an important role. Major characteristics of Indonesian commercialized microfinance include relatively high interest rates, requirement of collateral and allowing for borrowing a relatively large amount of money (Takahashi et al., 2010).

However, a smaller number of micro-finance organisations in Indonesia operate with the intention of adding social value to their services in addition to good financial performance. Examples of such

organisations are the savings and credit cooperatives of the KSP-QT project: KSP-QT, KSU-GTGS and KSP-MDM. In this section, we investigate whether micro-finance projects improve the livelihood of households: we focus on effects on savings and income. In addition, we summarize the literature on the effectiveness of financial literacy trainings.

### *Effectiveness of micro-credit*

First, looking in Indonesia, Takahashi et al. (2010) research a microfinance programme operated by Bank Perkreditan Rakyat Yayasan Bina Swadaya (BPR-YBS) in the Gresik District of Indonesia. This programme seems suitable for the poor, since it does not require collateral and offers small loans at a competitive interest rate (30% per year). The programme is commercialized, does not rely on government subsidies and applicants must make mandatory savings deposits before borrowing. The authors calculated the average treatment effect of the programme by comparing participants to incoming participants who have not received loans yet (85 pairs through Propensity Score Matching or PSM) over time (Difference-in-Difference or DD), and found that microcredit does significantly contribute to expanding per capita sales from self-employment business and nonfarm business: the sales from self-employment from the treatments group grew with approximately 3 million rupiah more between 2007 and 2008 than the sales from the control group. For the sales from nonfarm business this is even higher, namely 3.3 million rupiah. However, the microfinance programme did not increase either profits or income within a year. This is probably because households cannot find the optimal input mix within a short period of time. By adding a dummy for the initial poor to the analysis, the authors find that the benefit of increasing sales is predominantly captured by wealthier households, the net impact was negative if participants were poor. The authors did not find any significant differences between treatment and control groups in savings, durables or livestock using both Ordinary Least Squares (OLS) and PSM-DD estimates.

Yang and Stanly (2012) could not find an income effect either. They conducted a meta-analysis of the income effect from participating in a micro-credit programme of 14 papers. These were selected based on two systematic reviews, namely Duvendack et al. (2011) and Stewart et al. (2012), which claim to have evaluated all relevant research on microfinance in Africa and Asia up to that date. All three articles concluded that existing research contains no evidence that micro-credit programmes have a significant income effect, whether looking at the individual studies or across all studies that meet the criteria set by the systematic reviews.

A recent summary of seven randomized control trials on four continents draws the same conclusion: “microcredit does not have a transformative impact on poverty” (IPA, 2015, p. 1). However, the loans can give low-income households more freedom in choosing between their money making and spending activities.

Khandker et al. (1998) attempted to quantify the village-level impacts of the three most successful micro-credit programmes of Bangladesh: the Grameen Bank (group-lending), the Bangladesh Rural Advancement Committee (BRAC) (focusing more on human capital building) and Bangladesh Rural Development Board’s RD-12 project (combination of the former). The authors compare participating and non-participating villages (N=1798 households) after the programmes were running for over three years from a cross-section of data. The proportionate increase in per household total production compared to that in non-programme villages is 57% (t=2.242) in BRAC villages, 56% (t=2.046) in

Grameen Bank villages and 48% (t=1.954) in RD-12 villages, accrued largely through the rural non-farm sector. Overall village employment in Grameen Bank villages had increased (6.8%, t=2.387), while it decreased in BRAC villages (-11.2%, t=-3.439) and RD-12 villages (-6.7%, t=-1.954) compared to non-programme villages. The increase of employment in Grameen Bank villages was primarily due to an increase in self-employment in non-farm activities (51.1%, t=2.631). This was large enough to offset the decrease in farm wage employment (-39.4%, t=-2.175). Using OLS with White's correction, the authors estimated that income from all sources per household is 29.4% (t=1.861) higher in Grameen Bank villages and 32.7% (t=2.137) higher in BRAC villages, while RD-12 had no significant impact. It is suggested that, for sustainability, programmes must promote skill development and crop sector growth together with rural non-farm growth, since the programmes support workers who make a living from the rural non-farm sector, which is dependent upon agricultural growth.

### *Effectiveness of financial literacy trainings*

In Indonesia, financial literacy may be one of the most important barriers to access to banking. However, the Indonesian banking system has a wide geographical reach and is designed to serve the needs of low income customers as well. Still, only 41% of the total population and 32% of rural Indonesian households have a savings account in a bank (Cole et al., 2011). In addition, Eskes (2011) notes that since Indonesia got more involved in international trade, the importance of financial transactions increased, and therefore a higher level of financial literacy is desirable among the population.

Research to the effect of financial literacy programmes and financial incentives on the demand for a bank account is conducted by Cole et al. (2011) in Indonesia using randomized evaluation. Half of the sample of 564 unbanked households was offered a 2-hour financial literacy education session on the operation of banks and the benefits of opening a bank savings account. To understand cost sensitivity, they offered unbanked households subsidies ranging from 3-14 USD equivalent amounts if the households opened a savings account. The total score out of 4 questions about borrowing, savings and risk, interest rates and inflation was used as a measure for financial literacy. Of those invited for the financial literacy education, 69% attended the course, indicating that demand for financial education is quite high. Nevertheless, the offered financial literacy programme appeared to have no effect on the likelihood to open a bank account (point estimate of -0.02, s.d. 0.027). When comparing literate and uneducated households, the authors only found a substantial effect of 12.3 percentage points (p-value of 0.07) for uneducated households. A higher incentive increased the probability of opening a bank account, but fewer than 10% actually opened one. Using a follow-up survey in January 2010, the authors did not have sufficient statistical power to detect an overall net effect on savings from the financial literacy programme.

By investigating the effect of the Bantesa programme, a microfinance programme presented by Sintesa, on the financial literacy level of members living in Wakatobi, Indonesia, Eskes (2011) could not find a significant difference in saving behaviour either, nor in financial knowledge. The financial literacy training took one hour per day for around three days, dependent on the learning ability of the group. It covered topics about Sintesa and its procedures, the calculation of the interest rate, the importance of savings, the purpose of credit and bookkeeping. For her analysis, the author used secondary data, a few

depth interviews with borrowers and non-borrowers, key informant interviews and a survey (N=191, of which 135 are members and 56 are non-members).

***Summary***

The reviewed literature suggests that the use of micro-credits does not lead to a significant increase either in income or in savings. The BPR-YBS programme in Indonesia suggests that even if non-farm business sales of households increase, it does not necessarily translate into an income effect. Only one paper studying the effectiveness of Grameen Bank and BRAC in Bangladesh found a positive income effect from non-farm income. However, in the light of the other no-result studies, this positive result seems rather to be an exception.

When assessing the used articles in the meta-analysis and the method of the evaluation of the BPR-YBS programme, possible explanations for the difference in impacts are the date of the evaluation (after one year no significant effects are found), whether the loan was used for productive purposes, the size of the loans (larger loans produce generate larger impacts) and the initial level of income of the borrowers.

Concerning financial literacy, no evidence is found for a substantial effect of financial literacy training on financial knowledge. A substantial and sustainable increase in the probability of opening a bank account due to financial literacy training was only found for households with an initial level of financial literacy below median, but no effect from the training was found on savings.

Hence, this literature review warns us not to be overly optimistic about the effectiveness of the KSP-QT project.

# 3. The project

## 3.1. Project description

The Seed Capital programme of Hivos had the objective to improve the financial and social performance of three primary savings and credit cooperatives: KSP-QT, KSP-MDM and KSU-GTGS (see Annex I for further details). The last contract period for the project started on 1 December 2009 and ended on 31 December 2012.[3] There has not been a follow-up project to this contract. According to Hivos, the performance indicators of the cooperatives are strong enough to get funding from other sources. Through the Seed capital project, Hivos has built the capacity of the organisations so that they become self-sufficient.

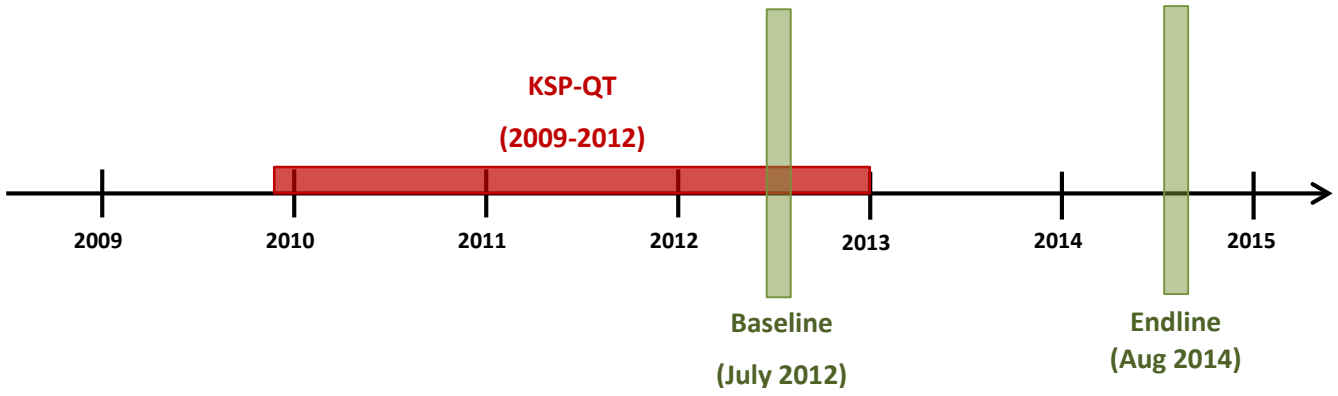
## 3.2. Project implementation

The implementation of the project corresponded with the initial plans. The secondary cooperative, KSM-QTha, was formally established on 16 January 2010 and became a legal entity in 2012. Between 2009 and 2011, capacity building trainings have been conducted for the staff from clerical to managerial level by Mr. Irawan of Lembaga Diklat Profesi (LDP). The focus of the training for the field staff was on basic

[3] In the previous contract period between 2007 and 2009 Hivos supported KSP-QT with capacity building programme to improve professionalism and capacity of the staff members; and Koperasi Simpan Pinjam – Mentari Dana Mandiri (*Saving and Credit Cooperative*, KSP-MDM) through a micro-fund project.

knowledge about cooperative, financial planning for family (financial literacy), and simple business plan. The field staff is in touch with the clients on a daily basis, as their main task is to collect the daily/weekly savings from members of the cooperatives. According to Mr. Mukito (Head Manager of KSM-QTha), most of the field staff are not professional applicants therefore they needed to be trained. However, since 2010 the focus of the trainings has shifted to improvement in financial indicators, supporting software maintenance and official toolkits (computer) from the clerical to the management level.

As specified in the work plan, 50% of the budget[4] was given to KSM-QTha (the secondary cooperative) as seed money. It is used to lend to the cooperatives that need more funding to provide loans to their members. The money is retained at KSM-QTha and is still used for this purpose in 2014.



Further information about Seed capital project of KSP-QT is provided in Annex I.

## 3.3. Evaluation objectives

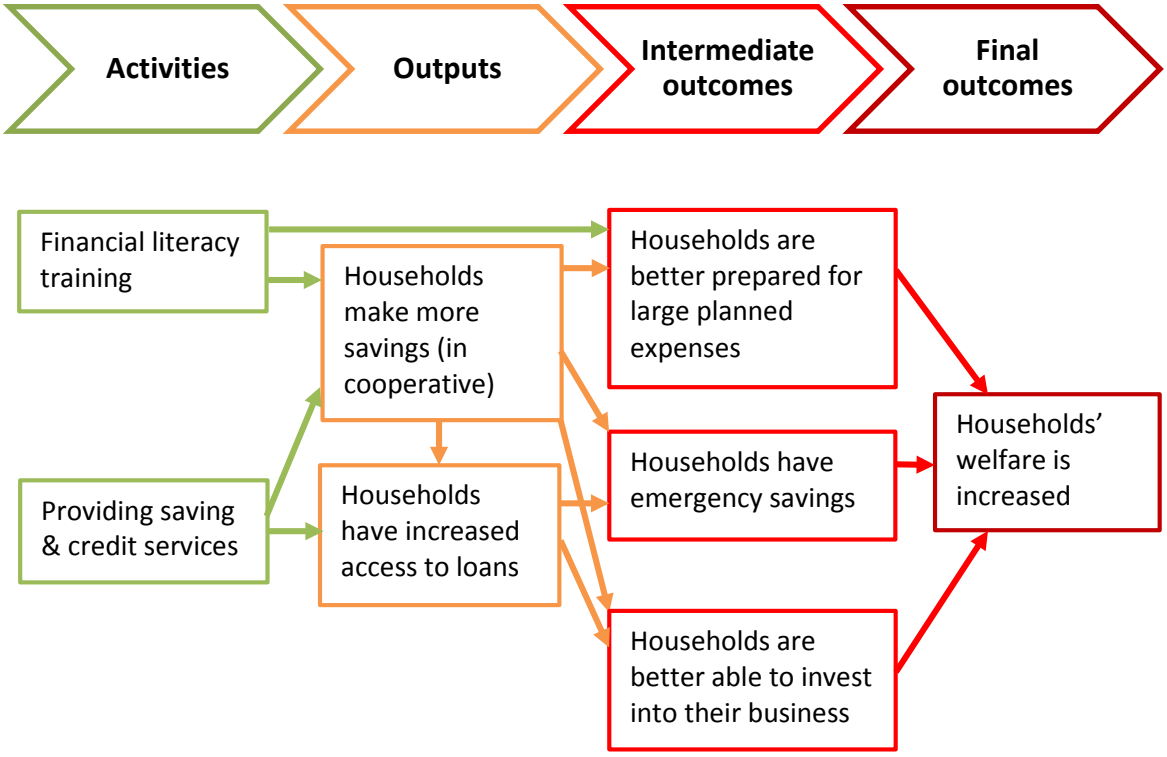
As discussed above, the Seed capital project's objective was to develop the capacity of the savings and credit cooperatives both in terms of their financial and social performance. Hence, the direct beneficiaries of the project are the cooperatives. Nonetheless, in the MFS II evaluation we focus on the cooperative members as the final beneficiaries of the project as the cooperatives serve the benefit of their members.

More importantly, Figure 1 shows that the project and evaluation periods are not well aligned: the project has already almost finished at the time of the baseline survey. Therefore, we are not able to compare the situation with the project to the situation before the project has been implemented. Instead, we focus the evaluation on the impact of the cooperatives on their members after the project. We jointly measure the effect of the availability of the cooperatives' services and the project's effect on improving their service delivery. In particular, the project introduced the family finance trainings to the cooperatives and enabled the cooperatives to increase their service area and better manage their finances.

**Figure 1: Timing of intervention**

[4] The amount of seed capital was 1,215,000,000 IDR or 98,780.49 EUR using exchange rate 12,300 IDR/EUR.

## 3.4. Result chain



In this section, we discuss the hypothesized result chain of the KSP-QT project for the purpose of the MFS II evaluation. The intervention logic of the project only covered the results at the cooperative level. Therefore, the research team has developed a result chain describing the savings and credit cooperatives' effect on their members. Figure 2 presents the result chain.

The figure starts out from one of the objectives of the secondary cooperative (KSM-QTha) regarding their social performance: "improving the welfare of the members and neighbouring communities". This objective is taken as the final outcome at the membership level.

We focus on the two main activities of the saving and credit cooperatives: providing saving and credit services and the trainings on family financing for each new member (financial literacy training). For simplicity, we omitted from the figure that the project's cooperatives are probably not the only micro-finance organisations offering saving and credit services to the population.

The financial literacy training starts with an hour-long individual or group training/discussion, and it is followed up by a daily/weekly collection service of the members' savings as part of a continuous education. However, prospective cooperative members learn about the importance of saving and planning their yearly incomes and expenditures (see Annex I). By saving in the cooperatives, members become eligible to borrow from the cooperatives. Savings also contribute to the emergency savings of the households, and together with access to credit they enable households to invest into their businesses. As a result, households rely more on savings and less on credit for their yearly expenses, and they are better able to plan activities for which they need to take credit.

**Figure 2: Result chain**

# 4. Evaluation questions and outcome variables

## 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. In the baseline report specific evaluations questions were specified. Table 1 shows these five questions and what it implies for this project.

**Table 1: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| 1 | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | 1. Do the members have better access to financing?<br>2. Do the members manage their financial flows better?<br>3. Did the livelihood of members improve as a result of better access to financing?<br>4. Did the repayment rate at the 3 cooperatives improve?<br>5. Were the cooperatives successful in reaching more female members? |
| 2 | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Are the observed changes above attributable to the intervention? |
| 3 | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>• Does the project address an important issue for the beneficiaries? |
| 4 | Efficiency: Were the development interventions of the Southern partner organisations efficient? | Was the intervention cost effective? |
| 5 | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

For the first question, we investigate the households' use of financial instruments (saving and borrowing); for the second question, we look at the financial skills and knowledge of respondents; while for the third question, we investigate the income, livelihood and food security of households.

Unfortunately, we do not have sufficient information to answer questions 4 and 5. Therefore, we will only focus on the first 3 questions presented in Table 1.

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators. The outcome indicators are split up into 4 groups: use of financial instruments, financial knowledge and skills, household income and livelihood, and food security and vulnerability. Each group represents a uniform indicator specified by the synthesis team for goal on poverty alleviation (MDG 1). For each group, we report on multiple outcome indicators.

Table 2 displays the outcome indicators of the main analysis, the scale of these variables and whether the indicator is a uniform indicator, while Annex II describes the outcome indicators in more detail.

**Table 2: Overview outcome indicators**

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| **Panel A. Use of financial instruments** | | | X |
| Percentage of households that know a place to borrow | (0%; 100%) | Household survey | |
| Percentage of households involved in a financial institution | (0%; 100%) | Household survey | |
| Percentage of households with savings in bank account | (0%; 100%) | Household survey | |
| Percentage of households with savings in savings and credit cooperative | (0%; 100%) | Household survey | |
| Percentage of households with savings in savings and credit group | (0%; 100%) | Household survey | |
| Percentage of households that have borrowed in the past 12 months | (0%; 100%) | Household survey | |
| **Panel B. Financial knowledge and skill** | | | X |
| Percentage of households that keep close eyes on expenditures | (0%; 100%) | Household survey | |
| Percentage of households that have financial plan | (0%; 100%) | Household survey | |
| Score on financial numeracy (only for panel respondents) | (0; 4) | Household survey | |
| **Panel C. Household income and livelihood** | | | X |
| Total income per month per capita (1000 Rp) | (NM; NM) | Household survey | |
| Food consumption per capita (1000 Rp) | (0; NM) | Household survey | |
| Non-food consumption per capita (1000 Rp) | (0; NM) | Household survey | |
| Housing facilities index | (NM; NM) | Household survey | |
| Asset index | (NM; NM) | Household survey | |
| Percentage of households invested in business | (0%; 100%) | Household survey | |
| Percentage of households invested in new farming tools | (0%; 100%) | Household survey | |
| Overall happiness (only for panel respondents) | (1; 4) | Household survey | |
| Current subjective wealth status (only for panel respondents) | (1; 6) | Household survey | |
| **Panel D. Food security and vulnerability** | | | X |
| Percentage of households that have emergency savings for at least one month | (0%; 100%) | Household survey | |

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| Percentage of household not able to cover their living costs during the last 12 months | (0%; 100%) | Household survey | |
| Current standard of living: daily needs covered (only for panel respondents) | (1; 3) | Household survey | |
| Current standard of living: food consumption covered (only for panel respondents) | (1; 3) | Household survey | |
| Notes: NM = no minimum/maximum | | | |

# 5. Data collection

This section describes the survey instruments and the sampling design and outcome in turn.

## 5.1. Survey instruments

We collected two types of data: quantitative and financial. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

To analyse the impact of the savings and credit cooperatives, structured household surveys been conducted with cooperative member households and comparison households. The baseline data have been collected in July 2012; while the endline data was collected in August 2014.

### *Financial data collection*

To collect information about the costs of the KSP-QT project, we conducted a project cost survey with director of KSP-QT on 22 July 2013. A follow-up interview has been conducted in June 2014.

## 5.2. Sampling outcome

The evaluation focuses on the impact of the KSP-QT project on direct beneficiaries: members of the savings and credit cooperatives. Therefore, members of KSP-QT cooperative were surveyed in 5 villages and members of KSU-GTGS in 3 villages. In addition, households were surveyed in 5 comparison villages.

The following sub-sections discuss the selection procedure for the survey respondents (sampling design) and the results of its implementation (sampling outcome).

### *Sampling design*

From the three primary cooperatives of the project, we have sampled from two: KSP-QT and KSU-GTGS. We chose these two cooperatives, because these focus on financial literacy education. The cooperatives have thousands of members living in a number of districts. We chose the districts, and within these districts we chose the villages with the largest group of members. We randomly sampled members from these villages stratified by the year of membership. We aimed to sample an equal number of member households from those that joined the cooperatives in 2010, 2011 and 2012.

Comparison villages were chosen in the same district as for the cooperatives, and using administrative data we have attempted to match them in terms of population, size and the percentage of household living from agriculture. Households in the comparison villages were randomly chosen stratified by location.[5] Hence, the comparison group should be a representative sample of the population in these villages. However, the households in the treatment groups are a representative sample of the households that have self-selected themselves into using the services of the cooperatives.

We planned to interview a total of 300 households for the survey in 13 villages. From these 105 households in 5 villages were sampled as members of KSP-QT, and 45 households in 2 comparison villages were chosen as a comparison group for the KSP-QT sample. Another 105 households in 3 villages were sampled from the members of KSU-GTGS, and 45 households in 3 villages were used as control for the KSU-GTGS sample. There is no overlap between the villages were KSP-QT and KSU-GTGS are active. The two subsamples for the cooperatives were also chosen in different districts.

At the endline survey, we aimed to re-interview all respondents and households participating in the baseline survey. However, if it was not possible to interview the same household or the household moved out of the village, we dropped the household from the endline survey (no replacement was made). As some of the questions in the survey relate to the knowledge or attitude of the respondent, we aimed to interview the same respondent as for the baseline survey. If this was not possible, we interviewed another household member knowledgeable about household income and consumption.

### *Sampling outcome*

Table 3 summarizes the planned and actual number of households interviewed during the baseline and endline period. The third column of the table shows that there was discrepancy between the planned and actual sample size at the baseline: the number of respondents in the KSU-GTGS sample is lower than planned. This is due to the low response rate in those villages: 155 households were approached for an interview from which 21 refused to participate and 37 households were not interviewed for other reasons. To compensate the low number of respondents, more households were interviewed for the KSP-QT sample. In total, interviews for 296 are used for the baseline survey because 4 interviews could only partially be completed.

The fourth column of the table (panel households) shows the number of households that were interviewed also at the endline. Overall, 98% of the sample was re-interviewed at the endline, which is a very low attrition rate.

[5] We did not have information about the characteristics of treatment households in advance, and this type of information was also not readily available at the villages. Therefore, we resorted to random sampling at the comparison villages.

**Table 3: Sampling outcome**

| Assignment group | Planned households | Baseline outcome | Panel households | Panel respondents |
|---|---|---|---|---|
| KSP-QT member | 105 | 110 | 108 | 99 |
| KSU-GTGS member | 105 | 96 | 95 | 86 |
| Comparison group | 90 | 90 | 87 | 78 |
| **Total** | **300** | **296** | **290** | **263** |
| Source: Household survey E6, MFS II Evaluation Indonesia | | | | |

The last column (panel respondent) shows the number of cases where the same respondent was interviewed both for the baseline and endline survey. Overall, for 89% of the baseline sample the same respondent has been interviewed at the endline. This percentage is similar among the assignment groups. The most common reason for a new respondent at the endline survey was that the respondent was not at home (13).[6]

# 6. Descriptive statistics

This section summarizes the main characteristics of the treatment and comparison groups using the baseline and endline surveys. First, the socio-economic characteristics of the sample is summarized, which is followed by discussing the self-reported project exposure of the households focusing on family finance meetings, saving and borrowing at the cooperatives. Characteristics of cooperative members are also discussed.

## 6.1. Household characteristics

To provide a better insight into the general characteristics of our sample, Annex V provides information on a number of general characteristics like household size; age, gender and education of the household head; and the main income of the household. The sample size for the variables is reported in Annex III. In addition, Annex IV provides information about the study locations.

The table in Annex V shows that cooperative member households (both KSP-QT and KSU-GTGS) are on average more educated (26-29% with secondary education compared to 13%) and rely less on remittances as their main income source (1-3% vs 9%). In addition, KSU-GTGS member households on average have younger (44 vs 52 years) and more often male household heads (98% vs 85%), and rely on non-farm business as their primary income source (43 vs 15%). In the data analysis, we control for these characteristics.

However, cooperative member households were on average not better off 5 years ago (before becoming cooperative members) compared to the comparison households based on their subjective wealth status. The average cultivated land size was also not significantly different between the treatment and comparison groups.

[6] Other reasons were illness (7), moved (3), too old (2), refusal (1) and other reasons (1).

The table also shows that, at the endline compared to the baseline, more KSP-QT households reported to have a household head with only primary education, and less with a secondary education. In the KSU-GTGS sample, more households reported crop farming as their main income source at the endline (42% vs 32%), which is a shift from non-farm business as primary income source. In addition, in all groups the average cultivated land size decreased between the baseline and the endline periods. We do not have an explanation for this change. However, we include the land size variables, along with the other variables that significantly changed over time, as controls in the data analysis of the change in outcome variables.

## 6.2. Treatment exposure

In this section, we investigate the exposure of the sampled households to the services of savings and credit cooperatives. We are interested whether households have learned about financial literacy or family finance, who the members are, and whether they are indeed using the services of savings and credit cooperatives for saving and borrowing.

First, Table 4 displays the information about attending meetings on family finances by treatment and comparison groups. The first variable reports whether households have attended such meetings organised by the cooperatives. This question was asked to the respondents when discussing their membership in the cooperatives. Hence, we directly asked whether any household member attended such meetings organised by the savings and credit cooperative in question. The table shows that almost 20% of the KSP-QT member households but only 3% of the KSU-GTGS member households reported to have attended any such meetings before the baseline. This suggests that most households cannot recall the discussion about family finances when they joined the cooperative.

These percentages are higher at the endline (37% and 5%), indicating that KSP-QT targets not only new members for providing information about family finance. Indeed, 21% of the member households indicate that they have received information about family finances from KSP-QT between the baseline and endline surveys despite already being a member of KSP-QT for some time. However, KSU-GTGS is either less active in discussing family finances with its members or the members cannot recall such information anymore. Based on these figures, we can only expect that KSP-QT has an impact on the financial skills of its members.

The second group of variables in Table 4 report the responses of the households when asked about meetings on family finances not in connection with financial institutions. The table shows that a few comparison and KSU-GTGS member households have also received such information from other sources than savings and credit cooperatives. However, some KSP-QT member households do not anymore recall attending meetings on family finances when asked independently of KSP-QT.

**Table 4: Participation in meetings on family finances**

| Assignment group | Comparison | KSP-QT | KSU-GTGS |
|---|---|---|---|
| % HHs ever attended any meeting on family finances organised by cooperative | | | |
| *Before baseline* | 0.0 | 19.6 | 3.2 |
| *Before endline*[1] | 0.0 | 37.4 | 5.4 |
| *Between 2012-2014* | 0.0 | 21.3 | 2.1 |
| % HHs ever attended a meeting on family finances […] | | | |
| *Before baseline* | 1.1 | 15.7 | 5.3 |
| *Before endline*[1] | 3.4 | 24.1 | 7.4 |
| % HHs attended a meeting on family finances between baseline and endline | 2.3 | 7.4 | 1.1 |

Source: Household survey E6, MFS II Indonesia

Notes:

1. Endline values are corrected for consistency with the baseline data. If households reported to ever attend a meeting on family finances at the baseline we assumed that this statement must also be true at the endline.

Next, in Table 5 we investigate information about the project cooperative members. First, the distribution of the sample by the year they joined the cooperative is displayed for the baseline, and also the percentage of households (HH) who reported to have remained members of the cooperatives at the time of endline survey (also by year of membership). The data shows that the members are similarly split among joining the cooperative in 2012, 2011 or 2010 (or earlier), as planned. The percentage of households who joined in 2010 can be calculated by subtracting the values for '2009 or earlier' from the values of '2010 or earlier'. In the case of KSU-GTGS, almost 12% of the sampled members reported to have joined the cooperative in 2009 or earlier.

In the endline columns, we observe that only 68% of the KSP-QT sample still report to be a member of KSP-QT and this percentage is 73% for KSU-GTGS. However, there is no clear pattern that older or newer members are more likely to quit the cooperatives. Having multiple household members as cooperative members is also no guarantee for continued membership: if anything households with multiple members are less likely to remain members by the endline (53% vs 68% for KSP-QT and 66% vs 73% for KSU-GTGS).

Looking at the gender of the members, above 70% of the sampled members are women for KSP-QT and almost 60% for KSU-GTGS, and this ratio is stable over time and represents the focus of the cooperatives on women. Cooperative members are most often either the spouse of the household head (40-58%) or the household head (28-32%), and in some cases their children (8-27%).

The last row in the table shows that, similarly to the information on family finance meetings, KSP-QT members are more likely to attend any meeting organised by the cooperative (39% vs 8% at baseline), and this percentage remains similar also at the endline.[7]

[7] However, note that at the endline we report on a 24-month-period compared to a 12-month-period at the baseline.

**Table 5: Cooperative membership**

| Assignment group | KSP-QT | | KSU-GTGS | |
|---|---|---|---|---|
| **Survey** | Base | End | Base | End |
| Year of membership[1] (%) | | | | |
| *2012* | 34.6 | 25.2 | 26.9 | 20.4 |
| *2011* | 35.5 | 22.4 | 36.6 | 29.0 |
| *2010 or earlier* | 29.9 | 20.6 | 36.6 | 23.7 |
| *2009 or earlier* | 3.7 | 2.8 | 16.1 | 11.8 |
| *Overall* | 100.0 | 68.2 | 100.0 | 73.1 |
| % HHs with more than one member | 17.6 | 9.3 | 25.3 | 16.8 |
| % HHs with both household head and husband/wife as member | 8.3 | 9.8 | 10.5 | 12.0 |
| % female members[2] | 73.2 | 71.7 | 56.3 | 60.0 |
| Relation to household head […][2] (%) | | | | |
| *Head of household* | 32.3 | 32.6 | 27.7 | 30.8 |
| *Spouse of household head* | 54.3 | 57.6 | 39.5 | 50.5 |
| *Children* | 10.2 | 7.6 | 26.9 | 15.4 |
| *Grandchildren* | 0.8 | 0.0 | 0.0 | 0.0 |
| *Father/Mother* | 2.4 | 1.1 | 0.8 | 0.0 |
| *Sister/Brother* | 0.0 | 0.0 | 0.8 | 0.0 |
| *Son/Daughter-in-law* | 0.0 | 1.1 | 4.2 | 1.1 |
| % HHs attended any meeting organised by cooperative in past 12 months (baseline) / past 24 months (endline) | 38.9 | 36.1 | 8.4 | 6.3 |

Source: Household survey E6, MFS II Indonesia
Notes:
1. At the endline report the percentage that still report membership in cooperative from those that became member in a given year.
2. Of total members. The sample size is bigger than the number of households since in some households more than one person is a member of the cooperative.

Finally, previewing some of the project outcomes, Table 6 shows information about the borrowing and saving activities of the households in relation to the project cooperatives by the year of membership. The table shows that a large percentage of households had savings at the cooperatives at the baseline (82-90%), while this percentage decreased by the endline to 56-71% partly due to households no longer being members of the cooperatives.

Borrowing was lower at the baseline (27-53%). At the endline, borrowing decreased from 53% to 40% for the KSP-QT sample, while it increased from 27% to 33% at KSU-GTGS. Unfortunately, we do not have in-depth information to explain these trends.

**Table 6: Borrowing money by year of membership in cooperatives**

| Assignment group | KSP-QT | | KSU-GTGS | |
|---|---|---|---|---|
| Survey | Base | End | Base | End |
| % HHs borrowed from cooperative in the past 12 months | 52.8 | 39.8 | 27.4 | 32.6 |
| % HHs borrowed from cooperative in the past 12 months if joined […] | | | | |
| *2012* | 59.5 | 45.9 | 16.0 | 28.0 |
| *2011* | 50.0 | 28.9 | 23.5 | 32.4 |
| *2010 (or earlier)* | 50.0 | 46.9 | 38.2 | 35.3 |
| *2009 or earlier* | 75.0 | 75.0 | 46.7 | 46.7 |
| % HHs have savings in a savings and credit cooperative | 89.8 | 55.6 | 82.1 | 70.5 |

# 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured between the base- and endline survey (2012-2014) are grouped into 4 categories: use of financial instruments, financial knowledge and skills, household income and livelihood, and food security and vulnerability.

Table 7 displays the results for the outcome indicators for the surveyed treatment (KSP-QT and KSU-GTGS members) and comparison groups. Columns 1-3 report on the comparison group: the mean at the baseline (1), mean at the endline (2) and the probability (p-value) that the average change in the comparison group between endline and baseline is zero (3). If the p-value is below 0.05, the change in the variable is significant at the 5% significance level. The standard error of the group means at the baseline and endline periods is reported in brackets below the mean.[8]

The following columns report on the outcome variables in the treatment groups: columns 4-6 shows the statistics for the KSP-QT member households, while columns 7-9 contain the results for the members of KSU-GTGS.

[8] Standard errors are corrected for heteroskedasticity and clustering at the location level. This means that the standard errors are allowed to have an arbitrary correlation for comparison or treatment respondents in the same village. In other words, we allow respondents in the same village in the same treatment group (comparison or treatment) to be more similar to each other than they are to a different randomly selected respondent in another village from the other treatment group.

The outcome indicators are reported for the panel sample. For 5 indicators (see Table 2) the significance of change (p-values) is only reported for the panel respondents as these variables represent the knowledge or subjective opinion of the respondent.

The results are discussed by outcome indicator group below.

### *Use of financial instruments*

The starting position of the comparison group versus the treatment groups was quite different: At baseline 22 percent of the comparison group reported to be involved in a financial institution whereas for the treatment groups the percentage was over 90 percent. This is no surprise, the cooperatives are financial institutions as they provide a possibility for lending and savings. The comparison group is drawn from the general population.

We observe a sharp reduction in the use of financial instruments that are directly related to the intervention of the members of KSP-QT and KSU-GTGS. This points to a fluctuations of members in the savings and credit cooperatives. These respondents were sampled because at baseline they were members, and we observe as expected, high use of services. But two years later, the utilization rates dropped considerably. For instance, for KSP-QT, 90 percent of members report to save in a credit cooperative at baseline, but by endline this dropped to 56 percent. For KSU-GTGS it dropped less sharp, from 82 to 71 percent. Respondents in the comparison group did not have savings in savings and credit cooperatives, both at baseline and endline. We also observe a drop in the households involved in a financial institution. The drop is less sharp, as expected, because the question is not limited to savings and credit cooperatives.

We observe a positive trends in the use of financial products which are not directly related to savings and credit cooperatives. KSP-QT (KSU-GTGS) members increased their use of savings accounts in regular banks from 14 (33) percent at baseline to 29 (37) percent at endline. For the comparison group, the trend is also positive, but much less, from 17 to 20 percent.

### *Financial knowledge and skills*

We see no trends in the score on financial numeracy. This score measures whether respondents answered four financial numeracy questions correct. The questions were about division, interest rates and understanding of profit on loans. The scores of the KSP-QT and KSU-GTGS members are only slightly above those of the general population. On average, respondents answered around 3 questions correct.

### *Household income and livelihood*

Panel C reports on household income and livelihood. First of all, we observe a huge discrepancy between incomes and consumption. Incomes are a fraction of the reported consumption figures. We have more faith in the consumption figures. The income figures are unrealistically low, with monthly income of around 312,000 Indonesian rupiahs (Rp) or 25 euros[9] per capita per month at the baseline (KSP-QT and KSU-GTGS). Consumption figures are more realistic with around 581,200 Rp or 48 euros per capita per month including food and non-food consumption (KSP-QT). Income data, especially from those self-employed are notoriously hard to collect. A major reason for the large discrepancy probably

[9] Using the annual average exchange rate for 2012 at 12,087.2 IDR/EUR.

has to do with the recall period. Income data were collected with a recall period of a year, and then scaled to monthly figures, whereas food consumption was collection for the last week, and scaled up to monthly.

We observe, from the consumption data, that cooperative member have similar average consumption levels as the general population. The averages of the asset and housing facilities indices, expressed in standard deviations of observed variations in asset holdings, indicate that KSP-QT have similar asset holdings as the comparison group but the KSU-GTGS members are substantially richer. For all groups, we observe a positive trend in the asset holdings. The subjective wealth status confirms this finding. On a scale from 1 to 6, KSU-GTGS members rate themselves around 3.1, while KSP-QT members rate themselves at similar levels as the comparison group, around 2.7.

Table 7 also reports on whether respondents invested in business or farming tools. The index is based on a question on whether respondents invest to expand their business (or started a new business) or had purchased new farming tools in the past 12 months (see Annex II). We observe that savings and credit cooperative members started and ended with a higher rate of investments. We also observe a downward trend for all groups. It is not clear why this happened, in particular for the comparison group. We do not see any indication of a loss in general welfare for this group.

### *Food security and vulnerability*

Precautionary savings provide a venue to reduce such vulnerability. We observe generally positive trends in the fraction of people reporting to have emergency savings. Members of the savings and credit cooperatives report more positive trends. At endline, 56 (70) percent of KSP-QT (KSU-GTGS) members report such savings. A similar trends is observed for whether people feel that in their income does not cover their living costs in the past 12 months. We observe a negative trend for the members of the savings and credit cooperatives, whereas the value for the general population has remained about the same. For the other subjective welfare questions on whether current standard of living covered daily needs and food consumption needs, we do not observe strong trends. The result suggest that households have been better able to smooth their consumption, avoiding periods of hardship, possibly with the help of precautionary savings.

Notes: Standard errors given in parentheses. Robust standard errors corrected for clustering at the village level are used to calculate p-values. P-values are not defined for variables where there was no change.

1. Significance of change (p-value) is reported only for panel respondents.
2. Prices are reported in 2012 real prices. Prices at the endline are deflated by the CPI for 2012 at 4.3% and for 2013 at 8.38% (total of 13.04%). Source: http://www.bps.go.id/eng/aboutus.php?inflasi=1

# 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

## 8.1. Methodology

We analyse the effects of the Seed capital project on beneficiaries using regression analysis. The primary analysis uses difference-in-difference methodology: we compare the changes in outcome indicators between the treatment groups (KSP-QT and KSU-GTGS members) and the comparison group. We assume that in the absence of the project cooperatives, on average, we would observe the same magnitude of changes in the treatment groups as in the comparison group.

However, because the Seed capital project started already before the baseline survey (as discussed in section 3.3) and we sampled cooperative members that have been members already for a longer time, we also analyse the early results of the project using cross-sectional analysis on the baseline data. Therefore, the total impact of the cooperatives is the sum of the early effects (at the baseline) and the effects found between the baseline and endline survey period (at the endline). Below we discuss the model used for the regression analysis in detail.

### *Treatment effect on the treated*

Regression (1) represents the general model for estimating the treatment effect of the WIIP project.

(1) $$Y_{it} = \alpha_t + \beta QT_{it} + \gamma GTGS_{it} + \zeta X_{it} + \eta_i + u_{it},$$

where $Y_{it}$ denotes an outcome variable from the list presented in section 4.2 (dependent variable) for household $i$ at time $t$; $QT_{it}$ is a binary variable with value 1 if household $i$ at time $t$ has been member of KSP-QT and 0 otherwise; and $GTGS_{it}$ is also a binary variable indicating whether household $i$ at time $t$ has been a member of KSU-GTGS. Please note that the two cooperatives operate in different villages, therefore, it is not possible for one household to be a member of both KSP-QT and KSU-GTGS. We estimate separate treatment effects for the two cooperatives because they offer slightly different financial products tailored to their target group.

In general, because the treatment and comparison groups are representative of different populations,[10] there could be differences in the characteristics of the treatment and comparison villages and of the households sampled in these villages. If some of these characteristics also affect the outcome of $Y_{it}$ and we do not control for these characteristics, we could mistakenly interpret the effect of these characteristics on the outcome variable as an effect of the project. Therefore, in (1) we include $X_{it}$, a set of observable control variables that affect the project outcome but they are not affected by the outcome itself (predetermined). In addition, we also include household fixed effects ($\eta_i$) that pick up unobservable time invariant household specific characteristics; and a time varying trend ($\alpha_t$) in the outcome variable. The remaining residuals ($u_{it}$) are clustered at the village level.

Finally, turning to the variables of interest: we are interested in the estimates of $\beta$ and $\gamma$, the coefficient of the treatment effect of KSP-QT and KSU-GTGS, respectively.

### *Early treatment effect on the treated at the baseline*

First, we adapt (1) to estimate the effect of the WIIP project at the baseline:

(2) $$Y_{i1} = \alpha + \beta QT_{i1} + \gamma GTGS_{i1} + \zeta Z_{i1} + u_{i1}$$

Note that the control variables in (2) were adjusted. First, it is not possible to estimate the individual fixed effects using only one observation per household; and second, the set of control variables, $Z$, satisfies the additional condition that it represent the situation of households prior to the start of the WIIP project at the beginning of 2012 (not effected by the project). In regression (2), it is important to control for all observable village and household characteristics that differ between treatment and comparison villages.

However, we have sampled households who became members of the cooperatives in 2010, 2011 and 2012. Assuming that the longer one is a member of a cooperative the larger the benefits are, it is sensible to include the length of membership in regression (2). Then,

(3) $$Y_{it} = \alpha + \sum_{k=2010}^{2012} \beta_k \, YQT_{it}^k + \sum_{k=2010}^{2012} \gamma_k \, YGTGS_{it}^k + \zeta Z_{it} + u_{it},$$

where $YQT_{it}^k$ and $YGTGS_{it}^k$ are dummy variables denoting the year of becoming a member in the savings and credit cooperative with $YQT_{it}^{2012} = 1$ if household $i$ joined the cooperative in 2012 and $YQT_{it}^{2012} = 0$ otherwise, *etc*. We expect that the longer a household is member of the cooperative the larger the impact, or that $\beta_{2012} < \beta_{2011} < \beta_{2010}$ and $\gamma_{2012} < \gamma_{2011} < \gamma_{2010}$. The results of (3) are presented in Annex VI for both the baseline and the endline surveys.

### *Treatment effect on the treated between baseline and endline*

We use difference-in-differences methodology to estimate the treatment effect of the Seed capital project between the baseline and the endline survey. We take the first difference of (1):[11]

(4) $$\Delta Y_{i2} = \alpha + \beta QT_{i2} + \gamma GTGS_{i2} + \zeta \Delta \mathrm{W}_{i2} + \Delta u_{i2}$$

The time-invariant household fixed effect disappears in (4) due to the differencing, along with some of the control variables in $X$ with $\Delta \mathrm{W}_{i2}$ containing the change in the remaining control variables. Only

[10] The treatment groups are representative of the cooperative members, while the comparison group is representative of the population of the comparison communities.

[11] Hence, $\Delta Y_{i2} = Y_{i2} - Y_{i1}$ and so forth.

variables where the change is significantly different between the treatment and comparison groups are included in W. In addition, we denote the average change of the outcome variable in the comparison group by $\alpha$.

Note that we omitted the change sign (Δ) from the treatment variables $QT_{i2}$ and $GTGS_{i2}$. In principle, taking the differences of the binary variables would be zero due to the households' being a member of the cooperative already at the baseline period. However, assuming that the longer term effect of the project is larger than at the short-term, we may still expect a positive impact from the project on the members. Note that we assume that $QT_{i2} = QT_{i1}$ and $GTGS_{i2} = GTGS_{i1}$ irrespective of the households not using the services of the cooperatives anymore.

We report the regression results for the treatment effects, $\beta$ and $\gamma$, with and without control variables (W). In addition, in Annex VI we also report on the difference-in-difference regression allowing for different effects for the households joining the cooperatives in different years (as in regression (3)).

## 8.2. Results

Table 8 reports the regression results for the outcome indicators in the same order as in section 7, and Annex VI contains the results for regressions separating the impacts by year of membership.

The first column of Table 8 contains the mean value of the variable in the comparison group at the baseline. This serves as a reference point for assessing the size of the project impact on the variables. The next three columns report on the project's impact on KSP-QT members: column 2 report the early treatment effect using regression (2) on the baseline data, column 3 reports the difference-in-difference (DD) regression results of regression (4) without the controls, and column 4 shows the regression results including controls (DDX). The regression results for KSU-GTGS are reported in columns 5-7 in the same order as for the impact of KSP-QT in columns 2-4. As mentioned above, the overall effect of the cooperatives on their members should be assessed as the sum of the baseline effect (column 2 or 5) and the DD effect (column 4 or 7).

In the baseline regression (columns 2 and 5), the age, gender and education of the household head; household size; gender of respondent; relation of respondent to the household head; respondent's risk preference and subjective wealth status 5 years ago; and the household's main income source are used to control for differences between the households. In the diff-in-diff regression (columns 4 and 7), household size, the size of land owned, education of the household head and the main income source of the households are included as control variables.[12]

The standard error of the coefficient estimates are calculated correcting for heteroskedasticity and clustering at the location level, and they are reported below the coefficients estimates in brackets (columns 2-7). The significance of the coefficient estimates is denoted by stars next to the coefficient

[12] Note that the coefficient estimates for KSP-QT and KSU-GTGS are obtained from the same regression estimates, i.e. we used one regression to obtain the results in column 2 and 5.

estimates.[13] Note that the sample size for the regressions is not reported but can be inferred from Annex III.

The impact results mostly are in line with the general trends observed in Table 7.

### *Use of financial instruments*

Panel A, on the use of financial instruments, shows that conditional on observed characteristics, savings and cooperative members were about 70 percent point more likely to be involved in a financial institution, and about 87 percent point more likely to have savings in a savings and credit cooperative. Notable is that for the latter, the drop for KSP-QT the drop from baseline to endline (in comparison with the comparison group) was around 33 percent and highly significant while for KSU-GTGS the effect is much less and insignificant from zero. The reverse occurred for the households holding savings in a bank. This indicates that KSP-QT members tend to make use of the regular financial system after they have paid back their loan, while KSU-GTGS members continue to use the financial services of the cooperative. The results in Annex VI confirm that this result is likely related to the paying back of loans. For KSP-QT members we find that the impact (Diff in diff, table 12) on holding savings in a savings and credit cooperative is about twice as big for those who became members in 2010 as compared to those who recently became members in 2012.

### *Financial knowledge and skill*

We observe small and often insignificant impact on the financial knowledge and skill indicators reported in Panel B. There are no significant effects for KSP-QT members. For KSU-GTGS members, we find some positive effects. Relatively more households report to have a financial plan, and at baseline, financial numeracy skills are higher. A positive effect on having a financial plan is also found for KSP-QT, but for them the effect is not significantly different from the comparison group. The effects are also not significantly different between the two types of cooperatives.

### *Household income and livelihood*

As discussed in the previous section, we focus on consumption rather than income data when discussing the effect on household wealth. We find that correcting for observed characteristics, membership in KSU-GTGS results in a positive impact on per capita consumption of about 20 percent. No such effects are found for KSP-QT. The diff in diff results indicate that over the course of the evaluation period, the differences between the groups did not change much.

To interpret the results on the asset and housing indices, it is good the recall the trends observed in Table 7. Note that members started off with higher values of the asset indices, and improvements were recorded for all groups over the course of the evaluation period. The positive results in the 'base' column for KSU-GTGS indicates that they started off with considerably more assets (correcting for observed characteristics) than the comparison group. This is not the case for KSP-QT for the housing facilities index. For regular assets, the baseline effect of KSP-QT is 0.1 standard deviation but not significant. The results also show that assets of cooperative members grew less than for the comparison

[13] The probability that the coefficient estimates are not significantly different from zero is indicated by stars: * denotes that this probability is smaller than 10%, ** is used if this probability is less than 5% and *** if it is less than 1%. Hence, the more stars indicate a higher probability that the effects are significantly different from zero.

group over the course of the evaluation period. For KSP-QT, the drop is higher than the positive effect found in the baseline results. For KSU-GTGS, the effect is less, indicating that they remained to keep higher assets as compared to the control group. The positive wealth effect for KSU-GTGS is also confirmed by the subjective wealth status question. We find positive and significant impact results for KSU-GTGS in the diff in diff results (of about 0.4 compared to 2.8 for the comparison group at baseline and on a scale from 1 to 6).

### *Food security and vulnerability*

Regarding food security and vulnerability, we find a confirmation of the positive impact of membership of the cooperatives on precautionary savings. The results for having periods in the past 12 months not being able to cover cost of living have clearly decreased. The results indicate that KSP-QT members started off from a more vulnerable position than the general population while the opposite holds for KSU-GTGS members. The more negative trends (less vulnerability) observed in Table 7 also show up in the negative diff in diff results, but the effects are all not significantly different from zero. On the other hand, we find a positive and significant effect on some of the subjective assessments on whether current income is sufficient to meet daily needs. It points to a weak, but positive effect of the project in reducing vulnerability.

### *Discussion of findings*

In this subsection we present some subjective assessments from the researchers, and readers are invited to disagree. We find the finding that the savings and credit cooperatives' services are often temporary and related to having a loan quite revealing. It is no surprise that utilization of loans reduces after having paid them back, but it is surprising that savings follow a similar pattern. One would expect members to keep their savings. It seems as if members only save at the savings and credit cooperative because they are obliged to do so as a condition for the loan. The nice thing on the other hand is that we do observe that KSP-QT opens the door to more participation in the regular financial sector. These members are not so different from the general population when they start, and financial access to bank account increases by about 20 percent as a result of the project.

The lack of effect on financial literacy and knowledge is unfortunate but also understandable. On the one hand, not many members recalled participating in trainings on household finances. On the other hand, the indicators used to assess this evaluation question were potentially not the most relevant for the cooperative members.

# 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular we look at the size of the impact and whether the project addresses an important issue for the beneficiaries (the cooperative members).

## 9.1. The size of the impact

In Table 5, we observe that only 68 (73) percent of the cooperative member households kept their membership at the endline in KSP-QT (KSU-GTGS). Accordingly, we observe a substantial reduction in savings at the cooperatives (from 90 to 56 percent at KSP-QT and from 82 to 71 percent at KSU-GTGS) and financial involvement (from 95 to 78 percent and from 93 to 84 percent), particularly for KSP-QT (Table 7). This suggests that after the repayment of loans, many households decide to stop saving and leave the cooperative. Hence, the project savings and credit cooperatives serve only a temporary purpose for some households.

As a result of the above, the project does not have a sizeable impact on most outcome indicators reported in the previous sections.

## 9.2. Does the project address an important issue for the beneficiaries?

Access to financial services in the form of saving and borrowing are important tools for better aligning household income and expenditure. Many rural households face constraints in accessing formal financial services. The cooperatives participating in the KSP-QT project offer financial services from poor (KSP-QT and KSU-GTGS) to middle income (KSU-GTGS) rural households that are designed to match the needs of their membership. In this respect, the project addresses a relevant issue for the beneficiaries.

# 10. Evaluation question 4: Efficiency of project

This subsection will answer evaluation question 4: Were the development interventions of the Southern partner organisations efficient?

Unfortunately, we are not able to evaluate neither the efficiency nor the effectiveness of the project. Therefore, in this section we put forward our arguments for failing to evaluate the question on efficiency. However, first, the available cost information for the KSP-QT project is discussed below.

## 10.1. Project costs

To collect information on the costs of the project, we conducted a structured interview with the director of KSP-QT[14] on 22 July 2013 using the 'budget survey' as described in section 0. In addition, we use data presented in the baseline report, which provide information about the costs of the project incurred by external consultants to the project (not included in the budget of KSP-QT). The cost figures are based on

[14] The interview was conducted with Mr. Mustamiroh, director of KSP-QT, and Ms. Ita Fitriyani, administrative staff member of KSP-QT.

actual expenditure data from KSP-QT and contracted amounts from Hivos. Differences in the numbers may occur due to the change in exchange rates during the reporting period.

Table 9 summarizes the actual project costs reported by KSP-QT per implementation year: the amounts are displayed in Indonesian rupiah in column 2 and in euros (using the yearly average exchange rate) in column 3. Overall, KSP-QT claimed 79% of the available budget (in Indonesian rupiahs).[15] Looking at the composition of these costs over the total project period, 64% of all costs have been used for seed capital (loans to members), 5% for equipment (computers), 6% for the training of members and staff and 26% for operational costs (staff, office, transport and audit costs).

**Table 9: Overview of the costs and number of beneficiaries at KSP-QT**

| Year | Total costs [IDR] | Total cost [EUR, current prices][1] | Percentage of costs funded by CFA | Number of cooperative members | Cost per beneficiary per year[2] |
|---|---|---|---|---|---|
| **2010** | 734,465,125 | 60,626 | 100% | 11,449 | N.A. |
| **2011** | 804,549,775 | 65,603 | 100% | 12,266 | N.A. |
| **2012** | 366,062,050 | 30,285 | 100% | 13,372 | N.A. |

Source: Budget survey and Financial Report of the Seed Capital Programme.
Notes:
1. Annual average exchange rate is used. Data is obtained from http://www.oanda.com/currency/historical-rates/
2. N.A.= not applicable

However, the total costs of the seed capital project cover not only the costs of KSP-QT. The total budget of the project[16] is 201,370 EUR, to which Hivos contributes 191,574 EUR (95%). The total amount of 191,574 EUR is divided into 3 contracts: 153,597 EUR for KSP-QT (total contract amount[17] with KSP-QT); 15,756 EUR for the consultant of the project (Mr Irawan of LDP) and 22,222 EUR for the rating agency.

Finally, the total number of members in the 3 project savings and credit cooperatives is reported in the fifth column of Table 9.

## 10.2. Assessment

There are a number of factors that complicate the calculation of cost per beneficiary. The project works on improving the financial and social indicators of the 3 savings and credit cooperatives. Hence, the project is more a capacity development project than working with direct beneficiaries. In addition, current and future members both benefit from improved services, while the project enables the

[15] Note that the available budget for the project was 153,597 EUR. However, the total Indonesian rupiahs available for the project were 2,415,350,000 IDR. Hence, the project has used only 79% of the available funds. Note that if someone were to add up the total euro amount in Table 9, he would get 156,514 EUR, which is more than the budgeted amount mentioned above. However, the discrepancy is due to the exchange rates used for the conversion. Note, further, that inflation is not taken into account in these calculations.
[16] Source: correspondence with Miranda Rustam, Hivos Project Officer for Green Entrepreneurship
[17] Source: Hivos contract letter to KSP-QT

cooperatives to grow more rapidly and reach new members and new project locations. Therefore, it would be difficult to decide what number to use as the number of beneficiaries reached in the cost per beneficiary calculation.

Further, we do not know the exact costs of the consultant, the rating agency and the project costs not covered by Hivos. We are only able to calculate the total project costs of KSP-QT in real value. This amounts to 535,437 international dollars in 2011 prices for the whole 2010-2012 period.[18]

Taking the above concerns into account, providing a meaningful estimate of the cost per beneficiary goes beyond the scope of this evaluation. Therefore, we refrain from going further in answering evaluation question 4 than the information on project costs provided in section 10.1.

## 11. Contribution of Capacity Development and Civil Society

KSP-QT was not selected for the evaluation of capacity development of the SPO and civil society strengthening.

## 12. Conclusion

KSP-QT and KSU-GTGS provide savings and credit services to rural households. The savings and credit cooperatives are designed to help households to align their yearly incomes and expenditures through regular savings (weekly) and credit.

We find that only 68 (73) percent of the cooperative member households kept their membership at the endline in KSP-QT (KSU-GTGS), and only 56 (71) percent of the households still had savings at the cooperatives down from 90 (82) percent at the baseline. The results suggest that household often quit the cooperative after the repayment of their loans, hence they only accumulate savings as a requirement for borrowing.

A significant number of KSP-QT members quitting the cooperative ended up opening and saving in a bank account, which shows that KSP-QT opened the door towards more participation in the regular financial sector. On the other hand, many members remaining at KSP-QT participate in family finance and other meetings of the cooperative that are probably designed to encourage saving behaviour. Hence, overall the project had a positive effect on savings either through savings at the cooperative or at a bank. The members of KSU-GTGS changed their membership less often. This cooperative may also function more as a bank with members participating less often in meetings organised by the cooperative.

Possibly due to the increased savings of the households, the project had a positive impact on the percentage of households with emergency savings covering the living costs for at least one month. In addition, the project also had a positive impact on the current standard of living in terms of the daily needs covered. However, no clear cut results are found in terms of the livelihood and wealth of households and improvements in financial knowledge and skills.

[18] PPP conversion factor to 2011 international dollars is calculated using the World Development Indicators: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#

These findings are compatible with the findings in the literature, except for the findings on savings. Concerning financial literacy literature, no evidence is found for a substantial effect of financial literacy training on financial knowledge or saving behaviour. The existing evidence on micro-finance projects suggests that most micro-finance projects do not improve the livelihood of household in terms of savings and income. While the results of this MFS II evaluation indeed showed no impact on financial knowledge and skills and on income, they showed a positive effect on savings.

Finally, the MFS synthesis team asked to score each project along a few indicators. Table 10 displays the indicators and the scores we deemed valid for the project.

**Table 10: Overall project scoring**

| Statement | Score | Comment |
|---|---|---|
| **1. The project was well designed** | 8 | The project was designed to build the capacity and improve the outreach and social and financial performance of the cooperatives. The focus on financial literacy education as means to improve both financial and social performance is well thought out. |
| **2. The project was implemented as designed** | 9 | We are not aware of deviations in the project implementation. |
| **3. The project reached all its objectives** | 8 | The project objectives were mostly defined in terms of the capacity building of the cooperatives.<br>At the household level, the objective of the project was to improve the welfare of its members, and increase the number of active members. This has been achieved to some extent: food security of households has somewhat increased but some members of KSP-QT have decided to stop their membership in the cooperative. |
| **4. The observed results are attributable to the project interventions** | 7 | The cooperative gives the means for the households to better manage their incomes and expenditures in the form of savings and credit. It is up to the households to decide how they use these possibilities. |
| **5. The observed results are relevant to the project beneficiaries** | 7 | Livelihood and food security improvements are probably the most relevant outcomes of the project. |
| **6. The project was implemented in the most efficient way** | - | We did not assess the efficiency of this project. |
| Notes: Scores are on a scale of 1 to 10, with 1 being “no agreement at all” and 10 being “completely agree with statement”. | | |

# Annex I. SPO and project description

### *The savings and credit cooperatives*

The Seed Capital Programme for Koperasi Mentari Qaryah Thayyibah was coordinated by Koperasi Simpan Pinjam - Qaryah Thayyibah (KSP-QT), however, the project involves three primary saving and credit cooperatives: Koprasi Simpan Pinjam Mentari Dana Mandiri (KSP-MDM), Koperasi Serba Usaha-Gardu Tani Gedong Songo (KSU-GTGS) and KSP-QT. In addition, the objective of the project was to establish a secondary cooperative: Koperasi Sekunder Mentari Qaryah Thayyibah (*Secondary Cooperative*, KSM-QTha).

The three primary cooperatives were established by Qaryah Thayyibah Federation of Farmer Association[19] (SPPQT) between 2002 and 2006. They have the same mission to provide financial services to the small-scale farmers and entrepreneurs to open their opportunities to improve livelihood by developing small-trading, livestock farming and home industries. However, the three cooperatives have different target areas and beneficiary groups: the main membership of Koprasi Simpan Pinjam Qaryah Thayyibah (*Saving and Credit Cooperative*, KSP-QT) comes from farmers who cultivate rice and vegetables, therefore the saving and credit activities are based on the rice harvesting time, which is usually every three months. On the other hand, the members of Koprasi Simpan Pinjam Mentari Dana Mandiri (KSP MDM) are mostly small traders in the local markets in Semarang city whose trading activities are daily, therefore their saving and credit activities are also daily. Finally, the members of Koperasi Serba Usaha-Gardu Tani Gedong Songo (*Multipurpose Cooperative,* KSU-GTGS) are more diverse: it includes farmers, traders, and manufacturing and garment industry workers whose saving and credit activities are typically every two weeks. All three cooperatives target women for membership, because in Javanese culture women are responsible for spending money.

In total, the cooperatives have reached 8,700 members with various saving and credit products by 31 August 2009.

### *The Seed capital project[20]*

The project aims to improve the performance of three cooperatives (KSP-QT/KSP-MDM/KSU-GTGS) as financial services providers, which is achieved by the establishment of the secondary cooperative KSM-QTha, and capacity development of both the secondary and primary cooperatives. KSM-QTha will serve as an umbrella organisation for the primary cooperatives which provides guarantee for inter-lending among the cooperatives and promotes the three cooperatives to the community.

The final objective of the project is to improve the social performance of the cooperatives which can be measured by the following indicators:

- Drop-out rate
- Depth of outreach
- Percentage of female clients

[19] SPPQT has been a Hivos partner since 1999 in the Sustainable Productions programme.

[20] This section describes the planned implementation of the Seed capital project. Therefore, it is written in present and future tense.

- Percentage of rural clients

In addition, KSM-QTha has three objectives that go along with improved social performance:

- Be a professional cooperative that is able to provide the best services for its members and the community
- Improve the welfare of the members and neighbouring communities
- Promote the cooperatives in its activities

In the 2009-2012 period, Hivos provides funds for the following activities: 50% of the funds is used as working capital for the cooperatives, and the other 50% is used for capacity building trainings:

- Trainings and workshops to staff members in the four cooperatives to facilitate capacity building to staff members
- Training to staff to enhance system and human resources development

The trainings are aimed to achieve the following results:

- Increased staff productivity and stability (measured by active loan clients per staff, growth indicators, active loan clients, loan portfolio quality, repayment rate, PAR30)
- Improved financial performance (measured by operational and financial self-sufficiency and operating expense ratio)

### *Financial literacy training*

Many cooperative members were in a debt trap at the time of becoming a member, and they have borrowed to be able to pay for a previous debt. To help the communities exit from debt trap, and to improve repayment rates, the Seed Capital programme started with a financial literacy programme. Before the Hivos programme, the cooperatives were not aware of the importance of financial literacy. However, with the help of the Seed Capital programme, all three savings and credit cooperatives started with their own financial literacy training.

At KSP-QT, each new prospective member participates in an hour long financial literacy training, either individually or in a group. This training introduces prospective members to the financial products of KSP-QT, and discusses household finances (financial management):

- Drawing a balance sheet: comparing income flows to expenditures
- Finding ways to save from all income a little bit at a time (for example 1000 rupiahs)
- Planning yearly incomes and expenditure: making a plan to start saving for planned larger expenses in time. It is discussed how much to save per day/week/month in order to accumulate the desired amount on time.
- Learning about the importance of keeping track of expenses

The discussions are held simple so that the people can understand it, and short so that they don't get bored or lose the attention. According to KSP-QT, when prospective members are approached to start saving at KSP-QT, they say that they are poor and don't have money to save. But then together with the KSP-QT staff, they draw a balance table of their yearly incomes and expenditures, work out how much money the family needs, and try to find small amounts of money that can be saved throughout the year.

They discuss which product would suit their needs the best (both in terms of savings and loans). Based on experience of KSP-QT staff, low to middle class have money to save but they were not taught how to save, so they don't know about it. After the training, people usually understand that they can also save. KSP-QT encourages members to save at least 1000 rupiahs per day. The cooperative also organises weekly meetings in the communities, where members can come together and deposit their savings together, which serves as a commitment device. Also in KSU-GTGS, a staff member visits members every week and collects savings.

### *Diverse financial instruments*

As discussed above, the three savings and credit cooperatives have different target groups with different needs. The cooperatives strive to develop financial instruments that match the needs of their members. For example, in KSP-QT there is a saving programme for planning ahead (for example for a wedding, a house or religious festivities). In KSU-GTGS, there is also group lending because there are many farmer groups. However, most loans are individual based.

### *Outreach of cooperatives*

Through the Seed Capital programme, Hivos urged the cooperatives to grow in order to increase their saving base. From less than 9,000 members in total, the cooperatives were expected to reach 15,000 members by 2012. Hivos provided funding to set up business in new locations (training of staff, transportation, IT, etc.).

With Hivos funding the cooperatives' membership increased to 13,372 by the end of 2012. Since the end of the project, the membership only grew to 14,407 by June 2014. As the director of KSP-QT explained "without Hivos it's like walking, with Hivos it's like riding a car – you get there but on foot it takes much longer". So, more members could be reached with the funding of Hivos than would have been possible otherwise.

After joining one of the saving and credit cooperatives, the new members have to start with saving. Only when they have saved a certain amount, are they entitled to borrow. The maximum amount of credit increases every time the members successfully repay a loan. However, members that are inactive for two years in the cooperative lose their membership.

### *Financial performance*

In 2014, the average loan size at KSP-QT is 5 million rupiahs, which marks a tenfold increase compared to 2008. The largest loan granted was 50 million rupiahs. Loans are mostly for 12 months with monthly repayments, while the longest period is 3 years. KSP-QT asks for collateral for loans above 2 million rupiahs, while for smaller amounts the (birth) certificate of the member (or child) has to be deposited. For members with a good track record, sometimes it is not necessary to provide collateral.

The interest rate on the loans is between 1.67-2% per month. This is higher than at the banks but lower than other sources of loans (even other savings and credit cooperatives). The default rate at KSP-QT is 10%, which mostly affects loans below 2 million rupiahs (as these do not have collateral). However, if a member cannot pay, KSP-QT first tries to restructure the loan.

The table below provides information about the financial performance of the 3 cooperatives at the end of 2012 (as part of the reporting obligation for Hivos).

**Table 11: Financial performance at the end of 2012**

| Parameter | Target in 2012 | Revised target in 2012 | Actual in December 2012 | | | |

# Annex II. Overview outcome indicators and indices

This annex provides a detailed description about the used outcome indicators. In addition, it discusses the variables which were used to construct the outcome indicator indices. Please note that some of the indicators are constructed as indices from multiple questions. In the main text of the report, only the indices are reported for such indicators.

Outcome variables for the project were collected at household level. The outcomes are reported for treatment and comparison households for the baseline and the endline surveys. The sample size can differ among outcome variables because the answers 'don't know' and `refused' are changed to a missing value or because a respondent could skip a question if he/she had no knowledge about what was asked (answered 'no' to a previous question). 'Don't know' responses were also changed to missing if the question had a scale of responses (for example from 1-4). However, if we were interested in the percentage of the households that answered 'yes' to a certain question, it made sense to change the 'don't know' answers to 'no'. All binary (dummy) variables were recoded so that 'No' is 0 and 'Yes' is 100[21]. The mean and total sample size of the indicators is reported in Annex III.

The outcome variables are discussed below one by one.

### *Use of financial instruments*

- *Access*
  - *Households that know a place to borrow money*: In section JK (Use of Financial Services) of the questionnaire it was asked whether the respondent or any other household member know of a place where they can borrow money. The question has 3 answer categories: "Yes", "No" and "Don't Know". In order to generate dummy variable "Don't know" answers were recoded to "No".
- *Membership*
  - *Households involved in financial institutions*: Dummy variable constructed using section JK (Use of Financial Services) of the questionnaire. The dummy is created by combing answers of 2 different questions; *jk05* and *jk17*. All households that answered to have savings in a bank account or in a savings and credit cooperative are counted as households that are involved in a financial institution. Furthermore, all households which were able to get a loan from: a. private commercial bank b. cooperative c. government/semi-government bank d. agricultural bank/SAPRODI and e. non-bank financial institution are counted as households that are involved in a financial institution.
- *Savings*
  - *Households with savings in bank account*: All information in order to construct the dummy variable was taken from question *jk05* for all households which replied that have savings in a bank account.

[21] 100 is used instead of 1 in order to report the dummy variables in percentages

- *Households with savings in savings and credit cooperative*: All information in order to construct the dummy variable was taken from question *jk05* for all households which replied that have savings in savings and credit cooperative.
- *Households with savings in savings and credit group*: All information in order to construct the dummy variable was taken from question *jk05* for all households which replied that have savings in savings and credit cooperative.

- *Borrowing*
  - *Households that have borrowed in the past 12 months*: All information in order to construct the dummy variable was taken from question *jk16* for all households which replied that were successful in securing a loan in the past 12 months. Answer categories `don't know' were replaced by missing values.

### *Financial Knowledge and skills*

- *Skill*
  - *Households that keep close eyes on expenditures*: Dummy variable based on question *kk02* of section KK (Cognitive Skills and Financial Literacy). Question *kk02* has 6 answer categories: 1. I don't keep an eye on expenses at all, 2. I keep my on expenses a bit, 3. Without keeping written records, I keep a fairly close eye on expenses, 7. Refused, 8. Don't Know. All households which choose answers categories 3 or 4 are counted as households which keep close eyes on expenditure.
  - *Households that have a financial plan*: All information in order to construct the dummy variable was taken from question *kk01* for all households which replied that have a plan on how to divide income among spending, saving and paying bills. Answer `don't know' was recoded to zero and category `refused' to missing.
- *Knowledge*
  - *Score on financial numeracy questions*: This is a scale variable which is reported only for panel respondents. A panel respondent indicates that the questionnaire was answered by the same respondent between baseline and endline. The variable is the result of the sum of 4 dummy variables therefore the scale variable takes values between 0-4. The 4 dummy variables used take the value of 1 if the panel respondent replied correctly in 4 questions (*kk06, kk07, kk08 and kk09*) concerning financial numeracy. The correct answers for the aforementioned questions are: 20000, more money than today, 0 and 10200 for each question respectively. Answer `don't know' was recoded to zero and category `refused' to missing.

### *Household Income and livelihood (uniform indicator)*

- *Household Income*
  - *Per capita total income per month (1000 Rp)*: The questionnaire includes separate sub-sections for income generated from: a. Crops, b. Livestock (net profit), c. Non-Farm activities (net profit) and d. Money transfers (net income). The total income variable is created by the sum of income generated by the different income sources mentioned above. Among these, crop income is calculated as the value of crops produced.

Therefore, the total income is reported as gross income and not as net income. Although the questionnaire captures expenditures such as input costs, labour costs, transfers costs etc., the data were considered unreliable as they were showing large fluctuations. Thus the costs were not taken into consideration for the construction of the total income variable. The total crop income is created by multiplying the total amount of harvested crops (*utb03, utb04, utb05*), converted in kg for each crop, with the price sold. The price is the mean price of each crop for each separate village. The total livestock income is created by summing the profits generated by the sale of livestock captured by question *utg07.* The total non-farm income derives from section NT. (Non-farm income) of the questionnaire and specifically from question *nt04* where the respondent is asked to provide information concerning the amount generated by non-farm business during the past 12 months. Total income from money transfers comes from section TF. (Transfer) of the questionnaire and specifically from question *tf02* where the respondent was asked to provide information about the type of assistance and the amount of Rupiah he/she received. Furthermore, the total income is divided by 12 (months) in order to report in monthly values, and in order to obtain the income per capita, the total income per month is divided by the household size. Finally, the total income per month per capita is divided by 1000 as to report in 1000 Rupiah.

- *Per capita consumption of households*
  - *Monthly Food Consumption Per Capita (1000 Rp):* The food consumption variable is created by using data from the section KS. (Consumption) of the questionnaire. The respondent is asked to provide information about the market-purchase expenditures (*ks01*) as well as the approximate value of self-produced consumed food items (*ks02*) which are covering different food categories such as: a. Staple foods, b. Vegetables, c. Dried Foods, d. Meat and Fish, e. Milk/Eggs, f. Spices and g. Beverages. The market-purchased expenditures and the value of self-produced food items are asked for the last week; therefore both are first multiplied by 52 (weeks) in order to create the yearly consumption expenditures and later divided by 12 (months) as to report in monthly values. The food consumption per capita is the sum of the monthly market purchased expenditures and the monthly value of self-produced food items, divided by the household size. The last step is to divide the food consumption per capita variable by 1000 as to report it in 1000 Rupiah.

  - *Monthly Non Food Consumption Per Capita (1000 Rp):* The non-food consumption variable is created by using data from the section KS. (Consumption) of the questionnaire. The respondent is asked to provide the monthly expenditures on a series of non-food items such as: a. Electricity, b. Water, c. Fuel, d. Personal Toiletries, e. Transportation, f. Household Items, g. Recreational and Entertainment, and h. Domestic Services and Servants' wages. The non-food consumption is generated by summing up the aforementioned monthly non-food expenditures and then dividing the sum with the

household size in order to report in per capita level. The last step is to divide the non-food consumption per capita variable by 1000 as to report it in 1000 Rupiah.

- *Asset holdings of households*
  - *Housing facilities index (PCA):* In order, that the housing facilities index in the MFS II projects have a meaningful interpretation, we calculate weights for the index components based on their predictive power for household expenditure. The weights are calculated using a population representative survey for Indonesia using regression analysis. We use the IFLS 2007 survey as a population representative sample. From the IFLS 2007 dataset we use aggregate expenditure data, asset ownership and sampling weights. As the aggregate expenditure variable the data analysis uses the logarithm of the monthly per capita expenditure (*lnpce*). The sampling weight used is the cross-sectional sampling weight adjusted for attrition. This weight should be representative of all households living in the IFLS provinces in Indonesia in 2007. Based on the KR section of the IFLS survey, we construct the housing variables that are the same in IFLS and the MFS II surveys. The variables used from the KR section of the MFS II surveys which are also the found in IFLS are: a. *kr01*, b. *kr02*, c. *kr04*, d. *kr07*, e. *kr10* and h. *kr13*. The corresponding variables in IFLS are: a. *kr03,* b. *kr13*, c. *kr16*, d. *kr20*, e. *kr11* and h. *kr24.* There are more variables which are the same between E6 and IFLS, however we wanted to construct a housing facilities asset variable which can be used by all MFS II surveys, thus the variables mentioned above are selected as they are common in most MFS II surveys. The first step is to recode the variables of MFS II surveys in order to have matching answer categories with the variables of IFLS; the same procedure is also followed for the IFLS variables. In addition, as the variable names are not the same among the two datasets, in the IFLS dataset we renamed the common variables as to have the same name with the MFS II variables. After, the aforementioned preparation the two datasets are combined into one dataset. Furthermore, dummy variables are created based on the answer categories of the chosen common variables. The reason behind the construction of the categorical dummy variables is to include them in the regression of the logarithm of the monthly per capita expenditure on the housing dummies. Nevertheless, not all of the categorical dummies are used in the regression model. The regression does not include dummy variables whose variation is higher than 97% of the sample or lower than 3% of the sample. Moreover, after we performed the regression the next step was to calculate the fitted values by predicting the expenditure based on housing facilities for both the IFLS and MFS II sample. Finally, the last step was to rescale the predicted variable in order to have a zero mean for the IFLS sample by subtracting the mean of the fitted value from the fitted value itself.
    Hence, we will be able to infer the livelihood of our survey participants compared to the Indonesian average in 2007: for example, if the value of the index is 0.10 (-0.10), on average, it implies that the sample is approximately 10% better off (worse off) than the average Indonesian household in 2007 based on the predictive power of housing facilities (like drinking water source) on household expenditure.

- *Asset index (PCA):* The construction of the asset index follows a similar procedure with the creation of the housing index, however in this case instead of the IFLS dataset the DHS 2012 dataset was used, as DHS includes more common asset variables with the MFS II surveys than the IFLS. Moreover, asset variables were chosen from the KR section of the MFS II surveys which are common with DHS variables. From MFS II dataset questions a. kr11 and b. kr12 were chosen while from the DHS dataset questions a. *hv207*, b. *hv208*, c. *hv209*, d. *hv243a*, e.*hv210*, f. *hv211*, g. *hv212*, h. *sh118c*, i. *hv243d* and j. *hv243c* were selected. The next step was to combine the two datasets and perform a factor analysis of the common variables in order to calculate the asset index. In addition, as mentioned above the 3% rule was also applied for the asset index, excluding from the factor analysis variables with small variation. Finally, the predicted asset index was normalized for the DHS sample (mean 0 and variance 1).

- *Investment into business or farm equipment*
  - *Household invested in business:* All information in order to construct the dummy variable was taken from question *jk42* for all households which replied that have expanded their family business by purchasing new equipment or start a new business in the past 12 months.
  - *Household invested in new farming tools:* All information in order to construct the dummy variable was taken from question *jk43* for all households which replied that have purchased new farming tools in the past 12 months.

- *Self-reported well-being*
  - *Happiness:* This is a scale variable which is reported only for panel respondents. A panel respondent indicates that the questionnaire was answered by the same respondent between baseline and endline. The variable using a Likert scale takes values from 1 (very happy) to 4 (absolutely not happy). All the information used for the construction of the Happiness variable is taken from question *sw03* of section SW. (Subjective wellbeing) of the questionnaire.
  - *Current wealth status:* This is a scale variable which is reported only for panel respondents. A panel respondent indicates that the questionnaire was answered by the same respondent between baseline and endline. The variable takes values from 1 (poorest) to 6 (richest). All the information used for the construction of the Happiness variable is taken from question *sw04* of section SW. (Subjective wellbeing) of the questionnaire.

### *Food security and vulnerability*

- *Households that have emergency savings for at least one month:* All information in order to construct the dummy variable was taken from question *kk03* for all households which replied that have set aside emergency or rainy day fuds that would cover their expenses

for one month, in case of sickness, job loss, economic downturn or other emergencies. Answer `don't know' was recoded to zero and category `refused' to missing.

- *Households not able to cover their living costs/ have not enough to eat:* All information in order to construct the dummy variable was taken from question *jk02* where the respondent was asked if sometimes people find that their income does not quite cover their living costs during the last 12 months. Answer category `don't know' was recoded to zero.
- *Current standard of living (daily needs covered):* Scale variable asked to panel respondents taking values 1 (not enough to fulfil my daily needs), 2 (only enough to fulfil my daily needs), 3 (more than enough to fulfil my daily needs). Answers 'don't know' where replaced with a missing value. All the information was taken from question *sw01*.
- *Current standard of living (food consumption):* Scale variable asked to panel respondents taking values 1 (not enough to fulfil my daily needs), 2 (only enough to fulfil my daily needs), 3 (more than enough to fulfil my daily needs). Answers 'don't know' where replaced with a missing value. All the information was taken from question *sw02*.

# Annex III. Summary statistics of variables

**Table 12: Descriptive Statistics**

| Survey period | Baseline | | Endline | | Change (Endline-Baseline) | |
|---|---|---|---|---|---|---|
| **Statistics** | Sample size | Mean | Sample size | Mean | Sample size | Mean |
| Household size | 290 | 3.80 | 285 | 3.99 | 285 | 0.18 |
| % HHs with Female HH Head | 290 | 9.31 | 290 | 9.31 | 290 | 0.00 |
| Age of HH Head | 290 | 48.30 | 290 | 50.20 | 290 | 1.90 |
| % HHs with religion: Muslim | 290 | 93.45 | 0 | | 0 | |
| % HHs with religion: Protestant | 290 | 93.45 | 0 | | 0 | |
| Size Of Cultivated Land ($m^2$) | 204 | 2,137.99 | 203 | 1,471.20 | 178 | -597.79 |
| Education of HH head (%): | | | | | | |
| *No/Islamic* | 289 | 11.42 | 290 | 10.34 | 289 | -1.04 |
| *Primary* | 289 | 62.63 | 290 | 63.45 | 289 | 0.69 |
| *Secondary* | 289 | 23.18 | 290 | 23.79 | 289 | 0.69 |
| *Higher* | 289 | 2.77 | 290 | 2.41 | 289 | -0.35 |
| Main income source (%): | | | | | | |
| *Crop Farming* | 290 | 45.17 | 290 | 51.38 | 290 | 6.21 |
| *Fishing* | 290 | 0.00 | 290 | 0.00 | 290 | 0.00 |
| *Livestock* | 290 | 0.69 | 290 | 0.69 | 290 | 0.00 |
| *Non-Farm Business* | 290 | 23.45 | 290 | 18.28 | 290 | -5.17 |

The description of the villages is given below:

### *Treatment villages of KSP-QT*

**EA. 001 KOPENG**

The village Kopeng is located in the sub-district Getasan (district Semarang). It is located on the slope of a mountain, about 1,450 metre above sea level and a lot of land consists of farming areas. The borders between the dusun (neighbourhoods) are visibly marked by rivers, and one of the dusun is attractive to tourists. About 75 percent of the population is Muslim, the other 25 percent is Christian (with Javanese tradition). Muslims and Christians in live in peace and harmony.

Transportation facilities to get to and to leave Kopeng village is very limited and most of the road condition to get the village is poor although it is covered by asphalt. However, the roads inside the dusun are made of stone and are the result of the villagers' hard work. Health and education facilities are adequate in number and accessible. The majority of villagers have access to electricity from PLN (State Electricity Enterprise). In addition, the communication facilities in Kopeng village are good since they already have both landline (PSTN) and cellulars.

The majority of the people in Kopeng are farmers. Farming crops yielded mostly by villagers are vegetables, such as cabbage, lighter coloured mustard greens, carrots, and cauliflower. However, they usually plant tobacco and corn during dry season. They usually market their crops directly to the

traditional market. The other livelihood of the villagers is cow farming which they use as dairy cattle. The marketing of the fresh milk is managed by the local village unit cooperatives (KUD).

**EA. 002 TAJUK**

The village Tajuk is located in the sub-district Getasan (district Semarang). The village is located high above the sea level and has a pretty cold temperature.

Despite the good condition of the road (asphalt), there is no public transportation to get to Tajuk. The available education facilities are elementary schools and middle schools. Both mosques and churches are present in the village. The communication facilities are still a bit weak as only one telecommunication provider can be received and no internet at all is available.

Most of the villagers in Tajuk work on farming fields, tobacco plantations, and the majority of the residents own cows for dairy. The dairy products are sold to one company (PT) or individually. The traditional culture is one of mutual assistance.

**Ea. 009 SUNGGINGAN**

The village Sunggingan is located in sub-district Miri (district Sragen). The village is located in a lower area and the temperature is quite hot. Yet, clean water is not difficult to find. There is no public transportation available to get to the village.

The available education facilities in the village are PAUD, kindergarten and elementary school. The available worshiping places are mosque and church. The majority of residents are Muslim. The communication facilities are good with respect to telecommunication. However, other facilities, such as an internet café, are unavailable in the village, but an internet café is available downtown (about 3 km away).

The majority of villagers are agricultural farmers. People here have strong tradition in mutual assistance just like in the other villagers. The residents have a high tolerance level, they welcomed the survey team very well and were willing to help the team.

**EA. 010 SOKO**

The village Soko is located in sub-district Miri (district Sragen). The village is located in a lower area and the air temperature is quite high. Soko lies next to the villages Pendem (east side) and Miri village (south-east side). The village is about 24 km away from the city Surakarta. There is no public transportation available from or to get to Soko. The road condition is poor as some of them were from stone.

The available education facility in the village is the elementary school. Soko has a mosque. Most of the villagers are Muslims. The electricity power from PLN is accessible for all the villagers. The communication facilities come from cellulars from different types of providers.

Majority of villagers' livelihood in Soko village are labourer/porter of limestone, construction workers, or agricultural farmers. The villagers' farming land is located far from the village (about 3 km). The have just the rain water as their irrigation method.

**EA. 011 BAGOR**

The village Bagor is located in sub-district Miri (district Sragen). The village is located in a lower area and the air temperature is quite high. The village is located next to the villages Brojol on the south side, Pandem on the east side, Kunti on the west side, and Kedungombo dam on the north side. Bagor is about 27 km away from the city Surakarta. There is no public transportation available to get this village. The road condition to get to the village is quite good as it is covered with asphalt. Yet some roads were damaged.

The available education facilities are elementary school and middle schools. In addition, the village has a health facility. The available worshiping facility is a mosque. The majority is Muslim, but Christians do also live in this village. The electricity power from PLN is accessible to all villagers, and communication facilities have been supported by both landline and telecommunication service providers for cellulars.

The majority of people in Bagor village are agricultural farmers. The main crops of their farming are rice, corn, cassava, peanut, and bananas. However, not all of their crops are sold in the market as some of them were consumed by their own household. The other source of living is working as a construction worker or as a civil servant.

### *Treatment villages of KSU-GTGS*

**EA. 003 LANJAN**

The village Lanjan is located in the sub-district Sumowono sub-district (district Semarang). The village is located in a mountain area and has a pretty cold temperature. This area is a developed rural area and the village is easy to access.

Education facilities available in this village are adequate, as they have PAUD (post ECED), kindergarten, elementary schools, middle schools, and high schools. Both mosques and churches are present in the village. The communication facilities in Lanjan are supported by several telecommunication service providers and all type of telecommunication signals can be received in this village. Internet service is available, as there is an internet cafe.

Most of villagers are farmers, and the rest of the residents are working in non-farming fields (civil servants (PNS), entrepreneurs, construction workers, retailers). People in Lanjan are considered as modern people and they tend to be critical toward strangers who come to them. Some respondents therefore refused to be interviewed and others were suspicious and worried that the collected data will be misused.

**EA. 004 JUBELAN**

The village Jubelan is located in the sub-district Sumowono (district Semaran). The village is located in a mountain area and has a pretty cold temperature. The village is located on the main road and easy accessible by public transportation.

The communication facilities in Lanjan are supported by several telecommunication service providers and all type of telecommunication signals can be received in this village. Internet service is available, as there is an internet cafe.

Jubelan is a heterogeneous community. The villagers come from several ethnicity, economic status, and have different types of livelihood.

**EA. 005 SUMOWONO**

The village Sumowono is located in the sub-district Sumowono (district Semarang). The village Sumowono is the capital city of the sub-district. The village lies on a mountain of about 960 M above sea level and therefore has a cold temperature. The access to get to Sumowono village is very easy. The condition of the road is pretty good as most of them have been covered with asphalt and are accessible for both two-wheel and four-wheel vehicles.

The available education facilities are PAUD (Post ECED), elementary schools, middle schools, and high schools. There are several worshiping places for Muslims and Christians. The communication facilities are good, as the village has both landline and telecommunication services for cellulars. In addition, electricity power from PLN has reached all the households in Sumowono village.

Most of the villagers in Sumowono work as merchants and civil servants. While some other villagers are farmers, who have chrysanthemum as their main agriculture product. Mutual assistance in the community of the village is very strong.

### *Comparison villages*

**EA. 006 KAWENGEN**

The village Kawengen is located in the sub-district Ungaran Barat (district Semarang). Although the village lies in a hilly area, the air temperature is quite hot. Kawengen lies next to Tembalang on the west side, Kebonbatur on the east side, Bulusan on the north side and Kalongan on the south side. Kawengen is about 13 km away from the city Semarang. The condition of the road in the village is mostly good and covered with asphalt, yet on some parts the asphalt has been damaged. However, public transport is not that good, so most of the villagers have their own vehicle.

The only available education facility in the village is an elementary school. The village does have an own mosque. The majority of the villagers are Muslims. Kawengen has telecommunication services from cellulars which is accessible for most of the villagers. Meanwhile, the electricity power from PLN is accessible for all villagers.

The villagers' livelihood comprises of 60% agriculture, 30% self-employed and 10% masonry. However, many of villagers went out of the village to seek a job. The main products of their agriculture are rice, corn, cassava, and peanuts. Most of the agricultural products are used for own consumption or individual selling.

**EA. 007 KEJI**

The village Keji is located in the sub-district Ungaran Barat (district Semarang). Although the village lies in a hilly area, the land is barren and the temperature is hot. In addition, houses located on a higher ground have difficulties to get water. Since the water source is limited, it is not suitable to grow rice and food crops in this village. There is not much public transportation available to get to Keji village.

The available education facilities in Keji are elementary school and Pondok pesantren/Islamic education. There are several worship places available in this village such as mushola (small mosque), mosque, and a

church. But most of the villagers are Muslim, only a few are Christian. The communication facilities are in place, yet other facilities such as a market and an internet café are unavailable, although about 5 km away from the village one can find an internet cafe.

Most of villagers in Keji are farmers, coffee cultivators, and non-agricultural actors such as factory employees and sellers. However, the majority of the villagers belong to the lower class society.

**EA. 008 GETASAN**

The village Getasan is located in the sub-district Getasan (district Semarang). The village lies on a plateau at the valley of a mountain of about 960 M above sea level. This village serves as the capital of the sub-district Getasan. The village Getasan lies between two villages; Wates on the west side and Sumogawe on the east side. Getasan village can be reached for about 15 km from the city of Salatiga and about 55 km from the city Semarang. As the village is located at the side of the main road, and mainly of good quality, to Kopeng, it is easy accessible. Besides, several options of public transportation are available.

The available education facilities are PAUD (Post ECED), kindergarten, elementary schools, middle schools, and high schools. Most of the villagers have access to the electricity power from PLN. A Mosque and church are available in the village. 75% of the residents are Muslim and 25% are Christian. Communication facilities are good as both landline and cellulars services are present. Moreover, Getasan has a market, which is the economic centre of that village.

The majority of the respondents depend for their livelihood on agriculture and animal farming. The main products of agricultural crops are vegetables such as pumpkins, corns, cassava, and tobacco in the dry season. Some products are sold individually at the market place, other to collectors. The main animal farming is dairy cattle to yield the milk. The village is an active community, almost every resident always participate in social activities such as Islamic preach every Friday night, arisan, and mutual assistance to clean village environment.

**EA. 013 CEPOKO**

The village Cepoko is located in the sub-district Sumber Lawang, (district Sragen). The village is located in a lower area and the air temperature is quite high. The village lies next to Jati on the south side and Mojopuro on the south west. Cepoko is about 26 km away from the city Surakarta. Public transportation facilities are not available to get to the centre of Cepoko. Parts of the road are covered with asphalt which is now starting to deteriorate; other parts are covered with cement which was built from the PNPM programme.

There is no education facility in the village. The only available health facility in this village is a village midwife. The majority of Soko villagers are Muslim and they have a mosque. The electricity power from PLN is accessed by all villagers. Several providers provide the telecommunication in the village with the help of cellars.

The majority of villagers are agricultural farmers, a minority are retailers. The main crops are rice, corn, cassava, and peanut. Some of their crops are sold in the market, some are sold to the collector, and some are just consumed.

**EA. 014 KACANGAN**

The village Kacangan is located in sub-district Sumber Lawang (district Sragen). The village is located in a lower area and the air temperature is quite high. Kacangan is located on the northern part of Sumber Lawang and it has a pretty wide area. Public transportation passes the village.

The available education facilities are PAUD (Post ECED), kindergarten, elementary schools, middle schools, and high schools, yet their locations are far from each other. The available worshiping places are a mosque and a church. Most of the villagers are Muslims. Communication services are available in the village, but other facilities such as internet as well as market place are still limited.

Most villagers depend for their livelihood on agricultural. However, many villagers went out of village or even went abroad to find work.

## Annex V. Descriptive statistics

The table below displays the socio-economic characteristics of the treatment (KSP-QT and KSU-GTGS member) and comparison households. The first 3 columns of the table contain information about the comparison group: the group mean at the baseline (1) and the endline (2), and the probability (p-value) that the change between the baseline and endline periods is zero. If the p-value is smaller than 0.05 it means that the change of the variable is significant at the 5% significance level.

Columns 4-7 report on the characteristics of the KSP-QT members and columns 8-11 on the KSU-GTGS members: the group mean at the baseline (4 and 8) and the endline (6 and 10), and the p-value for the change between the baseline and endline (7 and 11). In addition, in columns 5 and 9, we report on the p-value for testing that the mean value is not significantly different between the comparison and the KSP-QT/KSU-GTGS group at the baseline. Variables that have a p-value less than 0.10 are included in the baseline (and endline) regression analysis.

Source: Household survey E6, MFS II Indonesia

Notes: Robust standard errors corrected for clustering at the village level are used to calculate p-values. P-values are not defined for variables where there was no change.

1. Change in variable is only reported for the panel respondents.

# Annex VI. Evaluation question 2 – regression results by year of membership

The tables in this annex contain the results of regression (3) discussed on page 30. The first column contains the mean of the outcome variable in the comparison group as reference for the size of the cooperatives' effects on the outcome variables. Column 2-4 contain the cross-sectional regression results on the effect of cooperative membership at the baseline by the year of membership: column 2 shows the effects of being a member of the cooperative since 2010, etc. Columns 5-7 show the same statistics using the endline survey. Finally, columns 8-10 show the results for the change between endline and baseline again by the year of membership.

The effects of cooperative membership can be assessed as the sum of the baseline and diff-in-diff estimates or by looking at the results for the endline survey (columns 5-6). Table 19 displays the results for KSP-QT members, while Table 20 reports on the results for KSU-GTGS members. However, the same regression was used to generate the results for KSP-QT and KSU-GTGS per time period (baseline, endline and change).

## Annex VII. Additional explanatory variables

The tables below contain characteristics of the treatment (KSP-QT and KSU-GTGS member) and comparison households. The first 3 columns of the table contain information about the comparison group: the group mean at the baseline (1) and the endline (2), and the probability (p-value) that the change between the baseline and endline periods is zero. If the p-value is smaller than 0.05 it means that the change of the variable is significant at the 5% significance level.

Columns 4-7 report on the characteristics of the KSP-QT members and columns 8-11 on the KSU-GTGS members: the group mean at the baseline (4 and 8) and the endline (6 and 10), and the p-value for the change between the baseline and endline (7 and 11). In addition, in columns 5 and 9, we report on the p-value for testing that the mean value is not significantly different between the comparison and the KSP-QT/KSU-GTGS group at the baseline.

# 1. Introduction

## 1.1. Project context

Gender based violence (GBV) is a human rights violation and the social and economic costs are high. GBV is usually the result of unequal power relationships between men and women in families, communities and nations. GBV can result in "physical, mental, sexual, reproductive health and other health problems" for survivors and/or their children (WHO [1]), constituting a major public health problem. In addition, GBV also "impacts on, and impedes, progress in many areas, including poverty eradication, combating HIV/AIDS, and peace and security" (UN[2]). Several actions to combat GBV have been taken. The UN Declaration on the Elimination of Violence against Women (1993), the first international human rights instrument to deal exclusively with GBV, offered the first official definition of the term gender based violence, defining it as "any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or suffering to women, including threats of such acts, coercion or arbitrary deprivations of liberty, whether occurring in public or in private life." [3] Millennium Development Goal 3 calls for the promotion of gender equality and women's empowerment.[4]

In Indonesia, law no. 23/2004 (the PKDRT law) on the Elimination of Domestic Violence was the first regulation that finally legally entitled female victims of domestic violence to report any violence they experienced at the hands of their husband. In addition, as a result of the implementation of this law, institutions providing services to female and child victims of GBV started to be established. In Central Java Province,[5] the government issued by-law no. 3/2009 to assure better enforcement of the PKDRT law. This by-law governs, among others, the rights of female victims and the obligations of the local government with respect to prevention, protection and reintegration of victims. As a result, local governments are authorized to form integrated services centres (PPTKs) and commissions for the protection of female and child victims of domestic and/or gender based violence.

However, despite these efforts, the actual implementation and enforcement of the legislation, especially by local governments, is slow. In Indonesia's multicultural society, GBV is often tolerated and permitted due to patriarchy that manifests in cultural and religious beliefs and practices.

Domestic violence is by far the largest reported subcategory of GBV[6], which the PKDRT law defines as 'any act toward somebody in the household, especially women, that results in any psychological, physical and/or sexual suffering, and/or abandonment, including threat, force, or deprivation of liberty

[5] The location of the project.
[6] According to the National Commission on Violence against Women (Komnas Perempuan) 119.107 cases of violence against women had been reported in Indonesia in 2011. Almost 97% of the reports (110.468 cases) have been filed as 'domestic violence' cases. From the different types of violence against women in the domestic domain, psychological violence ranked the highest with 103.691 cases, followed by economic violence (3.222 cases), physical violence (2.700 cases), and sexual violence (1.398 cases) (Komnas Perempuan, 2012a & 2012b).

as defined by law, that happened within the domestic sphere' (Article 1). The roots of domestic violence in Indonesia can -at least in part- be found in gender inequality, particularly within marital relations. For example, the husband's culturally-instilled superior position as head and provider[7] has grave implications for women's willingness and ability to report domestic violence and/or file for divorce. Another example involves the marital practice where the father of the bride is taking on the role of his daughter's representative during the wedding ceremony. The husband thus swears the marital oath to the father of the bride, instead of to his bride herself. Many victims attest that, consequently, their husbands tell them during fights that "he is not bound by his oath to treat her well or stay faithful, because he hasn't sworn the marital oath directly to her". Worries about how to support herself and her children after a separation or divorce, can inhibit women from taking action to stop the abuse. Even though divorce is common in Indonesia, it is rarely instigated by the wife since she needs the income of her husband to take care of the children (Venning, 2010). Moreover, women that report their husband to the police face the threat of being stigmatized by her family and environment.

Data on GBV cases is gathered mostly by Non-Governmental Organisations (NGOs) working on violence against women. During the period of 2000 to 2011, there was an increasing trend of the number of female victims in Indonesia. Particularly, between 2009 and 2011, there were more than 100,000 reported cases per year. The National Commission for Women found that 95% of the divorce cases approved by the Religious High Court in 2011 were due to domestic violence against the wife. According to Komnas Perempuan (2012a; 2012b) the most vulnerable age group is 25-40 years. The most common reported form of violence in Indonesia is psychological abuse.

Though, the actual number of GBV cases is expected to be higher than the official data (Komnas Perempuan, 2012a; Komnas Perempuan, 2012b; Hayati, 2011). For example, based on the outcomes of the Violence Against Women Survey 2006, UN Women estimates that nearly 2.09 million women in Indonesia experienced at some point in their life a form of domestic violence (Utami, 2013). In November 2000, the prevalence of domestic violence in Central Java was investigated by Hakimi et al. (2001) in accordance with a questionnaire developed by a WHO Multi-Country Study on Women's Health and Domestic Violence Against Women. They found that 41% of women from Central Java had suffered physical or sexual violence at least once in their lives, mostly from their husbands. In addition, 20% of the women experienced sexual assault from someone other than their husband.

In general, the lack of autonomy and assertiveness among many Indonesian women, particularly of those who live in rural areas, hinders them to report the case to state apparatuses or bringing the case into public.[8] Women also often experience difficulties in accessing the legal system, for example due to the prohibitive cost and distance. Moreover, domestic violence is often regarded as a private matter, not belonging in the public domain. The taboo and stigma on domestic violence prohibits not only collecting accurate data (Utami, 2013), but more importantly hinders women to become aware of the

[7] Within Indonesian law and culture, the husband is always regarded as the head of the household and expected to be the breadwinner. The notion of the husband as the head of household is also stated in the marriage law no. 1, dating from 1974.

[8] ACNielsen (2005) finds that only 27% of victims would report domestic violence to the police.

problem and possible solutions. Therefore, the rising trend of GBV prevalence should be regarded as a positive sign of an increasing number of women having the courage to report their cases, hence breaking the taboo on domestic violence.

Several institutions in Indonesia provide services to female and child victims of violence. In 2011, Komnas Perempuan (2012a; 2012b) recorded a total of 395 of these institutions (both government and non-government initiatives) across 33 provinces in Indonesia, providing for example counsellors, gender-sensitive judges/district attorneys and database officers. LRC-KJHAM is one of the institutions. LRC-KJHAM provides protection services to, and engages in policy advocacy on the protection of victimized women and children. Its aim is to empower victims of domestic and gender based violence to become 'survivors' who are strong and knowledgeable enough to solve their problems.

## 1.2. Evaluation objectives

This report evaluates the LRC-KJHAM project[9] as part of as part of the *Medefinancieringsstelsel* (MFS) II evaluation for Indonesia under the Achievement of Millennium Development Goals (MDG) component. The project has been selected under the goals on gender (MDG 3). In particular, the current evaluation focuses on the following research questions: how did the empowerment of women survivors change? How did gender awareness among the women survivors change? How did the paralegal training change support groups of women survivors in advocating and assisting women victims?[10]

We investigate whether the project had a favourable effect on the above mentioned outcomes by looking at the changes in the outcome variables between the baseline and endline periods for the project beneficiaries.

Data was collected using structured surveys in September 2012, and the same respondents were re-interviewed twice, in November 2013 and September 2014. The survey respondents were selected from the clients of LRC-KJHAM who have sought help in relation to domestic violence in the first half of 2012. In total 20 women (out of 26 cases) were interviewed. Half of these respondents have visited LRC-KJHAM in 2012 for the first time. In addition to the quantitative information, we have also collected qualitative data about the respondents that helps us in determining the factors contributing to the change in outcome indicators during the evaluation period.

In order to gain further insights into the impacts of LRC-KJHAM, we collected additional qualitative information using in-depth interviews with support group members and other stakeholders, and a focus group discussion (FGD) with paralegals trained by LRC-KJHAM.

As specified in the Terms of Reference for this evaluation, the report addresses five evaluation questions to assess the project outcomes:

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?

[9] The project is described in more detail in section 3.
[10] This last evaluation question is answered using a qualitative study with the support group members.

2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern partner organisations efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

## 1.3. Summary of findings

LRC-KJHAM provides counselling and legal aid services to victims of GBV. For the evaluation, we interviewed 20 out of 26 women who visited LRC-KJHAM between January and July of 2012 and were victims of domestic violence. At the time of the baseline survey, several respondents visited LRC-KJHAM already multiple times, and 5 respondents were already divorced. During the evaluation period, only 7 respondents have still used the services of LRC-KJHAM.

These facts and the lack of control group pose limitations for measuring the effectiveness of the project. We tried to compensate these issues by using both structured and qualitative survey questions during two follow-up interviews with the baseline respondents both in 2013 (midline) and 2014 (endline).

The data show quite some changes in the marital status of the respondents: 4 women got divorced, 2 got separated and 3 got remarried. At the endline, 7 women were divorced, 4 were separated, 7 were married to their (abusive) husband and 2 found new husbands.

We find that most women got free of domestic violence and increased their autonomy either through divorce or separation or because the husband was not as abusive anymore, which translated into an 80% reduction in the number of types of abuse suffered by the respondents and a 38% reduction in the abusive traits of the (ex-) husbands towards their wives if they still communicated. But 5 respondents (25%) were still psychologically abused and one of them also sexually abused by her (ex-) husband. LRC-KJHAM contributed to these changes through the counselling and legal assistance provided for the respondents. Respondents felt that the survivors at LRC-KJHAM were patient and friendly and they really defended domestic violence victims. The knowledge and moral support received from these survivors provided strength for the respondents in solving their problems at court or in the household.

However, the support from family and friends and successes in employment were at least as important for the women to become more courageous and self-confident. In fact, respondents first confided their household problems to their close friends and family (parents and siblings) when they could not take the pressure and abuse anymore after a long period of suppressed insecurity and fear. It was usually these friends and family who advised the respondents to seek help at LRC-KJHAM.

The psychological well-being of respondents improved by 44% during the evaluation period. This change is probably due to the encouragement received from these sources. However, respondents who experienced less abuse also suffered from less distress, and respondents who solved their cases and settled the divorce consistently reported to feel more relaxed and relieved.

We do not observe any significant changes in the empowerment of the respondents, except for a substantial increase in their self-esteem. No changes were found with respect to the attitude towards their rights in marriage.

Finally, the qualitative data with support group members reported in Annex VIII suggests that LRC-KJHAM's strategy to change victims of gender based violence into survivors and active agents that are able to change their own situation as well as those of others is well chosen. By empowering victims and giving them the courage, skills, and will to actively speak up in court and actively commit their own knowledge and experiences to inspire and help other victims, the victims themselves become advocates for the fight against gender based violence. By changing shame and disgrace into power, they are able to gradually change the negative connotations that are traditionally associated with 'divorce' and 'assertiveness' in women, and inspire and encourage other victims to fight for their own rights, and ultimately those of others.

### 1.4. Structure of report

The rest of this report proceeds as follows: section 2 describes the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1) till 4) in turn. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. The SPO is described in Annex I. Regarding the survey data, the construction of the outcome indicators and indices is summarized in Annex II. Annex III in turn reports detailed descriptive statistics of the sample, while detailed figures on the change in outcome indicators are presented in Annex IV and further tables on analysing the attribution of changes is presented in Annex V. Tables on the information about the service satisfaction and types of information sought are reported in Annex VI, while Annex VII contains additional tables on the respondents who were not divorced at the baseline. Finally, the results of the qualitative data collection are presented in Annex VIII.

## 2. Literature overview

In order to better position the LRC-KJHAM project, this section summarizes relevant findings in the literature with respect to combating domestic and intimate partner violence (IPV)[11]. First, we discuss policy level recommendations and risk factors, and then report the results of specific interventions aimed at reducing the incidence of domestic violence and IVP, and/or supporting victims of domestic violence and IPV.

***Policy level recommendations for fighting domestic and intimate partner violence***

The state is an important actor when fighting domestic and intimate partner violence. It can adopt or improve domestic violence legislation to provide a framework to prevent and respond to domestic violence (UN, 2010). For example, it can alter the legal framework (e.g. criminal and civil remedies), start programmes to prevent violence (e.g. reduce alcohol abuse), or provide services for victims (e.g. protection services, legal aid services) (UN Women, 2011).

[11] Both domestic violence and IPV can take place in the domestic environment. However, IPV can also take place outside the domestic domain, for example dating violence. Domestic violence does not necessarily take place between partners like IPV, for example the violence can also be directed to children.

The movement aimed at changing domestic violence legislation have been partly successful. On the one hand, women's organisations' and human rights group's campaigns to reform criminal and civil laws related to domestic violence - often broadening the legal definition of domestic violence[12] - have achieved great progress (Heise, 2011). For example, the number of countries that have specific legal provisions on domestic violence has grown from 89 in 2006 to 125 in 2011.[13] On the other hand, however, implementation of these laws is yet quite insufficient (Heise, 2011).

Studies documenting the impact of reforming laws on changing behaviour in low income countries are scarce (Heise, 2011). However, it is generally recognized that resolving domestic violence through the state system can work, but if, for example, women and men do not regard themselves as equals in society, these laws and regulations lack the right effect (Venning, 2010). Then, implementing domestic violence legislation alone will not eliminate the violence. It is crucial to include provisions in domestic violence legislation to ensure efficient implementation of the domestic violence legislation, for example by training public officials. Moreover, laws on domestic violence should include public awareness raising programmes and education provisions to create an environment of zero tolerance for violence (UN Women, 2011).

### *Risk factors affecting the prevalence of domestic violence*

Efforts aimed at preventing domestic violence are very important, as the ultimate goal of both government and the NGO-sphere is to create a zero-tolerance to domestic violence. It is generally recognized that the roots of violence against women lie in gender inequality and discrimination.[14] The likelihood of a woman experiencing violence in a particular situation depends on a variety of (risk) factors at the individual, relationship, community and society (including the institutional/state) levels, together known as 'ecological model' (Heise, 2011). For example, the current stock of literature provides relatively strong evidence that gender-related norms, exposure to violence during childhood and male alcohol abuse are risk factors of IPV, at least in the developed world. However, the research on risk factors of domestic violence specifically on Indonesian women is scarce (Hayati et al., 2011).

Hayati et al. (2011) investigated the risk factors of rural Javanese women for physical and sexual violence. 765 women were interviewed by female field workers using the WHO Multi-Country study instrument on domestic violence. The lifetime exposure to sexual and physical violence was 22% and respectively 11%. The results displayed that women's risk of physical and sexual violence is related to traditional gender norms. These unequal gender relationships, measured with women's attitudes and norms, show that these relationships are more common among women living in the highlands and those being married to poorly educated men. Hence, the traditional gender roles, especially in marriage, should gain particular attention in preventive interventions in Indonesia.

Besides women's experiences, men's views on domestic violence are important to investigate to gain knowledge on the determinants of domestic violence (Hayati et al., 2014). Hayati et al. (2014) conducted

[12] With respect to the definition of domestic violence in the law, the UN Women (2011) recommends to have a detailed definition in the law which "captures women's experiences of violence in all its manifestations". Furthermore, the UN Women recommends to "domesticate the definitions by outlawing specific cultural manifestations of violence" (p. 17).

[13] Source: http://www.stopvaw.org/united_nations_model_legislation

[14] For example, see http://www.endvawnow.org/en/articles/300-causes-protective-and-risk-factors-.html

six focus group discussions with, in total, 44 local male community leaders in Purworejo, rural Java. Three different positions of masculinity with certain beliefs on the gender order and acceptance of violence within marriage among the sample were identified, ranging from high acceptance of violence (traditionalist), pragmatic acceptance if needed to correct the wife's behaviour (pragmatist), to no acceptance (egalitarian). A very important determinant of the beliefs of all three positions is religion. The study concludes by recommending that religion should be included in every type of preventive intervention for this population.

### *Effectiveness of preventive programmes*

The evidence about the effectiveness of preventive programmes is highly skewed towards high-income countries (especially the United States). Based on the available evidence, Heise (2011) provides us with an overview of the current research-based literature on the effectiveness of preventing IPV interventions in low- and middle income countries for five different varieties of programmes: law and justice system reforms (see above), harmful alcohol use, women's economic empowerment, childhood exposure to violence, gender-related norms and beliefs. The current evidence stock on harmful alcohol use and the economic empowerment was inadequate to draw general conclusions, but results from the other two programme varieties are promising.

Interventions aimed at reducing childhood exposure to violence show that parenting programmes can improve parent-child interactions and reduce harsh punishment, but more research is needed on a number of other programmes, e.g. positive child discipline or gender socialization interventions (Heise, 2011).

With respect to changing gender norms interventions, both small group and larger-scale campaigns seem to be effective to change norms, attitudes and beliefs related to gender. In addition, some studies show a decrease in reported IPV cases. Successful programmes seem to have engaged the community and locally respected leaders, have involved awareness raising and deliberation on values, rights and gender based discrimination, have built on local traditions, songs and values; and have addressed the drawback of non-compliance with social norms. However, many evaluation studies are methodologically weak (Heise, 2011).

One study in particular that does give evidence on the impact of a preventive intervention in a developing world context, is the SASA! Activist Kit for Preventing Violence against Women an HIV in Uganda. The programme seeks to change community attitudes, norms and behaviours that result in gender inequality, violence and increased HIV vulnerability. Community activists interested in issues of violence, power and rights were trained, along with staff from selected institutions, who worked through the Awareness, Support and Action phases. The programme introduced new concepts of power and encouraged an analysis of the imbalance of power through local activism, media and advocacy, communication materials and training. The activities in each community were developed in response to the community's needs. Abramsky et al. (2014) report that after almost 3 years of the programme, social acceptance of a man's use of violence against his partner was significantly lower among women

(adjusted risk ratio[15] 0.54, CI[16] 0.38 to 0.79) and lower among men (0.13, CI 0.01 to 1.15) in intervention communities compared to control communities. Similarly, more people in intervention communities reported attitudes supporting the acceptability of a woman refusing sex, statistically significant for both women (1.28, CI 1.07 to 1.52) and men (1.31, CI 1.00 to 1.70). Past year experience of physical IPV was substantially lower among intervention women compared to control women (0.48, CI 0.16 to 1.39). For sexual IPV, the difference between intervention and control communities was somewhat smaller and statistically non-significant (0.76, CI 0.33 to 1.72). These results should be interpreted as the short-term community-wide effects.

### *Effectiveness of post-violence services*

In addition to interventions aimed at preventing and resolving domestic violence, there are services aimed at the rehabilitation of survivors of violence, like facilitating access to justice or counselling.

One of the most popular responses by the government to fight domestic violence is to set up facilities which offer post-violence services, i.e. women's police stations facilitating access to justice for women (Heise, 2011). The effectiveness of domestic violence agencies in Illinois, U.S., is investigated by Bennett et al. (2004). Though the results are preliminary due to the study limitations (e.g. self-reported data, no control group), in all four programme areas, crisis hotline, counselling, advocacy, and emergency shelter, the outcomes were positive. Victims of domestic violence have gained important information due to their participation in the hotline, counselling and advocacy. Counselling and advocacy participation improved victims' decision-making ability. Furthermore, counselling alone increased the self-efficacy and coping skills of victims.

Studies on the effectiveness of women's police stations in the developing world show mixed results. On the positive side, the policy stations seem to make the domestic violence problem visible and offer women new opportunities to defend their rights. However, the stations do not necessarily contribute to the elimination of violence or guarantee access to justice since stations were not designed to fulfil *all* women's needs like emergency shelter, guidance, support and legal advice (Heise, 2011).

With respect to counselling, the literature suggests that counselling for battered women can improve a number of skills and characteristics, like self-esteem, assertiveness and coping abilities (Bennett et al., 2004). Based on international standards and good practices, the United Nations Women (2011) concludes that it is important for the long-term rehabilitation of survivors that counselling aims to empower them, be provided free of charge and should not be mandatory. Counselling for perpetrators must be mandated as supplementary to the criminal justice sanction (United Nations Women, 2011).

Other post-violence services are support groups. The results of the two available studies on their effectiveness is summarised below. Tutty, Bidgood, and Rothery (1993) evaluated the impact of 12 closed support groups (i.e. not open to new members after the start) on 76 women within a time span of 6 months. Women showed improvements in the areas of self-esteem, sense of belonging, locus of control, traditional attitudes towards marriage and the family, marital functioning and perceived stress.

[15] Adjusted risk ratios generated on the basis of expected number of events from a logistic regression model on individual data with independent variables including age, marital status and EA-level summary baseline measure of outcome indicator (Abramsky et al., 2014, p. 12)

[16] The 95% confidence interval (CI) of the estimates is reported.

Women living with their husbands showed significant decreases in both physical and non-physical and controlling abuse. Thought the results should be interpreted with caution due to the high level of attrition (n=32 at the endline) and the lack of a comparison group.

Constantino et al. (2005) evaluated 24 women in a domestic violence shelter (Western Pennsylvania, U.S.) using a randomized control design. The women were randomly designed to either the control group or the treatment group. Both the control and treatment groups received the standard shelter services provided to all women in the residence: meals, shelter, and necessary transportation. In addition, the treatment group received the social support intervention: once a week a 90-minute meeting led by a trained nurse for eight weeks. The meetings focussed on their social support networks and access to community resources. After the programme the treatment group showed greater improvement in psychological distress symptoms, reported higher feelings of social support, and showed less health care utilization than the control group.

However, the above findings may not be directly translated to Indonesian women due to differences in culture and context. As research in the U.S., U.K. and Australia has shown: "women's perceptions of appropriate and inappropriate responses [by professionals] partly depended on the context of the consultation, their own readiness to address the issue, and the nature of the relationship between the woman and the health care professional."(Feder et al., 2006, p.22).

#### *Summary*

Summarizing, it is found that in order to eliminate domestic violence both legal interventions and interventions to change social norms building on local traditions are important. In the context of Indonesia the traditional role of men and women in marriage deserves particular attention. Evidence on the effectiveness of programmes that aim to prevent domestic and IPV violence is scarce. The SASA! Programme was successful in changing beliefs about violence, but did not find significant results for a decrease in actual violence. For rehabilitation of survivors of domestic violence, counselling can help to emotionally strengthen survivors, but it is not clear whether it actually results in changing the abusive situation. More evidence is needed to pinpoint the key factors driving successful programmes aimed at eliminating domestic violence and the rehabilitation of survivors.

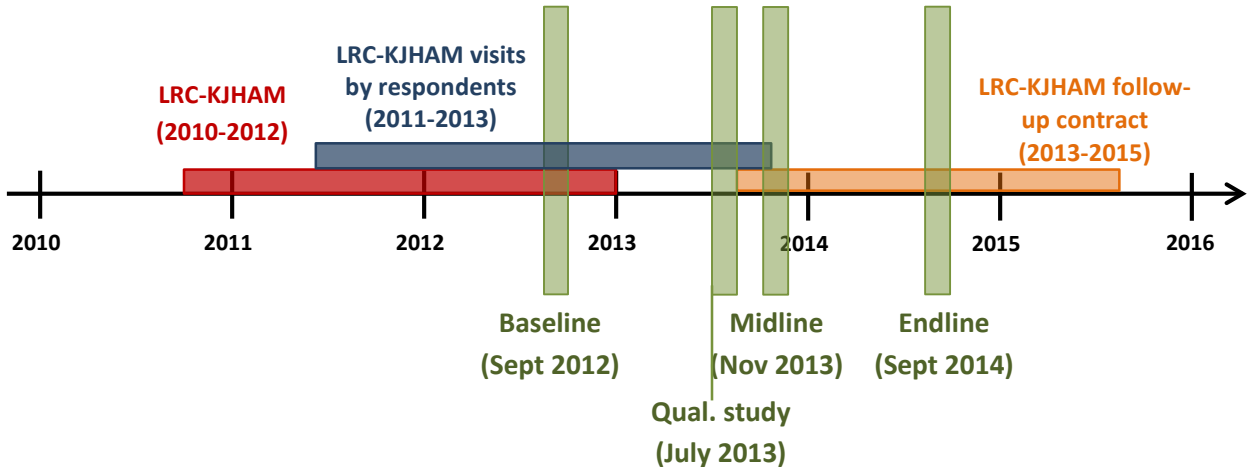
# 3. The project

## 3.1. Project description

The "Strengthening Marginalized Women's Access and Control to Legal Resources and Human Rights in Central Java 2010-2012" project of Legal Resources Centre for Gender Justice and Human Rights (LRC-KJHAM) ran between 1 October 2010 and 31 December 2012.[17,18]

[17] Hivos also provides funding for LRC-KJHAM between 14 August 2013 and 31 July 2015. This follow-up project is targeted at the support group. The objective is that it becomes an independent group that is able to advocate other victims of GBV and to campaign for SRHR. As such, the project focuses on 'woman leadership'. Hivos believes that the potency and capacity of survivors can be strengthened through this women leadership project. However, because this project has no effect on the current evaluation (respondent did not benefit from it prior to the interviews), we do not discuss this follow-up project in further detail.

The ultimate goal of LRC-KJHAM is to empower victims of GBV to become survivors. Accordingly, it aims to strengthen the access and control of women victims of GBV to legal resources and human rights in Central Java. [19]



Hivos provided funding for the following activities of LRC-KJHAM:

- Continuous victim support:
  - Providing legal aid to at least 25 female victims of GBV per year.
  - Strengthening 4 support groups for victims of GBV.
- Capacity building of LRC-KJHAM:
  - Training paralegals to support victims of GBV.
  - Recruiting volunteers for programme management or paralegal activities.
- Conducting research and data analysis on cases of GBV:
  - Developing a database of cases of GBV.
  - Developing guidelines to implement Feminist Participatory Action Research (FPAR) and Women's Rights Impact Assessment.
  - Developing a gender profile on health and GBV for 4 sub-districts of Semarang City.
- Organising policy advocacy activities on women's rights:
  - Publishing 2 women's rights journals.
  - Updating the website of LRC-KJHAM.

Among these activities, the evaluation focuses on the counselling and legal aid services to victims of domestic violence, and on the strengthening of the support groups.

Figure 1 summarizes the project periods and the evaluation activities.

**Figure 1: Timing of intervention**

[18] After 2012 Hivos stopped funding the core activities of LRC-KJHAM because LRC-KJHAM is able to obtain funding from the local government in Semarang, which is supportive of the issue of gender based violence and has a good working relation with LRC-KJHAM on the integrated service centres. In the project between 2013-2015, Hivos provides funding for the support group as an 'exit-strategy' because the local government does not provide funding for the strengthening of survivors.

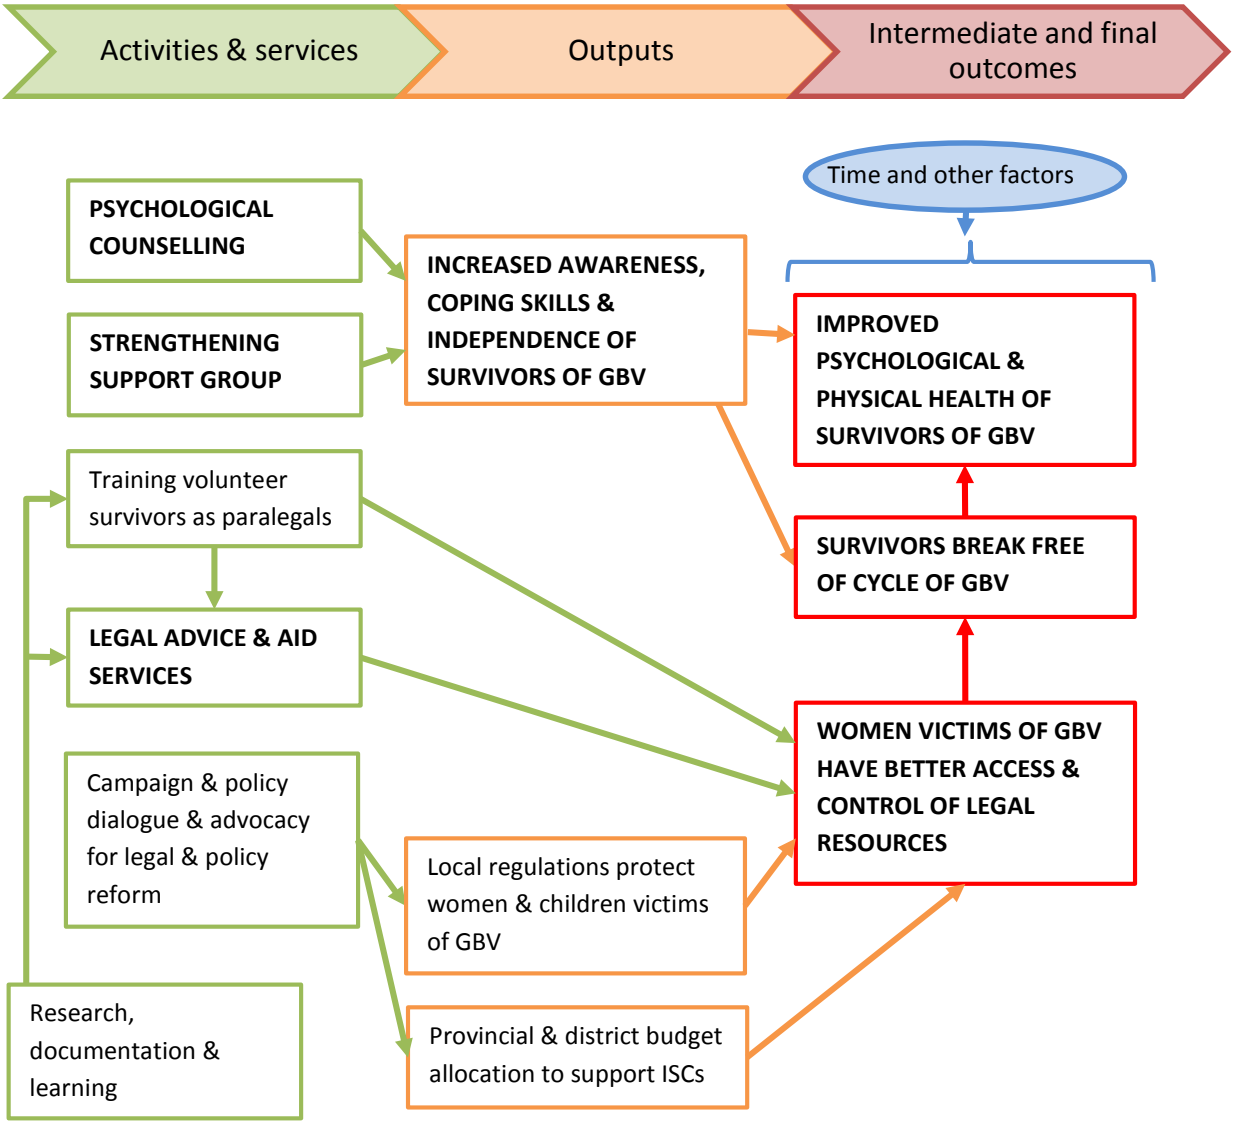
[19] For further information about LRC-KJHAM see Annex I.

## 3.2. Result chain

The result chain is displayed in Figure 2. It is based on both project documents and the interpretation of the evaluators. It is a rather complex project logic which incorporates both activities and their desired effects at the beneficiary and at the community and policy level.

As a pro-women's rights legal resource centre, LRC-JKHAM commits to strengthen the access of marginalized/poor women victims of gender based violence to legal resources. To this end, LRC-KJHAM provides legal aid services to women victims, holds campaigns for women rights and promotes legal and policy reform, empowers women victims with education and training, and conducts (documentation) research and data analysis on women victims of GBV, and uses the data to support policy advocacy on protecting women's rights. It is also engaged in strengthening survivor-based support groups to improve their ability to reach victims of GBV and engage in policy dialogue with the local parliament and government and help drafting local regulation and policy. The project aims to contribute to the enactment of local regulation on protection of women and children victims, and budget allocation in provincial and city/district levels to support the integrated service centre (ISC, or 'one stop crisis centre'/OSCC) at the district level. The basic idea of an ISC is to provide an integrated service unit to handling women victims of GBV. Included are: psychological counselling, mental and physical treatment and legal aid.

The evaluation focuses on the components of the result chain that are printed in bold and with capital letters. Regarding the activities of LRC-KJHAM, these are psychological counselling; legal advice and assistance; and support group. These activities were used by the respondents during the evaluation period. The hypothesised effects of these activities are discussed below in further detail.



The aim of counselling is to overcome the trauma and to improve the awareness, independency and honour of (female) victims. Support groups can also provide comfort for the women by sharing their experiences and providing support for each other. LRC-KJHAM provides the meeting facilities for the support groups. Regular group meetings discuss topics that are of interest to the respondents and sometimes invite guest speakers. Support group members also take part in demonstrations supporting the cases of other victims or campaigning for policy change.

LRC-KJHAM also provides legal advice for abused women regarding their rights and the procedure of divorce or other legal cases. If they are ready to take legal action (divorce), LRC-KJHAM offers assistance in handling the litigation procedure.

It is important to keep in mind that there are also other factors that affect the empowerment and psychological well-being of the survivors of domestic violence. These could be support from the family and friends of the respondents or new life experiences such as a new job.

Finally, it is of interest of the evaluation how the project beneficiaries get in contact with LRC-KJHAM. The victims contact LRC-JKHAM though three channels: survivor support groups actively approach women victims; victims go to support group and ask for assistance; or victims come directly to the ISC.

**Figure 2: Result chain**

Notes:

1. MFS II evaluation focuses on result chain items in bold and capitalized (e.g. psychological counselling).
2. Oval factor is independent of the activities of LRC-KJHAM.

# 4. Evaluation questions and outcome variables

## 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. In the baseline report specific evaluations questions were specified. Table 1 shows these five questions and what it implies for this project.

**Table 1: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| 1 | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | • How did the empowerment of women survivors change?<br>• How did gender awareness among the women survivors change? |
| 2 | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Are the observed changes above attributable to the intervention? |
| 3 | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>• Does the project address an important issue for the beneficiaries?<br>• Satisfaction of beneficiaries (self-reported impact) |
| 4 | Efficiency: Were the development interventions of the Southern partner organisations efficient? | Was the intervention cost effective? |
| 5 | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

The baseline report specifies three more evaluation questions than mentioned in Table 1. However, for two of those questions[20] we were not able to answer those questions because they are too general and ambitious. On the other hand, we investigate the other evaluation question using a qualitative study with support group members: how did the paralegal training change support groups of women survivors in advocating and assisting women victims?

[20] Were the research and database provided by SPO accessible and used by various stakeholders (GO and NGO)? How did the enactment of regulation on protection for women victims of GBV change?

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators following the result chain of the project discussed in section 3.2. The outcome indicators are split up into 4 sub-groups: the number of women free of domestic violence; psychological health of women; women's empowerment/attitude towards themselves; and attitude/empowerment in marriage. Since there are many possible and interesting outcome indicators, variables are grouped into indices for the main analysis.

Table 2 displays the outcome indicators of the main analysis, the scale of these variables and whether an indicator is a uniform indicator, while Annex II describes the outcome indicators in more detail and highlights the components per index. These uniform indicators are specified by the syntheses team for the goal of gender equality (MDG 3).

**Table 2: Overview outcome indicators**

| Outcome indicator | Scale (minimum; maximum) | Uniform indicator |
|---|---|---|
| **Panel A. Number of women free of domestic violence** | | |
| Abused by husband/partner in the past 12 months | (0;n) | |

# 5. Data collection

This section describes the survey instruments and the sampling design and outcome.

## 5.1. Survey instruments

We collected three types of data: quantitative, qualitative, and financial data. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

A structured survey was administered with 20 clients of LRC-KJHAM focusing on information related to the domestic abuse and help seeking, psychological well-being and attitude towards rights of wives and themselves. Some qualitative questions were integrated in this survey as well. The baseline data have been collected in September 2012, the midline data in November 2013, and the endline data in September 2014.

### *Qualitative data*

To gain more insight into the impact of the programme, a qualitative analysis was conducted in July 2013. In-depth interviews were conducted with four agencies (LRC-KJHAM, Seruni, Provincial PPT, and PPT city/BAPPERMAS), and with 9 female support group clients of LRC-KJHAM. One FGD was held with 5 female (ex-)clients who have become paralegals for LRC-KJHAM. The results of this study are summarized in Annex VIII.

### *Financial data collection*

To collect information about the costs of the project, we conducted a project cost survey with the head of internal matters, head of operations and the director of LRC-KJHAM on 19 July 2013.

## 5.2. Sampling outcome

### *Sampling design*

The evaluation focuses on the victims of domestic violence. According to our information the litigation procedure for domestic violence takes on average 6 months. Therefore, we selected the respondents from the clients of LRC-KJHAM who have sought help in relation to domestic abuse between January and August 2012. Until August, 26 such cases had been recorded at time of the sample selection. We have aimed at interviewing 20 of these women, giving priority for the newer cases.[21]

The same respondents were planned to be re-interviewed on an annual bases.

### *Sampling outcome*

The sampling design was carried out as planned. We have interviewed 20 out of 26 clients of LRC-KJHAM, who turned to the organisation between January and August 2012. For the timing of the data collection, see section 5.1.

[21] Hence, the selection of the sample is non-random due to the limited number of the beneficiaries.

# 6. Descriptive statistics

This section summarizes the main characteristics of the respondents by focusing first on their interaction with LRC-KJHAM, and then on their socio-economic characteristics. Additional tables are provided in Annex III.

## 6.1. Treatment exposure

Table 3 reports on how often and for what purpose the respondents used the services offered by LRC-KJHAM. Out of the 20 respondents, 11 visited LRC-KJHAM in 2012 for the first time, 6 of them contacted LRC-KJHAM already in 2011, while 3 respondents contacted LRC-KJHAM before 2011 for the first time.

At the baseline, a total of 8 of 20 respondents have explicitly mentioned that they have received psychological counselling, 9 respondents received legal advice and 7 received legal aid. During the evaluation period, in the first year (midline) 4 respondents benefitted from legal advice from which 3 have continued from the baseline. Hence, in total 10 respondents benefitted from the legal advice of LRC-KJHAM. During the same period, also 4 respondents reported to use legal aid services of LRC-KJHAM with 3 respondents continuing from the baseline. However, the overlap between the respondents benefitting from legal aid and legal advice is not complete. In total, 12 of 20 respondents reported to have received either legal advice or legal aid from LRC-KJHAM. However, this number may actually be higher for legal advice, as 4 respondents did not indicate the type of services used, despite 3 of them having visited LRC-KJHAM multiple times (but not having filed for divorce).

As the table shows, 7 respondents used the legal aid or legal advice services of LRC-KJHAM during the first year of the evaluation period and none of them did so after the midline study. Most of the cases were regarding divorce, however, one divorced client asked LRC-KJHAM to assist her in claiming her rights over a property acquired jointly with her ex-husband. Respondents stopped visiting LRC-KJHAM after their case had been settled or they had not yet made up their mind about divorcing their abusive husband.

Out of the 11 respondents that visited LRC-KJHAM in 2012 for the first time, only 3 reported that they visited LRC-KJHAM only once. Among these three, one actually received legal aid from LRC-KJHAM but then also got a lawyer to handle her divorce case; another one attended only one psychological counselling session but decided to remain with her husband; and the third one also decided to stay with her husband. The other respondents returned to LRC-KJHAM multiple times, even though not all of them used the legal aid services of LRC-KJHAM either because they did not file for divorce or they used other sources of help. Most (12 of 20) respondents visited LRC-KJHAM a total of 2-4 times. The 5 respondents who visited more often were all members of the support group as well.

The support group was formed by LRC-KJHAM and consists of the women victims who are both members and organisers of the group's activities. The group organises monthly regular meetings but occasionally also supports the trial of victims by use of demonstrations.[22] 6 of 20 respondents reported to be members of the group at the baseline, and 5 continued to be members up until the endline survey.

[22] For more information about the support group, see the qualitative report based on interviews with support group members in Annex VIII.

However, only 2 respondents at the midline and one of them at the endline reported to regularly attend the support group meetings. From the qualitative data we can see that respondents agreed that support group activities were very helpful for them. Unfortunately, they did not really have the chance to participate since most activities were carried out during working hours. As one respondent remarked *"I'm just an employee and if I skipped work my salary will be reduced. I wish I could join the group and meet the other women victims".* Another respondent also noted that "*I really want to gather and add my experience, but I don't have time. I have to meet my company selling target.*" In addition, the distance to the meeting place (the office of LRC-KJHAM) hindered the participants to join in the activities.

In the following data analysis, in addition to reporting the results for the group of all respondents, we also show the results for the group of respondents who have used the legal aid and legal advice services of LRC-KJHAM during the evaluation period (7 respondents).

**Table 3: Use of LRC-KJHAM services**

| Survey | 2012 | 2013 | 2014 |
|---|---|---|---|
| **Sample size** | 20 | 20 | 20 |

## 6.2. Respondent characteristics

To provide a better insight into the general characteristics of our sample, Table 4 displays a number of socio-economic characteristics of the respondent and her husband at the baseline. For variables where the sample mean is displayed, the standard deviation of the variable is reported in brackets below the mean (for example, for age or number of children). For categorical indicators, the number of respondents that belong in each category is reported.

**Table 4: General characteristics of the sample**

| Sample | Total sample | Used LRC since baseline |
|---|---|---|
| **Period** | 2012 | 2012 |
| **Sample size** | 20 | 7 |
| **Age** | 37.75 (10.02) | 35.57 (9.52) |
| **Number of children** | 1.78 (0.81) | 1.67 (0.82) |
| **Religion** | | |
| - *Islam* | 17 | 6 |
| - *Catholic* | 2 | 0 |
| - *Protestant* | 1 | 1 |
| **Highest level of education of respondent** | | |
| - *Elementary* | | |
| - *Junior High School* | 1 | 1 |
| - *Senior High School* | 3 | 2 |
| - *University* | 9 | 3 |
| | 7 | 1 |

| - *Work* | 16 | 6 |
| **Employment status of partner** | | |
| - *Unemployed* | 4 | 2 |
| - *Work* | 16 | 5 |
| **Asset index** | 0.76 (0.68) | 0.41 (0.65) |
| **Housing facilities index** | 0.58 (0.16) | 0.50 (0.15) |

Source: Respondent survey E7; MFS II Evaluation Indonesia
Notes: Standard deviations are given in parentheses.

The table shows that the average age of respondent was 38 years. The oldest respondent was 53 years old, while the youngest was 21. Most respondents were between 30-40 years old, hence they were in the productive age group both as mothers and as workers. They had on average 2 children, with 4 respondents with 3 children, 6 respondents with 2 children, 8 respondents with 1 child, and 2 childless respondents. Most of them also worked at the time of the baseline survey, with only 4 of 20 being unemployed or housewives. One respondent stated, *"I work to fulfil our daily needs, including my child's needs".* Several respondents reported as one of the reasons for divorce that their husband has not provided them with money to fulfil their and their children's daily needs. As the table shows, 4 respondents' husbands were unemployed.

Most of the respondents had at least senior high school level of education (16 out of 20) with 7 respondents also having university education. The education level of the partners was similar. Respondents' households are also better off than the average Indonesian household based on the asset and housing facilities indices.[23]

Regarding religion, most 17 respondents were Muslim, 2 were Catholic and 1 Protestant. Interestingly, one of the respondents indicated for the reason to divorce her husband that he had changed his religion. However, religion is unrelated to the treatment received at LRC-KJHAM.

Generally, women who turn to LRC-KJHAM are women who are in a high need of solving their problems. Usually, the economic factor is the main obstacle to deal with domestic violence problems. This is not the case in this sample as almost all women worked. There are three main reasons that seemed to trigger the respondents in turning to LRC-KJHAM: firstly, they felt tired, anger, disgust, and not loving their husband anymore due to his behaviour; secondly, their spouses never provided them for a living; and third, their husband had an affair.

## 6.3. Life events during the evaluation period

Below changes in marital status, housing condition and employment are summarized. Other positive and negative life events will be discussed in section 8 in more detail.

### *Marital status*

In Annex III, Table 13 reports on the changes in the marital status of respondents between the baseline and endline. From the 11 married respondents at the baseline, 3 got divorced and 2 got separated during the evaluation period, while 6 remained married to their husband. From 5 divorced respondents at the baseline, 2 has remarried by the endline, and from 4 separated respondents at the baseline, 2 got divorced and one of these also got married. Hence, in total 9 of 20 respondents changed their marital status during the evaluation period but only 4 got divorced. Two divorced respondents married a new husband who has been treating her better. One of the respondents confessed that "*My current husband is nice and gentle. His face is and body are sturdy but his heart is warm."*

However, one respondent re-married her abusive ex-husband due to the insistence of her daughter and the advice of the Ustad (religious leader) despite her statement *"I actually felt reluctant to get back together because I was still afraid of him".*

### *Housing situation*

Table 15 reports on the housing situation of the respondents. At the baseline, only 5 respondents lived in the same house as their husband, while this number is 8 at the endline including the newly married respondents. Most but not all respondents (14 out of 18) who had children actually lived with their children at the baseline, while this number was 13 at the endline.

[23] The asset and housing facilities indices are standardized at zero (mean) for the average Indonesian household based on the DHS 2012 and IFLS 2007 surveys, respectively. The asset index is also standardized to have 1 standard deviation.

### *Employment*

Table 16 reports on the changes in employment during the evaluation period. The table shows that quite some respondents changed their employment during the evaluation period. Most changes are improvements, for example from factory employees to running their own business. Only one respondent stated that she got a worse job.

In addition, 2 respondents stopped working after re-marrying as their new husbands did not allow them to work. *"I am not allowed to work, but I'm only allowed to help my husband's job", "My husband prohibits me to work. I only have to take care of him and his grandchild."*

One respondent who did not work during the evaluation period stated that "*I have already divorced but I receive allowance from my ex-husband every month, as mentioned during the divorce process. I spend it to fulfil my daily needs and I can still save some for savings."* However, her case is exceptional. She still lives in the same house with her ex-husband and their relationship has improved after the divorce.[24]

## 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured at the base-, mid- and endline surveys are grouped into four categories: exposure to domestic violence, psychological health, women's empowerment (attitude towards themselves), and empowerment in marriage. All outcome indicators are based on self-reported measurement tools.

Table 5 to Table 9 display the results for all outcome indicators for the total sample (n=20) as well as for the women who used the services of LRC-KJHAM since the baseline (n=7). For the baseline (2012), midline (2013) and endline (2014), either the mean of the outcome indices or the number of respondents in the categories are reported. In the first case, the standard deviation of the indicators is displayed below the means in parentheses. In addition, the changes between the surveys are reported by the changes in means or the change (increase or decrease) in number of respondents in the category. The significance of the change is only tested for the change in means. The standard deviation of the change is displayed below the means in brackets. The significance of the change from zero is denoted by stars, with '*' denoting that the change is significant at 10% significance level, '**' for 5% significance level and '***' for 1% significance level.

The following subsections discuss the levels of and changes in the outcome indicators. More information on how the indicators were constructed can be found in Annex II.

### *Exposure to domestic violence*

Table 5 reports on the respondents' experiences of domestic abuse during the past 12 months by physical, psychological and sexual abuse. The number of respondents who experienced the specified type of abuse during the past 12 months is shown in the table. In addition, the mean of the index indicating the number of types of abuse by the husband or partner is provided, as well as the change in

[24] One of the reason for divorce was that the husband has changed his religion.

this indicator between the indicated periods. Further details regarding the changes in exposure to domestic abuse are reported in Table 17 to Table 19 in Annex IV.

**Table 5: Experiences of domestic abuse**

| Period | 2012 | 2013 | 2014 | 2013-2012 | | 2014-2013 | | 2014-2012 | |

Source: Respondent survey E7; MFS II Evaluation Indonesia
Note: Standard deviations given in parentheses. * p-value<0.10, ** p-value<0.05, *** p-value <0.01

In 2012 (baseline) 15 out of 20 women reported to have been exposed to at least one form of domestic violence in the past year; 6 out of the 7 women who used LRC-KJHAM since the baseline experienced any form of abuse. The most frequently reported type of violence is psychological (15 of 20). Between 2012 and 2013, as well as between 2013 and 2014, we see a decrease in the number of women that experienced abuse by her husband/partner. Between 2012 and 2013, the improvement was mostly in terms of the reduction in the exposure to physical abuse (2 respondents), while psychological abuse did not subside substantially (12 respondents), and in fact, sexual abuse increased (8 respondents). 7 of 12 married respondents experienced sexual abuse at the midline. Table 18 shows that, during the first year of the evaluation period, 5 respondents' situation has worsened (above the diagonal), 6 respondents' situation improved (below diagonal, left) and 3 respondents' situation changed only slightly (below diagonal, right).

The improvement during the second year of the evaluation (2013-2014) was more pronounced. Remarkably, none of the women experienced physical abuse between 2013 and 2014. However, 5 women from the total sample still experienced psychological abuse during this period. Of them, 2 were still married, while 2 got divorced and 1 got separated between 2013 and 2014. In addition, one of the woman who got divorced during this period reported to be sexually abused between 2013 and 2014. Despite her divorce, she still regularly sleeps over at her ex-husband's house as her children stayed with her husband.

Overall, the exposure to domestic abuse decreased significantly during the evaluation period both in terms of the number of women experiencing abuse and the severity of the abuse. In some cases the improvement is due to divorce. Albeit divorce and separation allows a greater distance from the abusive (ex-) husband, it is not a guarantee for the termination of abuse. In most cases women endure psychological abuse for the sake of their children even after the divorce, especially if children stay in the father's house.

We also observe that women take long to decide on divorcing their husband and it is often triggered by the escalation of abuse. Out of the 6 respondents who were married at the midline and got separated (4) or divorced (2) at the endline, 5 experienced psychological abuse both at the baseline and midline, and 4 experienced sexual abuse at the midline (2 also at baseline). On the other hand, out of 5 respondents who did not get divorced or separated during the evaluation period, 3 experienced psychological abuse and 2 experienced sexual abuse in 2012 and 2013, but only one of them was still abused by her husband in 2014. She confessed that she did not consider divorce saying "*If my husband stays in my house I consider him my husband, but if he stays outside I do not consider him as my husband. It is an effort to calm my mind."*

Reporting on domestic abuse assumes that women are always aware that they are being abused by their husband. However, the first step to break the cycle of domestic abuse is the realisation that one is being abused. Therefore, it is of interest to report on how the respondents were being treated by their husband/partner. Seven abusive traits and four supportive traits are reported in Table 21, where the number of respondents who reported a certain trait about their husband is reported.

In Table 6 the domestic life of the respondents is summarized by the mean number of negative (out of 7) and positive (out of 4) traits.[25] The results in the table indicate that the number of negative traits of their (ex-) husband, such as controlling what the respondent does, significantly decreased during the evaluation period (by -1.5 traits out of 7). Hence, the autonomy of the respondents increased during the evaluation period. However, no significant improvement can be found in the supportive attitude of the (ex-) husband.

[25] Please note that at the endline survey the questions were asked for respondents that keep in touch at least once per month with their (ex)husband, and if the respondent has a new partner the questions refer to the new partner.

**Table 6: Relationship with current/last husband/partner**

| Period | 2012 | 2013 | 2014 | 2012-2013 | 2013-2014 | 2012-2014 |

### *Psychological health*

Table 7 reports on the psychological health of women measured with the psychological distress index based on GHQ-12. The psychological distress index is composed of three sub-indices: social dysfunction, anxiety and lack of confidence in oneself. The more psychological distress a woman had experienced in the past one month, the more components of an index were applicable to a woman, and hence, the higher the value of an index. The outcomes of the components included in the indices are provided in Table 21 and Table 22.

Data indicate that at the baseline (2012), most respondents experienced anxiety (2.4 out of 4) and loss of confidence (1.3 out of 2) but they were mostly able to enjoy their daily (social) activities (1.1 out of 6). On average, respondents regularly experienced 4.8 out of the 12 distress feelings.

During the evaluation period, we observe a significant improvement in the psychological well-being of the respondents in all 3 sub-indicators, with the improvements mainly occurring between the baseline (2012) and midline (2013) periods. We observe the most improvement in terms of confidence (-0.6 out of 2) including respondents not feeling depressed anymore (from 14 to 4); and in terms of anxiety (-0.8 out of 4) as most respondents do not feel under strain (from 13 to 2) and think themselves as worthless (from 11 to 5) anymore (Table 22). In addition, respondents became more able to enjoy their lives (social dysfunction changed by -0.7 out of 6) due to being more able to concentrate on things and feeling happier in general (Table 21).

However, most respondents were still struggling to overcome their emotional problems (16 at endline) due to the lingering effects of the abuse (or continued abuse) by their (ex-) husband. In addition, after a temporary improvement at the baseline, respondents still often lost confidence in themselves at the endline (10 respondents). This could potentially be due to new challenges in life such as providing for themselves and their children.

For the women who still used the services of LRC-KJHAM, no significant improvement in the indices are seen (except for Losing confidence in yourself 2013-2012), but the decreases in the indices are similar to the ones for the total sample. In addition, obtaining a significant difference is more difficult due to the lower sample size.

As discussed above, the exposure to domestic violence decreased most significantly between the midline and the endline (2013-2014). However, psychological distress most significantly decreased between the baseline and the midline (2012-2013). Independent of the abuse experienced at the baseline, we observe a general improvement (by 2.35 out of 12 on average) in the psychological well-being of the respondents between 2012 and 2013. The correlation between the number of types of abuses experienced between 2012 and 2013 and the change in the GHQ-12 index during the same period (2012-2013) is moderate (0.24),[26] while the correlation is quite high with the value of the GHQ-12 at the midline (0.74) and even for the endline (0.52).

These figures suggest that the improvement in psychological well-being between 2012 and 2013 is mostly unrelated to the exposure to domestic abuse. A more plausible explanation would be that respondents reached out to seek help for their problems and the support received from their social network and other organisations have helped them to redeem their self-esteem and confidence. For example, 5 of 16 respondents mentioned that they participate in more religious activities.

However, the respondents' who experienced (sexual) abuse at the midline had a 2.5 (1.5) worse score on GHQ-12 at midline compared respondents who were not abused (were 'only' psychologically abused) at the midline. As sexual abuse at midline had a reasonable prediction for being abused at the endline (correlation of 0.47), the difference also persists at the endline (1.9 and 0.9 respectively). As one respondent who was sexually abused by her husband stated "*During this year I often get headaches, colds, can't work for a long time, tired, and my husband is rude and often yelling.*"

[26] The correlation between the number of types of abuses experienced before the baseline and the change in the GHQ-12 index between 2012 and 2013 is even lower at -0.07.

**Table 7: Self-reported psychological health of women**

### *Women's attitude towards themselves*

Women's empowerment with respect to their self-image is measured by three indices and two indicators between the baseline (2012) and the endline (2014),[27] as shown in Table 8. The indices range from -2 to +2, where -2 indicates a negative outcome and +2 indicates a positive outcome. Hence, the higher the value of the index/indicator, the more empowered the women feel. The impact on the components of the indices is provided in Table 23.

At the baseline, all outcome indicators show a positive value, hence on average women have an average to medium empowerment/self-image. The support index shows the highest level (1.3), indicating that most of the women have someone who listens when they need to talk about their problems. The women still using LRC-KJHAM services show lower levels of empowerment with regard to the control index, higher levels of empowerment with regard to the dependency indicator and similar levels of empowerment with regard to the other indicators.

During the evaluation period, we generally observe a small increase in the indices except for support. However, the only significant improvement is in the self-esteem index (by 0.5) for both the total sample and the women who used the services of LRC-KJHAM. The respondents' self-esteem increased in terms

[27] These indicators were not measured at the midline.

of having more things to feel proud of and being more satisfied with themselves (Table 23). This finding is line with the decrease in anxiety and increase in confidence found for the psychological distress index.

### *Empowerment in marriage*

Table 9 reports the respondents' attitude towards their rights in marriage at the baseline (2012), midline (2013) and endline (2014). The rights of wife index indicates respondents' (assumed) autonomy in the marriage and it is measured by the average number of traits indicating autonomy that the respondents agree with (see Annex II for further details).[28] The table also reports on the number of women who agree with any reason for a husband to hit his wife and the number of women who agree with any occasion for a wife to refuse sex. Table 24 and Table 25 in Annex IV report on the components of the indicators.

[28] The rights of wife index was only measured at the baseline (2012) and endline (2014).

**Table 9: Empowerment in marriage**

| Period | 2012 | 2013 | 2014 | 2013-2012 | | 2014-2012 | |

| Nr. of good reasons for a husband to hit his wife (0-6) | 0.29 (0.76) | 0.86 (1.07) | 0.14 (0.38) | 0.57 (0.98) | | -0.14 (0.90) | |
| *Any occasion a wife can refuse to have sex* | 7 | 7 | 7 | 0 | 0 | 0 | 0 |
| Nr. of occasions a wife can refuse to have sex (0-3) | 2.57 (0.53) | 2.29 (0.76) | 2.14 (0.69) | -0.29 (0.95) | | -0.43 (0.98) | |

Source: Respondent survey E7; MFS II Evaluation Indonesia
Notes: Standard deviations given in parentheses. * p-value<0.10; ** p-value<0.05; ***p-value <0.01.

Almost all women agree with most occasions a wife can refuse to have sex. 15 out of 20 women find that none of the reported reasons are good enough reasons for a husband to hit his wife. The rights of wife index is in the upper halve of total scale of the index, meaning that women regard themselves to have medium levels of autonomy in their marriage. No significant change is found between the years on any of these indicators.

Even though not significant, we see a small decrease in the rights of wife index, indicating that the women feel that they had less rights in their marriage at the endline than at the baseline. These findings can be explained by the changes in the components. There we see a significant decrease in the fraction of women who think that 'a woman should be able to choose her own friends even if her husband disapproves' and in the fraction of women who think that 'woman should be allowed to have a full or part-time job outside the household even if her husband disapproves'. However, there was a significant increase in the fraction of women who disagree that 'it is a wife's obligation to have sex with her husband even if she does not feel like it'. These findings are found for the total sample as well as for the women who used the services of LRC-KJHAM.

***Summary***

Overall, the data show significant positive developments in the outcome indicators: 10 respondents became free of domestic abuse, and the extent of abuse significantly decreased for all except 1 respondent. In addition, the self-esteem and psychological well-being of the respondents had significantly increased during the evaluation period.

However, from all the indicators for empowerment, only the self-esteem index significantly improved. The indicators on women's empowerment in marriage were moderately high but some respondents still believed that a husband is justified to hit his wife if she disobeyed him (4) or neglected the children (2).

# 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

## 8.1. Methodology

The evaluation of the LRC-KJHAM project relies on a before-after comparison methodology. This means that we interviewed respondents at certain periods and evaluate how their situation changes over time. Due to the specific nature of the project and ethical reasons, no other method was possible. The difficulty of this approach is that we cannot be sure whether the changes (see evaluation question 1) occurred as a consequence of the project or due to other factors. Therefore, we have to use a Theory of Change (ToC) for the project and investigate whether the changes can be explained by this ToC or by alternative pathways. Qualitative analysis helps to disentangle the pathways.

The ToC or result chain for the LRC-KJHAM project was discussed in detail in section 3.2. Here, we summarize the ToC for the counselling and legal assistance services of LRC-KJHAM. It is hypothesised that providing psychological counselling and legal assistance will empower marginalised women by providing information about their rights. This will enable them to make informed decisions about their household situation (divorce, separation or staying with husband) and change their attitude and behaviour towards themselves and their husband, and, finally, improve their psychological health condition. If needed, the legal assistance provided by LRC-KJHAM enables abused women to take legal action against their abusers (in this case their husband), and break the cycle of abuse (by a divorce). All clients of LRC-KJHAM are also invited to join a support group, where survivors of abuse come together for learning and supporting cases of other abused women. This empowers women to become survivors of gender-based and/or domestic violence.

Hence, the outcome indicators of the project are related to women being free from abuse, female empowerment, psychological well-being (psychological health) and the behaviour of abused women. However, it is important to keep in mind that a number of alternative pathways or ToCs could also lead to improvement in these outcomes. For example,

- Women may have sought help elsewhere. If the client already knew about her right to divorce her husband and got divorced with the help of a lawyer, the change in the outcome indicators is not driven by the services of LRC-KJHAM
- She may have moved out of the house of her husband and she is not interacting with the husband anymore.
- Change in the outcome indicator on psychological well-being and empowerment can be originated in other aspects of the women's life than her relationship to her (last) husband. For example, she may have better living or working conditions; or she might suffer from the loss of a close family member.
- Change in the outcome indicator on psychological well-being and empowerment can be also explained by time. If she is not abused anymore, her psychological condition might improve due to new life experiences.

There are numerous other possible explanations for the change in the outcome indicators. In order to find out what share of the change in the outcome indicators can be attributed to the proposed ToC or LRC-KJHAM's services, at the end of the follow-up interview with the respondents, we allowed for open-ended discussion regarding the factors that influenced their lives since the baseline interview.[29] This self-reported information will be used to provide a qualitative explanation of the factors driving the changes and whether these changes can be attributed to the services received at LRC-KJHAM or to alternative pathways. The following section summarizes our findings.

## 8.2. Results

In section 7, we observed that self-esteem and confidence of the respondents increased during the first year of the evaluation period, and these cannot be explained by the exposure to domestic abuse even though the exposure to domestic violence affects the levels of these indicators. We also observed that the prevalence and intensity of domestic abuse decreased significantly during the evaluation period, particularly during the second year, both for married and divorced or separated respondents. However, whether respondents remained with their husband or left the household (divorced or separated) was largely dependent on whether the situation with the husband improved or got worse.

In this section, we try to identify the factors that contributed to these outcomes. We start by investigating the sources of help seeking (social network, LRC-KJHAM and other organisations), and then discuss other life events. In turn, we look at factors affecting the lives of respondents after the divorce, and the overall changes in their lives. We conclude this section by providing an ex-post Theory of Change based on the findings.

[29] The qualitative discussion focused on the following groups of questions: 1. Do you think you have changed since last interview? How? What are the sources/causes that made you change?; 2. We have discussed a lot of things. What were the most important sources of help for you to overcome the abuse in your marriage? Who helped you the most? And in what way? (These could be psychological, legal, economic, social etc. aspects or just time); 3. ONLY IF DIVORCED: How did your situation change after the divorce? (Emotional, family, social, economic aspects. The developments could both be positive or negative.) Why? Did you change? In what ways?

### *Sources of help seeking*

**Social network**

Respondents most often confessed their abusive household situation to their close friends (18 respondents at baseline, see Table 27 in Annex V). Close friends are considered the best place to share feelings and keep secrets. As stated by one respondent who trusted her colleague to tell about her problems "*I have a close friend whom I can trust, and I feel comfortable to share my marital problem."* Most respondents continued to share their household problems with their friends also after the baseline (13 respondents at midline).

Interestingly, the family of the husband was the second most used place to complain, represented by 14 respondents at the baseline. Subsequently, 11 respondents sought help from their siblings and 10 respondents from their parents. After the midline, respondents continued to rely on the support of their own family (9 respondents on siblings and 8 on parents at midline) but not anymore on the family of the husband (only 5 respondents at baseline). This can be explained by the divorced or separated status of the respondents.

The support from the respondents' family can take different forms: they may support her financially, by taking care of the children or even during the divorce. As one of respondent said *"My brother and parents supported me when I was going to report my husband to the police. They also helped me to prepare the divorce process."* However, respondents most often receive moral support and advices from their family (7 of 16 respondents). Only one respondent mentioned explicitly that her parents are taking care of her children so that she can work.

As mentioned before, 18 respondents have children. But most respondents did not tell their situation to their children because they did not want them to feel sad for their mother and as one respondent stated "*I don't want to burden them and they blame their father.*" Only 6 respondents confided in their children. However, it is great relief for the respondents if their children accept the situation and support their mother.

**Police**

Table 28 reports on the institutions where the respondents reported the abuse of their husband. The table shows that the police station was the first and most preferred place to report and ask for help when respondents experienced violence from their partner. Half of the respondents turned to the police for help before the baseline survey. Seeking help at police means respondents could not tolerate the abuse anymore for their own, as well as their family members' sake. The data shows that only 5 of 10 respondents who experienced physical or sexual abuse reported their husband to the police, and 3 of 10 respondents reporting their husband to the police did not experience any psychological or other types of abuse. As one respondent who reported her husband to the police said "*My husband got married to another woman when his status was still married to me."* Another respondent mentioned that "*I reported him [to the police] because he hit and kicked me that my mouth bled, and my stomach and shoulders hurt*". Hence, respondents turned to the police with very different cases. Nonetheless, from the 10 respondents reporting their case to the police, 6 got divorced from their abusive husband by the

endline. Whether respondents chose to get divorced seemed to be independent of the abuse they have reported in the baseline survey.

At the midline, 3 other respondents requested assistance from the police. These respondents have not yet reported their husbands at the baseline even though all of them experienced continued psychological abuse, and 2 of them experienced sexual and physical abuse as well. By the endline only 1 of them was divorced, while the other two were still married.

At the endline, none of the respondents reported their case to the police as they experienced less abuse during this period.

**Other organisations**

In addition to reporting to the police, 4 respondents reported their case at a hospital or health centre at the baseline, while 5 respondents sought help at community leaders (Table 28). In addition, 6 respondents reported their husband at the court and 3 turned for help at legal institutions. At the midline, 2 respondents turned to legal institutions for help and 3 turned to the community leader.

**Litigation**

Turing to the legal actions taken by the respondents, Table 29 summarizes actions taken by the respondent to resolve the abusive marital situation: reporting to the police, litigation procedure, divorce (this is a subcategory of litigation procedures) and mediation. The table explicitly indicates how many of these cases where assisted by LRC-KJHAM in order to see whether LRC-KJHAM played a useful part in the (legal) processes related to the marital situation of the respondents.

In general, respondents needed assistance to settle their marital issues. They decided to do so because they no longer felt comfortable with their situation and hoped to get through it as soon as possible. However, they thought carefully about divorce before starting the procedure. For example as stated by one respondent *"It is my decision to divorce my husband. My husband confessed that he married [by religion] to his colleague."* Another respondent who decided to divorce her husband said that "*I had a husband but he never gave me any money to fulfil our household needs, even I lost some of my savings. When I have no husband, I feel more secure when I work to earn money for the children."*
