The capability to act and commit improved slightly. Staff skills have improved slightly due to knowledge sharing between sisters and volunteers and a small increase in the number of training topics provided. Training opportunities improved as more were now available compared to 2012. These included training sessions on community empowerment, working with victims of violence, networking, anti-trafficking training for religious leaders, finance management, and law in handling trafficking.

As mentioned before, in the capability to adapt and self-renew, improvements could be seen. M&E application has improved slightly now that the organisation has a better understanding about the application and need of M&E than it did in 2012. Similarly, M&E competencies improved with the appointment of a program manager with a solid understanding of M&E.

No changes have occurred in terms of the capability to deliver development objectives.

The capability to relate improved very slightly in terms of its networking capacity. A slight improvement has occurred in the engagement in networks as the organisation has chosen to invest in its biggest area of influence: the Catholic Church. Currently GSS builds a relation with strategic institutions in implementing their work such as IOM to handle trafficking victims. A very slight improvement occurred in the engagement with target groups as well: In Batam the sisters have started with a "walk-in'' centre for working women in the prostitution areas of Batam. In this way they spend time with the women to provide counselling and teach practical skills such as computer usage, sewing, cooking and beauty classes.

No change has occurred in the capability to achieve coherence.

**General organisational capacity changes related to MFS II Interventions**

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. Please note that this information is based only on the information provided by GSS staff during the endline workshop, but no validation of this information has been done like with the process tracing causal maps. For details in relation to attribution, we refer to the next section (5.3).

During the endline workshop some key organisational capacity changes were brought up by GSS staff, these have been captured in the general causal map in 4.2.2: more effective work performance and

improved case handling. This was expected to contribute to GSS becoming more visible on the issues of single moms and trafficking. GSS staff experienced this as the most important capacity change in the organisation since the baseline.

GSS has become more visible on the issues of single moms and trafficking largely due to the increased trust from stakeholders (donors, beneficiaries and partners). This can be attributed to more effective work performance, improved case handling and the fact that GSS has a better position in its network, which has allowed them to reach out to new partners, form new alliances and overall streamline operational processes.

More effective work performance resulted from better financial management, better job descriptions and better program directions. These last two developments can be attributed to improved organizational management skills, whilst better program directions resulted from the development of impact indicators as a result of better monitoring and evaluation. Mensen met een Missie supported GSS with a one week training on M&E in 2014, which contributed to this capacity improvement. The underlying improved organizational management skills came from improved staff capacity, which can be attributed to the sharing of knowledge from volunteers to the sisters. This in turn can be attributed to more volunteers being involved in GSS (supported by MFS II capacity training on anti-trafficking), as more RGS communities are collaborating with GSS, and the more active role that GSS plays in its network.

Improved case handling was enabled by improved advocacy skills and better technical support from GSS's network. Whilst the former results from the improved staff capacity, the latter is the result from a wider network which enabled more support, as well as the direct support from three main dioceses.

In conclusion, according to the GSS staff present at the endline workshop, MFS II capacity development interventions can be tied to several of the organizational capacity changes as indicated by the SPO, although GSS did not specify exactly how. This was not the purpose of this particular exercise, since GSS was not selected for process tracing. It must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect.

# Appendix 1 Methodological approach & reflection

## Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

## Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.[16] Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

[16] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
   - -2 = Considerable deterioration
   - -1 = A slight deterioration
   - 0 = No change occurred, the situation is the same as in 2012
   - +1 = Slight improvement
   - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*

3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
   - Intervention, actor or factor at the level of or by **SPO**: ..... .
   - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
   - Intervention, actor or factor at the level of or by the **other funders**: ..... .
   - **Other** interventions, actors or factors: ..... .
   - Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;

- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5.* ***Prepare and organise the field visit*** *to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6.* ***Interview the CFA*** *– CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

*Step 7.* ***Run the endline workshop*** *with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

***Purpose of the fieldwork*:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

***Brainstorm on key organisational capacity changes and influencing factors***: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative.This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

***Self-assessments*:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8.* ***Interview SPO staff*** *– in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9.* ***Fill-in observation sheets*** *– in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

*Step 10.* ***Interview externals*** *– in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11.* ***Upload and auto-code all the formats*** *collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the **overview of information** per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13. **Analyse the data and develop a draft description** of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14. **Analyse the data and finalize the description** of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15. **Analyse the information** in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

## Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

- Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.
- Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.
- Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the

purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

*The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia*

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

*SPOs selected for process tracing – Ethiopia*

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| AMREF | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| CARE | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| ECFA | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| FSCE | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| HOA-REC | Sustainable Energy project (ICCO Alliance): 2014<br>Innovative WASH (WASH Alliance): Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| HUNDEE | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| NVEA | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |
| OSRA | C4C Alliance project (farmers marketing): December 2014<br>ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| TTCA | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

*The extent to which the Dutch NGO explicitly targets the following capabilities – India*[17]

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

*SPOs selected for process tracing – India*

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BVHA | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| COUNT | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| DRISTI | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| FFID | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |

[17] RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Jana Vikas | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| NEDSF | | | | | | | No – delayed baseline |
| RGVN | | | | | | | No - delayed baseline |
| Samarthak Samiti (SDS) | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| Shivi Development Society (SDS) | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| Smile | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| VTRC | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

*The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia*

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | PT. PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, PT.PPMA, YPI, YRBI.

Table 6

*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| ASB | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| Dayakologi | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| ECPAT | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| GSS | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| Lembaga Kita | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| PT.PPMA | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| Rifka Annisa | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| WIIP | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Yayasan Kelola | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| YPI | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| YRBI | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| Yadupa | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

*The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia*

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

*SPOs selected for process tracing – Liberia*

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BSC | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| DEN-L | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| NAWOCOL | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| REFOUND | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| RHRAP | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

4.

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

- A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
- A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
- **Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
- **Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and

then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for **coding** documents received from SPO and CFA in NVivo on the following:

- **5C Indicators**: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the **capacity development interventions implemented by the CFA** (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
  - In the 2012 **theory of change** on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
  - During the baseline the CFA indicated a link between **the planned MFS II support** to organisational development and the expected short-term or long-term results in one of the selected capabilities;
  - During the endline the **CFA** indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
  - During the endline the **SPO** indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on

climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.
The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

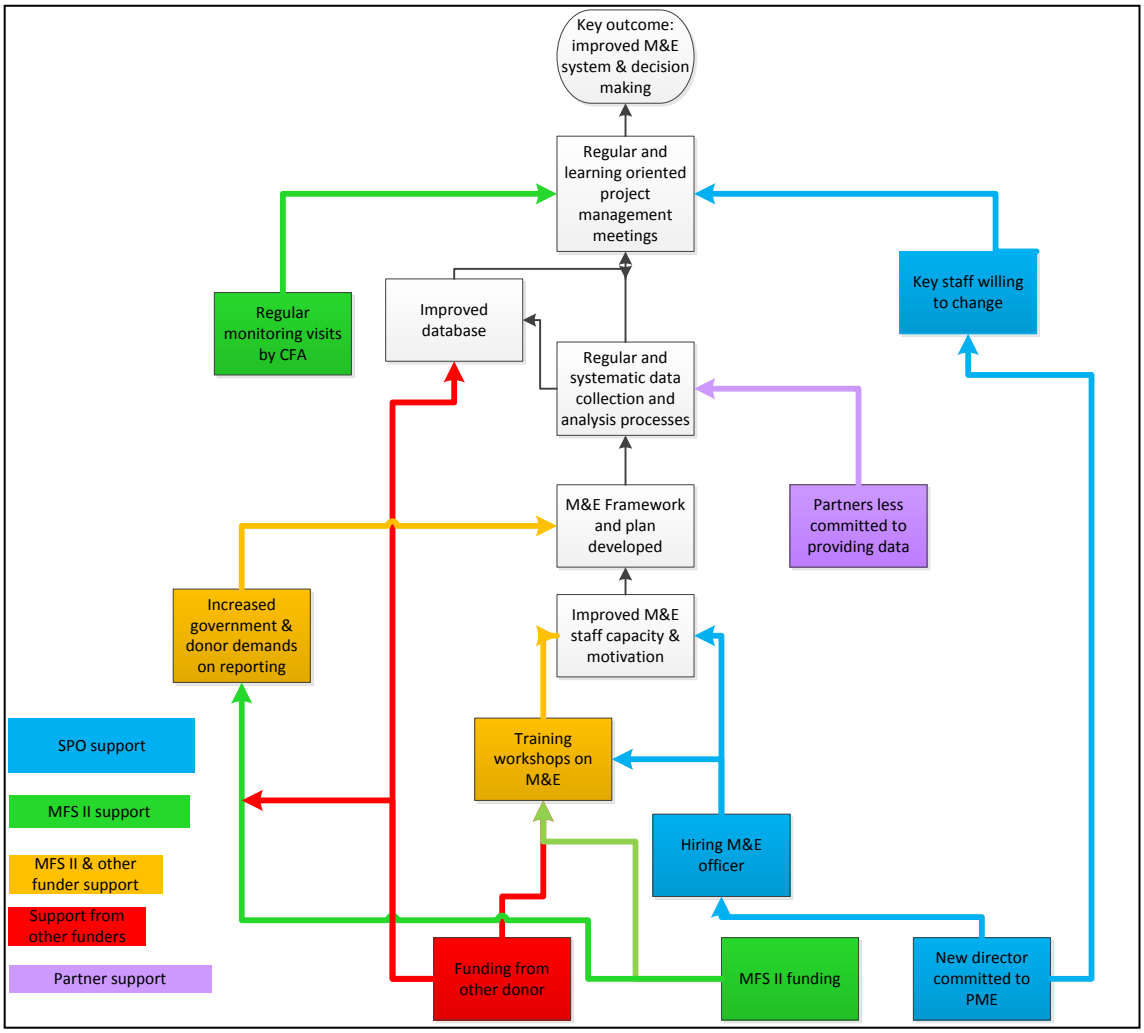

***Figure 1*** *An imaginary example of a model of change*

*Step 5. Identify* ***types of evidence*** *needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, *"What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?"*. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

- **Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.
- **Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
- **Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.
- **Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

*Format for identifying types of evidence for different causal relationships in the model of change (example included)*

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| Describe relationship between the subcomponents of the model of change | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions.<br>Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y?<br>Can we find this information by means of :<br>Pattern evidence;<br>Sequence evidence;<br>Trace evidence;<br>Account evidence? | Describe where you can find this information |
| Example:<br>Training workshops on M&E provided by MFS II funding and other sources of funding | Example:<br>What type of training workshops on M&E took place?<br>Who was trained?<br>When did the training take place?<br>Who funded the training?<br>Was the funding of training provided before the training took place?<br>How much money was available for the training? | Example:<br>Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br><br>Sequence evidence on timing of funding and timing of training<br><br>Content evidence: what the training was about | Example:<br>Training report<br>SPO Progress reports<br>interviews with the CFA and SPO staff<br>Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or

discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality** of data and **analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

| *Example format for the adapted evidence analysis database (example included)* **Description of causal relation** | **Confirming/ rejecting a causal relation (yes/no)** | **Type of information providing the background to the confirmation or rejection of the causal relation** | **Strength of evidence: strong/ rather strong/ rather weak/ weak** | **Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected** |
|---|---|---|---|---|
| e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

## Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

## Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes

comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design** – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment

and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

The capability to act and commit;
The capability to deliver on development objectives;
The capability to adapt and self-renew;
The capability to relate (to external stakeholders);
The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed. A detailed overview of capabilities with outcome domains and indicators is attached in Appendix 3.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Appendix 3 Changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

**Description of Endline Indicators ECPAT Indonesia**

**Capability to Act and to Commit**

**1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'**
*This is about leadership within the organization (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organization.*

The endline shows the same quality as the baseline with regard to responsive leadership. The leadership model in Good Shepherd Services for Women and Children (GSSWC), which falls under Good Shepherd Sisters (GSS) Indonesia Province, is not hierarchical and there is no single person who makes all decisions. Rather, many decisions are based on dialogue. GSSWC is an institution founded by the Good Shepherd Sisters of Indonesia province and operated by the Good Shepherd Sisters and lay partners.
The sisters do not just give instructions to the staff; they lead by example and encourage staff to understand the values of spirituality. The staff is given a lot of freedom to decide for themselves what to do. As pointed out by several people, the weakness of this system is inefficiency in decision making. It takes a long time to make a decision, and sometimes the decision is not clear. Some staff members expressed a feeling of having to face problems alone.

At the beginning of March 2014 GSS Indonesia Province has started a new chapter with a clearer view on mission, vision and spirituality. They have asked several lay partners to join in this new step. GSS Indonesia Province tries to work on the basis of people own initiative, especially for the sisters to take their own responsibility if they need change(s). By involving the lay partners more actively they hope to increase the communication between the different parties involved. A new GSS provincial sister has been chosen for 6 years starting June 2014. The Province Leader has ordinary authority over the province and is its official representative under the congregational leader. Her role is one of spiritual and apostolic leadership, service and love. The province leader's term of office is six years. She has also served as a member of the Justice and Peace Team in the Province of Indonesia. This sister is aware of some of the problems at the level of communication and decision-making. The organization hopes that she can make a positive change to make sure all partners both sisters as lay-partners are involved in the GSSWC work.

Score: From 3.5 to 3.5 (no change)

**1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'**
*This is about the extent to which the leader(s) provide strategic directions*

There were no changes on this indicator. The sisters are well informed about what their beneficiaries want, and how to achieve these goals. They discuss the vision, program, ideas, and strategies together with the project implementing staff. Program staff has sufficient freedom to be creative, which is why the sisters are not giving detailed strategic coaching but they discuss what programs need to be implemented in the next years. This situation creates a real work basis. Routine activities and procedures are not formalized or written but the project staff shows good understanding of the activities. There is a provincial level strategic plan which functions as "umbrella" in the program implementation. The strategic plan was developed by the GSS Indonesia province and followed by GSSWC in all branches. The core team directs the program officers in the field related to the activity

content to be in line within the "umbrella". Currently the situation is still the same. GSSWC has a work plan that they follow but there is space and opportunity to be flexible. The sisters and staff work at grassroots level and really focus on the day to day needs for their target groups. GSSWC trust their staff and give them space to work within the GSS framework.

Score: From 3 to 3 (no change)

**1.3. Staff turnover: 'Staff turnover is relatively low'**
*This is about staff turnover.*

No change has occurred in terms of staff turnover since 2012. Most of the staffs are still volunteers, although more volunteers have offered their services to the organization through friend-to-friend recommendations. GSS is still facing the same problem regarding financial insecurities. For example many of the teachers at the schools of GSS are not sure it they will be paid by the end of the month. GSS struggles to provide sufficient financial security for the staff members. Because both staff and lay partners feel a lot of motivation and satisfaction for the work of GSS they decide to stay committed. GSS is currently trying to add new people to the teams. Most of them are volunteers so they don't receive any financial support.

Score: 3.5 to 3.5 (no change)

**1.4 Organisational structure 'Existence of clear organization structure reflecting the objectives of the organization"**
*Observable indicator: Staffs have copy of org. structure and understand this*

There have been no changes to the organizational structure of GSS Indonesia Province and GSSWC and donors often do not understand the difference between GSS and GSSWC as in the baseline. Current management of GSSWC consists of nine core persons including a provincial leader. The GSSWC has a program manager who has the role mainly to create programmes to increase options for women at risk of trafficking.

Score: 2 to 2 (no change)

**1.5 Articulated Strategies. Strategies are articulated and based on good situation analysis and adequate M&E**
*Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.*

There is no change in the achievement against this indicator since the baseline. Learning and adaptation about the process and what works best, is a reflective and iterative process which the organization is well aware of. The GSSWC thinks about their experiences in projects and the consequences for their work. It may not be formally written down, but experiences in one year do have an effect on their work the next year. There still is a learning cycle. This learning is not planned systematically in formal M&E, but it occurs informally based on discussions and impacts on beneficiaries. The importance is recognized and evaluations receive sufficient follow-up. There is an overall strategic plan which functions as "umbrella" in the program implementation.

Score: 2.5 to 2.5 (no change)

**1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'**
*This is about the extent to which day-to-day operations are aligned with strategic plans.*

The GSSWC strategic plan refers to the GSS Indonesia Province strategic plan. At this point the GSS sisters are focusing on designing a strategic plan (as part of the new chapter 2014-2020) to guide the current way of working and activities with the vision and mission of GSS. The vision and mission of GSS are reflected in the work/activities. As a result, many activities that have been planned are actually realized, despite of low funding and staffing. The organization has stated that it prefers to make plans every year rather than applying for a 2-year or 3-year budget with MM. The reason for this is the shifting local context and the personal insecurity if the staff members will be appointed in the same locations for more years.

Score: From 2.5 to 2.5 (no change )

**1.7. Staff skills: 'Staff have necessary skills to do their work'**
*This is about whether staff have the skills necessary to do their work and what skills they might need.*

There is a slightly improvement in this indicator. All people that were consulted from outside the organization consider the GSSWC to be capable and dedicated. There is knowledge shared between volunteers and sisters. The implication of these knowledge sharing are:

a. improved capacity in facilitating beneficiaries with social and psychological skills to be more confident and brave to take a decision and there is a reintegration process;
b. improved managerial capacity including integrating the aspect of monitoring and evaluation in reporting form, for example the financial reports, and better in financial management;
c. improved advocacy capacity so that the stakeholders have the same understanding about the single mom and trafficking issues. One of the results is there is a village regulation about anti-trafficking (in Ruteng) stating that every person in a village who wants to make a birth certificate documentation should use baptismal certificate.

Furthermore, training has been provided on the following topics: community empowerment, working with victims of violence, networking, anti-trafficking training for religious leaders, finance management, and law in handling trafficking.
However, another stakeholder said that currently some of the GSS sisters are lacking basic knowledge on the subject of for example human trafficking or victim care. It will be necessary to make an assessment of the current level of education and skills regarding the work that is being done. Not all staff members are placed in the right position to do their work to their full potential. It will benefit the overall work of GSSWC if an investment can be made in necessary skills on both anti-trafficking training and generic skills for daily activities. Due to the dedicated atmosphere at GSSWC the staff manages to fulfill their work and work together to combine their strengths.

Score: From 3 to 3.5 (Slight improvement)

**1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'**
*This is about whether staffs at the SPO are offered appropriate training opportunities*

More opportunities for staff training were available since 2012. These included training sessions on community empowerment, working with victims of violence, networking, anti-trafficking training for religious leaders, finance management, and law in handling trafficking. Most of the training was funded by MM while some trained by a consultant from a volunteer organisation i.e. in financial training.

However, sometimes GSS is not able to join these meetings due to the high work pressure and busy day to day schedules while working with the complex target group. GSS feels that it will be needed to carry out a needs assessment within the GSS team (sisters and staff) to see which training opportunities are suitable and necessary.

Score: From 3 to 3.5 (Improvement)

**1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'**
*This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.*

The endline showed the same quality as the baseline with respect to this indicator. Many of the staff members still express their dedication and motivation as a strong motivator to continue their work for GSS. The main motivation mentioned by the staff comes from the effect they have on beneficiaries and the satisfaction obtained from acting on their faith. Their work is their spiritual calling, and their service to the community makes the staff grateful and happy even though they do not get paid or have a high workload.

The sisters of GSS spend a lot of time with the staff and pay a lot of attention to their personal situation either at home or work. Own initiatives by staff are encouraged by GSS; the positive outcome of activities is a strong motivating factor for the staff members/ lay partners. Some of the staff also mentioned that they enjoy the variety in the work and working together as a team with the

sisters.  Also they have a lot of freedom at work, and they are involved in many different tasks and learn from the experience.

Score: From 3.5 to 3.5 (no change)

**1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'**
*This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.*

For the donor institution, GSSWC is still mainly depending on Mensen met een Missie (MM) for financial support. Besides that, GSSWC ensures that the issues they work on are included in the agenda of the diocese (church administrative unit) to ensure future funding for their work. At the local level, GSSWC supports the sisters to access funds from local level such as the Ministry of Social and Health Services. GSS receives some donations from well-wishers from the local society and there are more people who believe and support them, not just in terms of financial resources, but also by providing for example free electricity. Nonetheless, GSSWC is not really looking ahead to see how to increase the possibilities to secure funding in the long term, and they have indicated that they prefer a shorter term (annual) basis for contracts to stay flexible.

Score: From 2 to 2 (no change)

**1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'**
*This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.*

No changes have occurred in funding procedures for the organization. GSSWC is aware of the risks and the current situation regarding exploring new funding opportunities. There is no consistent program aimed at generating income. Small requests for funding are made to the Archdiocese, but the sisters are not accustomed to approaching big donors and cooperating with them. GSSWC really needs to start focusing on networking and establishing written funding procedures. Perhaps a training on this issue could provide them with the necessary skills. What also hinders them is that the distinction between the GSS and the GSSWC is not understood by donors. The GSSWC does not have a legal standing of its own. They do however need funds to continue their program in Batam, Ruteng and Tangerang and to develop new activities. GSSWC still manages their projects with the support of MM and the help of the Archdiocese. Especially for Batam GSSWC are facing a lot of challenges regarding funding since the local community does not contribute due to religious issues on the island.

Score: From 2 to 2 (No change)

**Summary Capability to act and commit**
Mostly GSSWC is still in the same situation as it was during the baseline evaluation. The organization has a capable and dedicated team of staff and project leaders, although there is still a requirement to further enhance staff skills, particularly in the area of anti-trafficking. However, training has been provided in terms of community empowerment, working with victims of violence, networking, anti-trafficking training for religious leaders, finance management, and law in handling trafficking that funded mostly by MM, with a small number of training contributed independently by a consultant that came from the volunteer organisation. The staff is very motivated to do the work, mainly because of acting from their faith, even though financial benefits are minimal. However, they work under difficult conditions and a high workload. The leadership model in GSSWC is not hierarchical and there is no single person making the decisions, but decision-making can be inefficient and unclear. There have been no changes to the organizational structure of GSSWC and donors often don't understand the difference between GSS Indonesia Province  and GSSWC as in the baseline. The GSS Indonesia Province has developed the strategic plan and this is adopted by the GSSWC. They discuss the vision, program, ideas, and strategies together with the project implementing persons, and day-to-day activities are based on the vision and mission of the organisation, but a strategic plan developed independently by GSSWC is lacking. It mostly refers to the GSS Indonesia Province strategic plan. However, the strategic plan for GSSWC is being developed for the period 2014-2020. GSS is still mainly depending on Mensen met een Missie (MM) for financial support, and generally they are lacking procedures to secure funding.

Score: From 2.8 to 2.9 (very slight improvement)

**Capability to adapt and self-renew**

**2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'**
*This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).*

GSSWC now has a better understanding about the application and need of M&E than it did in 2012. There are no staff members that are trained in M&E, but there is one program manager that has worked in research and therefore has a basic understanding of monitoring and evaluation. Other staff members do not have any knowledge on this matter.
In general, GSSWC is a very participative organization and all feedback from staff and others is welcome and taken seriously. Currently one person is responsible for all M&E. This staff member requests bi-monthly reports from all regions. At this point GSSWC is having monitoring and evaluation meetings once or twice a year. There is better communication between the different regions and projects. The only issue is that the sisters really depend on the person in charge for all the M&E, to prepare the reports and do the follow-up. It would be better if the sisters from each region give their input on a more regular basis and not only if asked by the staff member. There are regular formal meetings to talk about the programs. Decisions are made collectively though discussion. At GSSWC the different communities of sisters have a meeting every 2 weeks. For GSSWC the internal contacts are planned more informally. During these meetings work related issues are discussed. For now only one M&E staff member tries to contact the project every month to follow the M&E developments. Overall, the organization monitoring and evaluation still focused activity and output at the project level.
On the whole, there is still no comprehensive monitoring and evaluation system in place and the monitoring and evaluation is mainly focused on activities and outputs.

Score: From 2.5 to 3 (Slight improvement)

**2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'**
*This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.*

There is still no dedicated M&E staff member in place, but there is one program manager that has worked in research and therefore has a basic understanding of monitoring and evaluation. Other staff members do not have any knowledge on this matter. The program manager requests reports every two months from all regions in Indonesia. This is input for special M&E meeting once or twice a year. There is still a lot of room for improvement of M&E capacity amongst the other staff members however, as currently everybody relies on a single person to collect, analyse and follow up on results gathered through the M&E process. The plan for the future is that one person is responsible for all M&E.

Score: From 1.5 to 2.5 (improvement)

**2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'**
*This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.*

Whereas during the baseline there was no systematic assessment of services in place for future strategies, currently, the monitoring results are communicated to be followed up in the program activities through the program manager that takes roles as an M&E person in the organization. The information is mostly on the activity and output at the project level, not yet to the outcome and impact. However, follow up is slow as only a single person is tasked with the M&E activities in GSSWC.

Score: Score 2.5 to 2.5 (no change)

**2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'**
*This is about whether staffs talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staffs are comfortable raising issues that are problematic.*

The endline showed the same quality as the baseline with respect to this indicator. Both formal and informal communication between staff members occurs regarding program activities. It is unclear whether there is a specific schedule or frequency to meetings for feedback. Overall however, the GSSWC remains a participative organization and all feedback from staff and others is welcome. For example, they request their clients in shelters to evaluate their services and also request all participants, facilitators, staff and volunteers to evaluate the programs. It is not clear to what extent the meetings are really critically reflective in nature and also informs future strategies.

Score: From 3 to 3 (no change)

**2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives**
*This is about whether staffs feel that ideas they bring for implementation of the program are welcomed and used.*

There is no change regarding this indicator. The atmosphere is still open. All staff members agree that they are welcome to give their ideas, that they are stimulated to do so, and that they all can have a say about solutions. The leaders are very open to input, and let people know what they have done with it.

Score: From 4 to 4 (no change)

**2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and developments in its operating environment'**
*This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.*

GSSWC is still in the same situation with the last baseline. GSSWC's network remains to be one of their prime assets. Their network is well established, also with people who support their work in kind like priests. The GSSWC are part of a network extending all over Indonesia, including schools and hospitals, where victims can be found. All sister congregations are involved in this network. Additionally, there is the mailing list of GSS International, JPIC that gives information on the Asia-Pacific region, a church-owned website that informs about the situation in Indonesia, and at the diocese level there are monthly newsletters. GSSWC has really been investing in the contact with the diocese.

They are working closely together and use the different networks to strengthen their contacts. GSSWC does realize that they need to invest in their network to stay up to date with trends and developments in their working area i.e. by actively strengthening the communication within the networks by sharing GSSWC publications and being actively involved in the discussions.

Score: From 3.5 to 3.5 (no change)
**2.7. Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and the general public'**
*This is about what mechanisms the SPO has to get input from its stakeholders, and what they **do** with that input.*

GSSWC has been investing a lot working contacts on different levels. However, even though they are open to all outside parties, the focus lies on their network within the church. GSSWC works closely together with the diocese and other churches based organization and this has resulted in a good work atmosphere and mutual strengthening. Through this way they hope to strengthen their influence within the church structures.
There is no clear vision on how to respond to stakeholders, and although there is more stakeholder trust in what GSSWC has done. Additionally, they hold regular meetings with beneficiaries, for example target group meetings or focus group discussions. The reason for holding the regular meetings is to build the trust and enhance the beneficiaries skill as a single mother. The beneficiaries give information about their own personal and social situation, and are also involved in decisions regarding themselves in the crisis center.

Score: From 3.5 to 3.5 ( no change)

**Summary capability to adapt and self-renew**
There is still no comprehensive monitoring and evaluation system in place and the monitoring and evaluation is mainly focused on activities and outputs and mostly at the project level. This is a small organization taking on a tremendous and controversial topic in a sometimes hostile atmosphere. The issue taken care by the organization (trafficking, unwanted pregnancy or single mother) are uncommon issues discussed inside the church and to some extent might not conform to the church values. Learning and adaptation about this process and what works best is a reflective and iterative process, which the organization is well aware of. This learning is not always evaluated and / or planned systematically but it is recognized and receives sufficient follow-up. The main improvement in regard to this capability is that there is now a person responsible for monitoring and evaluation, and the position is embedded to the roles of program manager. This person requests bimonthly reports from the different regions and there is a special monitoring and evaluation meeting once or twice a year. However, monitoring and evaluation mainly remains in the hands of this monitoring and evaluation officer and there is a need to enhance the capacity and responsibility of the regions in monitoring and evaluation. At GSS the different communities of sisters have a meeting every 2 weeks. For GSSWC the internal contacts are planned more informally. During these meetings work related issues are discussed. For now only one M&E person (the program manager) member tries to contact the project every month to follow the M&E developments.
In general, GSS is a very participative organization and all feedback from staff and others is welcome and is taken seriously. The leaders are very open to input, and let people know what they have done with it. The strength of the GSSWC is their network with all relevant local stakeholders, which includes beneficiaries but also locations and connections such as hospitals, law enforcement agencies, local government, airport customs, ports, and shelters. GSS works closely together with the diocese and this has resulted in a good work atmosphere and mutual strengthening, which also supports the organisation in tracking the environment. There is no systematic assessment of services in place for future strategies, since the organisation mainly focuses on monitoring of activities and outputs at the project level, not outcomes and impact. .

Score: from 2.9 to 3.1 (very slight improvement)

**Capability to deliver on development objectives**

**3.1. Clear operational plans: 'Organization has clear operational plans for carrying out projects which all staff fully understand'**
*This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.*

The endline showed the same quality as the baseline. The GSSWC continues to work according to operational plans, but their activities cannot always be planned. For example when confronted with a victim of abuse, they have to adapt to the situation and environment at hand. The number of victims cannot be predicted beforehand They have guidelines on how to work with vulnerable people. It may not have been formalized into protocols, but they all know what to do. Furthermore, each project has an operational work plan and budget that is used for day to day operations. Often however, there is not enough funding and they must choose which activities can be implemented or look for help from other people.

Score: From 3 to 3 (no change)

**3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'**
*This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.*

There is no change in the achievement against this indicator. Staff compensation in terms of salary remains low. Office facilities are limited which forces staff members to bring their own equipment, like computer or vehicles, but they can get reimbursement for transportation costs. In this way organizational costs are kept low and the staff therefore feels that they work cost-effectively. Moreover, the implementation of program activities are supported by many volunteers. The great deal of uncertainty in the work ahead requires the organization to be lean and adaptive, also with its resources.

Score: From 4 to 4 (no change)

**3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'**
*This is about whether the SPO is able to carry out the operational plans.*

The endline showed the same quality as the baseline. GSSWC continuous to deliver outputs on time and presents the results in reports. The main changes that affect to the current report development is that the sisters is now more cooperative to provide the report than before, however the content mostly not much developed. Program manager is the person who develop the report. The organization makes a point of staying lean and adaptive, and may alter plans, outputs and activities if they feel that this is in the beneficiaries' best interest.

Score: From 4 to 4 (no change)

**3.4. Mechanisms for beneficiary needs: 'The organization has mechanisms in place to verify that services meet beneficiary needs'**
*This is about how the SPO knows that their services are meeting beneficiary needs*

Close communication and involvement of the beneficiaries remains key to GSS's working approach. This approach has remained unchanged over the last two years. Beneficiaries are included in the formulation and design of programs, but also in the assessment of their impact through active discussions. Impact here means on how's GSSWC intervention has affected changes in the beneficiary's life. They also gather information on delivered services to beneficiaries through surveys in which questionnaires are disseminated through the parish church. This work method that GSS is using is highly appreciated by the clients. Through this way they make the contact very personal and really address the needs of the clients.

Score: From 3.5 to 3.5 (no change)

**3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratio's)'**
*This is about how the SPO knows they are efficient or not in their work.*

There were not many changes on this indicator. Similar to M&E there is no formal system that allows GSSWC to monitor its efficiency. GSS adopts a very flexible way of managing programs and can change directions during their implementation. This makes monitoring of efficiency difficult. GSS has started documenting the number of clients/target group members through which they can follow the increasing number of clients that are consulting GSS.

Score: From 2 to 2 ( no change)

**3.6. Balancing quality-efficiency: 'The organization aims at balancing efficiency requirements with the quality of its work'**
*This is about how the SPO ensures quality work with the resources available*

The endline showed the same quality as the baseline. The GSSWC tries to make the most of their limited resources and believes in the quality of their work. This is informally evaluated by comparing outputs against the work plan, and getting feedback from beneficiaries and other stakeholders.

Score: From 3 to 3 (no change)

**Summary of Capability to deliver on development objectives**
The endline showed the same quality as the baseline. The GSSWC continues to work according to operational plans, but their activities cannot always be planned. For example when confronted with a victim of abuse, they have to adapt to the situation and environment at hand. The number of victims cannot be predicted beforehand. They have guidelines on how to work with vulnerable people. It may not have been formalized into protocols, but they all know what to do. Furthermore, each project has an operational work plan and budget that is used for day to day operations. Often however, there is not enough funding and they must choose which activities can be implemented or look for help from other people. Staff compensation in terms of salary remains low. Office facilities are limited which forces staff members to bring their own equipment, like computer or vehicles, but they can get

reimbursement for transportation costs. In this way organizational costs are kept low and the staff therefore feels that they work cost-effectively. Moreover, the implementation of program activities are supported by many volunteers. GSS continuous to deliver outputs on time and presents the results in reports managed by the program managers. The organization makes a point of staying lean and adaptive, and may alter plans, outputs and activities if they feel that this is in the beneficiaries' best interest.
Close communication and involvement of the beneficiaries remains key to GSSWC's working approach that has remained unchanged over the last two years. Beneficiaries are included in the formulation and design of programs, but also in the assessment of their impact through active discussions. They also gather information on delivered services for beneficiaries need through surveys in which questionnaires are disseminated through the parish church. Similar to M&E there is no formal system that allows GSSWC to monitor its efficiency. GSSWC adopts a very flexible way of managing programs and can change directions during their implementation. This makes monitoring of efficiency difficult.

Score: From 3.2 to 3.2 (no change)

**Capability to relate**

**4.1. Stakeholder engagement in policies and strategies: 'The organization maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organization'**
*This is about whether the SPO engages external groups in developing their policies and strategies, and how.*

No changes have occurred in terms of stakeholder engagement in policies and strategies since 2012. The network of the GSSWC can be considered selective with a strong focus on Catholic partners like dioceses, parishioners, bishops, members of different church commissions and congregations, and local volunteers. It is however also considered sufficient and it contributes to the strength and legitimacy of the organization and its capacity to reach desired goals. They do not engage external groups in developing GSSWC policies and strategies however. GSSWC realizes that they need to invest more in external partners on the level of developing their own policies and strategies but past experiences have not been good. Good potential partners are hard to find due to religious conflict(s) hidden agenda's or financial issues.

Score: From 3 to 3 (no change)

**4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'**
*This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.*

The GSSWC works together with institutions that are relevant to their beneficiaries. Their network is well established, extending over the whole of Indonesia. For their programs they work together with dioceses, parishioners, archbishops, family life commission, migrant commission, religious networks, NGO networks, government networks, orphanages, health care providers, and the Good Shepherd justice and peace partnership networks.

GSS has experienced that their impact and area of influence is the biggest within the Catholic Church. Therefore they have chosen to really invest in this area. GSS still has many contacts with other relevant organizations. They consult each other in case of special cases/situations. GSS is well respected within the anti-human trafficking network in for example Jakarta. Currently GSSWC builds a relation with strategic institutions in implementing their work such as IOM to handle trafficking victims.

Score: From 3 to 3.5 (Slight improvement)

**4.3. Engagement with target groups: 'The organization performs frequent visits to their target groups/ beneficiaries in their living environment'**
*This is about how and when the SPO meets with target groups.*

The sisters continue to make regular visits to their target groups. There is a monthly meeting of the single mother community in Jakarta, the sisters visit victims of trafficking in Bambu Apus every week, and they have daily interaction in their own shelters.

In Batam the sisters have started with a "walk-in'' centre for working women in the prostitution areas of Batam. Through this way they spend time with the women to provide counseling and teach practical skills such as computer usage, sewing, cooking and beauty classes.

Score: From 4 to 4.25 (very slight improvement)

**4.4. Relationships within organization: 'Organizational structure and culture facilitates open internal contacts, communication, and decision-making'**
*How does staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?*

There is no change in the achievement against this indicator. There is still an open atmosphere and everyone is free to speak their mind. This can be done informally and if necessary over the telephone, but also there are regular formal meetings to talk about the programs. Decisions are made collectively though discussion.

At GSS the different communities of sisters have a meeting every 2 weeks. For GSSWC the internal contacts are planned more informally. During these meetings work related issues are discussed. Staff has indicated that it would be good for GSS to have the different locations (Batam, Ruteng and Tangerang communicate more. For now only one staff member tries to contact the project every month to follow the M&E developments.

Score: From 3.5 to 3.5 (No change)

**Summary of Capability to relate**
The network of the GSSWC can be considered selective with a strong focus on Catholic partners like dioceses, parishioners, bishops, members of different church commissions and congregations, and local volunteers. However, they do not engage external groups in developing GSSWC policies and strategies however. GSS realizes that they need to invest more in external partners on the level of developing their own policies and strategies The GSSWC works together with institutions that are relevant to their beneficiaries. Their network is well established, extending all over Indonesia. The sisters make regular visits to their target groups. There is a monthly meeting of the single mother community in Jakarta, the sisters visit victims of trafficking in Bambu Apus every week, and they have daily interaction in their own shelters. There is an open atmosphere and everyone is free to speak their mind. This can be done informally and if necessary over the phone, but there are also more formal opportunities to do so in the form of regular meetings.
Score: From 3.4 to 3.6 (very slight improvement)

**Capability to achieve coherence**

**5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organization'**
*This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.*

The endline has shown the same quality as the baseline. GSSWC is part of an GSS Indonesia Province which falls under an international congegration. The vision and mission are decided at the international level, and are then specified according to the situation in Indonesia. The sisters look at the international focus and local issues, and have chosen a particular focus on the victims of trafficking and single mothers, keeping in mind their local capacity. The coordinator and the manager of the program discuss the vision and mission every year before starting to develop a new program.

Score: From 2.5 to 2.5 (no change)

**5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'**
*This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.*

There is no change in the achievement against this indicator. The GSSWC has guidelines for example on how to work with vulnerable groups. However, guidelines will be different between the three

regions because of their different situation, and they will not cover all activities. So there is freedom in carrying out activities, and the development of guidelines for activities is something they do together. These are not created top down.

Score: From 2 to 2 (no change)

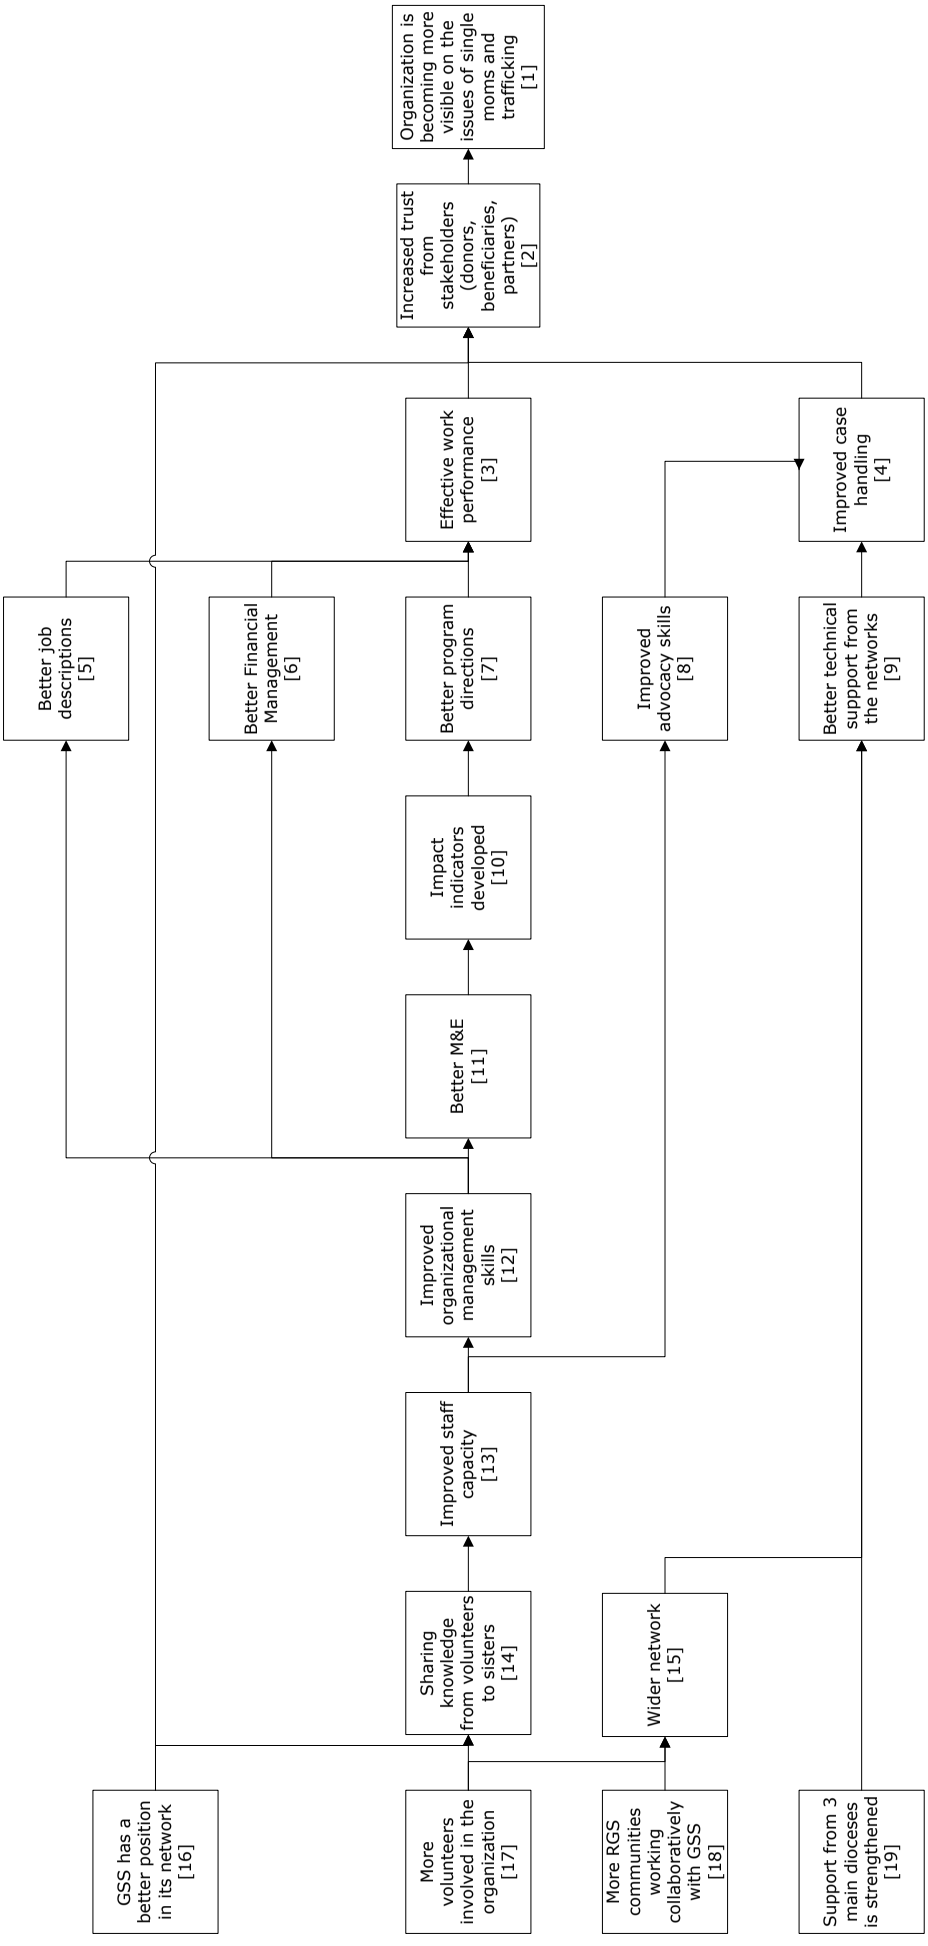
**5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'**
*This is about whether the operations and strategies are line with the vision/mission of the SPO.*

The endline showed the same quality as the baseline. The program manager and coordinator discuss the vision and mission every year before starting to plan for a new program. As a result, all staff members indicate that their operations are in line with the vision and mission of the Good Shepherd Sisters. Currently GSSWC choose their partners having the same vision and mission with GSS.

Score: From 3 to 3 (no change)

**5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'**
*This is about whether the efforts in one project complement/support efforts in other projects.*

There is no change in the achievement against this indicator. Efforts in one project complement and support efforts in other projects. For example the program on economic empowerment supports the program aimed at single mothers, which in turn supports the anti-trafficking program. The projects are local and tuned to the specific conditions. In one place it is rescue, in another place it is prevention. So the strategies depend on the location and context and how the coordinators form the link among them. They can observe the relevance of what happens in one place for another location. It may also be the case that the different projects support one another in a financial sense.



Score: From 4 to 4 (no change)

**Summary Capability to achieve coherence**
The end line showed the same quality as the baseline. GSSWC is part of an GSS Indonesia Province which falls under an international congegration. The vision and mission are decided at the international level, and are then specified according to the situation in Indonesia. The program manager and coordinator discuss the vision and mission every year before starting to plan for a new program, and the projects are in line with the vision and mission and also contextualized. In one place it is rescue, in another it is prevention. So the strategies depend on location, context and how the project coordinators form the link among them. Efforts in one project complement and support efforts in other projects for example the program on economic empowerment supports the program aimed at single mothers, which in turn supports the anti-trafficking program. In terms of having operational guidelines, GSSWC as a number of guidelines in place, for example on how to work with vulnerable groups. However, guidelines will be different between the three regions because of their different situation, and they will not cover all activities.

Score: From 2.9 to 2.9 (no change)

# Appendix 4 Results - key changes in organisational capacity - general causal map

**GSS General Causal Map**

Organization is becoming more visible on the issues of single moms and trafficking [1]
Increased trust from stakeholders (donors, beneficiaries, partners) [2]
Effective work performance [3]
Improved case handling [4]
Better job descriptions [5]
Better Financial Management [6]
Better program directions [7]
Improved advocacy skills [8]
Better technical suppport from the networks [9]
Impact indicators developed [10]
Better M&E [11]
Improved organizational management skills [12]
Improved staff capacity [13]
Sharing knowledge from volunteers to sisters [14]
Wider network [15]
GSS has a better position in its network [16]
More volunteers involved in the organization [17]
More RGS communities working collaboratively with GSS [18]
Support from 3 main dioceses is strengthened [19]

**Narrative of Good Shepherd Sisters General Causal Map :**

During the end line workshop at GSS, a discussion was held around what staff perceived as the key changes in in the organization since the baseline. This then led to a discussion on what were the key organizational capacity changes and why these changes have taken place according to staff present at the end line workshop. The discussion resulted in a 'general causal map' which is described below. The general causal map provides a comprehensive picture of organizational capacity changes that took place since the baseline, based on the perspective of GSS staff present at the end line workshop.

Since the baseline in 2012, several key organisational capacity changes have occurred within GSS. First of all, the organization shifted its' focus more towards the issues of single mothers and trafficking.Globally, there has been a movement within the churches to have emphasise these issues more. The movement is mostly driven by female religious leaders. GSS has also been known as the organisation that consistenly workson these issues.

With this new focusthe organization has become more visible in dealing with the issues of single moms and trafficking [1]. According to GSS staff present at the endline workshop, increased trust of stakeholders and beneficiaries in GSS to deal with these issues [2], has led to an increase in sponsored activities but also the spread of GSS's reputation in these issues.

The increase in stakeholder trust came about from three main developments:

1. First of all GSS's better positioning in the network [16] has allowed them to reach out to new partners, form new alliances and overall streamline operational processes.
2. Secondly, an increase in effective work performance [3].
3. Thirdly improved case handling and quality of work [4] played an important role in partners and beneficiaries development of faith in the organization.

The increase in effective work performance [3] can be related to a greater focus on specifying the work at hand. This was achieved by providing better job descriptions [5] on the one hand, and offer better overal program directions [7] on the other. The former was the direct result of a general improvement in organizational management skills and attitude [12], whilst the latter resulted from the development of clear indicators [10] which came about from improved monitoring and evaluation (M&E) practices [11]. These M&E practices were also part of overall improved organizational management skills.

These skills themselves were developed alongside a general improvement in staff capacity [13]. Staff and volunteers of GSS now have better advocacy, counseling and facilitation,and organisational management skills (financial, ME and human resources). Improved staff capacity [13] came about from an increasing degree of sharing knowledge between staff members, particularly from the field volunteers to the sisters responsible for running the programs. Narrowing the knowledge gap between field and program staff was a good starting point to specify and focus program activities to become more practice oriented.

The need to share knowledgefrom volunteers to the sisters resulted from three developments. Firstly, GSS has a better position in its network. By involving Catholic Church especially diocese, enabled GSS has a better position in networking. The diocese has its power and it encouraged more Religious of Good Shepherd (RGS) communities to join and to involve GSS in serving people to decrease number of trafficking. RGS is one of congregation (Roman Catholic Religious Institute). It is abbreviated from Religious of Good Shepherd. When the human resource was proper in quality and quantity, it enabled knowledge sharing from volunteers to sisters. [14]. Secondly, an overal increase of volunteers in the organization and work activities occurred, which is made easier to share knowledge and information between volunteers and sisters. Thirdly, more RGS communities now work together with GSS, which calls for increased coordination and communication, and thus also sharing of information and knowledge.

The third and final big factor influencing the increased trust of shareholders in GSS came about from their ability to handle cases better [4]. For instance GSS has succesfully supported the establishment of Perdes (Village Regulation) in Ruteng to prevent traficking. This improvement resulted from an overall improvement in the organizations advocacy skills [8], which came along with the overall increase in staff capacity [13] and knowledge exchange with partner organizations and volunteers [14]. The second big reason why cases were handled better was that over the last two years the techical support from within GSS networks have greatly increased. This has enabled GSS to tap the expertise and in–depth knowledge of partners in the network if required.

The latter came about from more intensive networking which resulted in a wider overal network [15] on the one hand, but also the internal strengthening of GSS through the combination of efforts among three dioceses (church administrations) in Jakarta, Semarang and Ruteng [19].

On the whole, improved staff capacity as well as improved networking have been the main underlying reasons, leading to changes that led to improved trust from stakeholders, which has helped the organisation to become more visible the issues of single mothers and trafficking.

Report CDI-15-036

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Report CDI-15-043

Kusters, C., Wieriks, M., Dwi Andari, B., Suprobo, N., Priyahita, W., Sihombing, R.R., Rokhmatulloh, S.W., Rosita, I., 2015. *Endline report – Indonesia, Institut Dayakologi. MFS II country evaluations; Capacity of Southern Partner Organisations (5C) component.* Centre for Development Innovation, Wageningen University & Research centre. Report CDI-15-043. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Indonesia, Institut Dayakologi. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

# Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation Institut Dayakologi and the Co-Financing Agency ICCO for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to Institut Dayakologi, ICCO, the synthesis team, IOB and NWO/Wotro.

# 1 Introduction & summary

## 1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: ECPAT in Indonesia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1.Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps describe the identified key organisational capacity changes that are possibly related to MFS II

interventions in these two capabilities, and how these changes have come about. More detailed information can be found in appendix 5.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR: Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

## 1.2 Brief summary of analysis and findings

Since the baseline, two years ago, Institut Dayakologi has only seen changes in the capability to act and commit. A slight improvement occurred in this regard. This was particularly through a change in staff turnover as a result of several senior staff members resigning. New, younger staff was attracted to replace these functions, which resulted in overall lower costs of wages, more training opportunities and better communication between staff members and management. No further changes occurred in any of the other four capabilities.

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team. During the endline workshop some key organisational capacity changes were brought up by Institut Dayakologi's staff: improved secretarial coordination and support, improved staff morale, strengthened role as a networking hub for advocacy on Dayak communities and culture, increased executive team's capacity to develop proposals, improved staff decision-making process, more qualified human resources.

According to the SPOs staff, MFS II funded capacity development interventions for program support have contributed to organizational capacity change in several ways, both directly and indirectly. The supported training interventions to increase staff capacity in the skills and capacity to document and spread information to the public has contributed significantly to inspiring the community to think back to the Dayak culture and indigenous customs, that has helped improve program implementation and achievements. On the other hand the continuous support of Cordaid in reconstruction by rebuilding the offices, infrastructure and office structure have helped in improving day to day operations of the secretariat, strengthened the role of Institut Dayakologi as a networking hub and improved staff morale, all leading to improved program implementation and achievements. Although the 5C indicators in the previous section don't show great change for the organization, the general causal map highlighted that MFS II support has certainly contributed to strengthening the organizational capacity and laying the foundation for increased capacity to mobilize resources for operations and program management of Institut Dayakologi. However, it must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect.

# 2 General Information about the SPO – Name SPO

| **Achievement of MDGs and themes** | |
| **Capacity development of Southern partner organisations** | X |
| **Efforts to strengthen civil society** | |

## 2.2 The socio-economic, cultural and political context in which the partner operates

**The socio-economic, cultural and political context in which the partner operates**

The main feature outlining the context in which Institut Dayakologi operates is a historical struggle between traditional Indigenous' norms and values (in this case is the Dayak) and the modern ideas of what a society should look like. The Dayak people are originally from Borneo and live from farming and herding[1]. Very little has changed in the Dayak farming techniques throughout the years and it is not exceptional to find groups still living in the so-called longhouses (houses where about a hundred people live together- separated in apartments for each family)[2]. The Dayak have their own system of beliefs and ideas about how humans should live in harmony with each other and with nature. On the basis of these ideas the Dayak have been struggling to protect their peculiar way of living in face of fast urban and technological developments that have been taking place in Indonesia that increasingly demand Dayak territory for its further expansion.

The principles on which the Dayak base their lifestyle have been put in contrast with principles typical of modern societies. These principles are:

- "Sustainability (biodiversity) versus productivity (monoculture)
- Collective (cooperation) versus individuality (competition)
- Natural (organic) versus engineered (inorganic)
- Spirituality (rituality) versus rationality (scientific)
- Process (effectiveness) versus result (efficiency)
- Subsistence (domesticity) versus commerciality (market)

[2] Compost, A.(2012)*"Borneo People",* WWF- Available at: http://wwf.panda.org/what_we_do/where_we_work/borneo_forests/about_borneo_forests/people/ Accessed on 13.11.2012

- Customary law (locality) versus state law (global)"[3]

John Bamba, the executive director of Institut Dayakologi, stresses that "failure to achieve these ideals is believed to result in barau (Jalai Dayak): a situation when nature fails to function normally and thus results in chaos. Barau is a result of Adat* transgression—a broken relationship with nature. "Poverty" for the Dayak is linked directly with failure to exercise the Adat that governs the way in which the people should live"[4]. As it is the case with other Indigenous peoples around the world, the Dayak people struggle for the right to self-determination. That is, to decide based on their own norms and values how to live their lives in their community, how to use their land and how to cultivate their animals.

The challenges in setting forth this struggle derive mainly from power differences. This means that although the Dayak are covered by the United Nation's Declaration on the Rights of Indigenous Peoples (2007)[5], corporate and governmental actors still invade Dayak areas, resulting in the sometimes forceful expulsion of the areas' inhabitants. These factors increase the pressure on and the difficulties for the Dayak to maintain and continue the communal, natural and traditional identity and life-style they have cultivated throughout their existence. Furthermore, urban and technological developments do not reach the Dayak in an inclusive way; rather, these groups grow marginalized in relation to the rest of the country[6]. A curious fact is that, despite the destruction of indigenous religions by European Christians, it has often been Christian missionaries (Roman Catholic) who have struggled to preserve the Dayak culture and religion[7].

Institut Dayakologi engages in the struggle for the right to self-determination and preservation of the Dayak culture. Through empowering the Dayak community with knowledge; advocating for the Dayak cause and enhancing peace in the community the Institut Dayakologi raises awareness in the community about the value and potential of the Dayak culture in contributing to humankind; in its own and indigenous way of doing so[8].

The program activities of Institut Dayakologi for year 2010-2013 formulated based on the above objectives that are to be achieved in the next 3 years are as follows[9]:

1. Activities of Documentation, Research, Studies and Publication Programme
2. Activities of Collaboration and Advocacy Programme
3. Activities of Recovery and Reconstruction Programme
4. Activities of Institutional Empowerment Programme

* Adat: set of local and traditional laws.

## 2.3 Contracting details

When did cooperation with this partner start: For more than 15 years Cordaid has been cooperating with Institut Dayakologi

What is the MFS II contracting period: 2010-2015

Did cooperation with this partner end: Not applicable

If yes, when did it finish: Not applicable

What is the reason for ending the cooperation with this partner: Not applicable

Is there expected cooperation with this partner after 31st of December 2015: No.

## 2.4 Background to the Southern Partner Organisation

Based on the fact that the Dayak culture has been vanishing over time due to unequal and invasive urban and technological developments, the founders of what later came to be called Institut Dayakologi aim at preserving and promoting the Dayak culture among its members. Through raising awareness of the richness and importance of the Dayak traditions, ways of thinking and lifestyle, the Institut Dayakologi envisions the Dayak as a people with the right of self-determination about the meaning of progress and well-being as well as the kinds of developments it should avoid or bring forth for the Dayak community members.

In 1981 in Pontianak, Dayak intellectuals (mostly teachers) established the Fundation Yayasan Karya Sosial Pancur Kasih (YPSPK) where formal education for raising awareness of the Dayak culture was the first service offered to the Dayak community[10]. As YKPSK grew in size and scope, it expanded its services to other areas, now also empowering the Dayak in social, economic and political matters[11]. In 1987 the Pancur Kasih Credit Union was established by YKSPK in Pontianak, and in 1991 a rural bank was established in Sungah Pinyuh (50 km from Pontianak). This Community Credit Bank was created for the purpose of generating a small-scale credit for the communities in the rural areas. At the end of the 1990's the Institute of Dayakologi Research and Development was established, which has been known as the Institut Dayakologi since 1998[12].

In 2007 a fire accident in Institut Dayakologi's office destroyed almost 90% of the documentation collected since the establishment of the organization. After a short break for recovery of the damage; Institut Dayakologi continued its operations.

Year 2013, precisely five years have passed since Institut Dayakologi has had to resume its operation with new condition following the fire disaster in 2007. This five years' period can be divided into 2 important and noteworthy stages, they are recovery from 2007 to 2009, which was marked by the recovery of institutional non-physical infrastructures (programmes, strategic planning and so forth) and reconstruction from 2012 to 2013 that was marked by the procurement of supporting infrastructure in the form of the Office Building and Jurung of Institut Dayakologi.[13] With this new beginning, the organization saw the need of redefining the organization's focus and strategy[14].

For more details on the history of Institut Dayakologi please see appendix A for the historical time line that was developed during the baseline workshop.

**Vision**

*"The Indigenous peoples - the Dayak peoples in particular - are able to determine and manage their social, cultural, economic and political in together in the spirit of love to struggle for their dignity and sovereignty"[15].*

**Mission**

*"To conduct research and/or advocacy in the spirit of education, independency and solidarity for the revitalization and restitution of the Dayaks' existence".[16]*

[10] UNICEF (2012), *"State of the World's Indigenous People",* Chapter 1. Available at: http://www.un.org/esa/socdev/unpfii/documents/SOWIP_chapter1.pdf Accessed on 14.11.2012

[16] Source: information provided by Institute Dayakologi in response to reviewing the draft baseline report, d.d. 15-01-2013

**Strategies**

In order to maximize the role of "encouraging the advocacy and dissemination of Dayak culture as well as encouraging the better recognition of the Dayak culture and indigenous rights at home and abroad", Institut Dayakologi has strategic actions such as building up a multi-level network approach in order to broaden the impact of its actions. Institut Dayakologi expects "that the advocacy of indigenous peoples' cultural revitalization, environment and natural resources management, as well as efforts to build peace and transformation can work more effectively owing to the supports of various parties, at local, national and international level"[17].

Based on the Strategic Planning resulted from the Workshop held on 23 – 25 March 2009, and from the reflection of Institut Dayakologi's performance held on 9 August 2009 by Institut Dayakologi, activities for the period of 2010 – 2013 in an integrative Institutional Programme have been formulated aiming to achieve the following Goals and Objectives[18]:

**1. Goals**

1.1. Realization of Institut Dayakalolgy as the Information Centre for Dayak culture that is accessible to public and is beneficial to the advocacy of indigenous Dayak peoples.

1.2. Increased participation of indigenous peoples and other oppressed communities in struggling for their rights, justice, pluralism, gender equality and anti-violence through facilitation, community organizing, media as well as local, national and international networks.

1.3. Conducting recovery by means of managing the remaining data in the form of audio cassettes, and photos saved from the fire, as well as re-collecting data still available from external parties; recovery of Pancur Dangeri Cooperative and Mitra Kasih Printing House; and realization of reconstruction of Institut Dayakologi's office in order to support the performance of Institut Dayakologi's role as the Information Centre and Advocacy of Dayak culture.

1.4. Increased accountabilities and capabilities of Institut Dayakologi in managing available institutional resources in sustainable ways in order to improve infrastructure, welfare and capacities of its activists to be able to implement the institution's programs.

**2. Objectives**

2.1. Objectives of Documentation, Research, Studies, Publication Programme

Objective 1: Documentation

By May 2013, Institut Dayakologi shall have re-documented Dayak oral traditions and music from all districts in West Kalimantan, with the priority of 11 sub-ethnic groups in Ketapang, Sintang, Kapuas Hulu and Melawi Districts based on pre-survey for better quality and management than those before the fire.

Objective 2: Research and Studies

By May 2013, Institut Dayakologi shall have had 10 research/study findings related to social, cultural, environmental, economic and political issues that bring impacts to the indigenous Dayak communities in West Kalimantan.

Objective 3: Publication

By May 2013, Institut Dayakologi shall have produced 29 titles of books, 2 journals, and published the works of Institut Dayakologi through local media, exhibition, and Institut Dayakologi's website, so that they become sources of reference about Dayak culture that are accountable for and accessible to local, national and international public.

[17] Institut Dayakologi (2010) *"Institutional Report January-December 2010: Towards Institut Dayakologi as information centre for Dayak culture".* (p.2)

[18] Annual Progress Report 2013 :Toward Institut Dayakologi As The Information Center for Dayak Culture , January-December 2013

2.2. Objectives of Advocacy and Collaboration Programme

Objective 1: Communities Empowerment and Advocacy
By the end of May 2013, Institut Dayakologi shall have facilitated 9 activities of Community Empowerment programme in order to become empowered and professional communities through Communities Organizing, natural resources management, advocacy and empowerment of the Alliance of Indigenous Peoples of Jalai Sekayuq-Kendawangan (AMA JK) in Jelai Hulu, Marau, Tumbang Titi, Manis Mata, Air Upas, Tayap subdistricts, in Ketapang District.

Objective 2: Peace Building and Transformation

By the end of May 2013, Institut Dayakologi shall have facilitated multicultural partnership through 4 times of peace education in Central Kalimantan and East Kalimantan, 5 times of training on natural resources conflict resolution in West Kalimantan and the teaching of Multicultural Local Culture at 14 Junior High Schools (SMP), 20 campaign activities and peace culture promotion, facilitation on 6 multicultural productive-business groups in order to maintain peace and transformation in West Kalimantan.
Objective 3: Local Culture Teaching

By the end of May 2013, Institut Dayakologi shall have facilitated the teaching of Local Culture at 20 Primary Schools (SD) and Junior High Schools (SMP) in West Kalimantan to pass Dayak culture tradition to the younger generation.

2.3. Objectives of Recovery and Reconstruction Programme

Objective 1: Recovery
By the end of May 2013, Institut Dayakologi shall have conducted recovery actions through management of remaining data saved from the fire in the form of 2,000 audio cassettes, 7,000 photos, re-collection of data from external parties, as well as the recovery of Pancur Dangeri Cooperative and Mitra Kasih Printing House to reach their cash flow liquidity of 10-20%.

Objective 2: Reconstruction
By the end of December 2011, Institut Dayakologi shall have had a new office in Pontianak, West Kalimantan, in order to support the role of Institut Dayakologi as the Information Centre and Advocacy of Dayak Culture.

2.4. Objectives of Institutional, Financial and Secretariat Development Programme

Objective 1: Financial Management
By the end of May 2013, Institut Dayakologi, shall have applied standard financial management, collected funds needed for the implementation of its programs, obtained more alternative income sources, and conducted financial audit, in order to manage its financial resources more professionally, effectively and efficiently.

Objective 2: Institutional and Activists Empowerment
By the end of May 2013, Institut Dayakologi shall have facilitated the improvement of its activists' capacities through various policies in supports for studies, training, short courses, creating new cadres, and refreshing.

Objective 3: Secretariat
Secretariat of Institut Dayakologi shall have been managed professionally (efficient, secured, proactive, quick-to-respond, effective) in order to be able to provide effective and friendly services as well as to be able to manage ID's database based on its standards.

# 3 Methodological approach and reflection

## 3.1 Overall methodological approach

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

5. What are the changes in partner organisations' capacity during the 2012-2014 period?
6. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
7. Were the efforts of the MFS II consortia efficient?
8. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

## 3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012[19].

[19] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

## 3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question*: **To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia* (i.e. measuring effectiveness)?** and the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

### 3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.
For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:
Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
Liberia: BSC, RHRAP (2/5).

### 3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

### 3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II

supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
Difficulty of verifying each and every single change and causal relationship:

- Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
- Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design** – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

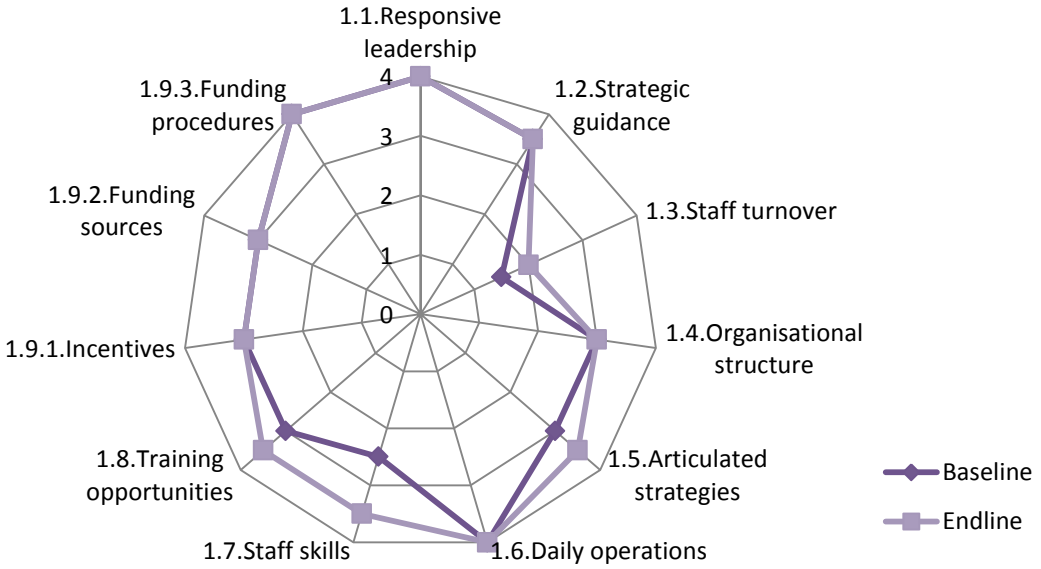
# 4 Results

## 4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of Institut Dayakologi that have taken place since 2011 are described. The information is based on the information provided by ICCO.

Table 1
*Information about MFS II supported capacity development interventions since baseline*

| Title of the MFS II supported capacity development intervention | Objectives | Activities | Timing and duration | Budget |
|---|---|---|---|---|
| Rebuilding of Office and Jurung meeting facility | Rebuild the office space for ID after the fire | Rebuilding the office environment and providing a special meeting room | 2012-2014 | 100,000 Euro |
| Documentary film making training | Training on how to make documentary films for the public | Scenario and manuscript writing, manual walkthrough | 2013 | 1785 Euro |
| IT Training, database and website | Development of a Dayak cultural database and source | IT Consultant designation, database development, SOP and procedure development | 2012 | 26000 Euro |



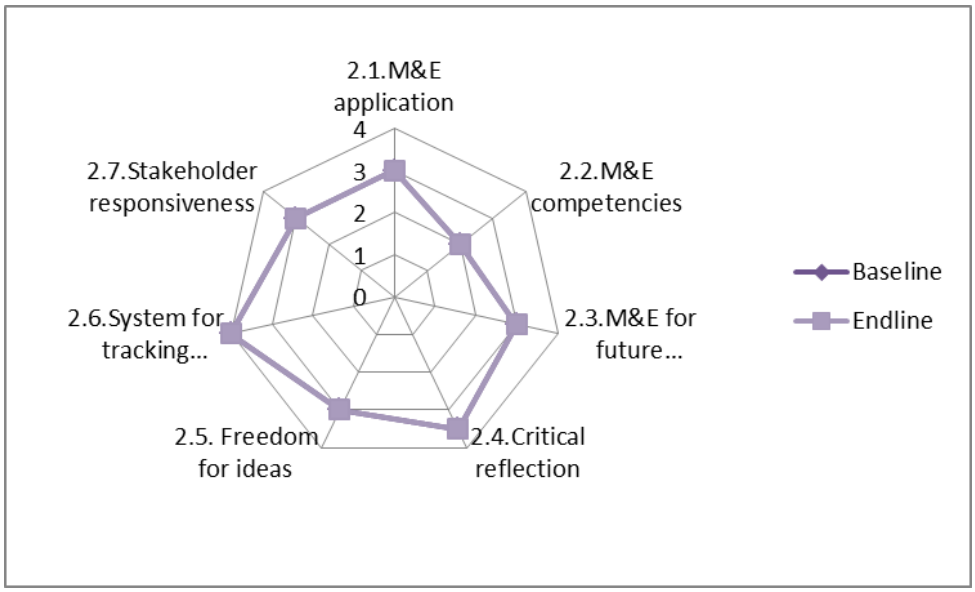
Source: 5C endline_support to capacity development sheet_SPO perspective_Indonesia_Institut Dayakologi

## 4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities. This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also annex 3.

### 4.2.1 Changes in the five core capabilities

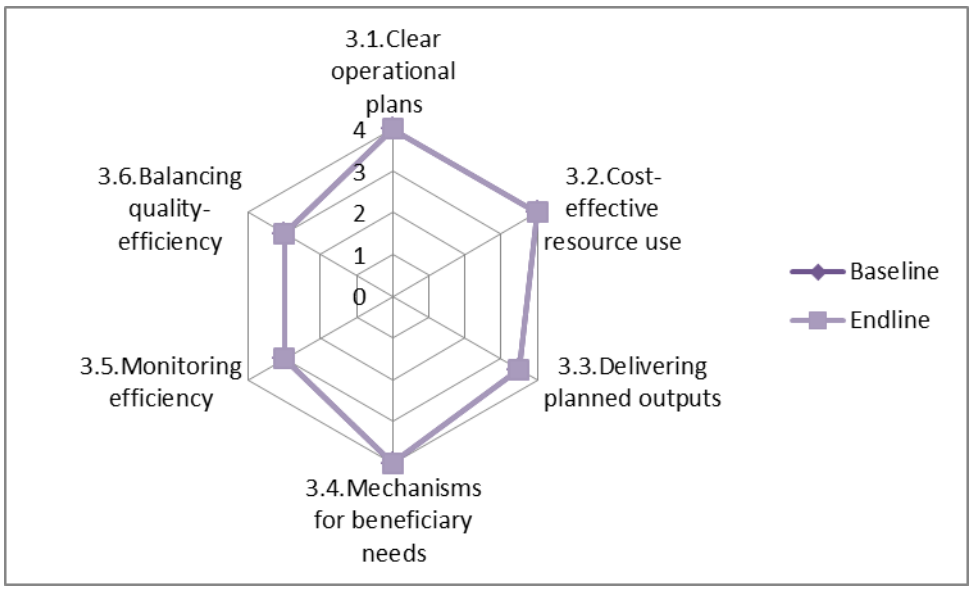
**Capability to act and commit**



In terms of strategic guidance to resist slight change since the baseline. The director has become the chairman of another organization (GPPK) and the treasurer of yet another (CUG). Now the division Manager has the authority to make decisions as long as it is within the scope of the program. Meetings in the division depend on the initiative of the management team and Division Managers but are routinely held each month and this is where strategic and operational guidelines are provided. The management team provided mentoring and guidance to division managers. Strategic plans are well articulated and based on monitoring and evaluation, although there is no systematic monitoring and evaluation in place. The changing on the day to day leadership on management team has opened a wide opportunity of discussion between management team, division managers, and program managers, on the program implementation. As the communication and capacity gap was minimum and staff became more free to express ideas. The discussion became a means of collecting facts, analysing the condition, and deciding strategies for a better implementation. The organization also runs a research and studies program, an advocacy and collaboration program, and an empowerment of resource program. M&E is done both internally and externally and the result was used to analyse program implementation and formulate better pogram implementation strategy. M&E has become one of the approaches in the preparation of strategic planning. There is no particular tool to do this process. Meetings for annual planning and review are used to deliver the next strategic plan.

Staff turnover is still high , since some experienced staff left the organisation by the end of 2012. But there is also been some new staff. This left the organisation with a gap in terms of available knowledge and skills but the money that came available by staff leaving has been used to train other staff. There have been plenty of opportunities for skills upgrading both in the organisation through sharing meetings as well as by attending capacity building events mostly finded by MSF II especially in house trainings within the organisation. Generally, the staff of *Institut Dayakologi* are loyal, dedicated and committed but still lack general skills i.e. language skills. Motivation to work for the organisation mainly comes from staff's dedication to contribute to the Dayak culture, although some staff have left the organisation due to better financial gains elsewhere. Staff in this organization are included in a social security system, provided allowance for family and children, health insurance, accommodation and transportation. A pension program for staff is under development and hopefully can be implemented before the end of 2014 The organization still has a complicated but firm organization structure, and also has clear procedures to develop the strategic planning which is included target communities. It has relative stability in financial resources and there are procedures and plans to obtain additional income and to become less dependent of donors, which is described in a ten year organization financial plan.

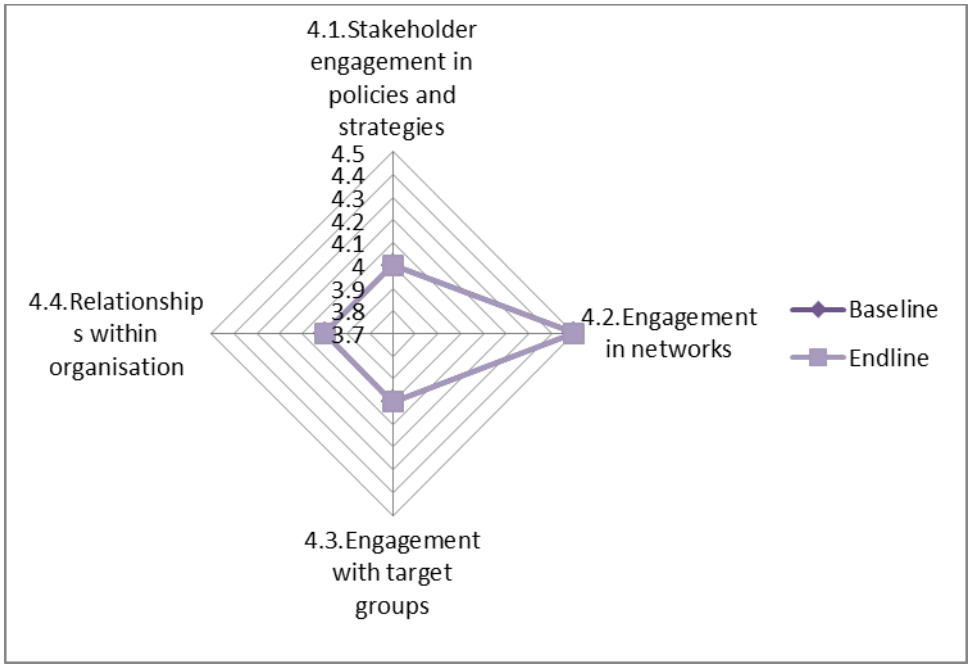
Score: from 3.1 to 3.6 (slight improvement)



**Capability to adapt and self-renew**

There is still no comprehensive and functional monitoring and evaluation system in place, but the organization receives feedback from other organizations and beneficiaries and evaluates the impact of the implemented programs as part of program implementation. ID has setup a M&E Division as one of its main programs starting 2015. This program will be managed by a Division Manager and put in the management structure of the organization. Furthermore, regular meetings are held to discuss progress program implementation and annual planning and review meeting is held to look back and plan ahead for the next year. There is no specific and dedicated trained staff to do M&E. Monitoring and evaluation is mainly focused on project and not organisational level and on activities and outputs and impact. The organisation also has published lots of publication that provided a deep analysis on the indigenous people culture. The book is a reflection of how the intervention bring changes on people's life. There are many ways for staff to deliver their ideas and critiques both informally and formally. Currently with the fast growth of social media, the staff are also able to deliver their ideas through digital media. The organisation tracks what is happening in the environment, mainly by engaging with the communities but also with the media.

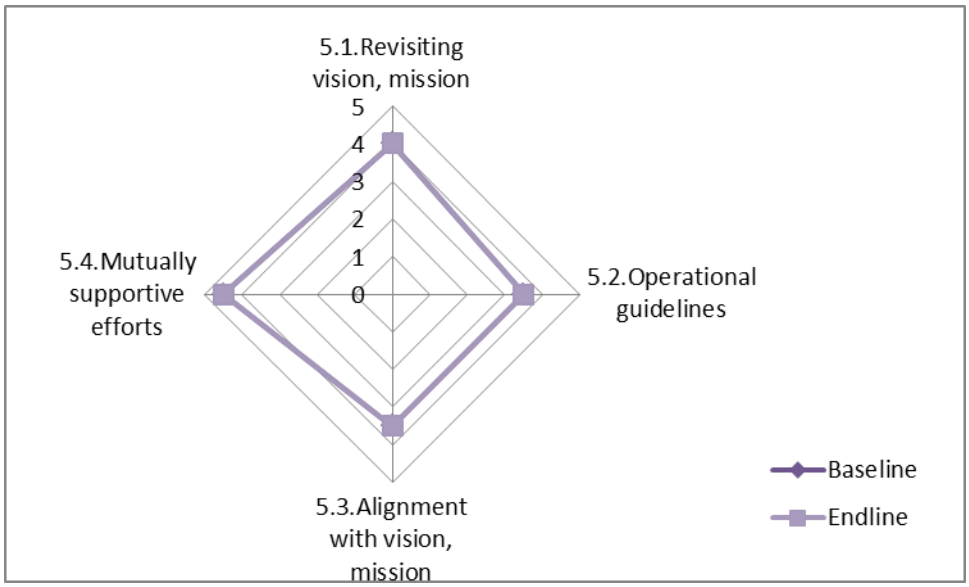
Score: from 3.1 to 3.1 (no change)



**Capability to deliver on development objectives**

Programs are implemented based on work plans and detailed operational budgets in the Program Implementation Planning (RPK) which includes activities, output, result, resources (assest) , and budget. All staff has a responsibility to develop RPK and APK. Beside the RPK, there is also Program Implementation Analysis (APK) which supports the analysis of program implementation. RPK and APK are used by the staff as a reference for daily operational activities. *Institut Dayakologi* has an approach for project implementation which requires developing the work plan and budget arrangement first and analyze it afterwards. This way, the staff can work efficiently and the resources are used appropriately. It also helps them to compare the input, the output and the impact. There is still deviation from the planning because of the external factors although the organization always finishes their program completely. In order to fulfill the needs of the beneficiaries, the organization held discussions and workshops before the programs are implemented. Sometimes, the staff stays with the beneficiaries to ensure optimal delivery. Since staff engages frequently with beneficiaries, this assists in assessing whether the services meet their needs.

Score: from 3.6 to 3.6 (no change)



**Capability to relate**

The organization has an extensive network and develops good relationships from village level to international level. Stakeholders are invited to provide suggestions to aid in the development of the strategic planning and asked to work together with the organization in the implementation of projects. There is frequent contact between staff members and beneficiaries through frequent visits or even by phone if distance or resources do not allow frequent visits. Sometimes staff members stay with the beneficiaries There are many ways to get staff feedback or involvement in the decision making process through routine meetings, informal communication and a suggestion box.

Score: from 4.1 to 4.1 (no change)

**Capability to achieve coherence**

The vision and mission of the *Institut Dayakologi* are reviewed every three years. Strategic planning directly becomes work planning, which enables projects to generally be in line with the vision and mission. The projects are also related to and supporte each other, therefore, mutually supportive. There is an agreed SOP to support the work of the staff covering HRM and finance which is developed together with the staff and these are effectively applied, but this hasn't changed since the baseline in 2012 .

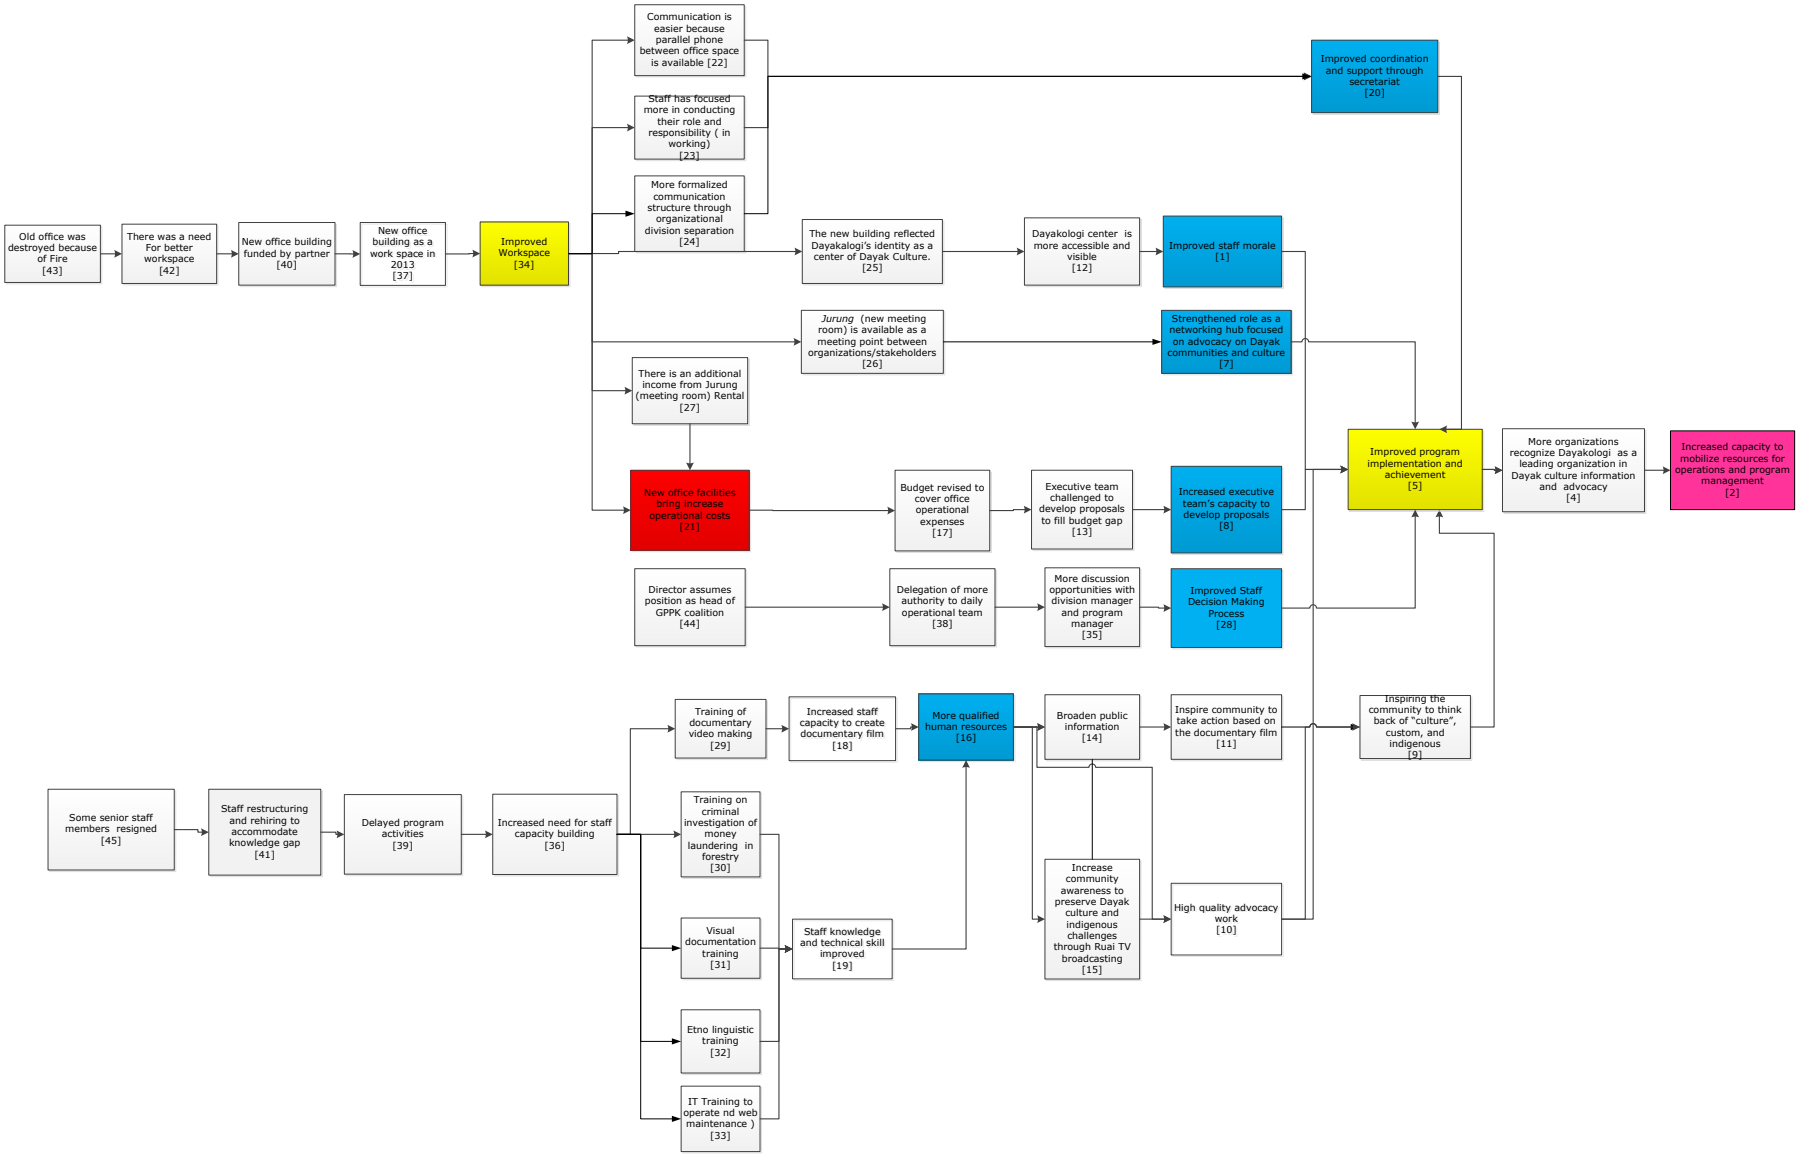
Score: 3.9 to 3.9 (no change)

### 4.2.2 General changes in the organisational capacity of the SPO

Institute Dayakologi (ID) is an advocacy organization which works for the preservation of the cultural preservation of the Dayak. One of the main activities of ID was to conduct advocacy of the natural and indigenous environment which is increasingly threatened by the expansion of plantation companies. In addition, ID takes a leading role in creating awareness in the community on pluralism through local subjects at schools. It targeted junior high school level students and was intended to bring awareness to children that they are part of a multi-cultural society.

1. The evaluation team carried out an end line assessment at Institut Dayakologi from 20 to 23 August 2014. During this workshop, the team made a recap of key features of the organisation in the baseline in 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline. The three main changes that happened in the organisation since the baseline, as identified by the staff during the end line workshop were:improved secretarial coordination and support [20]
2. improved staff morale [1]
3. strengthened role as a networking hub for advocacy on Dayak communities and culture [7]
4. increased executive team's capacity to develop proposals [8]
5. improved staff decision-making process [28]
6. more qualified human resources [16]

According to staff present at the end line workshop, these organizational capacity changes are expected to contribute to the development of Institut Dayakologi as a leading organization in indigenous culture preservation.



Apart from the fourth issue, all of these issues have contributed to improved programme implementation and achievements [5] which have helped the organization to be better recognized as a leading organization on the Dayak culture in terms of information and advocacy work [4]. This increased recognition as well as the increased executive team's capacity to develop proposals is

helping the organization in the capacity to mobilize resources for operations and program management [2].

One example of improved programme implementation could be seen in inspiring the community to think about the culture, customs and indigenous communities of the Dayak [9]. On the one hand this was done through the publication of a documentary film published by Institut Dayakologi [11], in an attempt to broaden public information [14]. On the other hand community awareness was addressed by pointing out the need to preserve the Dayak culture and the challenges that indigenous communities face on a daily basis through Ruai TV broadcasting. Based on the FGD with staff, Ruai TV had a role to publish or broadcast documenter films/movies produced by Institut Dayakologi.[15]. Both these initiatives were enabled by the increased staff capacity to create documentary films [18] , which are further explained below.

Another example includes the high quality advocacy work [10] that has been done by Institut Dayakologi. Next to specific new work initiatives, the quality of advocacy work went up significantly as well [10] due to more qualified staff and human resources available to the organization [16]. This is further explained below.

Each of the five key organizational changes are further explained below. The numbers in the narrative correspond with the numbers in the visual.

Old office was destroyed because of Fire [43]
There was a need For better workspace [42]
New office building funded by partner [40]
New office building as a work space in 2013 [37]
Improved Workspace [34]
Communication is easier because parallel phone between office space is available [22]
Staff has focused more in conducting their role and responsibility ( in working) [23]
More formalized communication structure through organizational division separation [24]
Improved coordination and support through secretariat [20]
The new building reflected Dayakalogi's identity as a center of Dayak Culture. [25]
Dayakologi center is more accessible and visible [12]
Improved staff morale [1]
Jurung (new meeting room) is available as a meeting point between organizations/stakeholders [26]
Strengthened role as a networking hub focused on advocacy on Dayak communities and culture [7]
There is an additional income from Jurung (meeting room) Rental [27]
New office facilities bring increase operational costs [21]
Budget revised to cover office operational expenses [17]
Executive team challenged to develop proposals to fill budget gap [13]
Increased executive team's capacity to develop proposals [8]
Director assumes position as head of GPPK coalition [44]
Delegation of more authority to daily operational team [38]
More discussion opportunities with division manager and program manager [35]
Improved Staff Decision Making Process [28]
Improved program implementation and achievement [5]
More organizations recognize Dayakologi as a leading organization in Dayak culture information and advocacy [4]
Increased capacity to mobilize resources for operations and program management [2]
Some senior staff members resigned [45]
Staff restructuring and rehiring to accommodate knowledge gap [41]
Delayed program activities [39]
Increased need for staff capacity building [36]
Training of documentary video making [29]
Increased staff capacity to create documentary film [18]
More qualified human resources [16]
Broaden public information [14]
Inspire community to take action based on the documentary film [11]
Inspiring the community to think back of "culture", custom, and indigenous [9]
Training on criminal investigation of money laundering in forestry [30]
Increase community awareness to preserve Dayak culture and indigenous challenges through Ruai TV broadcasting [15]
High quality advocacy work [10]
Visual documentation training [31]
Staff knowledge and technical skill improved [19]
Etno linguistic training [32]
IT Training to operate nd web maintenance ) [33]

**Improved secretarial coordination and support [20]**
Daily tasks and program implementation work were more effectively executed [5] by having better coordination and support from the organization's secretariat [20]. Program activities could now be carried out with more coordination, focus and in a timely manner. The secretariat now possesses good communication infrastructure, such as multiple phone connections [22], stronger work discipline and focus in carrying out their duties [23] and most importantly, a more formalized communication structure which was brought about by the physical restructuring of the department into separate divisions [24]. The underlying cause for this overall professionalization of the secretariat was the improved workspace [34] which was upgraded as part of the new office building in 2013 [37]. Funds for this rebuilding was provided for 35% by partner donor agencies, and the remainder was paid for with Institut Dayakologi's sustainability fund [40].The new office building was a necessity [42] after the old building got destroyed in a fire in 9 August 2007[43], but also a welcome change after working for years in an inadequate and improvised environment. It greatly impacted staff morale and the professionalization of the organization as a whole.

**Improved staff morale [1]**
According to staff present at the end line workshop, staff morale overall was greatly impacted by the accessibility and visibility of the newly constructed Institut Dayakologi building [12]. More people came to visit this building to learn and look for references about Dayak Culture, which enthused and engaged the organization's staff. The new building-itself became more visible through their designs, which incorporate and display both the Dayak Culture's and the organization's identity [25]. This major overhaul of office space was part of a greater initiative to improve office space [34], which will be explained as a separate change factor in more detail further below. Improved staff morale is expected to lead to improved programme implementation [16].

**Strengthened role as a networking hub for advocacy on Dayak communities and culture [7]**
Institut Dayakologi strengthened its role as a hub in the network that focuses on the advocacy for Dayak communities and culture [7]. Partners and stakeholders supported Institut Dayakologi role as such due to their provision of meeting space in their new office as meeting point for thenetwork [26]. The meeting room, or better known traditionally as a "Jurung", was created as part of the new office environment, and meant to be used both for internal use as well as external use by renting out the space publicly. The Jurung is a true replication of a traditional Dayak meeting space, and provides an important role in the Dayak culture.

**Increased executive team's capacity to develop proposals [8]**
The executive team's capacity to develop proposals [8] has been increased after the executive team was challenged to increase their competencies and find additional funding for the organization in order to be able and fill the new budget gap [13]. Institut Dayakologi's budget had to be revised [17] after it came under strain as a result of the higher operational expenses brought in from usage of the new office facilities [21]. Although some of these expenses could be covered by income from renting out the "Jurung" meeting room [27], new funds were required to balance the organization's budget after the workspace improvements had been realized [34].

**Improved staff decision-making process [28]**
The organization has improved its decision making process [28]. The junior Staffs were given more opportunities to discuss matters with the division manager and program manager [35], who in turn utilized this input into their management decisions. These opportunities were created through the delegation of more authority to the daily operational team [38]. Prior to this it was mostly the Director who dealt with such issues and management decisions, but as he assumed position as head of the GPPK coalition [44], the director was forced to put down some of his day to day Institut Dayakologi activities and delegate them to his subordinates.

**More qualified human resources [16]**
Institut Dayakologi now has more qualified human resources [16] . Due to having increased capacity for staff to create documentary films [18], after following a training session on the subject of documentary video making [29]. Staff capacity also increased due to improved technical knowledge and skills of staff [19]. This was due to a series of trainings. On the knowledge side, staff was trained for instance on Etno linguistic skills, which enabled them to understand and communicate with Dayak communities at a higher level [32]. On the technical skill side, staff went through training on criminal investigations of money laundering in forestry [30], visual documentation [31] and IT training to operate IT but also maintain for example the website [33]. All the trainings provided by Institut Dayakologi were part of the organization addressing the need for further staff capacity building [36]. This became evident after program activities became more and more delayed after a large restructuring operation of human resources [41]. Staff was relocated, newly hired and repositioned to accommodate the knowledge gap [41] that was left behind after several senior staff members resigned [45] from the organization in the observed period in the end of 2012.

1. Improved program implementation and meeting the set objectives [5]
The strategy of program implementation was broadened through the use of visual documentation of indigenous custom through movies or videos. This was enabled by inspiring community (not only beneficiaries) to think about the culture, customs and indigenous communities of the Dayak [9]. On the one hand this was done through the publication of a documentary film published by Institut

Dayakologi [11], in an attempt to broaden public information [14]. On the other hand community awareness was addressed by pointing out the need to preserve the Dayak culture and the challenges that indigenous communities face on a daily basis through Ruai TV broadcasting (15]. Both these initiatives were enabled by the increased staff capacity to create documentary films [18] after following a training session on the subject of documentary video making [29].

2. High quality advocacy work [10]

Next to specific new work initiatives the quality of advocacy work went up significantly as well [10] due to more qualified staff and human resources available to the organization [16].Both staff knowledge as well as technical skills improved [19]

**Better recognition of Institut Dayakologi as a Dayak Culture information center [2]**

Institut Dayakologi has become known as the leading organization with respect to Dayak Culture information [2] amongst both the public as well as public and private institutions. The prime reason for this was the fact that more organizations have experienced and observed Institut Dayakologi efforts in advocacy for the natural and indigenous environments which are increasingly threatened by the expansion of plantation companies and the Dayak culture in general. The reasons for this recognition have already been explained in the sections above.

.

# 5 Discussion and conclusion

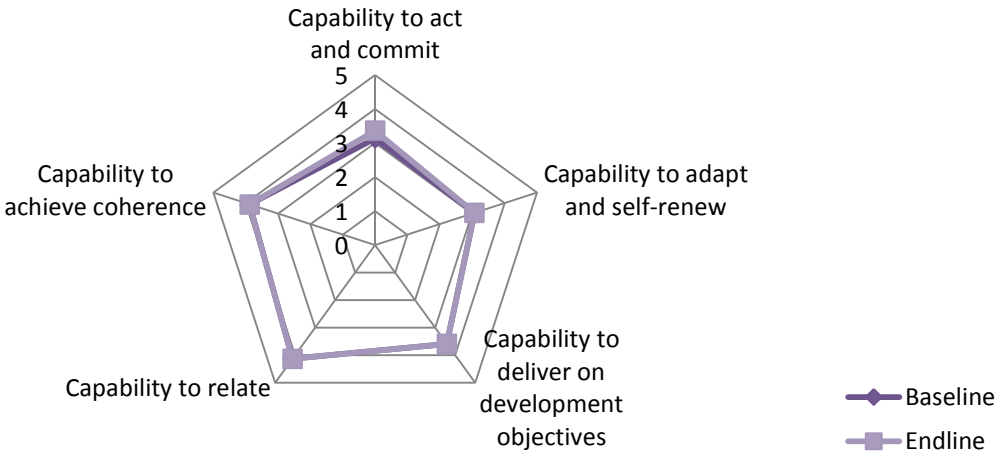
## 5.1 Methodological issues

**General: Applied to all or most SPOs**

With regard to the methodology, Indonesia has made some data collection adjustment based on the context. The first adjustment was related to the type of instrument used. To assess the organizational capacity, the study has provided self-assessment, observation and interview sheets. These all were used during the baseline with all SPOs. During the end line the team used self-assessment, interview and observation sheets. However the evaluator applied interview sheets as self-assessment—where participants were asked to fill these sheets by themselves. For the participants who did not attend the workshop, the interviews were done separately using the interview sheet and the results from the interview were included in the subgroup interview sheet that was already filled by the staff member. Were combined into the relevant sub categories in the interview sheet. Interview sheets were also applied for interviews with the CFAs, partners and consultants.

The baseline study showed that having two similar instruments (self assessments, and interview sheets) did not have any effect in relation to obtaining adequate and quality data.

To have some clarification post visit to all SPOs, the evaluator used email and phone interviews.



**Institut Dayakologi**

In preparation for the endline workshop, the evaluation team sent the interview sheets in advance to Institut Dayakologi and had an opportunity to have the filled sheets prior to workshop. When reading the interview sheet, it was clear that staff had different understanding in answering the questions. The information gained from the interview was confirmed during the workshop in Institut Dayakologi through group interview. All staff attended the workshop, and represented group categorization such as management, program, field staff, and admin/HR. Specific M&E was not available and attached to certain function and role in the organization. Team also had opportunity to interview 2 partners of Institut Dayakologi, unfortunately consultant was not available. he workshop was started by discussion on the general causal map, which includes the key organisational capacity changes since the baseline, as perceived by the SPO. Since there has been a high staff turnover between baseline and end line, most of the staff respondents were different from the staff respondents during the baseline. Like during the baseline, a large number of staff (23 during the endline), attended the endline workshop. This made it difficult for all staff to be able to express their views, but this has been solved by organizing in-depth interviews using the same interview sheets.

## 5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Whilst changes took place in all of the five core capabilities, overall very little has changed for Institut Dayakologi over the last two years. Below the changes in each of the capabilities are further explained, by referring to the specific indicators that changed. All changes took place in the indicators under the capability to act and commit.

There was a slight improvement in the indicator on staff turnover. After a series of resignations of senior staff, Institut Dayakologi was able to recruit new staff early 2013 for data base management, research, administration and cleaning services. Even though a skill and knowledge gap occurred, the reduction of senior staff freed up financial resources that could be applied to the new staff's development and training. In terms of articulated strategies, a slight improvement occurred as well: a change in day to day leadership narrowed the communication and capacity gap and allowed more staff to become involved in program management and implementation decisions. Additionally, staff members were given the opportunity to speak more freely and express ideas. Staff skills improved as well due to tighter screening of new employees and more in-house training opportunities for new staff. These training opportunities resulted from a greater training budget now that more senior staff has left the organisation.

No further changes occurred in any of the other four capabilities.

**General organisational capacity changes related to MFS II Interventions**

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. Please note that this information is based only on the information provided by Institut Dayakologi staff during the endline workshop, but no validation of this information has been done like with the process tracing causal maps. For details in relation to attribution, we refer to the next section (5.3).

During the endline workshop some key organisational capacity changes were brought up by Institut Dayakologi's staff, these have been captured in the general causal map in 4.2.2: improved secretarial coordination and support, improved staff morale, strengthened role as a networking hub for advocacy on Dayak communities and culture, increased executive team's capacity to develop proposals, improved staff decision-making process, more qualified human resources. All of these are expected to contribute to Institut Dayakologi having increased capacity to mobilize resources for operations and program management. Institut Dayakologi staff experienced these as the most important capacity changes in the organisation since the baseline.

The improved secretarial coordination and support, improved staff morale, strengthened role as a networking hub for advocacy on Dayak communities and culture, increased executive team's capacity to develop proposals, and improved staff decision-making process, were all said to lead to improved program implementation and achievements. Each of these capacity changes is detailed below.

Improved coordination and support through the secretariat can be attributed to improved communication in the new office through parallel phone lines, staff focussing more on carrying out their roles and responsibilities as well as having a more formalized communication structure. Each of these developments can be attributed to the improved workspace, which was build and funded by Cordaid with MFS II funding. The requirement to rebuild the office space originated from the fire that destroyed the previous office back in August 2007, and required major investments and support to rebuild the organization.

Improved staff morale can be attributed to the Institut Dayakologi center now being more accessible and visible, as a result of the new building, incorporating and reflecting the organizations identity as a center of Dayak Culture better. This was a fundamental goal of the improved workspace, which can be related to MFS II funding as explained above.

The strengthened role as a networking hub of Institut Dayakologi was strongly enabled by the creation of a *Jurung* (traditional meeting room) in the new offices, which acted as a central meeting point for organizations, partners and stakeholders. This too was the direct result of the MFS II intervention to support the rebuilding of the office.

The increased executive team's capacity to develop proposals resulted from the challenge to fill the budget gap that occurred due to the change in operational expenses imposed by the new building and it's facilities. This change occurred through greater costs resulting from the greater costs to run the facility. Although some of the costs could be diminished through additional income from renting out meeting room facilities, the net effect was still negative. Through this the improved workspace also contributed to the organization adapting and developing capacities to support change.

The improved staff decision making process can be attributed to the greater amount of discussion opportunities with the division manager and program manager of staff. This was enabled by more delegation of authority to the daily operational team, which was attributed to the Director assuming the position as head of the GPPK coalition. This change can therefore not be attributed to MFS II.

The last factor that resulted indirectly to the improved program implementation and achievement of Institut Dayakologi was the inspiring of the community to think back of the cultural and indigenous customs. This inspiration could be attributed to the call for action from the documentary film, and the high quality advocacy work that the organization undertook. The former resulted from the initiative to broaden public information, whilst the latter came about the increase in community awareness through Ruai TV which broadcasted Institut Dayakologi material. Both initiatives were enabled by more qualified human resources as a key organizational capacity change.

The increase in Institut Dayakologi's staff capacity resulted specifically from training in video and documentary making on the one hand, and increased staff knowledge and technical skills on the other. Staff knowledge and skill came about from a series of trainings which were all MFS II supported, and focused on both skills such as visual documentation, linguistic training and IT training as well as more substantial matter relating to the criminal investigation of money laundering in forestry. All MFS II funded capacity development interventions resulted from an increased need for staff capacity building. This could be attributed to delayed program activities, after staff had to be rehired and restructured to fill the knowledge and capacity gap that occurred after some of the senior staff members resigned.

In conclusion, MFS II funded initiatives for program support have contributed to organizational capacity change in several ways, both directly and indirectly. The supported training interventions to increase staff capacity in the skills and capacity to document and spread information to the public has contributed significantly to inspiring the community to think back to the Dayak culture and indigenous customs, that has helped improve program implementation and achievements. On the other hand the continuous support of Cordaid in reconstruction by rebuilding the offices, infrastructure and office structure have helped in improving day to day operations of the secretariat, strengthened the role of Institut Dayakologi as a networking hub and improved staff morale, all leading to improved program implementation and achievements. Although the 5C indicators in the previous section don't show great change for the organization, the general causal map described above highlights that MFS II support has certainly contributed to strengthening the organizational capacity and laying the foundation for increased capacity to mobilize resources for operations and program management of Institut Dayakologi. However, it must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect.

# Appendix 1 Methodological approach & reflection

## 1. Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

## 2. Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline

has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.[20] Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

[20] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
   - -2 = Considerable deterioration
   - -1 = A slight deterioration
   - 0 = No change occurred, the situation is the same as in 2012
   - +1 = Slight improvement
   - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*
3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*

- Intervention, actor or factor at the level of or by **SPO**: ..... .
- Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
- Intervention, actor or factor at the level of or by the **other funders**: ..... .
- **Other** interventions, actors or factors: ..... .
- Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;
- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;

- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5.* ***Prepare and organise the field visit*** *to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6.* ***Interview the CFA*** *– CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

5C Endline assessment Dutch co-financing organisation;
5C Endline support to capacity sheet - CFA perspective.

*Step 7.* ***Run the endline workshop*** *with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

Explain the purpose of the fieldwork;
Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.

Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

***Purpose of the fieldwork*:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

***Brainstorm on key organisational capacity changes and influencing factors***: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative.This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

***Self-assessments*:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8.* ***Interview SPO staff*** *– in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9.* ***Fill-in observation sheets*** *– in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

5C Endline observation sheet;
5C Endline observable indicators.

*Step 10.* ***Interview externals*** *– in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11.* ***Upload and auto-code all the formats*** *collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the **overview of information** per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13. **Analyse the data and develop a draft description** of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14. **Analyse the data and finalize the description** of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15. **Analyse the information** in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

# 3. Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

## Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

> Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.
> Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.
> Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

*The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia*

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

*SPOs selected for process tracing – Ethiopia*

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| AMREF | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| CARE | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| ECFA | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| FSCE | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| HOA-REC | Sustainable Energy project (ICCO Alliance): 2014 Innovative WASH (WASH Alliance): Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| HUNDEE | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| NVEA | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |
| OSRA | C4C Alliance project (farmers marketing): December 2014 ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| TTCA | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

*The extent to which the Dutch NGO explicitly targets the following capabilities – India*[21]

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

*SPOs selected for process tracing – India*

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BVHA | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| COUNT | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| DRISTI | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| FFID | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |

[21] RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Jana Vikas | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| NEDSF | | | | | | | No – delayed baseline |
| RGVN | | | | | | | No - delayed baseline |
| Samarthak Samiti (SDS) | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| Shivi Development Society (SDS) | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| Smile | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| VTRC | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

*The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia*

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | Pt. PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, Pt.PPMA, YPI, YRBI.

Table 6

*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| ASB | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| Dayakologi | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| ECPAT | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| GSS | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| Lembaga Kita | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| Pt.PPMA | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| Rifka Annisa | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| WIIP | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Yayasan Kelola | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| YPI | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| YRBI | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| Yadupa | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

*The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia*

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

*SPOs selected for process tracing – Liberia*

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BSC | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| DEN-L | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| NAWOCOL | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| REFOUND | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| RHRAP | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
**Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
**Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and

then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for **coding** documents received from SPO and CFA in NVivo on the following:

**5C Indicators:** this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
Information related to the **capacity development interventions implemented by the CFA** (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.
In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

MFS II supported capacity development interventions during the MFS II period (2011 until now). Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon. There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:

- In the 2012 **theory of change** on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
- During the baseline the CFA indicated a link between **the planned MFS II support** to organisational development and the expected short-term or long-term results in one of the selected capabilities;
- During the endline the CFA indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
- During the endline the SPO indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on

climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

The causal pathways that relate the intervention to the realised change/ outcome;
Rival explanations for the same change/ outcome;
Assumptions that clarify relations between different components or parts;
Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.
The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

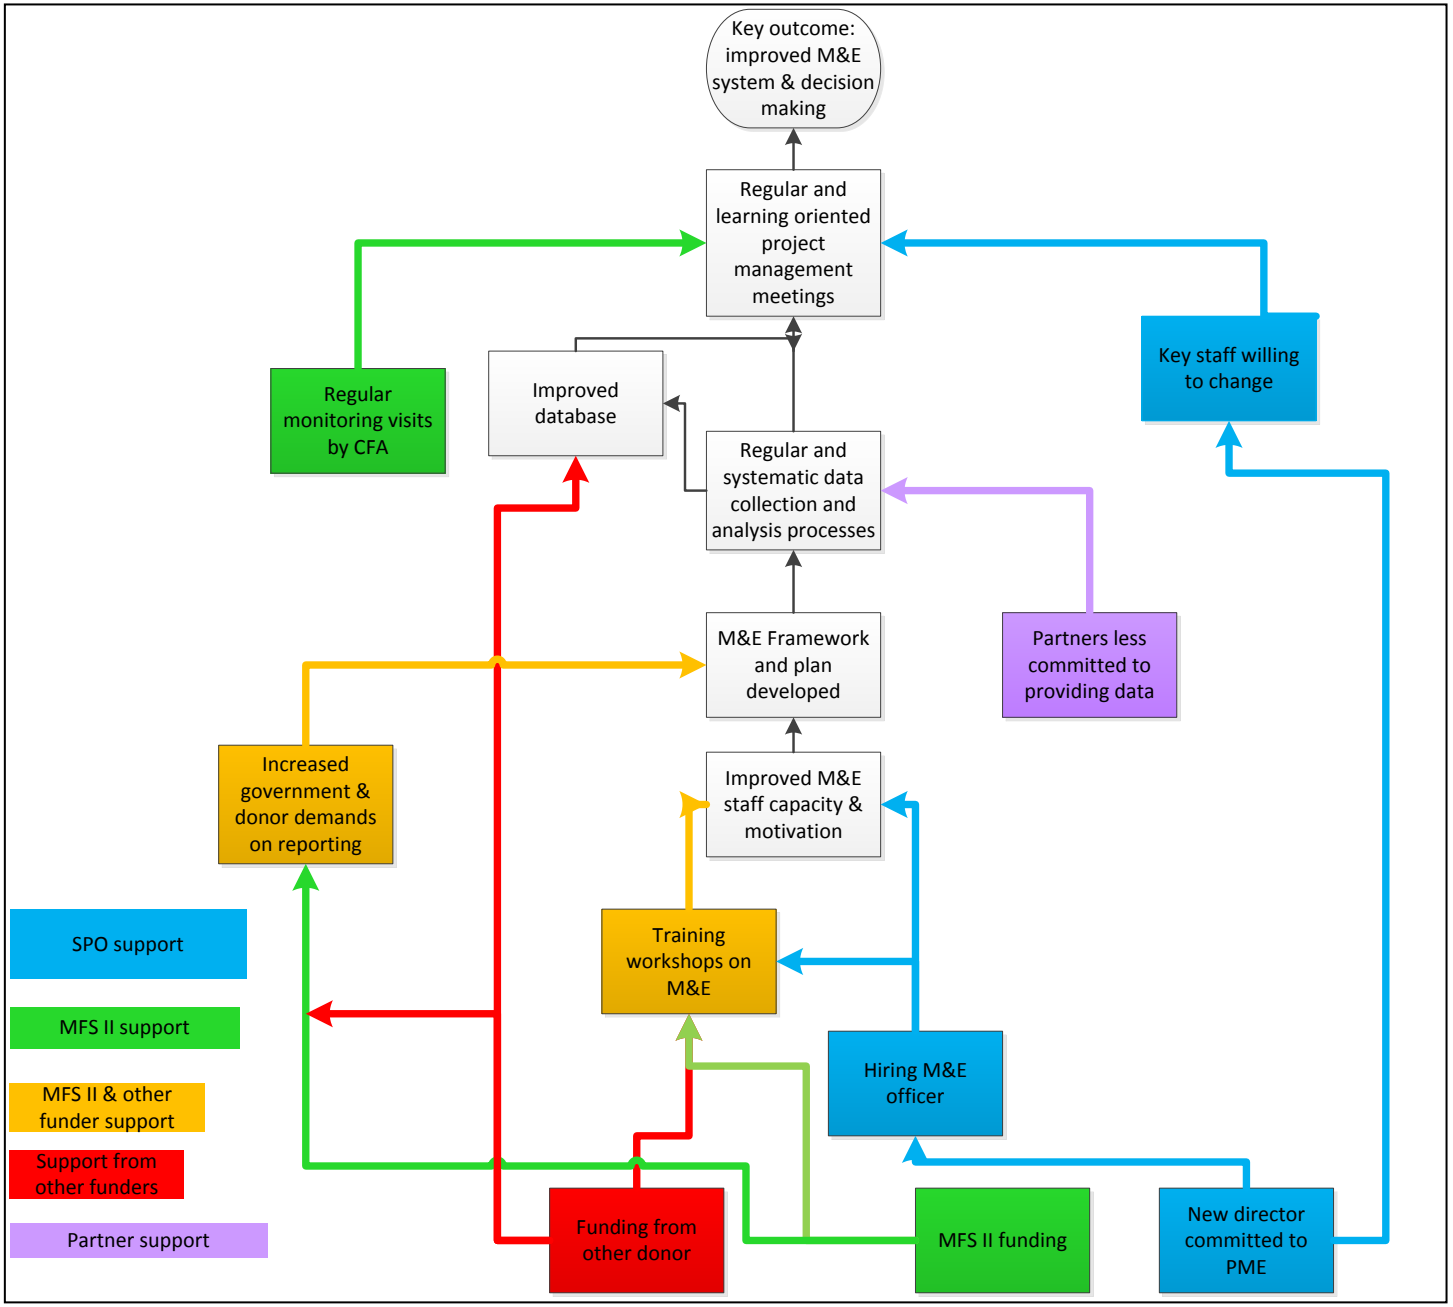

***Figure 1*** *An imaginary example of a model of change*

*Step 5. Identify **types of evidence** needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, *"What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?"*. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

**Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.
**Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
**Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.
**Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.
*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

*Format for identifying types of evidence for different causal relationships in the model of change (example included)*

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| Describe relationship between the subcomponents of the model of change | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions.<br>Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y?<br>Can we find this information by means of :<br>Pattern evidence;<br>Sequence evidence;<br>Trace evidence;<br>Account evidence? | Describe where you can find this information |
| Example:<br>Training workshops on M&E provided by MFS II funding and other sources of funding | Example:<br>What type of training workshops on M&E took place?<br>Who was trained?<br>When did the training take place?<br>Who funded the training?<br>Was the funding of training provided before the training took place?<br>How much money was available for the training? | Example:<br>Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br><br>Sequence evidence on timing of funding and timing of training<br><br>Content evidence: what the training was about | Example:<br>Training report<br>SPO Progress reports<br>interviews with the CFA and SPO staff<br>Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality** of data and **analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible.

These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

Confirming/ rejecting a causal relation (yes/no);
Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

| ***Example format for the adapted evidence analysis database (example included)*** **Description of causal relation** | **Confirming/ rejecting a causal relation (yes/no)** | **Type of information providing the background to the confirmation or rejection of the causal relation** | **Strength of evidence: strong/ rather strong/ rather weak/ weak** | **Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected** |
|---|---|---|---|---|
| e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

# 4. Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this.

This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

# 5. Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.

Difficulty of verifying each and every single change and causal relationship:

Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.

Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on

design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

The capability to act and commit;
The capability to deliver on development objectives;
The capability to adapt and self-renew;
The capability to relate (to external stakeholders);
The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed. A detailed overview of capabilities with outcome domains and indicators is attached in Appendix 3.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Appendix 3 Changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

**Description of Endline Indicators Institut Dayakologi**

**Capability to act and commit**

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

*This is about leadership within the organization (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organization.*

The active leader has remained the same for quite a long period of involvement in the organization. He is an inspiration and a leader for his staff with appropriate knowledge and capacity, charismatic and democratic leadership. He was involved in the establishment of the organization and devoted to the cultural issue of *Dayak* although it is not considered a "sexy" issue according to one of the staff. He is able to continue the organization's existence and keep the staff's spirit ignited.

The problems in the organization are resolved in discussions, as well as participatory decision making. Generally, the Institut Dayakologi has the organization elements with structure, set and principles for decision making at any level. The leader provide drafts of decisions for strategic decision making related to important issues and external & supporting networks before meeting with the staff for critique and suggestions. This is the way the staff learns to understand the problems and to find a way out of them.

At this moment, the director of Institut Dayakologi was also in charge as a chairman of GPPK "Gerakan Pemberdayaan Pancur Kasih", a coalition of several NGOs in which Institut Dayakologi becomes one of its members. He gave more authority to the Institut Dayakologi daily management team (dewan pengurus), - consisting of 4 senior staff-, to run the organization and providing supervision to the program division and implementation. The management team provided supervision and day to day mentoring to the staff in implementing the program, especially the division manager. Each of of them has responsibility to provide guidance and supervision to each division. They conducted regular discussion on program implementation and supported the division to overcome challenges. Starting 30 January 2015, the director has resigned from his position as the executive director of ID for personal reasons, and was replaced by the former Division Manager of Research and Studies.

Score: 4 to 4 (no change)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

*This is about the extent to which the leader(s) provide strategic directions*

There is a slight change in the decision making mechanism due to the leader becoming the chairman of another organization (GPPK) and the treasurer of yet another (CUG). At this moment, the director of Institut Dayakologi was also in charge as a chairman of GPPK "Gerakan Pemnerdayaan Pancur Kasih", a coalition of several NGOs in which Institut Dayakologi becomes the member. He gave more

authority to the Institut Dayakologi daily management team (dewan pengurus), - consisting of 4 senior staff-, to run the organization and providing supervision to the program division and implementation. The management team provided supervision and day to day mentoring to the staff in implementing the program, especially the division manager. Each of of them has responsibility to provide guidance and supervision to each division. They conducted regular discussion on program implementation and supported the division to overcome challenges.

The all division Managers have the authority to make decisions as long as it is within the scope of the program. Meetings in the division depend on the initiative of the Division Manager but are routinely held each month. Random meetings are held sometimes in informal situations. The Division Manager and Team Leader are for certain activities able to coordinate and provide strategic orientation for the involved activists therefore the activities run smoothly within the planning. The division Manager is coached and controlled by the management team in daily activities due to the external activities of the leader. Sometimes the Board also goes to the field.

There was an improvement of the regeneration that management team substituted the role of the director to decide technical things. Institute Dayakologi (ID) staff used to be very dependent on the leadership of the director, but now they learned how to manage programs, involving in the implementation supervision, even to develop proposal. The director provided more opportunity and authority for the management team to work and decide on the day to day progress in the organization.

Score: 3.5 to 3.5 (no change)

1.3. Staff turnover: 'Staff turnover is relatively low'

*This is about staff turnover.*

By the end of 2011 and 2012, five senior staff (division manager) and one executive staff resigned from the organization due to getting higher salary offers and better opportunity to improve capacity from other organizations. Early 2013, the organization recruited new staff for data base management, research, administration and cleaning services.

When some of the senior staff resigned, there was some turbulence within the organization due to the skill gap. The organization had to train new staff in order to meet the requirements of running the activities in *Institut Dayakologi*. But on the other hand, there was a financial benefit for the organisation since the budget for senior staff salary could now be used for the new staffs' development and training.

Score: 1.5 to 2 (slight improvement)

1.4 Organisational structure: 'Existence of clear organisational structure reflecting the objectives of the organisation'

The organizational structure has not changed since the baseline and still consists of:

Members of Meeting; Executive Chairman of the Association, consisting of the chairman, secretary and member; Board of Financial Audit, consisting of chairman, secretary and member; Board of Management, consisting of chairman, vice chairman, secretary, treasurer, and member; Executive Body.

Standard operational procedures are also present to support the organizational structure. These explain decision-making and operational mechanisms, authorities, job-descriptions, and the responsibility of each of the components within the board of managers, board of executives and the activists as well as guidelines for accountability and reporting of activities.

Score: from 3 to 3 (no change)

1.5 Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E'

The change in the day to day leadership in the management team has opened a wide opportunity of discussions between the management team, division managers, and program managers, on the program implementation. Also the communication and capacity gap was minimum and staff became more free to express ideas. The discussion became a means of collecting facts, analysing the condition, and deciding strategies for better implementation. The organization also runs a research and studies program, an advocacy and collaboration program, and an empowerment of resource program. M&E is done both internally and externally and the result was used to analyse program implementation and formulate better pogram implementation strategy.

M&E has become one of the approaches in the preparation of strategic planning. There is no particular tool to do this process. Meetings for annual planning and review are used to deliver the next strategic plan.

Score: 3 to 3.5 (slight improvement)

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'

*This is about the extent to which day-to-day operations are aligned with strategic plans.*

The daily operatios run in line with the strategic plan. The core Program activities are described in the annual program plan and this plan was specifically conducted through the Program Implementation Plan (RPK) and Program Implementation Evaluation (APK). RPK was the operational plan of the program implementation and evaluated or monitored through APK. The program implementation plan was intended to provide guideline on the activities, while program implementation evaluation provided opportunity to reflect on the program implementation plan.  The RPK and APK were developed in an annual management workshop within the organization but according to some staff, the implementation is not always consistent as in the planning due to control weaknesses at managerial level.

Score: 4 to 4 ( no change)

1.7. Staff skills: 'Staff have necessary skills to do their work'

*This is about whether staff have the skills necessary to do their work and what skills they might need.*

The organization has a tight selection on new staff recruitment , which is based on their skill and education background. Similarly, staff is placed within the organization based oncapacity and background.

There is also an improvement related to staffs' skill in understanding and analyzing the situation in the field, and their abilities to understand the cultural issues which the organization deals with. Most of the staff stated that they need capacity building and language (English) training.

ID conducted and joined lots of training, especially in house trainings to improve staff capacity. The resignation of some senior staffs had encouraged ID to build the capacity of the current staff, such as proposal development training attended by all staff ID, documentary film production attended by 19 staff ID and 6 GPPK staff, and database and website training attended by all management staff. MSF II funded the trainings and 1 collaboration was with another donor.

Score: 2.5 to 3.5 (improvement)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

*This is about whether staff at the SPO are offered appropriate training opportunities*

Since the baseline in 2012 , the organization held in-house training sessions to share the knowledge and experiences among the staff. The in-house trainings consisted of a proposal preparation training, production of documentary films training, and data base and website training. Basically, the organization has given the opportunity to attend any training related to skill improvement for all the staff without differentiations between senior and junior levels. However, due to the organization's last experience in terms of having some senior staff with high skills resigning, tight selection and requirements are now applied in sending staff to follow training outside the organization. Currently it is mainly staff at managerial level who are sent for training outside the organization, they are required to write a written report of the training and there is a routine in sharing their learning through monthly meetings.

Score: 3 to 3.5 (improvement)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

*This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.*

Nothing has changed in terms of incentives for staff members in the last two years. The staff continues to work for the organization not just for the work but to be part of an opportunity to strengthen the *Dayak* culture.

Staff in this organization is included in a social security system, provided allowance for family and children, health insurance, accommodation and transportation. A pension program for staff is under development and hopefully can be implemented before the end of 2014. ID arranges the staff's pension plan through Credit Union. ID adds 10% to each salary of the staff every month for pension plan which is managed through Credit Union. This portion of salary is used to pay back the loan at the CU that each staff borrows. The loan is used as saving at the Credit Union with 15% interest p.a. for their pension purpose.

Another incentive is the opportunity to attend trainings, in house or outside the organization as the organization fully supports staff capacity building.

Score: 3 to 3 (no change)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

*This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.*

Generally, the organization now has a stable income, although some donors already reduced or even stopped their support. Income comes from donors, especially foreign donors, but also from donations, fundraising, and investments. The fluctuating income is compensated during the program implementation or by raising additional income through program activities themselves.

The management realises that the organization has to build autonomy and independence in its position regarding income, and develop a particular division to focus on this issue. Financial plans are projecting that by 2019, the organization should have more internal revenue sources than external, decreasing the dependency on donor organizations. Another income source is from *GCU* and *GPPK* for the development of *Kalimantan Review*, whether from compulsory contribution of the members or from the advertisements in the *Kalimantan Review*.

Score: 3 to 3 (no change)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'

*This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.*

No change has occurred with respect to funding procedures at *Institut Dayakologi* over the last two years. The organization has a good financial strategy which is described in the ten year organization financial plan (2010-2019).

However to sustain the organization income, ID improved the mechanism of organization fundraising and proposal development by conducting training on proposal development. The training of proposal development was attended by all staff, forming a team of proposal development , collecting information on partners who worked at the similar issue. ID also made an effort to strengthen the organization fundraising by recruiting 1 staff to work on the outlet of ID. The outlet of ID provided public with more ID publication such as publication of research on indigenous people , in the form of books, bulletin, and newspaper. It also collected the artwork of indigenous people and help them sell their product. New Jurung also provided new opportunity to generate income from organization asset.

Score: 4 to 4 (no change)

**Summary Capability to act and commit**

In terms of strategic guidance to resist slight change since the baseline. The director has become the chairman of another organization (GPPK) and the treasurer of yet another (CUG). Now the division Manager has the authority to make decisions as long as it is within the scope of the program. Meetings in the division depend on the initiative of the management team and Division Managers but are routinely held each month and this is where strategic and operational guidelines are provided. The management team provided mentoring and guidance to division managers. Strategic plans are well articulated and based on monitoring and evaluation, although there is no systematic monitoring and evaluation in place. The changing on the day to day leadership on management team has opened a wide opportunity of discussion between management team, division managers, and program managers, on the program implementation. As the communication and capacity gap was minimum and staff became more free to express ideas. The discussion became a means of collecting facts, analysing the condition, and deciding strategies for a better implementation. The organization also runs a research and studies program, an advocacy and collaboration program, and an empowerment of resource program. M&E is done both internally and externally and the result was used to analyse program implementation and formulate better pogram implementation strategy. M&E has become one of the approaches in the preparation of strategic planning. There is no particular tool to do this process. Meetings for annual planning and review are used to deliver the next strategic plan.

Staff turnover is still high , since some experienced staff left the organisation by the end of 2012. But there is also been some new staff. This left the organisation with a gap in terms of available knowledge and skills but the money that came available by staff leaving has been used to train other staff. There have been plenty of opportunities for skills upgrading both in the organisation through sharing meetings as well as by attending capacity building events mostly finded by MSF II especially in house trainings within the organisation. FGenerally, the staff of *Institut Dayakologi* are loyal, dedicated and committed but still lack general skills i.e. language skills. Motivation to work for the organisation mainly comes from staff's dedication to contribute to the Dayak culture, although some staff have left the organisation due to better financial gains elsewhere. Staff in this organization are included in a social security system, provided allowance for family and children, health insurance, accommodation and transportation. A pension program for staff is under development and hopefully can be implemented before the end of 2014 The organization still has a complicated but firm organization structure, and also has clear procedures to develop the strategic planning which is included target communities. It has relative stability in financial resources and there are procedures and plans to obtain additional income and to become less dependent of donors, which is described in a ten year organization financial plan.

Score: from 3.1 to 3.6 (slight improvement)

**Capability to adapt and self-renew**

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

*This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).*

Compared to the baseline there is still no comprehensive and functional M&E system in place and there are no written documents or formal procedures for M&E. M&E is just centered on discussions between staff and coordinators. M&E is applied at the project level, not yet the organizational level. M&E is done in the form of discussions based on projects, together with stakeholders sharing experiences, renewing reports, and providing suggestions. The monthly meeting which is attended by all staff is also used as the evaluation forum discussing achievements, problems, and solutions. An annual evaluation and planning meeting is also held to evaluate all the implemented programs within a year and to arrange next year's programs. Staff members are slowly learning about M&E, identifying obstacles and constraints and reducing the risk of failure by finding solutions.

Score: 3 to 3 (no change)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

*This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.*

Compared to the baseline, there is still no particularly trained staff to implement M&E although they do understand the importance of M&E. Staff gathers information on the implementation of their programs, resources and the needs of targeted community. Division Manager and program managers provide monthly, quarterly, six-monthly and annual reports.

Some staff members have been requested to do M&E in the internal organization of GPPK.

Score: 2 to 2 (no change)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

*This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.*

No change has occurred in this indicator compared to the baseline. Generally, management decisions are based on program implementation reports however, the findings are not always recorded and neither is feedback from the beneficiaries. The reported problems are analyzed to find the solutions which are then recommended as the basis for decision-making. Through this process, M&E has become one of the approaches in the preparation of strategic planning. There is no particular tool to do this process. Meetings for annual planning and review are used to deliver the next strategic plan.

Score: 3 to 3 (no change)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

*This is about whether staff talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staff are comfortable raising issues that are problematic.*

Critical reflection is done in executive meetings, program meetings, and monthly meetings in the form of "debates". The monthly meeting is held to discuss any concerns related to programs or non-programs openly. There is an informal mechanism within the staff and management to discuss those concerns for example during lunch time.

The suggestion box is changed into a digital forum through social media and short message service, which staff members can use as a tool to convey feedback to management. Despite offering this mechanism in an electronic format now, there is no difference compared to two years ago.

Monitoring and evaluation on programme implementation of respective divisions are carried out on a montly, quarterly, semester and annual basis as well as per activity. The instruments used to monitor the programme implementation are Activity Implementation Plan (RPK), Activity Implementation Analysis (APK), monthly reports that are submitted by staff to programme manager, Quarterly reports that are submitted by programme manager to Division Manager, Semester reports that are submitted by Division Manager to Director. In addition, monitoring and evaluation are also held during monthly meetings, executive meetings and programme's year-end evaluation and monitoring.

Monitoring and evaluation aimed at ensuring that programmes implemented in compliance with work plans that have been previously formulated and providing feedback for perfection and improvement of programmes taking into account today's development ongoing in the facilitated communities.
Monitoring on budget is carried out every day, once in 4 months, semester and year. The aims of monitoring are not only to ensure that every activity is implemented on time, on target and on budget but also to provide input and recommendation for the next activities.
Daily monitoring is carried out every working day at the secretariat of Institut Dayakologi in Pontianak, whereas the monitoring on the implementation of Grasshopper IV programme in Tanjung, Jelai Hulu, Ketapang District is carried out once in 4 months (quarterly) by conducting a direct visit to the field to see whether the budget is used appropriately for the programme implementation in the field.
The aim of evaluation is to evaluate the progress and outcomes of the programme implementation as well as to identify constraints sustained. The aspects that are evaluated, among which are the time of activity implementation, the compliance of preparation of activity with the work plan, the compliance of activity implementation with time table, human and financial resources, costs, how the activity is carried out, goals and what instruments are used as well as all the notes and receipts as source of evidence for the activity implementation. All these aspects are evaluated as to see whether they comply with the Work plan, Activity Implementation Plan, Activity Implementation Plan and Budget Form.
Score: 3.5 to 3.5 (no change)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives

*This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.*

There is no change regarding sharing ideas among the staff. They feel that the organization is always open for any comments and ideas through formal meetings or personal communication. For example, if the finance staff needs an external financial consultant to develop organizational financial software, the organization will find an appropriate consultant to develop this idea. The new ideas, including technical suggestions for program implementation are accommodated as long as they are in line with the vision and mission of the organization.

Score: from 3 to 3 (no change)

2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and developments in its operating environment'

*This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.*

There has been no change in the way that Institut Dayakologi tracks its environment. *Institut Dayakologi* as a leading NGO on the Dayak culture in West Borneo finds that it has to follow general trends and developments in its environment, particularly developments with good impact for the organization. It is easy to find information about the changes and trends as it has coaching programs with activists being involved in the community's everyday life. Another method to obtain information is by conducting a forum for external reflection with participants from universities, church representatives and local community members.

Since 2012, the organization has held an annual celebration for its anniversary with particular events such as book/documentary film/journal launching to attract public attention.

Score: 4 to 4 (no change)

2.7. Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and the general public'

*This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.*

No changes have taken place with regards to stakeholder responsiveness. *Institut Dayakologi* invites all stakeholders and other organizations in an evaluation meeting to evaluate the implemented programs and to obtain suggestions for next programs. There is also a general evaluation session which involves stakeholders and beneficiaries to obtain criticisms and suggestions for the next implemented programs.

Score: 3 to 3 (no change)

**Summary of capability to adapt and self-renew**

There is still not comprehensive and functional monitoring and evaluation system in place , but the organization receives feedback from other organizations and beneficiaries and evaluates the impact of the implemented programs as part of program implementation. ID has setup a M&E Division as one of its main programs starting 2015. This program will be managed by a Division Manager and put in the management structure of the organization. Furthermore, regular meetings are held to discuss progress program implementation and annual planning and review meeting is held to look back and plan ahead for the next year. There is no specific and dedicated trained staff to do M&E. Monitoring and evaluation is mainly focused on project and not organisational level and on activities and outputs and impact. The organisation also has published lots of publication that provided a deep analysis on the indigenous people culture. The book is a reflection of how the intervention bring changes on people's life.There are many ways for staff to deliver their ideas and critiques both informally and formally. Currently with the fast growth of social media, the staff are also able to deliver their ideas through digital media. The organisation tracks what is happening in the environment, mainly by engaging with the communities but also with the media.

Score: from 3.1 to 3.1 (no change)

**Capability to deliver on development objectives**

3.1. Clear operational plans: 'Organization has clear operational plans for carrying out projects which all staff fully understand'

*This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.*

Programs are implemented based on work plans and detailed operational budgets in the Program Implementation Planning (RPK) which includes activities, output, result, resources (asset), and budget. Beside the RPK, there is also Program Implementation Analysis (APK) which analyzes program implementation. RPK and APK are used by the staff as a reference for daily operational activities. However, various staff members have raised concerns related to the effectiveness of RPK due to lack of staff to implement all the programs, and an alternative, simpler way of planning may be more applicable and effective.

Score: 4 to 4 (no change)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

*This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.*

Cost effective resource use is promoted through the budget arrangement . Budget is the first process to be prepared to ensure that the organization has the resources needed and make a cost effective activitivy plan. The staff needs to propose the budget before the program starts and they need to submit reports and receipts to be verified by the finance department. This mechanism gives a significant impact in budget saving and the staff can work efficiently before the budget is allocated without considering the needs or real demand in the field. This mechanism has remained unchanged since 2012, relating in no change with respect to this indicator.

Score: 4 to 4 (no change)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

*This is about whether the SPO is able to carry out the operational plans.*

There is no change related to operational planning and program implementation. *Institut Dayakologi* implemented the program based on the planning. Acivities to implement the program was conducted to achive the objective of the program. on the planning made by all the staff. Generally, operational planning runs smoothly as long as the planning is well and carefully prepared. Any deviation that occurred was caused by external factors or other situational conditions in the field. Most staff members have high commitment regarding  program implementation which enables them to run their planning well. Overall outputs have been delivered according to the plans consistently.

Score: from 3.5 to 3.5 (no change)

3.4. Mechanisms for beneficiary needs: 'The organization has mechanisms in place to verify that services meet beneficiary needs'

*This is about how the SPO knows that their services are meeting beneficiary needs*

There is no change in the way the organization fulfills the needs of the beneficiaries. The organization holds a workshop and discussions at the start of a program to assess the newest condition in the community. Community involvement is the key for this organization in implementing the programs as well as doing monitoring and evaluation. During program implementation, the team will allocate time

to stay together with the beneficiaries. This engagement with the communities supports assessing whether the services meet beneficiary needs.

Score: from 4 to 4 (no change)

3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratio's)'

*This is about how the SPO knows they are efficient or not in their work.*

There is no change related to the monitoring efficiency. The organization reviews Program Implementation Planning (RPK) and undertakes Program Implementation Analysis (APK). This is the most effective way to find out the relation between the input and output of the implemented program, and to find out the achievement of target percentage. Staff performance is evaluated by each program manager biweekly and by division manager monthly.

Score: from 3 to 3 (no change)

3.6. Balancing quality-efficiency: 'The organization aims at balancing efficiency requirements with the quality of its work'

*This is about how the SPO ensures quality work with the resources available*

Quality and efficiency are balanced by comparing the used resources and the impact of an implemented program, and this has been performed consistently over the last two years. No significant changes have therefore been found with respect to this indicator.. Program quality or activity can be seen from the positive feedback from the beneficiaries, local government, and other stakeholders. The needs of the beneficiaries and the demand in the field are high whilst the available resources are limited. Staff has to be creative in way to keep the result optimal.

Score: 3 to 3 (no change)

**Summary of Capability to deliver on development objectives**

Programs are implemented based on work plans and detailed operational budgets in the Program Implementation Planning (RPK) which includes activities, output, result, resources (assest) , and budget. All staff has a responsibility to develop RPK and APK. Beside the RPK, there is also Program Implementation Analysis (APK) which supports the analysis of program implementation. RPK and APK are used by the staff as a reference for daily operational activities. *Institut Dayakologi* has an approach for project implementation which requires developing the work plan and budget arrangement first and analyze it afterwards. This way, the staff can work efficiently and the resources are used appropriately. It also helps them to compare the input, the output and the impact. There is still deviation from the planning because of the external factors although the organization always finishes their program completely. In order to fulfill the needs of the beneficiaries, the organization held discussions and workshops before the programs are implemented. Sometimes, the staff stays with the beneficiaries to ensure optimal delivery. Since staff engages frequently with beneficiaries, this assists in assessing whether the services meet their needs.

Score: from 3.6 to 3.6 (no change)

**Capability to relate**

4.1. Stakeholder engagement in policies and strategies: 'The organization maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organization'

*This is about whether the SPO engages external groups in developing their policies and strategies, and how.*

*Institut Dayakologi* is a part of an extensive network, GPPK or Gerakan Pemberdayaan Pancur Kasih (Pancur Kasih Empowerment Movement), in Borneo. The organization has developed various activities to exchange experience within the network from the village level up to the international level. It also develops good relationships with some external communities to develop its policy and strategy through strategic planning and review meetings for and these meetings are open for feedback and suggestions by anybody.

Score: 4 to 4 (no change)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'

*This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.*

Institut Dayakologi has maintained its engagement level in it's networks. The internal relation within *Institut Dayakologi* has remained strong as well as the relations with other strategic networks whether local, national or at the international level. External relations have been developed since the program was implemented. The network consists of the Credit Union (CU), Catholic Church (diocese), the regency (Education Department, animal husbandry, fishery, and National Land Agency, libraries, etc.), the local village government (in the beneficiaries' areas), traditional organization, partner organization, and international NGO i.e. Cordaid.

The organization participates in other organizations' programs and vice versa, or implements a joint program such as lobbying at the national level and amongst government. The relationship with government was better as government has put more trust on ID's work. The stakeholders trust was shown from the use of books published by ID as their reference, including being used by school as a textbook. ID also developed stronger relationship with Media, such as Ruai TV.

The new "Jurung" also contributed to strengthen ID networking as it opened for any organization activities.

Score: 4.5 to 4.5 (no change)

4.3. Engagement with target groups: 'The organization performs frequent visits to their target groups/ beneficiaries in their living environment'

*This is about how and when the SPO meets with target groups.*

*Institut Dayakologi* has continued its processes related to the engagement with its target groups. It visits the targeted communities frequently, which has become an important part of program implementation. The amount of visits depends on the program, for example in the division for Collaboration and Advocacy the staff had to stay with the beneficiaries. In another program, the organization communicates with the targeted community by visiting their homes, or holding seminars or meetings. The amount of visits depends on the needs of the community but because of the distance and cost, not all the communities have been visited with the same frequency. In that case, the staff communicate with the community representative via telephone.

Score: 4 to 4 (no change)

4.4. Relationships within organization: 'Organizational structure and culture facilitates open internal contacts, communication, and decision-making'

*How does staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?*

Relationships within the organization have remained strong and well. Communication and decision making is still done through routine meetings: monthly, executive, managerial, annual evaluation and annual program. The organization also uses a mailing list to communicate with the staff/activists. An annual performance review by the executive director has also become a forum to communicate in which the director closely communicates with the staff whilst the staff can share any problems related to their performance.

The other way is through suggestions via short message service and social media. Previously the organization provided a suggestion box to obtain the staff's ideas, feedback, and suggestions. The daily communication is open through direct communication or electronic media (email, SMS, or phone call).

Sejauh ini seperti itu, ketika pembicaraannya sampai ke tingkat direktur mengenai masslah pribadi, itu harus dilakukan. Tetapi sebelumnya terlebih dahulu di bicarakan di tingkat pengurus, baru kalau tidak diselesaikan di tingkat pengurus, baru ke tingkat direktur, disitu keputusannya, dan itu harus dilakukan. Kalau mailing list di beberapa tahun ini tidak jalan. Dan saat ini di lakukan di grup bbm untuk share-share pekerjaan walaupun belum mencakup semua staf karena tidak semua menggunakan bbm.
Score: 4 to 4 (no change)

**Summary of Capability to relate**

The organization has an extensive network and develops good relationships from village level to international level. Stakeholders are invited to provide suggestions to aid in the development of the strategic planning and asked to work together with the organization in the implementation of projects. There is frequent contact between staff members and beneficiaries through frequent visits or even by phone if distance or resources do not allow frequent visits. Sometimes staff members stay with the beneficiaries There are many ways to get staff feedback or involvement in the decision making process through routine meetings, informal communication and a suggestion box.

Score: from 4.1 to 4.1 (no change)

**Capability to achieve coherence**

5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organization'

*This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.*

No changes have occurred regarding the revisiting of Institut Dayakologi vision and mission. The vision and mission are reviewed formally in the meeting for strategic planning which is held every three years. Stakeholders are involved in the discussion with the founders, management, executives, and staff. The discussion about the vision and mission is not always producing changes but can be a reflection of the current social situation (consider vision and mission in any program).

Score: from 4 to 4 (no change)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

*This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.*

Operational guidelines have stayed the same over the last two years, and continue to be effectively applied to day to day work. The organization has clear rules to direct the performance of the staff. There is a twenty page document regarding Standard Operational Procedures (SOP) which has been revised many times -. The newest version is from the year of 2007 regarding technical operation guidelines, administration and HRM. Th was a new SOP of building maintenance. The SOP refered to the new building of ID that just finished its construction in 2013. The SOP is used and supported by the management. There is also a description of the jobs and the documentation process as well as financial procedures. Before using the SOP, the description of the jobs is discussed and the staff members are asked to provide feedback.

Score: 3.5 to 3.5 (no change)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'

*This is about whether the operations and strategies are line with the vision/mission of the SPO.*

No changes have occurred since 2012 with regards to the alignment with vision and mission. Project and strategy are still in line with work programs of the organization, the objective and the activities are taken directly from the vision and mission. ID staff has internalized the vision and mission of the organization. The work has reflected the vision and mission of the organization.

Score: 3.5 to 3.5 (no change)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

*This is about whether the efforts in one project complement/support efforts in other projects.*

Dayakologi's efforts remain greatly mutually supportive. All the running projects are designed to relate to each other, for example the documentation of *Dayak* culture has given an impact towards the awareness amongst the community regarding the importance of maintaining their culture. The publication has suppoted the work of ID direct intervention with community. One of the issue was a conservation of indigenous territory which has to face with private company expansion. The publication hads influenced the community in such a way they have a good knowledge and understanding to defend indigenous territory. This common issue was an example of how reserach division support the publication division and , adcocacy division to solve the environmental problems followed by an increase in income. All the programs support each other in such a way.

Score: 4.5 to 4.5 (no change)

**Summary Capability to achieve coherence**

The vision and mission of the *Institut Dayakologi* are reviewed every three years. Strategic planning directly becomes work planning, which enables projects to generally be in line with the vision and mission. The projects are also related to and supporte each other, therefore, mutually supportive. There is an agreed SOP to support the work of the staff covering HRM and finance which is developed together with the staff and these are effectively applied, but this hasn't changed since the baseline in 2012 .

Score: 3.9 to 3.9 (no change)

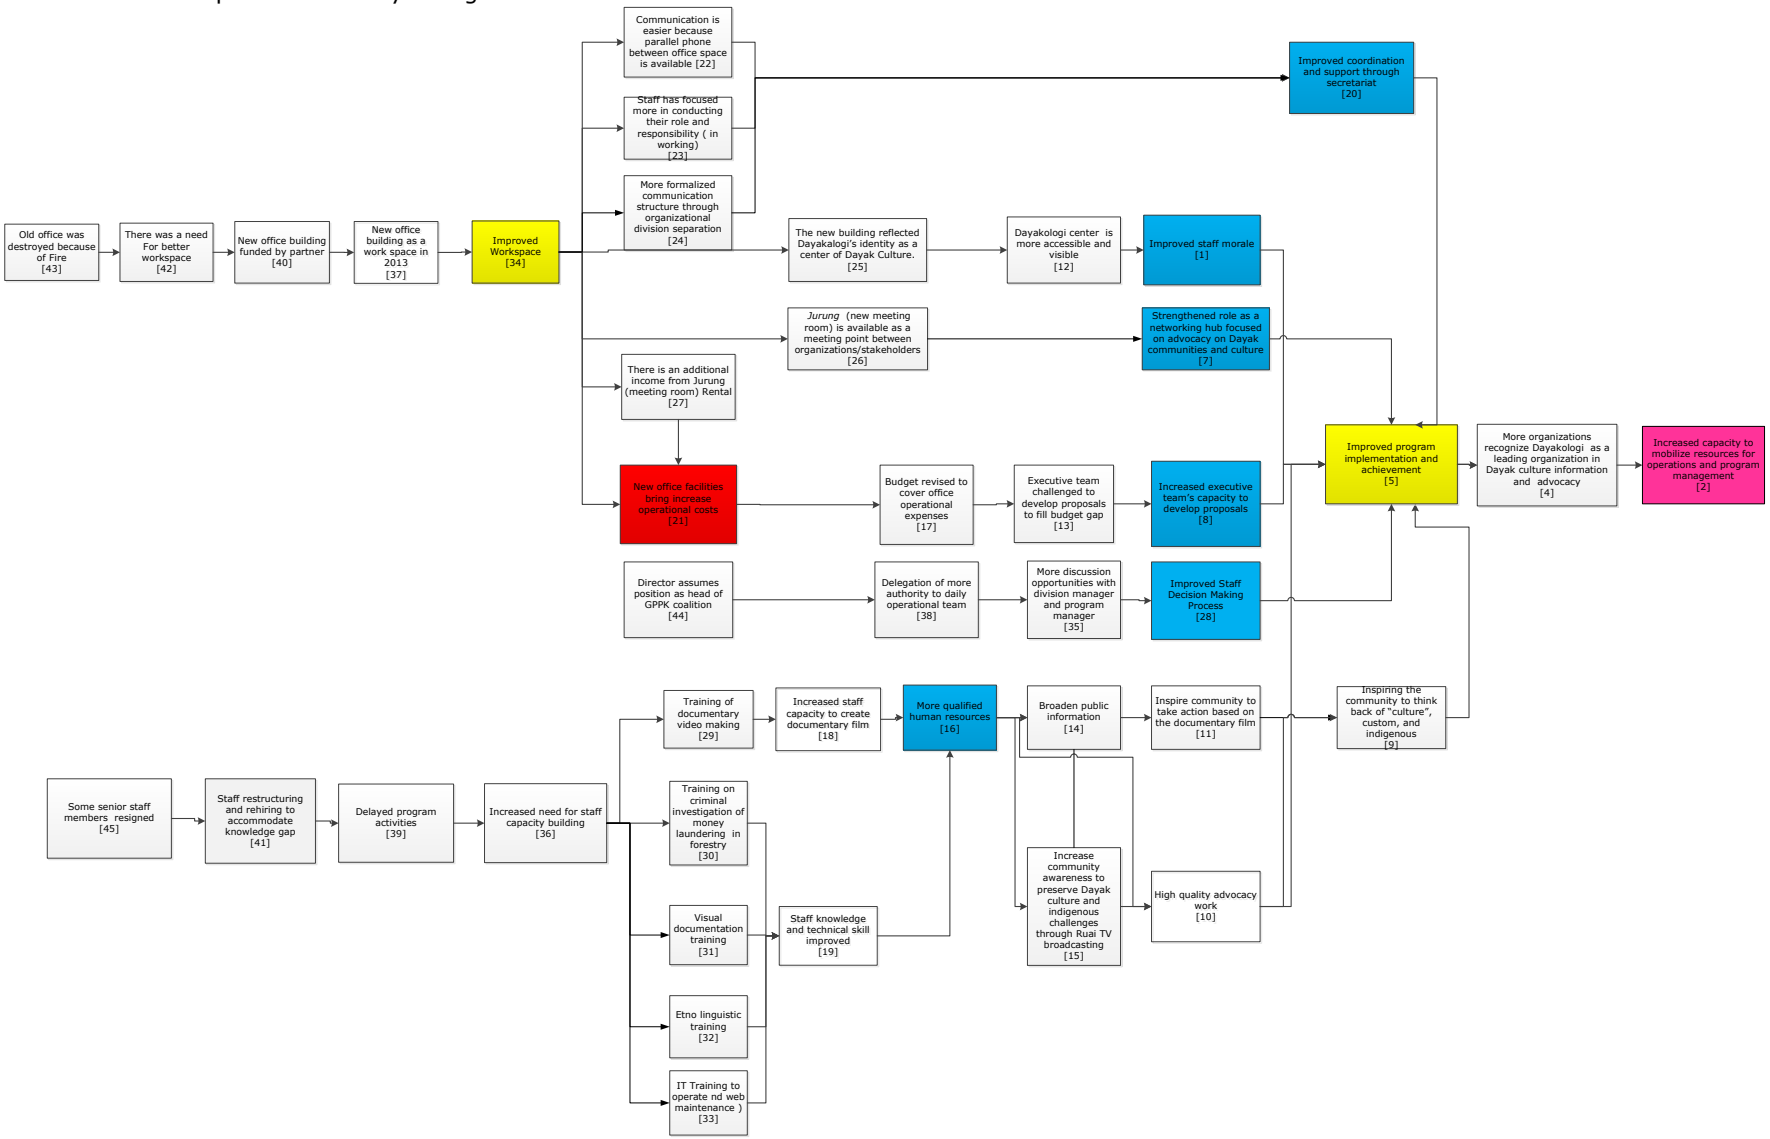
# Appendix 4 Results - key changes in organisational capacity - general causal map

**Narrative of Genral Causal Map of Institut Dayakologi**

Institute Dayakologi (ID) is an advocacy organization which works for the preservation of the cultural preservation of the Dayak. One of the main activities of ID was to conduct advocacy of the natural and indigenous environment which is increasingly threatened by the expansion of plantation companies. In addition, ID takes a leading role in creating awareness in the community on pluralism through local subjects at schools. It targeted junior high school level students and was intended to bring awareness to children that they are part of a multi-cultural society.

1. The evaluation team carried out an end line assessment at Institut Dayakologi from 20 to 23 August 2014. During this workshop, the team made a recap of key features of the organisation in the baseline in 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline. The three main changes that happened in the organisation since the baseline, as identified by the staff during the end line workshop were:improved secretarial coordination and support [20]
2. improved staff morale [1]
3. strengthened role as a networking hub for advocacy on Dayak communities and culture [7]
4. increased executive team's capacity to develop proposals [8]
5. improved staff decision-making process [28]
6. more qualified human resources [16]

According to staff present at the end line workshop, these organizational capacity changes are expected to contribute to the development of Dayakologi as a leading organization in indigenous culture preservation.



Apart from the fourth issue, all of these issues have contributed to improved programme implementation and achievements [5] which have helped the organization to be better recognized as a leading organization on the Dayak culture in terms of information and advocacy work [4]. This increased recognition as well as the increased executive team's capacity to develop proposals is helping the organization in the capacity to mobilize resources for operations and program management [2].

One example of improved programme implementation could be seen in inspiring the community to think about the culture, customs and indigenous communities of the Dayak [9]. On the one hand this was done through the publication of a documentary film published by Institut Dayakologi [11], in an attempt to broaden public information [14]. On the other hand community awareness was addressed by pointing out the need to preserve the Dayak culture and the challenges that indigenous communities face on a daily basis through Ruai TV broadcasting. Based on the FGD with staff, Ruai TV had a role to publish or broadcast documenter films/movies produced by Institut Dayakologi.[15]. Both these initiatives were enabled by the increased staff capacity to create documentary films [18] , which are further explained below.

Another example includes the high quality advocacy work [10] that has been done by Institut Dayakologi. Next to specific new work initiatives, the quality of advocacy work went up significantly as well [10] due to more qualified staff and human resources available to the organization [16]. This is further explained below.

Each of the five key organizational changes are further explained below. The numbers in the narrative correspond with the numbers in the visual.

## General Causal Map of Institut Dayakologi

**Improved secretarial coordination and support [20]**

Daily tasks and program implementation work were more effectively executed [5] by having better coordination and support from the organization's secretariat [20]. Program activities could now be carried out with more coordination, focus and in a timely manner. The secretariat now possesses good communication infrastructure, such as multiple phone connections [22], stronger work discipline and focus in carrying out their duties [23] and most importantly, a more formalized communication structure which was brought about by the physical restructuring of the department into separate divisions [24]. The underlying cause for this overall professionalization of the secretariat was the improved workspace [34] which was upgraded as part of the new office building in 2013 [37]. Funds for this rebuilding was provided for 35% by partner donor agencies, and the remainder was paid for with Institut Dayakologi's sustainability fund [40].The new office building was a necessity [42] after the old building got destroyed in a fire in 9 August 2007[43], but also a welcome change after working for years in an inadequate and improvised environment. It greatly impacted staff morale and the professionalization of the organization as a whole.

**Improved staff morale [1]**

According to staff present at the end line workshop, staff morale overall was greatly impacted by the accessibility and visibility of the newly constructed Institut Dayakologi building [12]. More people came to visit this building to learn and look for references about Dayak Culture, which enthused and engaged the organization's staff. The new building-itself became more visible through their designs, which incorporate and display both the Dayak Culture's and the organization's identity [25]. This major overhaul of office space was part of a greater initiative to improve office space [34], which will be explained as a separate change factor in more detail further below. Improved staff morale is expected to lead to improved programme implementation [16].

**Strengthened role as a networking hub for advocacy on Dayak communities and culture [7]**

Dayakologi strengthened its role as a hub in the network that focuses on the advocacy for Dayak communities and culture [7]. Partners and stakeholders supported Institut Dayakologi's role as such due to their provision of meeting space in their new office as meeting point for thenetwork [26]. The meeting room, or better known traditionally as a "Jurung", was created as part of the new office environment, and meant to be used both for internal use as well as external use by renting out the space publicly. The Jurung is a true replication of a traditional Dayak meeting space, and provides an important role in the Dayak culture.

**Increased executive team's capacity to develop proposals [8]**

The executive team's capacity to develop proposals [8] has been increased after the executive team was challenged to increase their competencies and find additional funding for the organization in order to be able and fill the new budget gap [13]. Institut Dayakologi's budget had to be revised [17] after it came under strain as a result of the higher operational expenses brought in from usage of the new office facilities [21]. Although some of these expenses could be covered by income from renting out the "Jurung" meeting room [27], new funds were required to balance the organization's budget after the workspace improvements had been realized [34].

**Improved staff decision-making process [28]**

The organization has improved its decision making process [28]. The junior Staffs were given more opportunities to discuss matters with the division manager and program manager [35], who in turn utilized this input into their management decisions. These opportunities were created through the delegation of more authority to the daily operational team [38]. Prior to this it was mostly the Director who dealt with such issues and management decisions, but as he assumed position as head of the GPPK coalition [44], the director was forced to put down some of his day to day Institut Institut Dayakologi activities and delegate them to his subordinates.

**More qualified human resources [16]**

Institut Dayakologi now has more qualified human resources [16] . Due to having increased capacity for staff to create documentary films [18], after following a training session on the subject of documentary video making [29]. Staff capacity also increased due to improved technical knowledge and skills of staff [19]. This was due to a series of trainings. On the knowledge side, staff was trained for instance on Etno linguistic skills, which enabled them to understand and communicate with Dayak communities at a higher level [32]. On the technical skill side, staff went through training on criminal investigations of money laundering in forestry [30], visual documentation [31] and IT training to operate IT but also maintain for example the website [33]. All the trainings provided by Institut Dayakologi were part of the organization addressing the need for further staff capacity building [36]. This became evident after program activities became more and more delayed after a large restructuring operation of human resources [41]. Staff was relocated, newly hired and repositioned to accommodate the knowledge gap [41] that was left behind after several senior staff members resigned [45] from the organization in the observed period in the end of 2012.

1. Improved program implementation and meeting the set objectives [5]
    a. The strategy of program implementation was broadened through the use of visual documentation of indigenous custom through movies or videos. This was enabled by inspiring community (not only beneficiaries) to think about the culture, customs and indigenous communities of the Dayak [9]. On the one hand this was done through the publication of a documentary film published by Institut Dayakologi [11], in an attempt to broaden public information [14]. On the other hand community awareness was addressed by pointing out the need to preserve the Dayak culture and the challenges that indigenous communities face on a daily basis through Ruai TV broadcasting (15]. Both these initiatives were enabled by the increased staff capacity to create documentary films [18] after following a training session on the subject of documentary video making [29].
2. High quality advocacy work [10]
    a. Next to specific new work initiatives the quality of advocacy work went up significantly as well [10] due to more qualified staff and human resources available to the organization [16].Both staff knowledge as well as technical skills improved [19]

**Better recognition of Dayakologi as a Dayak Culture information center [2]**

Institut Dayakologi has become known as the leading organization with respect to Dayak Culture information [2] amongst both the public as well as public and private institutions. The prime reason for this was the fact that more organizations have experienced and observed Institut Dayakolog'si efforts in advocacy for the natural and indigenous environments which are increasingly threatened by the expansion of plantation companies and the Dayak culture in general. The reasons for this recognition have already been explained in the sections above.

Report CDI-15-043

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Report CDI-15-044

Kusters, C., Wieriks, M., Dwi Andari, B., Suprobo, N., Priyahita, W., Sihombing, R.R., Rokhmatulloh, S.W., Rosita, I., 2015. *Endline report – Indonesia, Lembaga Kita. MFS II country evaluations; Capacity of Southern Partner Organisations (5C) component.* Centre for Development Innovation, Wageningen University & Research centre. Report CDI-15-044. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Indonesia, Lembaga Kita. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

# 1 Introduction & summary

## 1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: Lembaga Kita in Indonesia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1.Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps

describe the identified key organisational capacity changes that are possibly related to MFS II interventions in these two capabilities, and how these changes have come about. More detailed information can be found in appendix 5.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR: Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

## 1.2 Brief summary of analysis and findings

Since the baseline, two years ago, Lembaga Kita has seen a slight improvement in the capability to act and commit. The organizational structure of the organization improved with the addition of a new Steering Committee (SC) and Organization Committee (OC) and clearer responsibilities between the two. Training opportunities also improved with the addition of training on human trafficking by IOM and training in PME by Mensen met een Missie. The capability to adapt and self renew has improved slightly in terms of freedom for ideas as well as the system to track the environment as Lembaga Kita has made an extra effort to gather stakeholders in villages to thoroughly assess their situations. In the capability to deliver on development objectives a slight improvement occurred. In terms of delivering on planned outputs for example, Lembaga Kita has started to reap the rewards from their intensive door to door policy to gain trust from local communities in their output planning. The capability to relate improved slightly due to more frequent engagement with beneficiaries, as well as better internal communication through the fusion of field offices which encouraged staff members to talk and share more frequently. The greatest improvements occurred in the capability to achieve coherence. The organization's focus has broadened to now also include anti-trafficking issues. Since the restructuring of the organization, job and task descriptions have been specified and made clearer and are now documented, but not yet developed in the standard operating procedures. A very slight improvement also occurred in mutually supportive efforts. Lembaga Kita attempts to go beyond solving the problem on its own. For instance, they don't just warn communities for the dangers of trafficking, but also attempt to remove the reasons why people sometimes fall victim to it. They try to give them good opportunities in life.

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. During the endline workshop some key organisational capacity changes were brought up by Lembaga Kita's staff: a more visible organization through the implementation of the community assistance model; and greater recognition amongst stakeholders through the systematic production of documentation. The organization becoming more visible with the more accepted community assistance model can be attributed to the increased trust in the organization. This was enabled by the beneficiaries being more satisfied with better services provided, which was the result of better staff working performance and a quicker response to beneficiaries' concerns. Increased staff working performance can be attributed to the change in the incentive system, better outputs achieved and increased community participation in the programming. Lembaga Kita has become more recognized by stakeholders through the production of documentation as a result of better documentation of data. This initiative can be attributed to the change in organizational management that took place.

Various changes were indicated by the SPO that can be linked to one of the MFS II capacity development interventions by Mensen met een Missie: the organizational capacity scan that took place after the external MFS II 5c baseline in 2012. This influence the change in organisational

management, improved it's organisational profile and brought about a change in the Community Assistance Model, which are the main underlying reasons for these key changes in the organisation, as perceived by the SPO. The CFA indicated that other capacity development interventions took place, including several trainings, but these could not be directly linked to the mentioned key organizational capacity changes mentioned in the general causal map, and process tracing was not carried out for this SPO since the SPO was not selected for this.

# 2 General Information about the SPO – Lembaga Kita

## 2.1 General information about the Southern Partner Organisation (SPO)

| **Efforts to strengthen civil society** | |

## 2.2 The socio-economic, cultural and political context in which the partner operates

**The socio-economic, cultural and political context in which the partner operates**
Lembaga Kita works in the field of gender equality. The project funded by MFS II focuses on prevention and support of victims of Gender-Based Violence (GBV). The project is situated in a poor and rural district in Central-Java: Wonosobo, where people mainly live from agricultural and forest products.[1] As in many areas in Indonesia where income-generating activities are very limited, people see labour-migration as the only option to earn a decent living for themselves and their families. Especially females, who often work as domestic laborers, face multiple problems when they return from their overseas jobs. It is not uncommon that these women have been confronted with GBV during their migration and returning home after such an experience is viewed as a failure. Lembaga Kita aims to improve the situation of women in the Wonosobo disctrict. [2]
Related to Social-economic condition in Kumejing , especially in dusun Kiringan, people has understood gender equality that are applied in daily life and this is proven by cooperation among women and men. The establishment of PRA cooperation (Participatory Rural Approach) makes economic capital family and decreases economic harassment in family.

In Sitiung, Wonosobo, a large number of people look for livelihood as a rubbish collector, asongan sellers (a walking seller with only few things sold), and labors. About 25 head of family have a special community in which they protect each other as what they can afford. The daily outcome only could meet the need of very simple meal. Their children get education at free school which is managed by educational valunteers. With the lack of economy, it is very easy to meet harassment toward women both economy, psychological, physic.

The victims of gender-based violence often happen to mothers and children. This takes place because of patriarchy culture. To build gender responsive mindset must be done in all components government, society, and family from all ages. Building gender responsive mindset on children can be done by some ways for example, through organization in their school. This is a very effective way to

2 Mensen met een Missie (2010) 2010 – 2011 Beoordelingsmemo

give understanding about health and its application as well as analysis of effect from unfair gender treatment.[3]

It is estimated that every year 700.000 registered Indonesian migrant workers seek employment oversees.[4] The majority of the Indonesian migrant-labourers go to South-East and East Asia and the Middle East, in particular in Malaysia, Singapore, Hong Kong Special Administrative Region, Taiwan Province of China, Saudi Arabia, Kuwait and the United Arab Emirates.[5] The International Migration Organization (IOM) on Labour Migration from Indonesia (2010) states that the migration of Indonesian labourers is a driving force behind the Indonesian economy and development of Indonesian human resources; the 4.3 million Indonesians who work abroad send between USD 6 – 8.2 billion back home in the form of remittances.[6] The number of unregistered migrant is expected to be 2 – 4 times higher and 75% of the migrant-labourers are females who are mostly working in the domestic services sector.[7] Although a driving force, migrant workers, especially female domestic workers susceptible to exploitation as well as physical and psychological abuse including violence, (sexual) harassment and intimidation at different stages of the migration process (IOM, 2010). Main problems faced by Indonesian labourers are a) labour problems: wages below agreed rates, unpaid wages, passport and other document retained by their employers, excessive work hours, insufficient food and/or rest, restrictions of access to information and communication and inhumane working conditions; b) problems related to violence: sexual abuse, rape, torture and murder.[8] The perpetrators of these practices are mostly brokers, recruitment agents, employers and officials.

The Indonesian Government has taken steps to reduce the problems faced by the migrant workers. For example recruitment agencies are now required to register all Indonesian workers at the Indonesian embassy or consulates when they arrive. The embassy registers the address of the migrant worker's employer and holds a copy of their contract which makes it easier to locate the worker and undertake action when exploitation or abuse is reported.[9] However, enforcement of these new regulations is not yet up to standards.

## 2.3 Contracting details

When did cooperation with this partner start: 01-01-2012

What is the MFS II contracting period: 1-1-2012 to 31-12-2012 (but extended program activities through amendment)

Did cooperation with this partner end: Not applicable

If yes, when did it finish: Not applicable

What is the reason for ending the cooperation with this partner: Not applicable

Is there expected cooperation with this partner after 31st of December 2015: Yes.

## 2.4 Background to the Southern Partner Organisation

**History**

Lembaga Kita was founded in 2007 by Sister Antonie, the head of the congregation Putri Maria and Yosef (PMY).[10] The organization resulted from multiple collaborations, initiated by Sister Antonie since 2001, in the field of gender-equality promotion in Indonesia.

Lembaga Kita can be best described as a network-organization that facilitates and coordinates multiple gender-related programs in and around Wonosobo (Java), all under the supervision of PMY[11]. One of the NGOs in the network of Lembaga Kita is Srikandi Women's Cooperative, which was also founded by Sister Antonie. This is an organization that focuses on income generating activities to female ex-migrant workers who returned to Wonosobo.[12] A key-partner in the network of Lembaga Kita, and very relevant to this MFS II Evaluation, is Association of Wonosobo Women Struggle (Per3W). The project that is currently funded by MFSII through Press Freedom 2.0 is a continuation of a program of Association of Wonosobo Women Struggle (Per3W) that started in 2010. The program of 2010 focussed on strengthening the capacity of Per3W and its network with other NGOs; increase awareness on Gender equality and gender-based violence (GBV); and improving the economic situation of families in Wonosobo. [13] Lembaga Kita took over the project of Per3W in 2011 and takes on a coordinating role, while Per3W focussed on carrying out the project in Kumejing village.[14] The program now focuses on prevention and supporting victims of GBV.

The organisation consists solely of volunteers who do their work in three villages because of their social engagement. Strategy and activities are designed together with the Sisters PMY. They also guide the Lembaga Kita team in the implementation.

A team of volunteers is very sympathetic but certainly also has its drawbacks. Because of this setup one of the realities was that a project meant for 1 year, took 2,5 years to be fully implemented. Their relation is such though that they communicate about this openly and MM adjusts to this situation easily.

This voluntary setup is also a very positive signal though. It means the team is doing their work because their heart tells them to, not because of any external financial incentive. The team relates very well with the target group and knows very well what the issues and needs are because they are so embedded.

Being a group of volunteers is mostly a limitation in terms of time and organisational procedures (the paperwork), not in terms of quality. They have relevant knowledge and expertise to do the work. The coordinator, works at the government, which also provides Lembaga Kita with interesting contacts with relevant stakeholders.[15]

[10] The Congregation of the Daughters of Mary and Joseph was founded in 1820 and is active in The Netherlands and in Indonesia. The Congregation in Indonesia, *Putri Maria and Yosef* (PMY), is led by Sister Antonie who resides in the Wonosobo community of Sisters. PMY consists in of seven communities and a noviciate, all on Java. The community of Sisters in Wonosobo also leads the Dena-Upakara boarding school for deaf and hearing-impaired children can be found. The community of Sisters in Yogyakarta works at the Helen Keller Institute, an institute for the care and education of deaf-blind children. *Source*: Website Congregatie Dochters van Maria en Jospeh (2012): http://www.congregatiedmj.nl/organization (Accessed: 8 November 2012)

[11] Lembaga Kita is under the supervision of PMY as can be observed from the Contract with Mensen met een Missie (2012) which is signed by Sister Antonie on behalf of Lembaga Kita.

[14] Marieke Oteman (2012) External Evaluation Lembaga Kita

[15] Anne B, MFS II endline Evaluation, 2014

**Vision**
The vision of Lembaga Kita is: "*To embody gender equality and gender justice collectively".*[16]

**Mission**
The mission of Lembaga Kita is: "*protection and empowerment for women and children, mainstream gender in policy and development, social empowerment for women and children*". [17]

**Strategies**
Lembaga Kita aims to: "*create a safe and caring environment and society for women, to help and empower victims of gender-based violence, to (economically) empower women and improve cooperation between various parties and networks.*
The main activity of Lembaga Kita is: *"social empowerment and advocacy for women and children's issues, focusing on GBV'.*

The target group of Lembaga Kita consists of: "*women and children, especially the ones at risk for GBV, poor women and ex-migrants."* [18]

The current project focuses on increasing awareness on gender-based violence (GBV) among communities in Central-Java.[19] The project entails two sub-projects:

a. Improving the network of women with the objective to protect women from gender-based violence. This sub-project intends to work on prevention as well as supporting victims of GBV. [20] The network focuses on improving the network of NGSOs working in the field of GBV. The network will serve mainly as a referral system for shelter, medical care and other support victims of GBV. [21] To reduce the susceptibility to GBV, Lembaga Kita will develop income-generating activities as well as micro-finance opportunities for women in Central - Java. The rational is that economic empowerment of women reduces their vulnerability of falling into a situation of GBV. [22] Lembaga Kita and its partners developed income-generating activities with women's groups in three villages: Kemejing Village, Tempuran Village and Purwojiwo Village. The programs in these villages are developed through 'participatory rural appraisal' method; a method where the villagers (women in this case) participate in the development and implementation of the program. [23]

b. Educating teenagers on sexual health and raising awareness on GBV. This sub-project intends to educate children in schools and appoint a counselor at these schools who can provide guidance to the children. Lembaga Kita plans to develop visual media to spread their message on GBV and sexual health. [24] Lembaga Kita already runs a program in a local high school in Wonosobo where they give courses about under aged marriage and trafficking.[25]

# 3 Methodological approach and reflection

## 3.1 Overall methodological approach

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

## 3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012[26].

[26] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

## 3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*** and the fourth evaluation question: ***"What factors explain the findings drawn from the questions above?"***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

### 3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)

India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)

Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)

Liberia: BSC, RHRAP (2/5).

### 3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

### 3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have

come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team

has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# 4 Results

## 4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of Lembaga Kita that have taken place since 2011 are described. The information is based on the information provided by Mensen met een Missie.

Table 1
*Information about MFS II supported capacity development interventions since baseline*

| Title of the MFS II supported capacity development intervention | Objectives | Activities | Timing and duration | Budget |
|---|---|---|---|---|
| MM Capacity Scan by Independent consultant in 2012 | Evaluate the organization's capacity development needs and highlight opportunities for growth | Capacity scan, evaluation report and recommendations for follow-up. Basis for collective as well as individual capacity building trajectories. | July-August 2012 | 2000 Euro |
| Training on law enforcement | Increasing knowledge on the processes of law enforcement | 3 day training and exchanging knowledge | 5-8 Februari 2012 | 6320 Euro (for all partners in network) |
| Project Cycle Management training | Increase knowledge on project cycle management | One week training on PCM | Late 2014 | 18000 Euro (for all partners in MFSII program – not exclusively Lembaga Kita) |

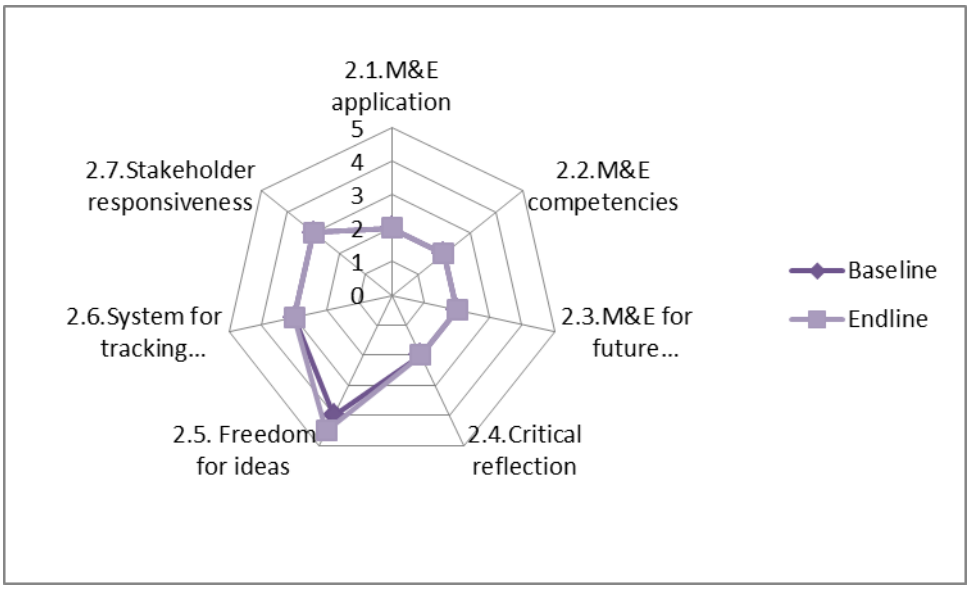
## 4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities. This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also annex 3.

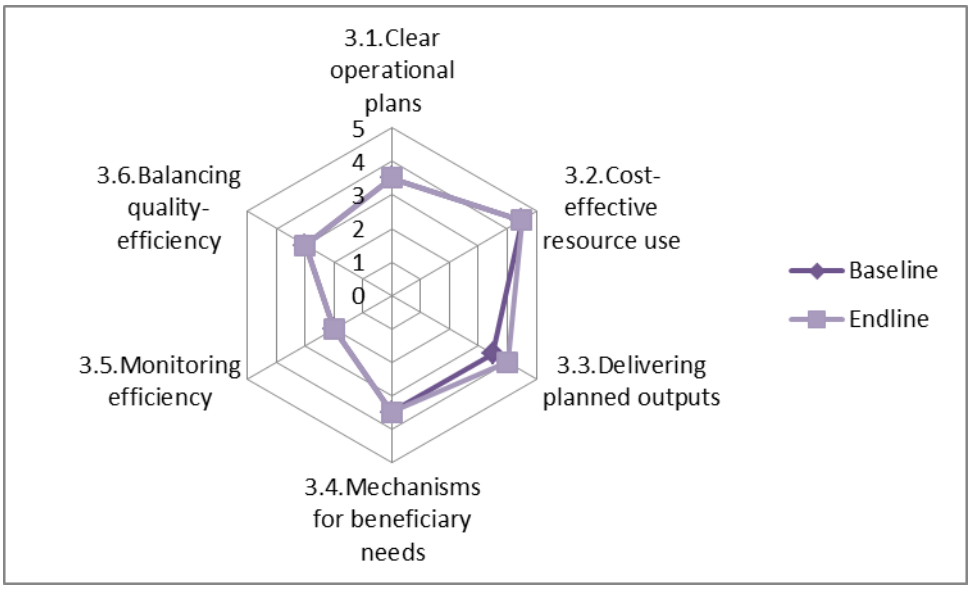
### 4.2.1 Changes in the five core capabilities



**Capability to act and commit**

The leadership within the organization changed from Sister Antonie to Sister Patricia, and Ms. Maria Susiawati, the chairperson. Sister Patricia is the new provincial in Wonosobo therefore; she automatically takes the leadership in the organization. With the addition of two committees (Steering committee and Organization committee) overseeing the activities of the organization, a change in focus and visibility were enabled. Strategic guidance is developed together through cooperative meetings with staff, and not solely by the leaders. Both leaders (strategic and operational) are involved in the development of strategic guidance. In the last four years the organization had a relatively steady number of staff members. They started with four persons and two volunteers joined as field staff. Staff is dedicated, motivated and very knowledgeable in their field. Each of the staff members has a particular expertise that has contributed to the work of the organization. Currently, there are two trainings that have been organized since the baseline; training in human trafficking by IOM and the other training in PME in 2014 by MM. Staffs are motivated to work for Lembaga Kita mainly due to their passion to the work and sharing the values of the organization. Lembaga Kita does not have a solid donor base. To date Mensen met eenMissie is the only donor. There are no clear procedures for exploring new funding opportunities.

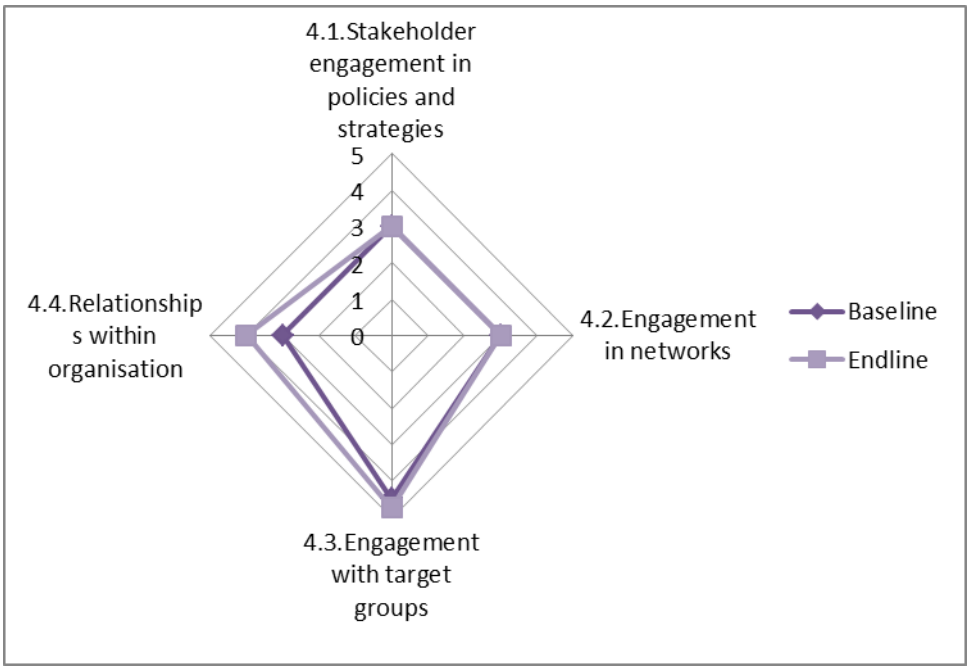
Score: From 2.5 to 2.7 (very slight improvement)



**Capability to adapt and self-renew**

There is no formal M&E system in place. The organization looks only at the project level in terms of monitoring and evaluation of activities. In some proposals, it is mentioned that they have a regular meetings to discuss the progress of the project and how it will be improved together with the beneficiaries. Staff and volunteers of Lembaga Kita have the competences to conduct monitoring and evaluation in a very basic manner. M&E is conducted through focus group discussions with the beneficiaries as well as direct informal discussions with the village leaders. Staff indicates that M&E findings are used for future strategies, but there is no M&E system in place and the strategic plan is missing. Evidence in the form of documentation to support these claims could not be found. Lembaga Kita has several meetings on a monthly and annual basis. In these meetings, staff, volunteers and beneficiaries are gathered to discuss relevant issues. Since Lembaga Kita has an office, now the project staff and the sisters live more closely to each other and this assists in having frequent meetings. They are able to express their ideas, feelings and concerns openly. Lembaga Kita has very close connections with their target groups and this also makes them aware of what is happening in their surroundings and project areas, although a systematic way of tracking their environment is still missing.

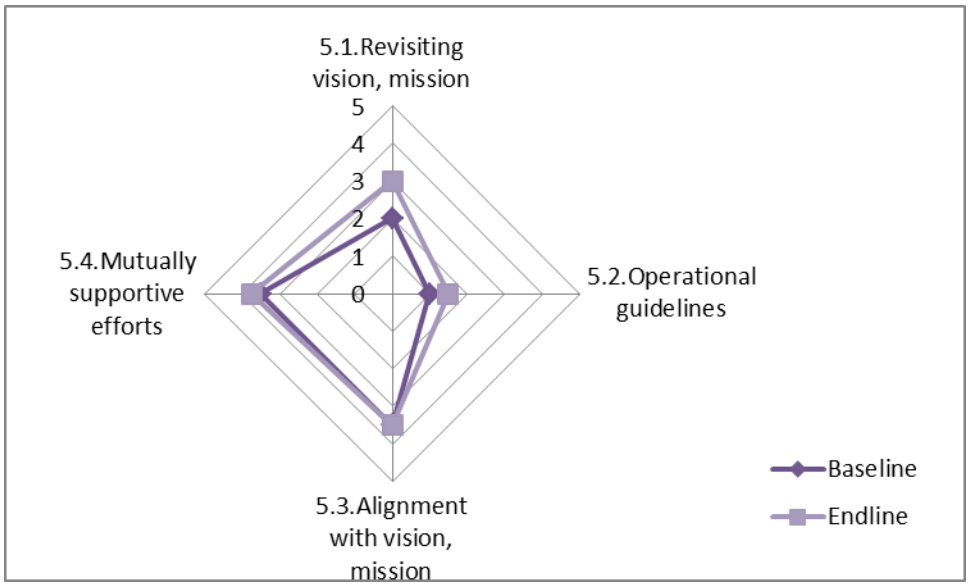
Score: From 2.6 to 2.6 (no change)



**Capability to deliver on development objectives**

The operational plans are based on the project proposal as funded by Mensen met een Missie. There is a budget and operational plan available that covers the basic necessities to run the program. The organization is realistic in their budgets and ensures that staff understands the costs involved, and hereby aims to use resources cost-effectively..This is further contributed to by the fact that they work locally and also with local people as to keep operational expenses low. Monitoring and evaluation remains subject to improvement, particularly to setting up a more systematic way to do so and as such there is no system in place to measure efficiency by relating inputs to outputs. Currently the organization mainly looks at budget expenditure and compares this with what was planned. The organization balances quality with efficiency by keeping costs low whilst delivering quality work through field monitoring, and engaging competent staff and volunteers, and by having good interpersonal relationships and personal commitment to the work. Whilst planned activities seem to be implemented long-term effects take time.

Score: From 3.3 to 3.4 (very slight improvement)

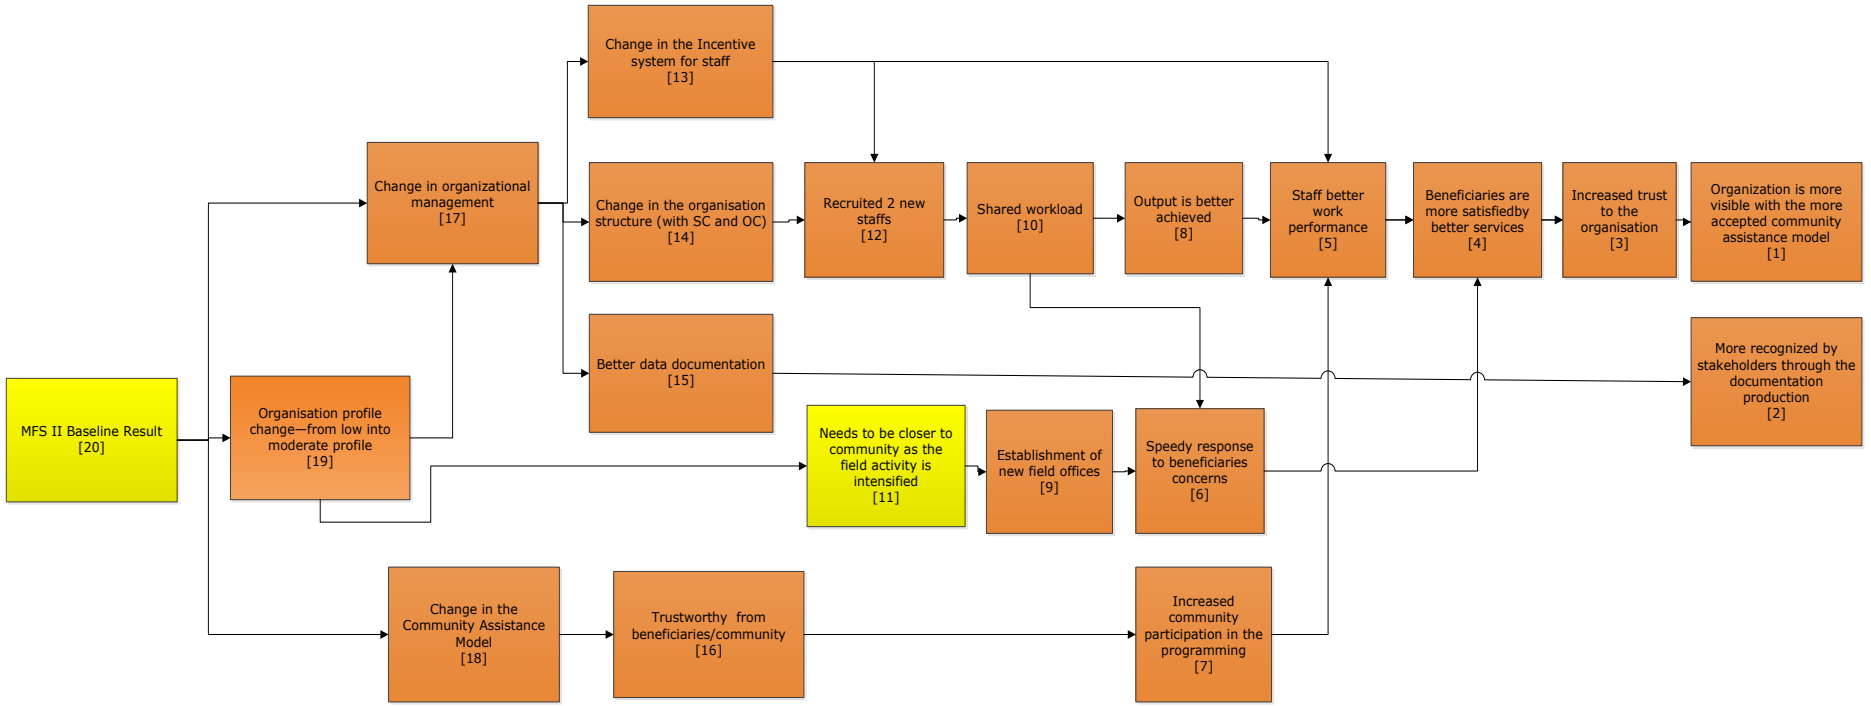


**Capability to relate**

Lembaga Kita is a small organization and is part of a network extending over the whole of Indonesia, including for example schools and hospitals where victims can be found. All Indonesian sister congregations are involved in this network. Lembaga Kita has sufficient capacity to relate to their stakeholders. It is not complicated at all for the organization to establish contact, because each member is also a member of another organization in the Lembaga Kita network. At the international level, all organizations in the Mensen met eenMissie network come together twice a year for discussions, trainings, etc. However, the organization does not have any formal way to engage external groups in developing their policies and strategies. The organization works closely together with the community, and has changed its stance from low profile to a more moderate and visible profile within the communities the organization serves. This has led to increased trust amongst beneficiaries. Their strength is their grassroots involvement in the organization now works closely with the communities. Internal relations have improved through the establishment of a new office building in which staff can now regularly meet and freely communicate.

Score: from 3.4 to 3.7 (very slight improvement)

**Capability to achieve coherence**



There is a very slight improvement in this capability. The organization has a mission and vision developed collectively with the staff in 2007. There is no detailed information on how the vision and mission were developed.Within the last two years, the organization's focus has broadened and does not only focus on violence based on gender but now also includes anti-trafficking. This change is based on MFS II baseline 2012 results. There are no operational guidelines available in the organization in term of Human Resources, Administration and Finances, although job and work descriptions have been specified and made clearer. The management relies on guidance provided by the donors. There is a large coherence between goals, aims, activities and available resources, although there is no strategic plan in place and activities are based on the project proposal funded by MM. They don't do different projects but do their work in different villages. In what they do there is a logical consistency aimed at the prevention of trafficking, and their greater engagement within communities to raise the organization's profile has forced staff members to integrate with community activities that are not necessarily directly related to project or program activities.

Score: From 2.5 to 2.9 (slight improvement )

### 4.2.2 General changes in the organisational capacity of the SPO

During the end line workshop at Lembaga Kita, a discussion was held around what staff perceived as the key changes in in the organization since the baseline in 2012. This then led to a discussion on what were the key organizational capacity changes and why these changes have taken place according to staff present at the end line workshop. The discussion resulted in a 'general causal map' which is described below. The general causal map provides a comprehensive picture of organizational capacity changes that took place since the baseline, based on the perspective of SPO staff present at the end line workshop. The numbers in the narrative correspond with the numbers in the visual.

Two key organisational capacity changes have occurred at Lembaga Kita since the baseline:
1. A more visible organization through the implementation of the community assistance model [1].
2. Greater recognition amongst stakeholders through the systematic production of documentation [2].

MFS II Baseline Result [20]
Organisation profile change—from low into moderate profile [19]
Change in organizational management [17]
Change in the Incentive system for staff [13]
Change in the organisation structure (with SC and OC) [14]
Recruited 2 new staffs [12]
Shared workload [10]
Output is better achieved [8]
Staff better work performance [5]
Beneficiaries are more satisfiedby better services [4]
Increased trust to the organisation [3]
Organization is more visible with the more accepted community assistance model [1]
Better data documentation [15]
More recognized by stakeholders through the documentation production [2]
Needs to be closer to community as the field activity is intensified [11]
Establishment of new field offices [9]
Speedy response to beneficiaries concerns [6]
Change in the Community Assistance Model [18]
Trustworthy from beneficiaries/community [16]
Increased community participation in the programming [7]

**A more visible organization through the implementation of the community assistance model [1].**

First of all. Lembaga Kita is now more visible with a more accepted community assistance model that has been put in to place since 2013 [1]. The community assistance model allowed staff to place themselves as so called partners in the communities they were serving, and provided a way to be closer to beneficiaries whilst performing informal activities. This greatly increased trust by the community in Lembaga Kita [3].

The overall increase in trust came about from an overal increase in satisfaction about Lembaga Kita's services to the beneficiaries [4] on the one hand, as well a greater sense of ownership and participation within program activities by the communities and beneficiaries [7].

Beneficiaries were overall more satisifed due to an overall increase in staff working performance [5] as well as the speed with which the organization responded to beneficiary concerns and requests [6]. Both factors will be explained below in more detail.

First, the increase in work performance can be explained by the organization achieving better outputs [8] through staff increasingly sharing their workload with each other and cooperating [10]. This in turn was enabled by the recruitment of two new staff members [12], and an overall change in organization structure [14], which was the result of a broader change in organizational management [17].

Prior to the baseline in 2012, most of the volunteers in Lembaga Kita were government officers *(Pegawai Negeri Sipil)* who had very limited time for field implementation. After that, the organization recruited two more staff. Apart from the staff additions, revisions in the organizational structure included the splitting into Steering Committee (SC) and Operational Committee (OC). The intention of this action was to achieve better coordination and communication, faster field response, and clearer job distribution. In the same year, the organization added one more target village to a total of three supported villages right now.

**Greater recognition amongst stakeholders through the systematic production of documentation [2].**

Secondly, the overal speed with which staff members responded to beneficiary requests increased by a change in the incentive system for staff [13], as well as the establishment of new field offices [9], which addressed the need to have staff members to be closer to the community in the field during their work activities [11]. Changes to the incentive system [13] included payment of transportation to staff on a monthly basis, and ultimately into a stand-alone transportation fund. This allowed staff to travel more freely and quicker to beneficiaries and stakeholders in the field.

Both the need to be closer to the community whilst carrying out activities as well as the overall changes in organizational management sprung from Lembaga Kita's objective to change their organizational profile from low to more moderate and public [19], which was one of the conclusions drawn by Lembaga Kita based on the results from the MFSII organisational capacity development (5c) baseline assessment that was carried out in 2012 [20].

The second factor which greatly impacted the increased trust in the organization was the increase of community participation in the programming of activities and the activities themselves [7]. Communities and other beneficiaries more readily accepted to participate due to an increase in trust in the organisation [16] resulting from the changes made in the community assistance model. Previously, they were more focused on program delivery and still had less attention to community engagement. As a result, community seen Lembaga Kita as "donor" instead of empowering community. After the baseline, they changed the strategy to more strengthened the community enggagement by having more interaction with community. Current approcah has resulted in the more positive image of the organisation to community[18]. The reason to set up this model was also a conclusion drawn by Lembaga Kita on the basis of theMFS II organisational capacity development (5c) baseline results in 2012 [20].

Finally, stakeholders indicated that Lembaga Kita has paid considerable attention to the practice of documentation of data and activities [2]. This development was already recognized during the baseline MFS II 5c evaluation, but was significantly improved over the last two years [15] as part of the changes and professionalization in organizational management [17] or example a documentary film

was made about sustainable waste management. The documentary has been used as learning material for local communities and beneficiaries.

# 5 Discussion and conclusion

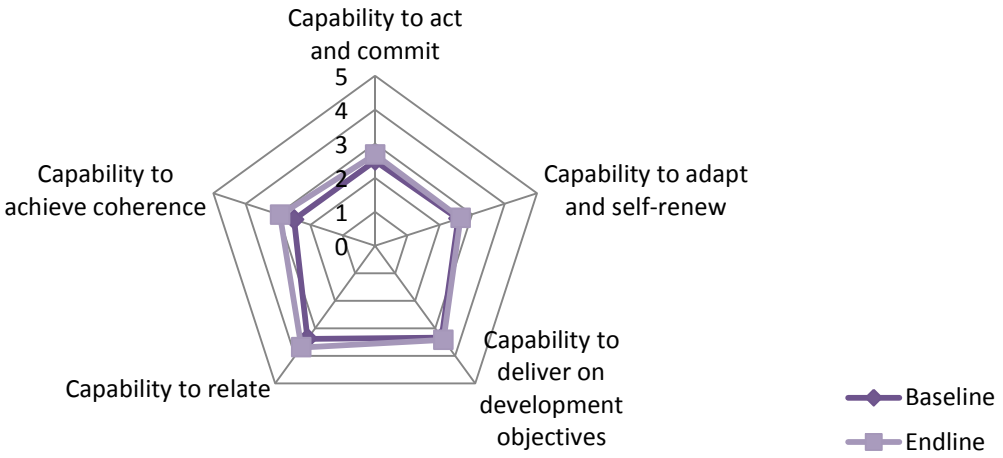
## 5.1 Methodological issues

**General: Applied to all or most SPOs**

With regard to the methodology, Indonesia has made some data collection adjustment based on the context. The first adjustment was related to the type of instrument used. To assess the organizational capacity, the study has provided self-assessment, observation and interview sheets. These all were used during the baseline with all SPOs. During the end line the team used self-assessment, interview and observation sheets. However the evaluator applied interview sheets as self-assessment—where participants were asked to fill these sheets by themselves. For the participants who did not attend the workshop, the interviews were done separately using the interview sheet and the results from the interview were included in the subgroup interview sheet that was already filled by the staff member. Were combined into the relevant sub categories in the interview sheet. Interview sheets were also applied for interviews with the CFAs, partners and consultants.

The baseline study showed that having two similar instruments (self assessments, and interview sheets) did not have any effect in relation to obtaining adequate and quality data.

To have some clarification post visit to all SPOs, the evaluator used email and phone interviews.



**Lembaga Kita**

The staff involved in the endline process were 2 management, 1 coordinator program, 1 finance and administration, 1 field staff. The interview sheet was sent prior to the workshop, however only one was returned. The rest of the interview sheets were filled in by staff during the endline field visit. The endline workshop started with completing the self-assessment sheets, and this was followed by the development of the general causal map which looked at organisational capacity changes in the organisation since the baseline, and as perceived by the SPO. The discussion was organized in the evening due to staff availability. The interview views with partners, consultants and M&E staff were not conducted. The SPO indicated that they do not have any long-term partner and consultant, which intensively and formally works with them. The organization only set up an ad hoc partnership such as when they organized seminars or workshops, but there is no partnership on a long-term basis, where partners also get to know the SPO very well. Furthermore, the organization' role is mostly to facilitate the targeted area to get the particular experts as a resource person. There was also no interview with M&E staff as this function is non-existing in the organization. One of the significant people who attended the baseline-the Coordinator of Lembaga Kita, could not be involved during the end line workshop as she was in the Netherlands during the time of the field visits. However, the information collected was still adequate, as her role was replaced by the present Program Manager during the data collection.

## 5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Whilst changes took place in all of the five core capabilities, the most improvements to place in Lembaga Kita's (LK) capability to achieve coherence. Below the changes in each of the capabilities are further explained, by referring to the specific indicators that changed.

Over the last two years a slight improvement took place in the capability to act and commit. The organizational structure of the organization improved with the addition of a new Steering Committee (SC) and Organization Committee (OC). The steering committee focuses on the management of Lembaga Kita and the Organization Committee is more focused on program implementation. Training opportunities also improved with the addition of training on human trafficking by IOM and training in PME by Mensen met een Missie.

The capability to adapt and self renew has improved slightly in terms of freedom for ideas. Critical feedback can be shared comfortably without fear, whilst keeping conversations light and positive. The system to track the environment improved very slightly as Lembaga Kita has made an extra effort to gather stakeholders in villages to thoroughly assess their situations.

In the capability to deliver on development objectives a slight improvement occurred. In terms of delivering on planned outputs for example, Lembaga Kita has started to reap the rewards from their intensive door to door policy to gain trust from local communities in their output planning.

The capability to relate has improved slightly as well. A very slight improvement was found in terms of engagement with target groups due to an increase in frequency in meeting beneficiaries of up to sometimes 2-3 times a week. An improvement also took place in the relationships within the organization. With moving to a new office, staff members feel more at ease and feel encouraged to talk openly, share and provide feedback whenever needed.

Lastly the greatest improvements occurred in the capability to achieve coherence. With respect to revisiting the vision and mission, Lembaga Kita 's focus has broadened. The organisation does not only focus on violence based on gender but now also includes anti-trafficking. This shift in focus was brought about from results during the baseline workshop where they realized that they have a choice on what issues are of their concern. Also, operational guidelines have improved slightly due to an increasing awareness of the organization to have better technical and operational guidelines. Since the restructuring of the organization, job and task descriptions have been specified and made clearer and are now documented, but not yet developed in the standard operating procedures. A very slight improvement also occurred in mutually supportive efforts. Lembaga Kita attempts to go beyond solving the problem on its own. For instance, they don't just warn communities for the dangers of

trafficking, but also attempt to remove the reasons why people sometimes fall victim to it. They try to give them good opportunities in life.

**General organisational capacity changes related to MFS II Interventions**

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. Please note that this information is based only on the information provided by Lembaga Kita's staff during the endline workshop, but no validation of this information has been done like with the process tracing causal maps. For details in relation to attribution, we refer to the next section (5.3).

During the endline workshop some key organisational capacity changes were brought up by Lembaga Kita staff, these have been captured in the general causal map in 4.2.2: a more visible organization through the implementation of the community assistance model; and greater recognition amongst stakeholders through the systematic production of documentation. Lembaga Kita staff experienced these as the most important capacity changes in the organisation since the baseline.

The organization becoming more visible with the more accepted community assistance model can be attributed to the increased trust in the organization. This was enabled by the beneficiaries being more satisfied with better services provided, which was the result of better staff working performance and a quicker response to beneficiaries' concerns.

Increased staff working performance can be attributed to the change in the incentive system, better outputs achieved and increased community participation in the programming. The incentive system for staff was changed as a result of a change in organizational management. Better outputs achieved resulted from sharing the workload amongst staff members, which was enabled by recruiting two new staff members. This was possible through the change in the incentive system on the one hand and the change in organisation structure on the other. According to SPO staff, both factors can be attributed to the change in organizational management, which resulted from a shift in strategy for the organization to change from a low into a moderate profile, which was one of the conclusions drawn from the MFS II sponsored capacity scan that Mensen met een Missie carried out after the external MFS II baseline took place. The third factor that SPO staff mentioned as contributing to better staff working performance is the increased community participation in programming, which resulted from an increase in trust amongst beneficiaries and the community in Lembaga Kita. This can be attributed to the change in the community assistance model, in which Lembaga Kita changed from a more donor centric role to an involved and interactive organization. This too can be partly attributed to the MFS II sponsored capacity scan that Mensen met een Missie carried out after the external MFS II baseline took place.

Lembaga Kita has become more recognized by stakeholders through the production of documentation as a result of better documentation of data. This initiative can be attributed to the change in organizational management that took place.

In conclusion, various changes were indicated by the SPO that can be linked to one of the MFS II capacity development interventions by MM , namely the organizational capacity scan that took place after the external MFS II baseline in 2012. The CFA has also indicated that other capacity development interventions took place, including several trainings. However, these were not mentioned and included in the general key changes causal map by the SPO due to a lack of specification of this causal map, since this was on the purpose of this assessment. Lembaga Kita has not been selected for process tracing, which would have provided more detailed information. It must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect.

# Appendix 1 Methodological approach & reflection

## 1. Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

## 2. Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline

has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.27 Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

[27] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

*1. How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*

- -2 = Considerable deterioration
- -1 = A slight deterioration
- 0 = No change occurred, the situation is the same as in 2012
- +1 = Slight improvement
- +2 = Considerable improvement

*2. Please describe what exactly has changed since the baseline in 2012*

*3. What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*

- Intervention, actor or factor at the level of or by **SPO**: ..... .
- Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
- Intervention, actor or factor at the level of or by the **other funders**: ..... .
- **Other** interventions, actors or factors: ..... .
- Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;
- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5.* ***Prepare and organise the field visit*** *to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6.* ***Interview the CFA*** *– CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

*Step 7.* ***Run the endline workshop*** *with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

**Purpose of the fieldwork:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

**Brainstorm on key organisational capacity changes and influencing factors:** a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative.This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

**Self-assessments:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8.* ***Interview SPO staff*** *– in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9.* ***Fill-in observation sheets*** *– in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

*Step 10.* ***Interview externals*** *– in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11.* ***Upload and auto-code all the formats*** *collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the* ***overview of information*** *per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13.* ***Analyse the data and develop a draft description*** *of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14.* ***Analyse the data and finalize the description*** *of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15.* ***Analyse the information*** *in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

# 3. Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew,

and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

### Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

- Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.
- Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.
- Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a

particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

*The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia*

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

*SPOs selected for process tracing – Ethiopia*

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| AMREF | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| CARE | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| ECFA | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| FSCE | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| HOA-REC | Sustainable Energy project (ICCO Alliance): 2014 Innovative WASH (WASH Alliance): Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| HUNDEE | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| NVEA | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |
| OSRA | C4C Alliance project (farmers marketing): December 2014 ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| TTCA | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

*The extent to which the Dutch NGO explicitly targets the following capabilities – India*[28]

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

*SPOs selected for process tracing – India*

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BVHA | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| COUNT | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| DRISTI | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| FFID | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |

[28] RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Jana Vikas | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| NEDSF | | | | | | | No – delayed baseline |
| RGVN | | | | | | | No - delayed baseline |
| Samarthak Samiti (SDS) | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| Shivi Development Society (SDS) | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| Smile | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| VTRC | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

*The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia*

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | PT. PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-

mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, PT.PPMA, YPI, YRBI.

Table 6
*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| ASB | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| Dayakologi | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| ECPAT | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| GSS | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| Lembaga Kita | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| PT.PPMA | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| Rifka Annisa | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| WIIP | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Yayasan Kelola | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| YPI | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| YRBI | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| Yadupa | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

*The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia*

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

*SPOs selected for process tracing – Liberia*

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BSC | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| DEN-L | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| NAWOCOL | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| REFOUND | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| RHRAP | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

- A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
- A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
- **Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
- **Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for coding documents received from SPO and CFA in NVivo on the following:

- 5C Indicators: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the capacity development interventions implemented by the CFA (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
  - In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
  - During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;
  - During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
  - During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.

The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

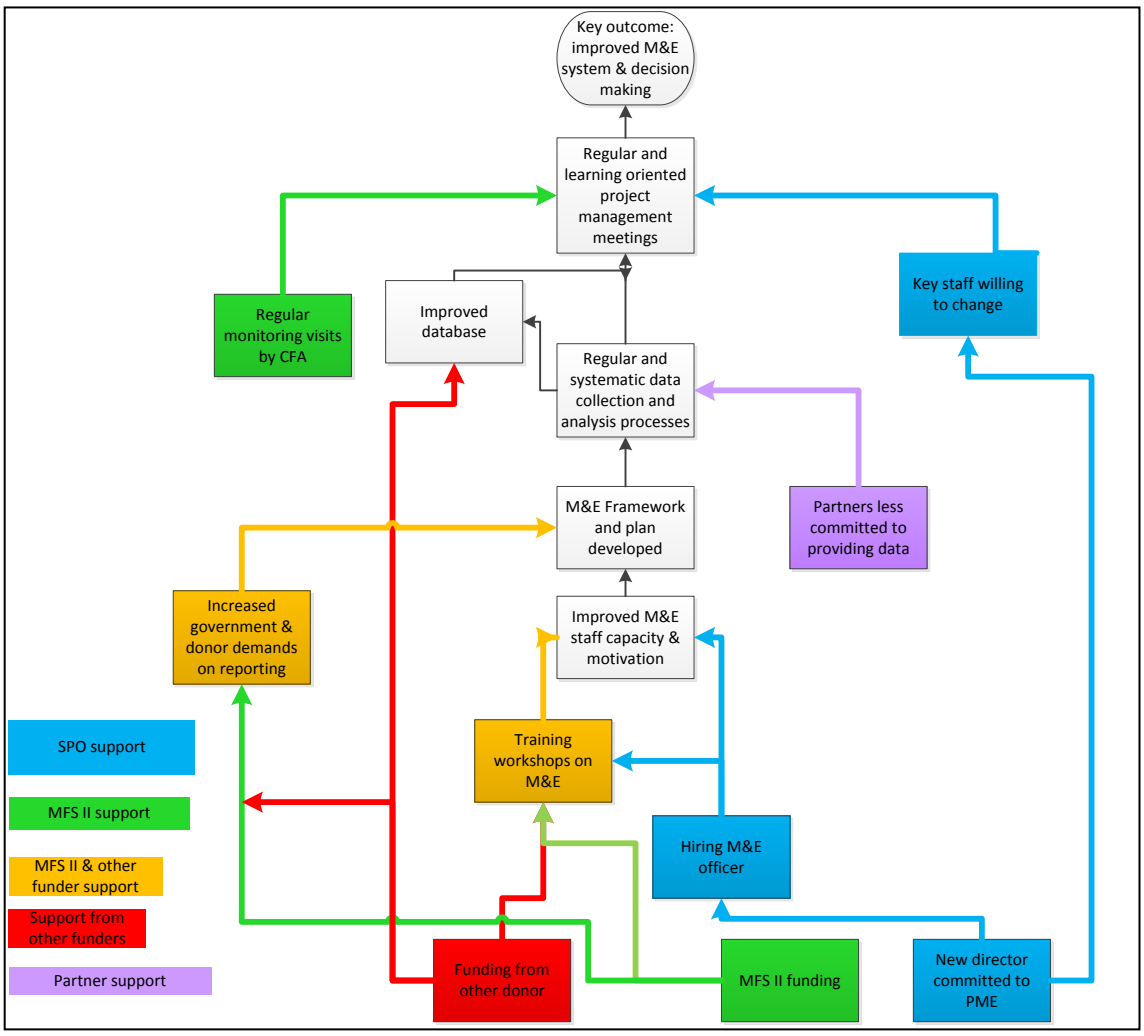

***Figure 1*** *An imaginary example of a model of change*

*Step 5. Identify **types of evidence** needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, "What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?". The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: pattern, sequence, trace, and account. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

- **Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.
- **Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
- **Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.
- **Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

*Format for identifying types of evidence for different causal relationships in the model of change (example included)*

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| Describe relationship between the subcomponents of the model of change | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions.<br>Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y?<br>Can we find this information by means of :<br>Pattern evidence;<br>Sequence evidence;<br>Trace evidence;<br>Account evidence? | Describe where you can find this information |
| Example:<br>Training workshops on M&E provided by MFS II funding and other sources of funding | Example:<br>What type of training workshops on M&E took place?<br>Who was trained?<br>When did the training take place?<br>Who funded the training?<br>Was the funding of training provided before the training took place?<br>How much money was available for the training? | Example:<br>Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br><br>Sequence evidence on timing of funding and timing of training<br><br>Content evidence: what the training was about | Example:<br>Training report<br>SPO Progress reports<br>interviews with the CFA and SPO staff<br>Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality** of data and **analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

| *Example format for the adapted evidence analysis database (example included)* **Description of causal relation** | **Confirming/ rejecting a causal relation (yes/no)** | **Type of information providing the background to the confirmation or rejection of the causal relation** | **Strength of evidence: strong/ rather strong/ rather weak/ weak** | **Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected** |
|---|---|---|---|---|
| e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

# 4. Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

# 5. Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has

provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is

crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or

not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

- The capability to act and commit;
- The capability to deliver on development objectives;
- The capability to adapt and self-renew;
- The capability to relate (to external stakeholders);
- The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed. A detailed overview of capabilities with outcome domains and indicators is attached in Appendix 3.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Appendix 3 Changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

**Description of Endline Indicators Lembaga Kita**

**Capability to act and commit**

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

*This is about leadership within the organization (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organization.*

Leadership of Lembaga Kita has remained largely unchanged since the baseline in 2012. The same sisters remain in charge. Within the congregation Sr. Fransiska has now been appointed as one of the program officers for Lembaga Kita. She works very well together with the Lembaga Kita team. The newly established steering committee serves as the decision making body for day to day work as well as long term strategies. The leadership Maria and Sr. Patricia have a good working relation and this also has positive effects on the team. Despite the formation of a new steering team, leadership responsiveness remains the same.

Score: From 3.5 to 3.5 (no change)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

*This is about the extent to which the leader(s) provide strategic directions*

Lembaga Kita is still in the same situation as it was during the baseline evaluation. Strategic guidance is developed together through meetings, not solely by the leaders. Both leaders (strategic and operational) are involved in the development of strategic guidance together with the other staff members. At the level of beneficiaries, strategic and technical guidance remains to be provided by the relevant field staff. Lembaga Kita has a new organizational structure which consists of a Steering Committee (SC) and Organization Committee (OC). The SC focuses on the management of Lembaga Kita and the OC is more focused on program implementation. The additions of these new organizational entities have allowed the organization to pivot their priorities and goals. For instance, Lembaga Kita has made a conscious effort to become more visible in public by adopting a more moderate stance and profile. Additionally, their focus on operations has shifted from an exclusive focus on violence based on gender, to include more anti-trafficking related work. Both these shifts were prepared and facilitated by the new committees in place.

Score: From 3 to 3 (no change)

1.3. Staff turnover: 'Staff turnover is relatively low'

*This is about staff turnover.*

Lembaga Kita's situation with regards to staff turnover remains unchanged compared to the baseline. The organization had a relatively steady number of staff members. There is a higher turnover in volunteers and partner staff, as their involvement depends on the requirements in the on-going programs. Lembaga Kita remains very selective in recruiting new members, expecting that they are loyal and dedicated. Not all interested applicants and volunteers are accepted. Currently two volunteers have become staff members due to the need of the organization.

Score: From 3 to 3 (no change)

1.4 .Organisational structure 'Existence of clear organization structure reflecting the objectives of the organization"

*Observable indicator: Staffs have copy of org. structure and understand this*

Lembaga Kita has a new organizational structure which consists of a Steering Committee (SC) and Organization Committee (OC). The SC focuses on the management of Lembaga Kita and the OC is more focused on program implementation. Both institutions understand their place and function in the organization and act accordingly.

Score: From 3 to 4 (improvement)

1.5 Articulated Strategies. Strategies are articulated and based on good situation analysis and adequate M&E

*Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.*

The end line showed the same quality of this indicator as compared to the baseline. Lembaga Kita still does not have clear documentation of their strategic planning, although there are well defined mechanisms and assessment systems in place and applied in the formulation and implementation of projects. Although the basis for the development of strategies, monitoring and evaluation are there, none of it is articulated, specified or documented. Lembaga Kita does not have a written vision, mission or strategy on paper. They use the baseline as a strategic plan and reference for the organization. They have worked this out in a Theory of Change and this serves as their strategic guideline. They've been through a process of discussions about the strategy. First they wanted to fix the organizational structure, then evaluate their programs in the past and then develop a strategic plan. However, relevant the staff members and leadership do talk about the future direction of the organization with regards to staffing, resource mobilization and their programmatic area.

Score: From 2.5 to 2.5 (no change)

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'

*This is about the extent to which day-to-day operations are aligned with strategic plans.*

Lembaga Kita is still in the same situation as it was during the baseline evaluation. Lembaga Kita does not have any documentation of their strategic planning for 5 years but has an annual planning. However, when relevant they do talk about the future direction of the organization with regards to staffing, resource mobilization and their programmatic area. The day to day operations are based on the approved work plan for the project. They are able to work in accordance with this work plan but a strategic plan is missing. Most activities are in line with it, with some minor adjustments made based on the context. For example, the time to deliver the result can be delayed.

Score: From 2 to 2 (No change)

1.7. Staff skills: 'Staff have necessary skills to do their work'

*This is about whether staff have the skills necessary to do their work and what skills they might need.*

Staff remains dedicated, motivated and very knowledgeable in their field. Each of the staff members has a particular expertise that has contributed to the work of the organization. The staff interviews show that they are confident to perform their tasks. There is still no system in place for staff training, which reinforces the need to pay close attention for learning opportunities outside of the organization. The staff is aware that , they need capacity building to improve their skills, for example project management skills, paralegal training to assist victims of trafficking, and skills on anti-trafficking.Since the baseline in 2012, they have been trained in human traffickingfunded by IOM, and PME training funded by Mensen met een Missie (MFS II).

The coordinator has good leadership skills, the finance officer and field staff are also skilled but they still feel the need for one English speaking staff member. Also they observe many issues and cases related to women's rights and they help case by case, but feel that they should document these observations, but they do not know how and exactly for what purpose.

Score: From 3.5 to 3.5 (no change)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

*This is about whether staffs at the SPO are offered appropriate training opportunities*

Partially due to the observations in the baseline for the need of additional training opportunities and the need for capacity building, this indicator has improved over the last two years. Training on human trafficking by IOM and training in PME by Mensen met eenMissie has been organized. Since some staff work on a voluntary basis and also work with other organizations (such as in the government, Women's Network etc) opportunities for training may arise in those organizations.

Score: From 1 to 2 (improvement)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

*This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.*

There is no change in the achievement against this indicator. Staffs are still motivated to work for Lembaga Kita mainly due to their passion to the work and sharing the values of the organization. The other reason is the flexibility at work, as the organization does not apply office hours and has no physical office, which allows people to work for other organizations. Staff works mainly on a voluntary basis. For the volunteers, the benefits lie in "learning by doing" during project implementation. There are no financial incentives for volunteers. From July 2014 onwards, 4 of the staff members will get some financial compensation. Until now, they worked because of the social engagement (heart and spirit). The activity related costs have been reimbursed.

Score: From 3 to 3 (no change)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

*This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.*

Lembaga Kita is still in the same situation with the last baseline. Lembaga Kita does not have a solid donor base. To date Mensen met eenMissie is the only donor. They are aware that in the future they should consider fundraising with other organizations but still, there is no effort to look for other resources.

Score: From 2 to 2 (no change)

1.9.3.Funding procedures: 'Clear procedures for exploring new funding opportunities'

*This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.*

Lembaga Kita is still in the same situation with the last baseline. There are no clear procedures for exploring new funding opportunities. The only funding they have is from Mensen met eenMissie. Previously Sr. Antonie, now Sr. Patricia, is the main person who deals with donors, including preparing the paper works, while other staff members have less understanding about it.

Score: From 1 to 1 (no change)

**Summary Capability to act and commit**

The leadership within the organization changed from Sister Antonie to Sister Patricia, and Ms. Maria Susiawati, the chairperson. Sister Patricia is the new provincial in Wonosobo therefore; she automatically takes the leadership in the organization. With the addition of two committees (Steering committee and Organization committee) overseeing the activities of the organization, a change in focus and visibility were enabled. Strategic guidance is developed together through cooperative meetings with staff, and not solely by the leaders. Both leaders (strategic and operational) are involved in the development of strategic guidance. In the last four years the organization had a relatively steady number of staff members. They started with four persons and two volunteers joined as field staff. Staff is dedicated, motivated and very knowledgeable in their field. Each of the staff members has a particular expertise that has contributed to the work of the organization. Currently, there are two trainings that have been organized since the baseline; training in human trafficking by IOM and the other training in PME in 2014 by MM. Staffs are motivated to work for Lembaga Kita

mainly due to their passion to the work and sharing the values of the organization. Lembaga Kita does not have a solid donor base. To date Mensen met eenMissie is the only donor. There are no clear procedures for exploring new funding opportunities.

Score: From 2.5 to 2.7 (very slight improvement)

**Capability to adapt and self-renew**

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

*This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).*

M&E application in Lembaga Kita has remained the same since the baseline evaluation. Practices are not documented, which makes it very difficult to evaluate the impact of specific activities and other data collection that took place. The organization applies some evaluation at the project level, but most of this done non-systematically and without recording of results and practices. Staff has indicated that it is aware of the need for an M&E system and has followed PME training in May 2014. The results of this training and intentions to develop a proper system could not yet be seen at the date of publishing of this report.

Score: From 2 to 2 (no change)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

*This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.*

Staff and volunteers of Lembaga Kita continue to have the capability to conduct monitoring and evaluation in a very basic manner. M&E is conducted through focus group discussions with the beneficiaries as well as direct informal discussions with the village leaders. Staffs are equipped with skills and knowledge on the Participatory Rural Appraisal prior to the implementation of the program but some stated that they still need capacity building related to the M&E skill.

Score: From 2 to 2 (no change)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

*This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.*

Due to the lack of development of new M&E systems and processes, nothing has changed with respect to the application of outcomes to adapt future strategies. Staff indicates that M&E findings are used for future strategies, but there is no M&E system in place and the strategic plan is missing so in fact it is not possible to do this effectively. There is a clear intention to develop an M&E system in the near future, but no concrete steps have been taken to achieve this as of yet.

Score: From 2 to 2 (no change)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

*This is about whether staffs talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staffs are comfortable raising issues that are problematic.*

Lembaga Kita has continued to hold meetings on a monthly and annual basis.. Now that the project staff and the sisters live more closely to each other, such meetings can be organized more frequently. Critical and strategic reflection was emphasized more, due to the outcomes of the baseline study. As the strategic plan and an M&E system are still missing, critical reflection is not done systematically nor strategically.

Score: From 2 to 2 (no change)

2.5. Freedom for ideas: 'Staff feels free to come up with ideas for implementation of objectives

*This is about whether staffs feel that ideas they bring for implementation of the program are welcomed and used.*

Staff members are continued to be welcomed to come up with ideas, as well as to collectively set up agreements on which ideas are to be implemented in the field. They are able to express their ideas, feelings and concerns openly. This situation was also observed during the workshop for the baseline, where all staff equally expressed their ideas without any domination from both leaders. Ms. Rumi and Sr. Fransiska can both share critical feedback while keeping conversation light and positive. They both expressed that they feel totally free to express this throughout the organization. Creative ideas are very welcome and communication in Lembaga Kita is considered very strong.

Score: From 4 to 4.5 (slight improvement)

2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and developments in its operating environment'

*This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.*

A strong asset of Lembaga Kita continues to be its use of Participatory Rural Appraisal as a mechanism to design the projects in the villages. With this, the local context is reflected in the planning of the organization. Lembaga Kita has very close connections with their target groups and this also makes them aware of what is happening in their environment. Lembaga Kita has made an extra effort to gather stakeholders in a village (both from formal structures as well as from informal structures) and thoroughly analyses the situation. In other villages they organized meetings with the direct target group  with strongly using informal information sessions i.e going door to door and meeting people face to face in addition to community meeting. Despite these very practical and hands-on methods, there is still no formal system in place to follow trends and developments.

Score: From 3 to 3.25 (very slight improvement)

2.7. Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and the general public'

*This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.*

Lembaga Kita remains focused and tuned in to the needs of their beneficiaries. They act on the needs they observe in the villages where they work. They are well connected and offer solutions. To get input from other stakeholders they rely on the networks that staff members already have, and do so through informal conversations rather than a structured way of data collection. Lembaga Kita has developed a process and method which allows participation from community, program beneficiaries and also partner institutions, starting from the program design, implementation, monitoring and reporting. It remains unclear whether this process has been implemented due to the lack of supporting documentation. They have informal conversations with local authorities to tune activities. They also communicate the needs of their target group to the government. Lembaga Kita has very close connections with their target groups and this also makes them aware of what is happening in their environment.

Score: From 3 to 3 (no change)

**Capability to adapt and self-renew**

There is no formal M&E system in place. The organization looks only at the project level in terms of monitoring and evaluation of activities. In some proposals, it is mentioned that they have a regular meetings to discuss the progress of the project and how it will be improved together with the beneficiaries. Staff and volunteers of Lembaga Kita have the competences to conduct monitoring and evaluation in a very basic manner. M&E is conducted through focus group discussions with the beneficiaries as well as direct informal discussions with the village leaders. Staff indicates that M&E findings are used for future strategies, but there is no M&E system in place and the strategic plan is missing. Evidence in the form of documentation to support these claims could not be found. Lembaga

Kita has several meetings on a monthly and annual basis. In these meetings, staff, volunteers and beneficiaries are gathered to discuss relevant issues. Since Lembaga Kita has an office, now the project staff and the sisters live more closely to each other and this assists in having frequent meetings. They are able to express their ideas, feelings and concerns openly. Lembaga Kita has very close connections with their target groups and this also makes them aware of what is happening in their surroundings and project areas, although a systematic way of tracking their environment is still missing.

Score: From 2.6 to 2.6 (no change)

**Capability to deliver on development objectives**

3.1.Clear operational plans: 'Organization has clear operational plans for carrying out projects which all staff fully understand'

*This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.*

As Mensen met een Missie remains the sole donor of Lembaga Kita, he operational plans are still based on the project proposal, and have not changed over the last two years. There is a budget and operational plan available that covers the basic necessities to run the program. The operational plan is reported annually to the donor. Currently, strategies are developed during staff meetings and changes are discussed with everyone to ensure that everybody clearly understands their relation to operational activities

Score: From 3.5 to 3.5 (no change)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

*This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.*

Lembaga Kita remains cost-effective in the use of their resources. Budgets are realistic and well understood by staff and leadership. They work locally and also with local people so they do not have high expenses. They allocate most of the funds to the program, using local standard cost while other expenses are covered individually/collectively. Between 2012 and 2013, they did not use the budget but the program has been implemented well nonetheless. It is dues to higher community involvement than before so that some program implementation does not need any financial cost as it is covered by community voluntarily.  Currently, there are some changes in staffs' composition; some volunteers have become permanent staff members who have increased operational costs, but overall their cost is still warranted through more effective output of the staff members in their new roles.

Score: From 4.5 to 4.5 (no change)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

*This is about whether the SPO is able to carry out the operational plans.*

Lembaga Kita continues to deliver results, although it struggles with their documentation, monitoring and evaluation. Late transfer of funds delays the process of implementation. Planning is not done well, although planned activities are said to be implemented. To really contribute to sustainable changes takes a long time. To gain trust in the communities is a long process. They go door to door and bring food, but no money. This does not always necessarily open the doors, and developing trusts takes time. Now however, these investments have paid up and the relationship with the target villages is very good. Lembaga Kita gain stronger trust and participation from community.

Score: From 3.5 to 4 (improvement)

3.4. Mechanisms for beneficiary needs: 'The organization has mechanisms in place to verify that services meet beneficiary needs'

This is about how the SPO knows that their services are meeting beneficiary needs

The end line showed the same quality as the baseline. Lembaga Kita's strength remains their presence at the grass roots level and working very close together with the beneficiaries. Lembaga Kita undertakes participatory rural appraisal and this is the basis for their planning. To ensure the feedback from the community, they organize monitoring. They carry out monitoring through interviews with the

village facilitator or discussions with the beneficiaries directly. They also have strong relationships with the village leaders who directly inform them on the progress of the project. However, apart from the PRA there is no systematic M&E in place although there is an intention to begin to arrange such a system.

Score: From 3.5 to 3.5 (no change)

3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratio's)'

*This is about how the SPO knows they are efficient or not in their work.*

The organization conducts M&E at a very basic and undocumented level. They mainly look at budget expenditure and compare this with what is planned. A formal system to link outputs to inputs is still missing.

Score: From 2 to 2 (no change)

3.6. Balancing quality-efficiency: 'The organization aims at balancing efficiency requirements with the quality of its work'

*This is about how the SPO ensures quality work with the resources available*

The organization has continued the quality of their work through the monitoring of the situation in the field, and by engaging competent staff and volunteers. Another significant factor that enhances the quality of their work is the interpersonal relationships and personal commitment to the work.

Score: From 3 to 3 (no change)

**Summary of Capability to deliver on development objectives**
The operational plans are based on the project proposal as funded by Mensen met eenMissie. There is a budget and operational plan available that covers the basic necessities to run the program. The organization is realistic in their budgets and ensures that staff understands the costs involved, and hereby aims to use resources cost-effectively..This is further contributed to by the fact that they work locally and also with local people as to keep operational expenses low. Monitoring and evaluation remains subject to improvement, particularly to setting up a more systematic way to do so and as such there is no system in place to measure efficiency by relating inputs to outputs. Currently the organization mainly looks at budget expenditure and compares this with what was planned. The organization balances quality with efficiency by keeping costs low whilst delivering quality work through field monitoring, and engaging competent staff and volunteers, and by having good interpersonal relationships and personal commitment to the work. Whilst planned activities seem to be implemented long-term effects take time.

Score: From 3.3 to 3.4 (very slight improvement)

**Capability to relate**
4.1. Stakeholder engagement in policies and strategies: 'The organization maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organization'

*This is about whether the SPO engages external groups in developing their policies and strategies, and how.*

The end line showed the same quality as the baseline. In their project location their network currently consists of village leaders, the labor department, the forest/environment office, other NGOs. Lembaga Kita is part of a network extending over the whole of Indonesia, including for example schools and hospitals where victims can be found. All Indonesian sister congregations are involved in this network. Lembaga Kita has sufficient capacity to relate to their stakeholders. The network is only local and not very large, but helps the organization in reaching its goals. The legitimacy of the objectives of the organization is very high, but the organization itself is not widely known to the public (although this is increasing). The organization forms a very good bridge between different religions and successfully strives to alleviate poverty and create economic opportunities. There is a large involvement of local volunteers and friends. The organization does not have any formal way to engage external groups in developing their policies and strategies.

Score: From 3 to 3 (no change)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'

*This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.*

There is no change in the achievement against this indicator. Engagements in networks remain the same at both the local and international level. At the local level cooperation with NGOs working on similar issues remains strong. Locally, they are linked to five prominent women's organizations which are the Women's Organization Association (GOW), The Association of Women's Struggle Wonosobo (Per3W), Indonesian Migrant Workers Association (SBMI) and Srikandi Women's Cooperative. More networks and alliances with other CSOs had been established, such as with SPPTQ Salatiga, Percik, Persepsi, Upipa, Wonosobo Youth Center (WYC).There is no schedule for meetings with network partners. They have a meeting if there are specific issues that need to be discussed. It is not complicated at all for Lembaga Kita to establish contact, because each member is also a member of another organization in the LK network. At the international level, all organizations in the Mensen met eenMissie network come together twice a year for discussions, trainings, etc.

Score: From 3 to 3 (no change)

4.3. Engagement with target groups: 'The organization performs frequent visits to their target groups/ beneficiaries in their living environment'

*This is about how and when the SPO meets with target groups.*

There is a slightly improvement in this indicator. The organization works more closely together with the community. Their strength is their grassroots involvement. Meeting with the target groups are held more regularly. Previously the Village Facilitator visited the community, but currently field staff visited the community. They visit the target group more frequently; sometimes up to 2-3 times in a week. Beneficiaries are still strongly participating in the participatory rural appraisal that is used for planning activities. Over the past two years the organizations has shifted from a low profile position to a more moderate and visible profile through the implementation of the community assistance model. In this model staff members place themselves as partners within communities and perform both formal program related activities as well as informal and more ad-hoc activities to encourage trust among the beneficiaries.

Score: From 4.5 to 4.75 (very slight improvement)

4.4. Relationships within organization: 'Organizational structure and culture facilitates open internal contacts, communication, and decision-making'

*How does staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?*

There is an improvement in this indicator. Lembaga Kita has an office now. Since they have an office, communication within the organization has significantly improved and intensified. The staff members can talk openly and provide input and feedback to each other at any time.

Score: From 3 to 4 (improvement)

**Summary of Capability to relate**
Lembaga Kita is a small organization and is part of a network extending over the whole of Indonesia, including for example schools and hospitals where victims can be found. All Indonesian sister congregations are involved in this network. Lembaga Kita has sufficient capacity to relate to their stakeholders. It is not complicated at all for the organization to establish contact, because each member is also a member of another organization in the Lembaga Kita network. At the international level, all organizations in the Mensen met eenMissie network come together twice a year for discussions, trainings, etc. However, the organization does not have any formal way to engage external groups in developing their policies and strategies. The organization works closely together with the community, and has changed its stance from low profile to a more moderate and visible profile within the communities the organization serves. This has led to increased trust amongst beneficiaries. Their strength is their grassroots involvement in the organization now works closely with

the communities. Internal relations have improved through the establishment of a new office building in which staff can now regularly meet and freely communicate.

Score: from 3.4 to 3.7 (very slight improvement)

**Capability to achieve coherence**

5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organization'

*This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.*

There is an improvement in the achievement against this indicator. The organization has a mission and vision developed collectively with the staff in 2007. There is no detailed information on how the vision and mission were developed. Prior to 2007, the organization did not have a clear vision and mission. These were developed as a result of donor requirements. Within the last two years, the organization's focus has broadened and does not only focus on violence based on gender but now also includes anti-trafficking. This shift in focus was brought about from results during the baseline workshop where they realized that they have a choice on what issues are of their concern.

Score: From 2 to 3 (improvement)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

*This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.*

Operational guidelines in terms of Human Resources, Administration and Finances are still missing at Lembaga Kita. Management continues to rely on guidance provided by the donors, such as for the financial report. There is an increasing awareness of the organization to have better technical and operational guidelines. However, since the restructuring of the organization, job and task descriptions have been specified and made clearer an documented, but not yet developed in the SOP, which results in a slight improvement of this indicator as compared to the baseline.

Score: From 1 to 1.5 (slight improvement)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'

*This is about whether the operations and strategies are line with the vision/mission of the SPO.*

The endline showed the same quality as the baseline. There is a large coherence between goals, aims, activities and available resources. However the strategic plan is missing. Because of the small size of the organization, procedures are not always formalized and remain undocumented which makes tracking very difficult.

Score: From 3.5 to 3.5 (no change)

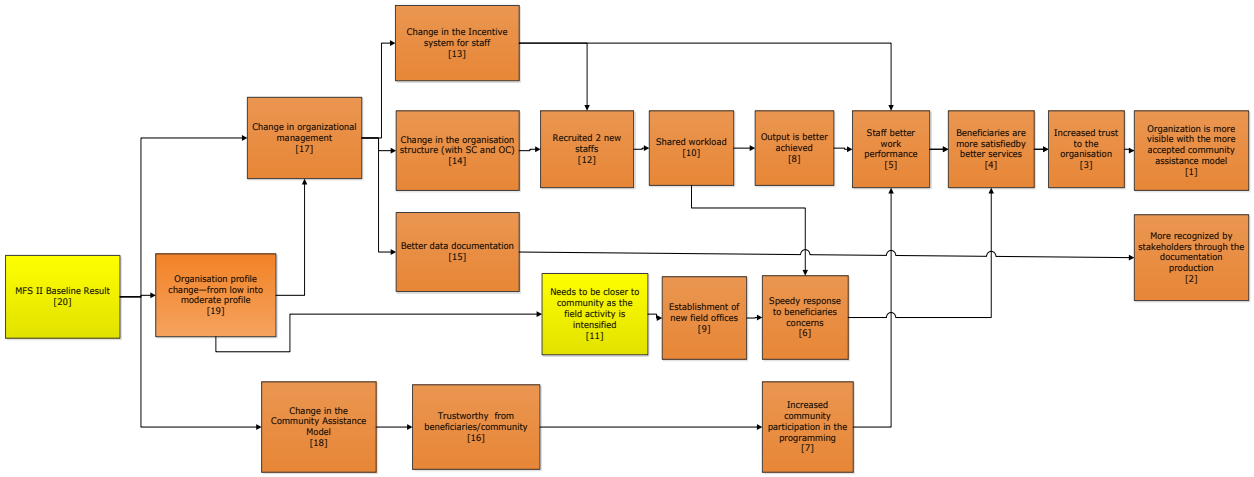
5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

*This is about whether the efforts in one project complement/support efforts in other projects.*

They don't do different projects but do their work in different villages. In what they do there is a logical consistency aimed at the prevention of trafficking. They go beyond just warning people, but also try to take away the reasons why people sometimes fall victim to it. They try to give them good opportunities in life. Furthermore, the choice of the organization to become more visible in the communities they serve made staff members engage in informal activities to support their formal work and goals to increase trust amongst beneficiaries.

Score: From 3.5 to 3.75 (very slight improvement)

**Summary Capability to achieve coherence**



There is a very slight improvement in this capability. The organization has a mission and vision developed collectively with the staff in 2007. There is no detailed information on how the vision and mission were developed.Within the last two years, the organization's focus has broadened and does not only focus on violence based on gender but now also includes anti-trafficking. This change is based

on MFS II baseline 2012 results. There are no operational guidelines available in the organization in term of Human Resources, Administration and Finances, although job and work descriptions have been specified and made clearer. The management relies on guidance provided by the donors. There is a large coherence between goals, aims, activities and available resources, although there is no strategic plan in place and activities are based on the project proposal funded by MM. They don't do different projects but do their work in different villages. In what they do there is a logical consistency aimed at the prevention of trafficking, and their greater engagement within communities to raise the organization's profile has forced staff members to integrate with community activities that are not necessarily directly related to project or program activities.

Score: From 2.5 to 2.9 (slight improvement )

# Appendix 4 Results - key changes in organisational capacity - general causal map

**General Causal Map Lembaga Kita**

During the end line workshop at Lembaga Kita, a discussion was held around what staff perceived as the key changes in in the organization since the baseline in 2012. This then led to a discussion on what were the key organizational capacity changes and why these changes have taken place according to staff present at the end line workshop. The discussion resulted in a 'general causal map' which is described below. The general causal map provides a comprehensive picture of organizational capacity changes that took place since the baseline, based on the perspective of SPO staff present at the end line workshop. The numbers in the narrative correspond with the numbers in the visual.

Two key organisational capacity changes have occurred at Lembaga Kita since the baseline:

3. A more visible organization through the implementation of the community assistance model [1].
4. Greater recognition amongst stakeholders through the systematic production of documentation [2].

**A more visible organization through the implementation of the community assistance model [1].**

First of all. Lembaga Kita is now more visible with a more accepted community assistance model that has been put in to place since 2013 [1]. The community assistance model allowed staff to place themselves as so called partners in the communities they were serving, and provided a way to be closer to beneficiaries whilst performing informal activities. This greatly increased trust by the community in Lembaga Kita [3].

The overall increase in trust came about from an overal increase in satisfaction about Lembaga Kita's services to the beneficiaries [4] on the one hand, as well a greater sense of ownership and participation within program activities by the communities and beneficiaries [7].

Beneficiaries were overall more satisifed due to an overall increase in staff working performance [5] as well as the speed with which the organization responded to beneficiary concerns and requests [6]. Both factors will be explained below in more detail.

First, the increase in work performance can be explained by the organization achieving better outputs [8] through staff increasingly sharing their workload with each other and cooperating [10]. This in turn was enabled by the recruitment of two new staff members [12], and an overall change in organization structure [14], which was the result of a broader change in organizational management [17].

Prior to the baseline in 2012, most of the volunteers in Lembaga Kita were government officers *(Pegawai Negeri Sipil)* who had very limited time for field implementation. After that, the organization recruited two more staff. Apart from the staff additions, revisions in the organizational structure included the splitting into Steering Committee (SC) and Operational Committee (OC). The intention of this action was to achieve better coordination and communication, faster field response, and clearer job distribution. In the same year, the organization added one more target village to a total of three supported villages right now.

**Greater recognition amongst stakeholders through the systematic production of documentation [2].**

Secondly, the overal speed with which staff members responded to beneficiary requests increased by a change in the incentive system for staff [13], as well as the establishment of new field offices [9], which addressed the need to have staff members to be closer to the community in the field during their work activities [11]. Changes to the incentive system [13] included payment of transportation to staff on a monthly basis, and ultimately into a stand-alone transportation fund. This allowed staff to travel more freely and quicker to beneficiaries and stakeholders in the field.

Both the need to be closer to the community whilst carrying out activities as well as the overall changes in organizational management sprung from Lembaga Kita's objective to change their organizational profile from low to more moderate and public [19], which was one of the conclusions drawn by Lembaga Kita based on the results from the MFSII organisational capacity development (5c) baseline assessment that was carried out in 2012 [20].

The second factor which greatly impacted the increased trust in the organization was the increase of community participation in the programming of activities and the activities themselves [7]. Communities and other beneficiaries more readily accepted to participate due to an increase in trust in the organisation [16] resulting from the changes made in the community assistance model. Previously, they were more focused on program delivery and still had less attention to community engagement. As a result, community seen Lembaga Kita as "donor" instead of empowering community. After the baseline, they changed the strategy to more strengthened the community enggagement by having more interaction with community. Current approcah has resulted in the more positive image of the organisation to community[18]. The reason to set up this model was also a conclusion drawn by Lembaga Kita on the basis of theMFS II organisational capacity development (5c) baseline results in 2012 [20].

Finally, stakeholders indicated that Lembaga Kita has paid considerable attention to the practice of documentation of data and activities [2]. This development was already recognized during the baseline MFS II 5c evaluation, but was significantly improved over the last two years [15] as part of the changes and professionalization in organizational management [17] or example a documentary film was made about sustainable waste management. The documentary has been used as learning material for local communities and beneficiaries.

Report CDI-15-044

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

# 1 Introduction & summary

## 1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: Rifka Annisa in Indonesia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1.Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps

describe the identified key organisational capacity changes that are possibly related to MFS II interventions in these two capabilities, and how these changes have come about. More detailed information can be found in appendix 5.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR: Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

## 1.2 Brief summary of analysis and findings

Since the baseline, two years ago, Rifka Annisa has seen an improvement in the capability to act and commit. The relation between upper management and staff has improved, with considerable improvements in strategic guidance and responsive leadership as a result. Staff turnover has improved and been reduced as a result of more focus on capacity building activities, which also led to greater staff skills. Employment benefits increased, whilst funding sources improved very slightly with the adoption of business programs to generate income and become less dependent of donors and more self-sufficient. The capability to adapt and self renew has improved overall. M&E tools have been developed and consistently applied, although Rifka Annisa still needs to step further building an effective MIS, database and knowledge management system. Rifka Annisa is also more aware of its surroundings through increased public discussions and knowledge sharing. The capability to deliver on development objectives has improved through more efficient operations and timely delivery of planned outputs. The capability to relate has also improved. This was achieved through various new relations to authorities and stakeholders at all levels of government. Engagement with target groups through the application of social media has aided in reaching out to new beneficiaries. In the capability to achieve coherence, operational guidelines have slightly improved as they are laid down in standard operational procedures (SOPs), for example in a finance manual and a method for setting up a referral system to other organizations.

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team. During the endline workshop some key organisational capacity changes were brought up by Rifka Annisa's staff: staff being more productive and involved in the organization's decision-making; greater motivation for staff to get promoted; staff being motivated to improve their facilitation skills; improved quality of monitoring and evaluation and a stronger partnership with local authorities in form of a signed MoU.

According to the SPO staff, these changes can partly be attributed to MFS II funded capacity development interventions, in particular in relation to improved monitoring and evaluation in the organization. This specifically refers to the MFS II funded capacity development intervention training on M&E and more particularly the development of M&E tools. The development of these tools was an MFS II funded capacity development intervention by Rutgers WPF, and can be attributed to the Donor requirement to adopt Results Based Management in program implementation. Furthermore, specific issues that required organizational development, were found in an MFS II funded organizational capacity scan that has led to some changes in the way staff performs. However, this has also been affected by other developments such as a major change in leadership as well as a greater focus on facilitation skills.

# 2 General Information about the SPO – Rifka Annisa

## 2.1 General information about the Southern Partner Organisation (SPO)

## 2.2 The socio-economic, cultural and political context in which the partner operates

**The socio-economic, cultural and political context in which the partner operates**
Gender-Based-Violence (GBV) is a crucial issue in the context of developing gender justice society in Indonesia. In Indonesia's multicultural society, gender based violence is tolerated and permitted across cultures and regions due to patriarchy that manifests in cultural and religious beliefs and practices. Prior to 2000, there was inadequate statistical data available that indicated GBV prevalence in Indonesia, because GBV is regarded as a personal and domestic issue. In addition, there was a lack of government's concern with regard to this issue. The data on GBV cases is gathered by non-governmental-organizations (NGOs) working on violence against women. For example, Rifka Annisa and LRC-KJHAM[1] documented GBV cases since 1994 based on reports from various resources (clients, newspapers, hotline service etc) (Hidayat et.al. 2009). National Commission on Violence against Women (*Komnas Perempuan*) initiated annual report and documentation on GBV since 2000[2].

During the period of 2000 to 2011, there was an increasing trend of the number of female victims. Particularly, between 2009-2011, there were more than 100.000 reported cases per year. The real number of GBV cases is expected to be higher than the official data (Komnas Perempuan, 2012, Hayati et.al. 2011). As the trends of GBV, in fact do not disclose the real conditions of GBV-practices in the society. Lack of autonomy and assertiveness among Indonesian women, particularly, those who live in rural areas, hinders then to report the case to state apparatuses or bringing the case into public. Moreover, since communities regard GBV as a personal issue, revealing the case often leads to stigmatizing the female victims as a disgrace to the family. However, the trend of GBV prevalence could also be regarded as a positive sign of an increasing number of women having the courage to report their cases.

[1] Both NGOs are selected for the MFSII Indonesia MDG Evaluation
[2] Indonesian government established the National Commission on Violence against Women through releseased Presidential Decree No. 181/1998.

According to Komnas Perempuan's annual record on GBV, in 2011, there were 119.107 female victims of GBV. The 2011's rating was 13.2% higher compared to the data of 2010[3]. A ranking of the study provinces has been made and the following provinces show the highest rates of GBV: Central Java (25.628 women victim), East Java (24.555 women), West Java (17.720), DKI Jakarta (11.286), and North Sumatra (8277). The number of female victims in Yogyakarta, target area of Rifka Annisa, was 4154. West Papua and Riau Islands were not included in the study as there were no reports of GBV in these areas. This does not necessarily mean that no GBV took place in these areas, more likely is that no one reported a case to official institutions.

In Indonesia, GBV is classified into three (3) categories. The categorization is based on the domain where the GBV takes place: domestic/family domain (including violence against wife, violence against children, dating violence), community/public domain (including sexual violence or harassment in the work place, sexual violence and harassment in public transportation etc), and state domain (discrimination and sexual harassment in public services, sexual violence in prison). Based on those categories, in 2011, domestic violence ranked as the highest compared to other types of violence. The ranking is based on the percentage of female victims of domestic violence i.e. 95.61% out of the total of GBV cases (Komnas Perempuan, 2012:11). The percentage of female victims of GBV in community/public domain was 4.35%, and the rest took place in the state domain. This trend is apparent is all Indonesian provinces (Komnas perempuan, 2012:14). The record of Komnas Perempuan confirmed by the report documented by Rifka Annisa and LRC-KJHAM (Hayati et.al. 2011; Hidayat et.al., 2009, LRC-KJHAM, 2012).

The ranges of types of violence in domestic domain are psychological violence (most common), economic violence, physical violence, and sexual violence. While in the community domain, the types of violence include sexual violence (most common), physical violence, psychological violence, trafficking (the number is significant in Central Java) and rape. With regard to the characteristics of female victims of GBV, the majority is aged between 25-40 years, and tends to be spouses (non working spouses), students, and workers (Komnas Perempuan, 2012). There is also indication that the number of female victims of GBV with a higher educational background is increasing (Hayati et.al. 2011; LRC-KJHAM, 2012). The perpetrators are usually relatives or others with whom she has a close relationship (Hidayat et.al, 2009).

**Impacts of Gender Based Violence: multi-faceted and multi-dimensional**

The impacts of GBV are multi-faceted and multi-dimensional. First, victims need to deal with the physical and psychological impact of their experiences. Victims of GBV typically experience organ dysfunction, metabolism disorder and injuries as well as psychological traumas and subsequently fear, stress, strain, lost of confidence, and mental disturbance. Second, the (financial) costs of openly admitting to be a victim and/or pursuing legal steps, are very high. Case studies show that married women end-up in a difficult financial situations because the ex-husband usually rejects to financially provide for the living cost of their children and his former spouse. Students and employed women, in particular when pursuing a legal procedure, are often faced with the fact that they cannot continue their study or lose their job, thereby losing their perspectives for a good future. The state has no funds available to help these women in their financial setback when trying to overcome the situation. GBV also influences the social position of female victims. They are labeled and stigmatized as the cause of the GBV (for example because they are not loyal to the husband, they dress improperly etc.), thereby victimizing them again.[4]

**Policy and Regulation in Tackling GBV**

The Indonesian Government implemented legislation with respect to Gender Equality with the ratification of CEDAW in the Law no. 7/1984 and the Presidential Instruction No. 9/2000 concerning Gender Mainstreaming. All legal products related to gender in Indonesia refers to those policies including the Law no. 23/2004 about Elimination of Domestic Violence. Following the Law on Elimination of Domestic Violence there are the Law No.21/2007 concerning anti human trafficking,

[3] Komnas perempuan compiled the record from its local partners(299 organizations), religious courts, and owmen and child service unit in police departmen and other institutions (Komnas Perempuan, 2012:9).

[4] Komnas perempuan, 2011; Rifka Annisa, 2011, Hidayat et.al., 2009

Indonesian Police Regulation No. 3/2008 about service unit for women and children in district/city police office, Ministerial Regulation No.1/2010 about budget allocation in the national and local government for shelter or crisis centre for women and children victim of GBV, and Ministry of Women Empowerment Regulation No. 1/2010 on Minimum service standard for GBV's victims service centre.

At the regional level, there are also some local government regulations regarding GBV (such as Gubernatorial Decree No. 6/2004 issued in North Sumatra province). The above regulations are also supported by services provided by both (different levels of) state and NGOs. According to Komnas Perempuan's fact sheet, in 2011, there are 395 institutions (organized by both government and non government) that provide services to female and child victims of GBV across 33 provinces in Indonesia (Komnas Perempuan, 2012).

To conclude, the government provided integrated and comprehensive regulations with respect to GBV. However, there is still a gap between the regulation and the implementation due to low level of law enforcement by the state apparatuses. In addition, the lack of gender perspectives among legal personnel should be improved as well.

## 2.3 Contracting details

When did cooperation with this partner start: 2003.

What is the MFS II contracting period: 1-4-2011 to 31-12-2015

Did cooperation with this partner end: No

If yes, when did it finish: Not applicable

What is the reason for ending the cooperation with this partner: Not applicable

Is there expected cooperation with this partner after 31st of December 2015: Yes.

## 2.4 Background to the Southern Partner Organisation

**History**
Rifka Annisa, meaning "Friends of Women", was founded in 1993 and is based in Yogyakarta. Rifka Annisa was initiated by Suwarni Angesti Rahayu, Sri Kusyuniati, Latifah Iskandar, Desti Murdijana and Sitoresmi Prabuningrat. Initially Rifka Annisa operated solely as a crisis and councelling center centre.[5] In 1995 Rifka Annisa started to broaden her activities and increasing their influence in the community by for example writing for a column in a local newspaper. Rifka Annisa also developed the unique perspective that man should be included in their programs, which was very uncommon practice at that time in Indonesia. In 1997, to decrease the gap between government institutions and NGOs working in the field of GBV, Rifka Annisa started to collaborate with regional police (women's and children protection division) and hospitals (victim services). The collaboration aimed to earlier detect and provide adequate services on different levels (medical care, legal aid and counseling). In the same year, Rifka Annisa developed a family approach for their domestic violence - counseling services whereby the husband and possibly the children are included in the counseling sessions. In the following years Rifka Annisa continued to develop their network with community and governmental organizations which leads to the implementation of an integrated service mechanism for female victims of GBV by the local government in the Yogyakarta region in 2005. Because of their effective programs and community influence it becomes easier for Rifka Annisa to attract funds and thus the organization and their activities can expand.

In 2013, Rifka Annisa worked with some priority issues, namely :
1.Involving men in eliminating violence against women , justice and gender equality;

[5] Rifka Annisa, (No year), Kenschets Rifka Annisa - Profil Lembaga Rifka Annisa

2. Integration UUPKDRT (domestic violence law) and Child Protection Law in the system of religious courts.
3. Trafficking and sexual violence

To optimize the program and achieving goals of all issues, Rifka Annisa has been supported by some agencies, namely :

- Rutgers WPF : Men Care + Engaging men in 4 Country Inisiatif dan Men Making Difference in Stopping Violence Againt Women
- UNTF : Establishing integrated response for survivor of Violence through Integration Domestic Violence Eradication Act into Syariah Law in Indonesia
- OXFAM : Strengthening Alliancebof New Men (LLB) Movement for Justice and Gender equality and Eliminate Violence Againt Women
- Up lift International : Gender Responsif Budgeting foe Women Health
- Awo International : Baseline untuk persiapan program "School-Based Prevention towards Trafficking and Sexual Violence against Children in the Regency of Gunung Kidul Yogyakarta October 2013 – December 2014"
- UN WOMEN : Qualitatif Household survey on Violence Againt Women and Masculinities in three areas in Indonesia ( Jakarta, Rural Java, and Papua)

Some programs run, have wedge issues mutually reinforcing each other . This is very important in order to accelerate the achievement of the program , build synergy among the issues and stakeholders in the various regions in Indonesia .[6]

Rifka Annisa has been very serious in improving their staff's capacity as wellas in delivering service for their clients. Activities have been conducted during 2012 and it showed their commitment and dedication. Capacity development which has been supported by MFS II as well as the changes, are as follows :

1. Counseling for women as victims of violence.
2. The provision of safe shelters.
3. Support Group service for the victims of violence.
4. Counseling service for male perpetrators.
5. Case conference
6. Capacity building on trauma healing for counselor
7. Monitoring tools for clients empowerment
8. Couples counseling
9. Community capacity building. It is aimed at increasing knowledge of the community in relation to violence against women and mechanisms of prevention and treatment .[7]

Since 2012 Rifka Annisa has documented five main significant changes as follows :

1. Change of leadership : improved leadership quality
2. Change of Remuneration system and staff's evaluation mechanism :Improved HR system and mechanism
3. Change of ME quality: the use of baseline in the program and developing new ME tools
4. Change of staff's capacity: facilitation skill has improved
5. Change of Organization's networking quality and quantity : MOU [8]

**Vision**

Rifka Annisa's vision is*: "to realize a gender just society that does not tolerate violence against women through the principles of social justice, consciousness and awareness, independence, integrity and preserve local wisdom."*[9]

[6] Annual Report Mencare. 2013
[7] Annex C, MFS II endline Evaluation, 2014.
[8] General Key Changes (Rifka Annisa), 2014.

**Mission**

Rifka Annisa's mission is: "*to organize women in particular and society in general to eliminate violence against women and creating gender equitable society through the empowerment of women victims of violence, including children, elderly, Lesbians, Gays, Bisexuals, Transgender and other, and increase public awareness and involvement through education and strengthening critical network.*"[10]

**Strategies**

Rifka Annisa provides services to victims of GBV through (initiation of community-based) crisis centres, counselling to both victims and perpetrators (male groups) legal assistance and women support groups. In addition, Rifka Annisa aims to develop a strong network of health care providers, police and legal aid organizations and to improve the capacity of their partners by providing for example training programs. At the same time Rifka Annisa is strongly advocating against violence and especially violence against women through the media (film production, photo exhibition etc.). They also aim to influence local government to implement gender responsive policies. [11].

# 3 Methodological approach and reflection

## 3.1 Overall methodological approach

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

## 3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and

indicate whether and how the endline situation (2014) is different from the described situation in 2012[12].

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team

[12] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

## 3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question*: **To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia*** **(i.e. measuring effectiveness)?** and the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

### 3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)

India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)

Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)

Liberia: BSC, RHRAP (2/5).

### 3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

### 3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design** – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the

most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

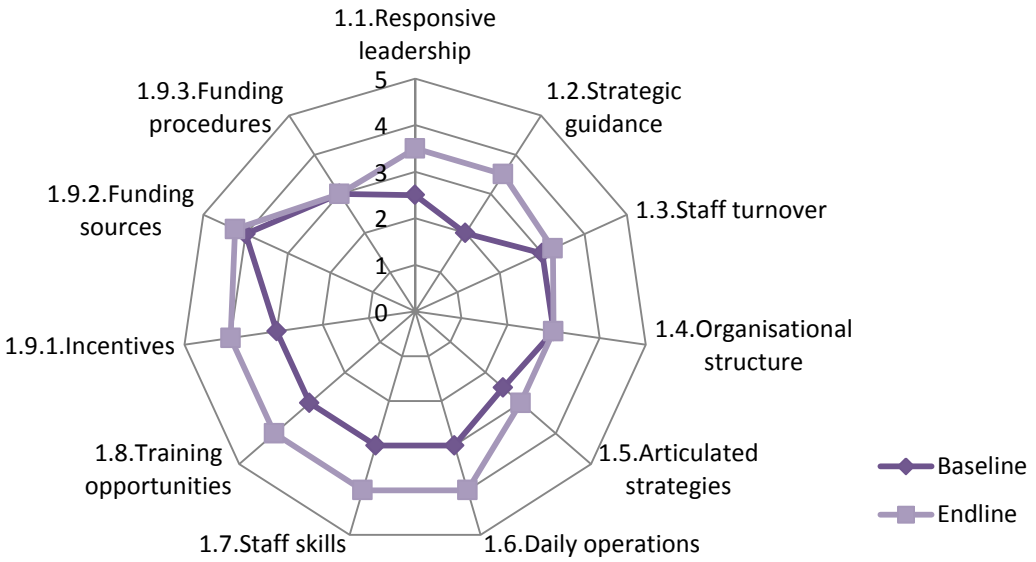
# 4 Results

## 4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of Rifka Annisa that have taken place since 2011 are described. The information is based on the information provided by Rutgers WPF.

Table 1
*Information about MFS II supported capacity development interventions since baseline*

| Title of the MFS II supported capacity development intervention | Objectives | Activities | Timing and duration | Budget |
|---|---|---|---|---|
| Capacity Development training on M&E | The development of more structural approach towards M&E | Tool development | 2012 | IDR 3.600.000 |



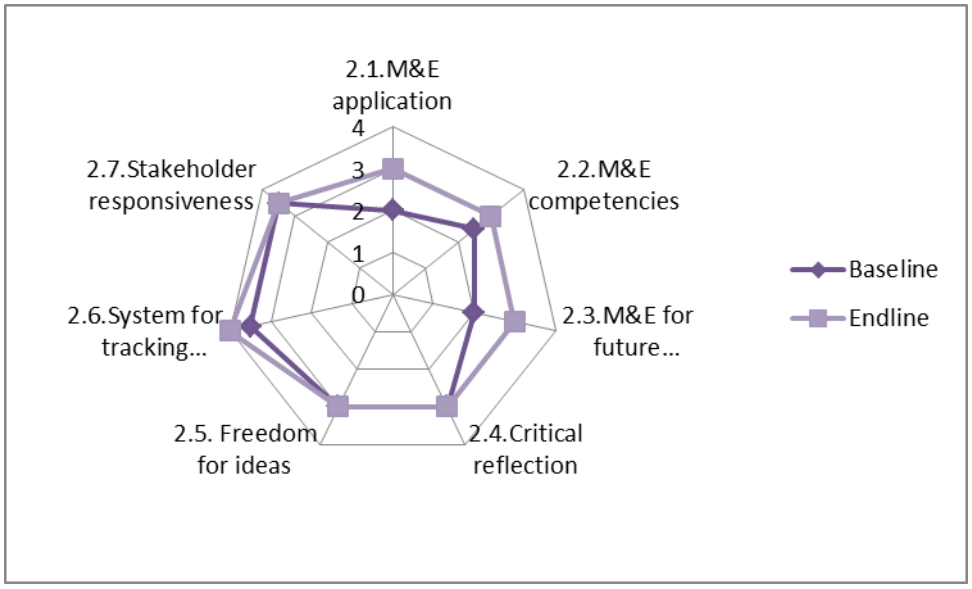
Source: 5C endline_support to capacity development sheet_SPO perspective_Indonesia_Rifka Annisa

## 4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities. This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also annex 3.

### 4.2.1 Changes in the five core capabilities

**Capability to act and commit**



Rifka Annisa experienced changes in the leadership, both at the board level and executive level (director). The change in leadership brought a positive atmosphere to the organization dynamic of Rifka Annisa. The management of the last two years has been very active in providing operational planning directives. Annual (work) planning includes a detailed budget plan to ensure that operational activities are financed in accordance with the strategic plan. Rifka Annisa still needs to improve their Strategic Planning and complete the plan with comprehensive external risk (threats) assessment and categorize the threats into low, medium and high risks, plus possible ways to overcome those threats. The organization also needs to regularly analyse the effectivity of budget spent (Budget vs. Actual Analysis), and this duty is part of the Board's responsibility.

Rifka Annisa gained a lot of benefit from the more active participation of the board, the director, and the managers in strategic guidance and decision making mechanisms. Strategies are now based on the vision and mission, in combination with baseline recommendations and findings, as well as input from stakeholders and staff on impacts on the target group. Almost all staff had the ability to do their day to day tasks and responsibilities. Rifka Annisa had also mandated the staff to master the knowledge of gender issue. This gained through induction and continuous capacity building within the organization. The capacity building through training has also supported Rifka Annisa's staff to conduct their role and responsibility better. English training for staff was intended to improve communication and wrting skill of the staff when they have to deal with Donors. Other thematic training such as, monitoring and evaluation training, the training on LGBT issues, feminism training, and men's care training was provided for all staff, starting from the office boy, security, and managerial level. The trainings have resulted in the improvement of staff capacity to accomplish the responsibilities, such as monitoring and evaluation capacity, facilitation skill, negotiation skill, proposal development skill, program planning skill, etc.

There is a standard mechanism for financial incentives for staff and also standard evaluation mechanism to be included in the payroll system. There is also an improvement regarding the reward and punishment system since April 2014. Remuneration now considers staff education background and work performance. Rifka Annisa is involved with many donor organizations and local governments and as such have a diversity of funders.  A clear funding procedure was still not in place, however, staff indicated that they have more opportunities in developing proposals to get funding from donors.

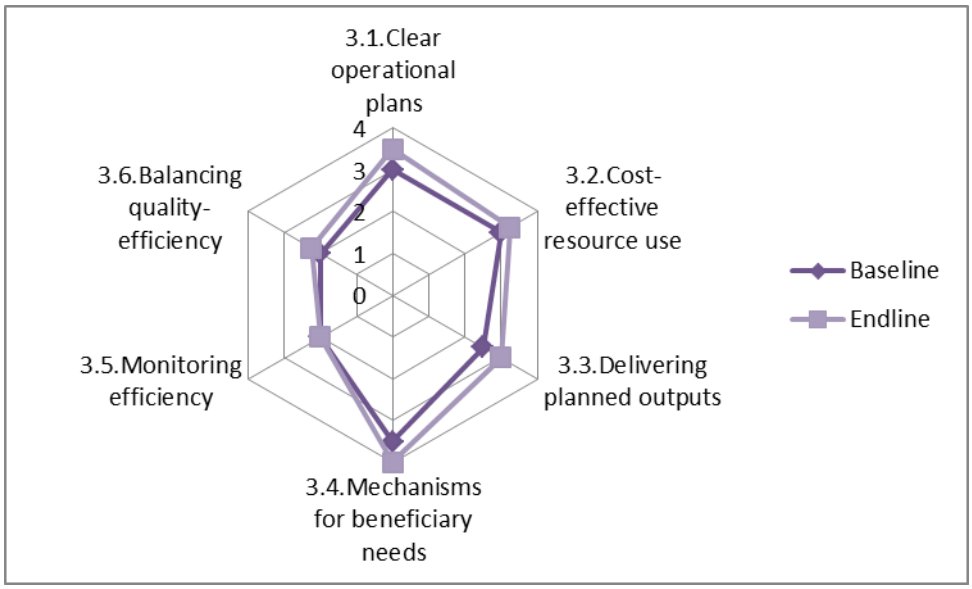
Score: from 2.9 to 3.6 (slight improvement)

**Capability to adapt and self-renew**

In the last two years M&E tools have been developed by the program division, and the information obtained has been used to improve and enrich existing programs. The evidence and results based M&E approach that is required by the donor encourages the staff to create programs in which information can be tracked and obtained up until the activity level.

Previously, it was director and manager who conducted evaluation, but now Rifka annisa applied a participatory evaluation. Every division evaluated other division. The evaluation was conducted within division and reported to the manager. In addition to that, the monitoring and evaluation training provided by donors have contributed to the increased staff capacity to conduct internal monitoring and evaluation.

M&E tools have been developed and applied at the activity level. A slight change has occurred There has been no new mechanism for the staff on reflection meetings during the last two years. There was a formal and informal meetings, such as organization meetings, managers meetings, annual staff meeting, evaluation and planning meeting to report the program development, its challenges, and its problems. The CFA has stated that although the M&E system is in place, Rifka Annisa needs to step further in order to build and effective MIS, data-base and knowledge management due to its leading position amongst similar organizations in Indonesia. A mechanism for sharing not only data, but also lessons learned to strategic stakeholders should be developed.



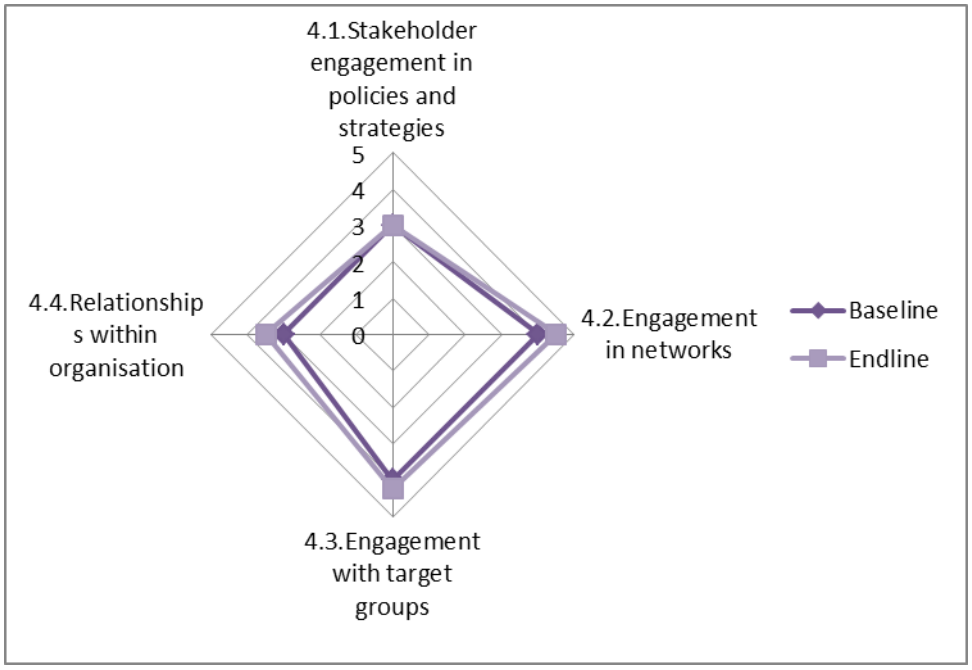
Rifka Annisa provided open and free opportunities for the staff to express their ideas on Wednesday and Friday. There was no gap between staff and the managerial levels.
Rifka Annisa has more extensive networking during the last two years. The networking has been expanded in village up to national level.

The program implementation was based on the input and feedback from the networkings, as well as based on the evidence from the stakeholders, iclusding the beneficiaries. Rifka Annisa conducted interview to beneficiaries about the impact of the program to beneficiaries' life.

There is no formal M&E system in place, although M&E tools have been developed and are utilized at the activity level in order to meet donor requirements. There is a detailed annual work plan and financial plan, and they have to report on activities and expenditures. There is no organizational level M&E aimed at measuring impact. There is however attention for outcomes and impact at the project level which is incorporated into reports. There is no dedicated person in place for M&E. There are conflicting statements onwhat M&E entails and how it is used. Discussions can be held at monthly staff meetings, at the managers' meetings, at the annual evaluation meeting and the annual members' meeting. The gap between managerial level, and staff has reduced and they are now more informal discussions with staff members. Rifka Annisa staff engages in network activities with various organizations, invites experts to share information, follows the media, maintains contacts through discussions and email, and shares this information internally. Rifka Annisa works closely together with its beneficiaries in order to best serve their needs. They are also open to their feedback and input.

Score: from 2.8 to 3.2 (slight improvement)

**Capability to deliver on development objectives**

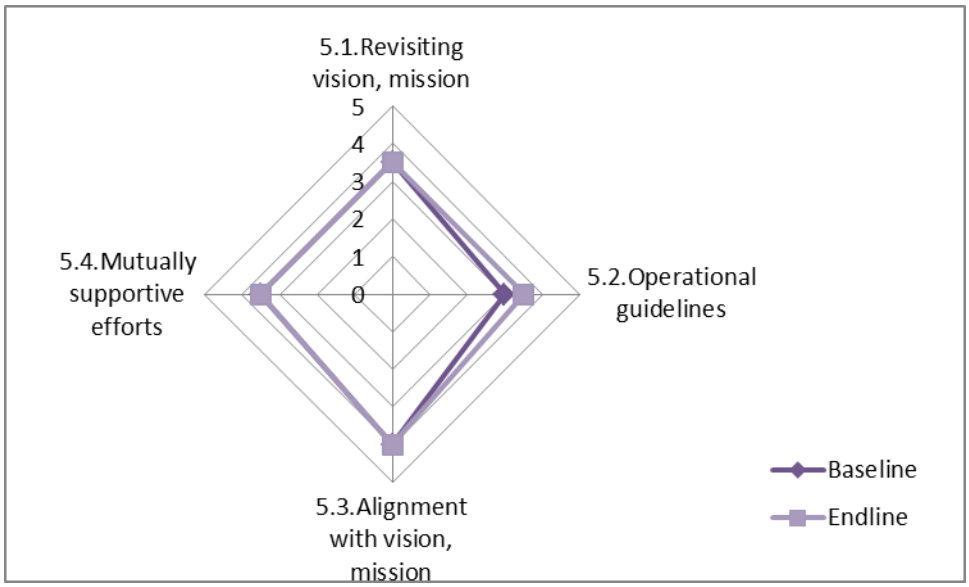


The development of the work plan was more rigid and there has been an annual activities planning funded by donor and by organization. Every program now has a clear work plan, budget, and target for each activity which is implemented by the staff. The work plan and budget plan are understood by the staff. Rifka Annisa also developed voluntarily system or mechanism to implement the program, having a low cost resource by opening internship. Rifka Annisa also built partnership with private sectors and media to get low cost price when conducting the program. Under the MFS II program Rifka had opened internship opportunities for other members of Aliansi Satu Visi (ASV), providing excellent chances to learn about management and SGBV case handling. Vice versa, RA had also sent its staff to Ardhanary Institute to learn more about Lesbian Bisexual and Transgender (LBT) issues. Based on this experience RA realized the need to improve SRH services for their clients, developing better referral networks with other members of ASV particularly in Yogyakarta (PKBI DIY and currently CD Bethesda) in order to provide more comprehensive services for SGBV survivors. Related to this need and situation, RA need to invest more in capacity building for staff as well as clients' data management. Furthermore the CFA stated that Rifka Annisa should focus in developing itself as a center of excellence in SGBV areas, as well as work with Theory of Change and using Result-based Management approaches in order to improve operations.

The organization has resources which are used effectively and efficiently. However, Rifka annisa has also made an effort to deliver the output in a timely manner by conducting more assistance to junior staff and supervision, conducting staff capacity building, and involving external consultant such as editor, translator, and writer,  Rifka Annisa had a mechanism to measure the quality of the service. The organization developed tools, such as tools to measure clients's resilience, pre test and post test of a training, etc. to measure whether their service has met beneficiaries's expectation.

Score: from 2.7 to 3.0 (very slight improvement)

**Capability to relate**



The organization expanded its network and develops good relationships from local level to national level. During the ast two years, they al also built relationship with schools, with Ministry of Religious Affair (religious Affair Office), BPPM (women and community empowerment board), Supreme Court, and some of the government institution, not only in national and provincial level, but also government in sub district and village level. The organization has done a lot in involving communities in their various activities, including to prevent violence against women. However, the CFA has stated that further development of the network and collaboration with private sectors is encouraged.

The organisation works together with stakeholders in building community based crisis centers and in shared activities like lobby and advocacy. Rifka frequently engages in campaigns and outreach activities. They do home visits and surveys, or invite clients for workshops and meetings and hereby

engage with the clients frequently. There are formal and informal meetings to discuss issues and exchange information and this is now also supported by the use of social media.

Score: from 3.5 to 3.8 (very slight improvement)

**Capability to achieve coherence**

The vision and mission of the organization are reviewed in the three-year general assembly meeting and the annual members' meeting, and all staff were involved in the annual strategic planning meeting. Operational guidelines are now laid down in standard operational procedures (SOP), now that manual of RCT and Rifka WCC have been combined. Almost all of the staff members hold the opinion that the programs are in line with the vision and mission and the long term strategic plan. Programs are connected with each other through their efforts to eliminate violence against women, as outlined in the vision and mission, and hereby complimentary in nature.

Score: from 3.5 to 3.6 (very slight improvement)

### 4.2.2 General changes in the organisational capacity of the SPO

The evaluation team carried out an end line assessment at Rifka Annisa from 25th March to 27th March 2014. During this end line workshop, the team made a recap of key features of the organisation in the baseline in September 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline. The main changes that happened in the organisation since the baseline, as identified by the staff during the end line workshop were:

1. Staff being more productive and involved in the organization's decision-making [3]
2. Greater motivation for staff to get promoted [9]
3. Staff being motivated to improve their facilitation skills [4]
4. Improved quality of monitoring and evaluation [2]
5. A stronger partnership with local authorities in form of a signed MoU [5].

All of these organisational capacity changes are expected to lead to strengthening the performance of the organisation [1].

1. Strengthening of the organization's work performance capacity [1];
Each of these changes in the organisation, and related organisational capacity changes and other factors are further explained below. The numbers in the narrative correspond to the numbers in the visual.

According to staff present at the end line workshop, **staff became more productive and involved in the organization's decision making** [3] since the baseline in 2012. This was enabled by an increase in collective decision making meetings where both regular staff and volunteers attended [6], a more active and engaged board of directors to deal with internal issues [7], and more staff members being promoted [8]. Each of these factors came about from an overall change in leadership in 2012 where both the acting director as well as the individual board members was replaced with new candidates [16].

The other organisation capacity change is that **staff became more motivated to get promoted** [9], which was due to a change in the HR policy and remuneration system. In this new system staff was evaluated differently, and compensated more fairly according to the tasks and responsibilities they possessed [12]. Prior to this, the salary difference between junior and senior level staff was almost negligible, providing little incentive for junior staff to opt for promotion. This change in the remuneration system was implemented following one of the recommendations from the organizational development consultant who Rifka Annisa hired in 2013 [17].

Another organisational capacity change that happened since the baseline was that staff became more **motivated to contribute to and develop facilitation sessions** [4]. Being an organization who focuses on capacity building, Rifka Annisa has a lot of scheduled time dedicated to training local communities, other organizations and internal staff. So whilst the need for facilitation skills was high, staff often considered the task of facilitation secondary to their other program activities. However, there was a change in the organisation in terms of realising the importance of increased facilitation skills [18] and this finally staff being more motivated to engage in facilitation [4]. There were three reasons for this change in motivation to facilitate. First of all the there was a new HRD system which now also included facilitation skills and volunteering as evaluation criteria[10].This was the result of an overall change in the staff's evaluation mechanism and remuneration system [12]. Secondly, there were now more opportunities for staff to take turns in facilitation sessions [13], which helped the staff in being able to actively contribute to facilitation [4]. This was a direct result of realizing the need to improve facilitation skill [18]. Thirdly, the new HRD regulation set a higher standard of being a facilitator [11] which encouraged staff to improve their facilitation skill.

A significant change in terms of an **improvement of the quality of monitoring and evaluation** in Rifka Annisa took place [2]. As mentioned before, this came about from a much more structural approach towards M&E in the form of specific tools such as program planning, log frame tracking and analysis, work plans and the development and monitoring of specific indicators [14]. These tools were developed [15] following strict donor requirements to adopt a result-based management approach in the implementation of the organization's programs [19].

Lastly, **the partnership with local authorities was significantly strengthened** after signing a Memorandum of Understanding (MoU) with sub-district government officials and the police [5]. This came about from an active effort to increase the networking quality and quantity of Rifka Annisa [20]. Results of this could be clearly seen in the contribution of Rifka Annissa to the LGBT – Lesbian, Gay, Bi-sexual, and Transgender) program where several organizations were drawn together to commit to the cross cutting issues of disability, LGBT and sexual abuse.

# 5 Discussion and conclusion

## 5.1 Methodological issues

**General: Applied to all or most SPOs**

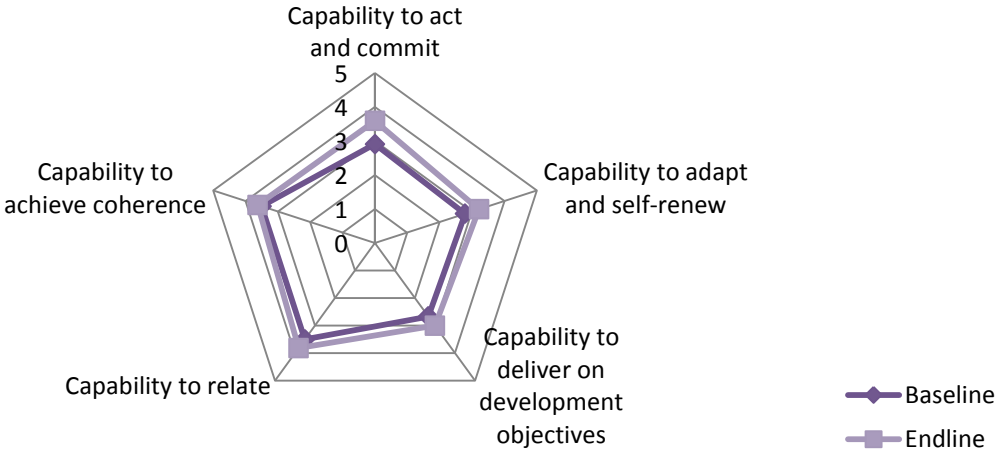
With regard to the methodology, Indonesia has made some data collection adjustment based on the context. The first adjustment was related to the type of instrument used. To assess the organizational capacity, the study has provided self-assessment, observation and interview sheets. These all were used during the baseline with all SPOs. During the end line the team used self-assessment, interview and observation sheets. However the evaluator applied interview sheets as self-assessment—where participants were asked to fill these sheets by themselves. For the participants who did not attend the workshop, the interviews were done separately using the interview sheet and the results from the interview were included in the subgroup interview sheet that was already filled by the staff member. Were combined into the relevant sub categories in the interview sheet. Interview sheets were also applied for interviews with the CFAs, partners and consultants.

The baseline study showed that having two similar instruments (self assessments, and interview sheets) did not have any effect in relation to obtaining adequate and quality data.
To have some clarification post visit to all SPOs, the evaluator used email and phone interviews.

**Rifka Annisa**

The MSF II evaluation team carried out endline workshop in Rifka Annisa in the end of March 2014, before the initial training for the evaluation team of MSF II endline conducted in Yogyakarta. As the first workshop of the endline process, the workshop in Rifka was considered as an effort to generate lessons learned of the data collection process in SPOs. The process followed strictly the methodological guidelines, and started with sending the self-assessment sheets to the SPO, a day before the workshop so that these could be filled beforehand . It was expected that the SPO has finished answering the self-assessment sheets on the endline workshop day and gained deeper understanding on the topics/theme of the end-line workshop. However, it turned out to be more appropriate to discuss and fill in the self-assessment sheets with the guidance of the evaluator in answering the questions related to the indicators.

The endline workshop started with general explanation of the end line process to participants, and the session continued with group self-assessment according to the functional groups of the organization (management, program staff, field staff, finance and admin staff). Since there was no specific person appointed as M&E, this function was represented by other staff who conducted an M&E role. . The SPO preferred to fill in the indicators during the workshop rather than prior to workshop as expected. Most of the groups needed to be assisted closely during the process, and be assisted in understanding the meaning of the questions related to the indicators in the self-assessment sheets. As more time was needed to finish the self-assessment sheet, the process moved to group interviews, and it was agreed to submit the filled self-assessment sheets on a particular date. Participants said that group interview sessions were much more effective as they could understand the questions easily and thereby provide answers. The interview sessions provided lot of information about organizational capacity. The general causal map discussion on the next day provided more information on the organizational capacity changes based on the 5 capabilities framework . It was later known that discussions did not need to strictly find out the changes for each of the 5 capabilities directly and had to draw the causal map between changes. The process of general causal map in Rifka Annisa was an analysis process after the workshop and concluded after all field notes were written and analyzed. - To complete the analysis, the



evaluation team interviewed the government partner from government and thecapacity development consultant.

However, it needs to be highlighted that the self-assessment sheet was quite challenging for the organization to fill in. It took a couple of days for the SPO to work with the group and have the paper filled in.

## 5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Changes on all five capabilities for Rifka Annisa, but mostly so under the capability to act and commit. Below the changes in each of the capabilities are further explained, by referring to the specific indicators that changed.

Over the last two years most improvements took place in the capability to act and commit. Responsive leadership improved as a change in leadership brought a positive atmosphere to the organization dynamic of Rifka Annisa. Strategic guidance improved considerably, due to a more active and involved upper management. The board is involved in more decisions on the ground and the director is more active in providing strategic directions, even upon a staff members request. Staff turnover has slightly improved. For the last two years the turnover was relatively lower than previous years, as Rifka Annisa made an effort to maintain the remaining staff by providing capacity building through training. Articulated strategies improved slightly as Rifka Annisa made an effort to have a baseline in every program in order to have a more systematic mechanism for evaluation during the endline. Daily operations improved as the management of the last two years has been very active in providing operational planning directives. Annual (work) planning includes a detailed budget plan to ensure that operational activities are financed in accordance with the strategic plan. Staff skills also improved due to greater attention to skills and training as well as facilitator selection. In turn, training opportunities increased in terms of English training for all staff, thematic training such as monitoring and evaluation training, the training on LGBT issues, feminism training, and men’s care training. Incentives for staff have improved as well. The organization now provides free accommodation, a basic salary and allowance, as well as loans through salary deduction. Funding sources have improved very slightly, and Rifka currently has business programs in place aimed at generating income for the organization in order

to become less dependent on donors and more self-sufficient. For example, they now actively run the business division by renting out the guesthouse.

The capability to adapt and self renew has improved overall. First, the application of M&E has improved. In the last two years the program division has developed M&E tools, and the information obtained has been used to improve and enrich existing programs. M&E competencies slightly improved as well. The development and implementation of M&E tools indicates that understanding about M&E has improved. M&E for future strategies has improved through the increased attention to outcomes and impacts at the project level. In terms of the organizations system for tracking the environment, a slight improvement was found through the increase in networking activities. More attention is now paid on this aspect through the organization of public discussions and by sharing knowledge regarding the newest issues which has influenced the organization's perspective.

The capability to deliver on development objectives has improved. In terms of clear operational plans the development of the work plan was more rigid and there has been an annual activities planning funded by donor and by the organization. Cost effective resources use has been slightly improved due to the application of an efficient cost activity, such as combining two activities at once to reduce transportation cost. Delivering planned outputs has also only slightly improved. Rifka Annisa has made an effort to deliver the outputs in a timely manner by conducting more assistance to junior staff and providing supervision, conducting staff capacity building, and involving external consultants such as editor, translator, and writer. The mechanism for beneficiary needs has improved slightly through a mechanism to measure whether services meet beneficiary needs. In this approach tools are developed which allow measuring of client resilience. The balance in quality and efficiency has slightly improved as Rifka Annisa has combined staff evaluations with job descriptions.

The capability to relate has improved slightly in terms of engagement in networks. During the last two years, staff indicated that Rifka Annisa has extended its' networking. Rifka Annisa did not only work with hospitals, police, court, but also built relationships with the Ministry of Religious Affairs (religious Affair Office), BPPM (women and community empowerment board), Supreme Court, and some of the government institutions, not only in national and provincial level, but also government in sub district and village level. Engagement with target groups has also very slightly improved through engaging in direct interaction with beneficiaries through campaigns and outreach activities, but also new social media such as WhatsApp Messenger and Twitter. Relationships within the organization have slightly improved in that the organization has committed to a good working atmosphere in which staff can share ideas freely.

In the capability to achieve coherence, operational guidelines have slightly improved as they are laid down in standard operational procedures (SOPs), for example in a finance manual and a method for setting up a referral system to other organizations.

**General organisational capacity changes related to MFS II Interventions**

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. Please note that this information is based only on the information provided by Rifka Annisa staff during the endline workshop, but no validation of this information has been done like with the process tracing causal maps. For details in relation to attribution, we refer to the next section (5.3).

During the endline workshop some key organisational capacity changes were brought up by Rifka Annisa staff, these have been captured in the general causal map in 4.2.2: staff being more productive and involved in the organization's decision-making; greater motivation for staff to get promoted; staff being motivated to improve their facilitation skills; improved quality of monitoring and evaluation and a stronger partnership with local authorities in form of a signed MoU. All of these are expected to contribute to strengthening of the organization's work performance capacity. Rifka Annisa staff experienced these as the most important capacity changes in the organisation since the baseline.

Staff is more productive and involved with organizational decision making as a result of collective decision making occurring more frequently, a more active and engaged board to organisational matters, and more staff being promoted. Each of these changes can be attributed to the change in leadership that occurred in 2012, where both the acting director as well as the individual board members were replaced with new candidates.

Greater motivation for staff to get promoted occurred due to greater benefits being offered. This can be attributed to a change in the remuneration system and the staff evaluation mechanism on the one hand, and to the increased number of opportunities to take turn in the facilitation sessions on the other. The former can bet attributed to a recommendation from the hired organizational development consultant on HR issues which was an MFS II sponsored capacity development intervention. The latter can be attributed to the organization realizing the importance to improve the staff's facilitation skills.

Similarly, staff being motivated to improve their facilitation skills resulted from a new HRD system in place that now is also applied to facilitator selection. This can be attributed to the change in the staff remuneration/evaluation system on the one hand, and the increased number of opportunities to take turn in facilitation sessions on the other, as described above.

Improved quality of monitoring and evaluation can be attributed to the baseline having encouraged the development of program planning, logframes, work plans and indicators. This resulted from an improved quality in monitoring and evaluation through development of M&E tools. The development of M&E tools was an MFS II funded capacity development intervention by Rutgers WPF, and can be attributed to the Donor requirement to adopt Results Based Management in program implementation.

Finally, the MoU with local authorities has strengthened the partnership to achieve a common goal, which can be directly attributed to the change of the organization's networking quality and quantity in that Rifka Annisa invested in relations to local authorities. Results of this could be clearly seen in the contribution of Rifka Annissa to the LGBT – Lesbian, Gay, Bi-sexual, and Transgender) program where several organizations were drawn together to commit to the cross cutting issues of disability, LGBT and sexual abuse.

In conclusion in relation to MFS II funded capacity development interventions, this can be mainly related to improved monitoring and evaluation in the organization, and specifically refer to the training on M&E and more particularly the development of M&E tools. Furthermore, specific organization development points were found in an organizational capacity scan that has led to some changes in the way staff performs. However, this has also been affected by other developments such as a major change in leadership as well as a greater focus on facilitation skills. Strengthening organization work performance in general can therefore be partially related to MFS II supported capacity development interventions, according to staff present at the endline workshop. However, it must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect.

# Appendix 1 Methodological approach & reflection

## 1. Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

# 2. Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.[13] Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or

[13] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;

4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
   - -2 = Considerable deterioration
   - -1 = A slight deterioration
   - 0 = No change occurred, the situation is the same as in 2012
   - +1 = Slight improvement
   - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*
3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
   - Intervention, actor or factor at the level of or by **SPO**: ..... .
   - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
   - Intervention, actor or factor at the level of or by the **other funders**: ..... .
   - **Other** interventions, actors or factors: ..... .
   - Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4.* ***Collect, upload & code the documents*** *from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;
- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5.* ***Prepare and organise the field visit*** *to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);

- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6.* ***Interview the CFA*** *– CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

*Step 7.* ***Run the endline workshop*** *with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

***Purpose of the fieldwork*****:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

***Brainstorm on key organisational capacity changes and influencing factors***: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative.This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

***Self-assessments*:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8. **Interview SPO staff** – in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9. **Fill-in observation sheets** – in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

*Step 10. **Interview externals** – in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11. **Upload and auto-code all the formats** collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the **overview of information** per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13. **Analyse the data and develop a draft description** of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14. **Analyse the data and finalize the description** of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15.* ***Analyse the information*** *in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

# 3. Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

## Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

- Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.
- Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.
- Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

*The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia*

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

*SPOs selected for process tracing – Ethiopia*

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| AMREF | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| CARE | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| ECFA | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| FSCE | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| HOA-REC | Sustainable Energy project (ICCO Alliance): 2014 Innovative WASH (WASH Alliance): Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| HUNDEE | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| NVEA | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |
| OSRA | C4C Alliance project (farmers marketing): December 2014 ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| TTCA | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

*The extent to which the Dutch NGO explicitly targets the following capabilities – India*[14]

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

*SPOs selected for process tracing – India*

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BVHA | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| COUNT | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| DRISTI | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| FFID | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |

[14] RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Jana Vikas | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| NEDSF | | | | | | | No – delayed baseline |
| RGVN | | | | | | | No - delayed baseline |
| Samarthak Samiti (SDS) | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| Shivi Development Society (SDS) | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| Smile | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| VTRC | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

*The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia*

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | Pt. PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, Pt.PPMA, YPI, YRBI.

Table 6

*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| ASB | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| Dayakologi | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| ECPAT | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| GSS | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| Lembaga Kita | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| Pt.PPMA | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| Rifka Annisa | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| WIIP | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Yayasan Kelola | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| YPI | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| YRBI | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| Yadupa | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

*The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia*

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

*SPOs selected for process tracing – Liberia*

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BSC | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| DEN-L | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| NAWOCOL | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| REFOUND | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| RHRAP | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the

field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

5.

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

- A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
- A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
- **Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
- **Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for coding documents received from SPO and CFA in NVivo on the following:

- 5C Indicators: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the capacity development interventions implemented by the CFA (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
  - In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
  - During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;

- During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
- During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*'

elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.

The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

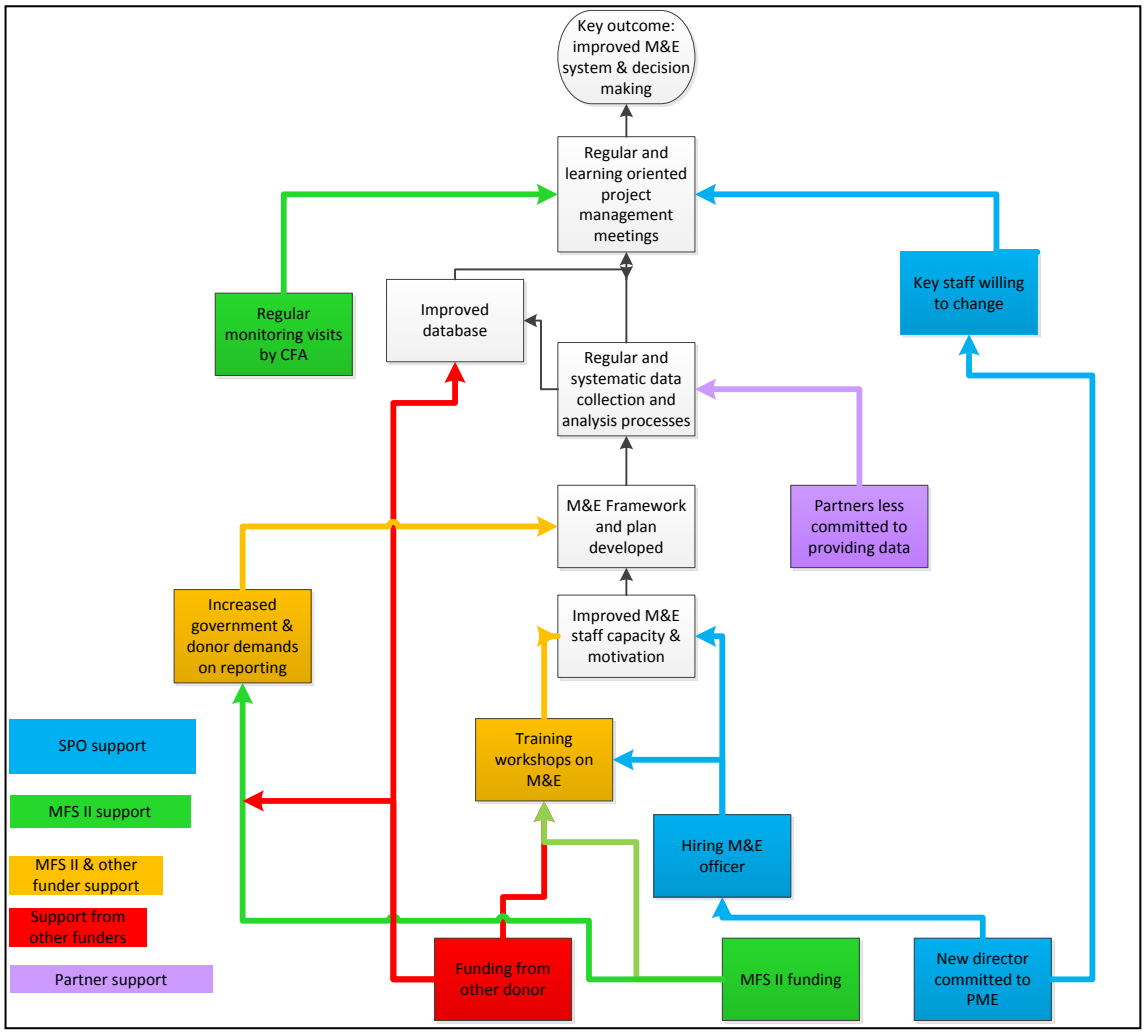

***Figure 1*** *An imaginary example of a model of change*

*Step 5. Identify **types of evidence** needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, *"What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?"*. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

- **Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.
- **Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
- **Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.
- **Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

*Format for identifying types of evidence for different causal relationships in the model of change (example included)*

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| Describe relationship between the subcomponents of the model of change | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions. Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y? Can we find this information by means of : Pattern evidence; Sequence evidence; Trace evidence; Account evidence? | Describe where you can find this information |
| Example: Training workshops on M&E provided by MFS II funding and other sources of funding | Example: What type of training workshops on M&E took place? Who was trained? When did the training take place? Who funded the training? Was the funding of training provided before the training took place? How much money was available for the training? | Example: Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br><br>Sequence evidence on timing of funding and timing of training<br><br>Content evidence: what the training was about | Example: Training report SPO Progress reports interviews with the CFA and SPO staff Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality** of data and **analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012),

Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

| ***Example format for the adapted evidence analysis database (example included)*** **Description of causal relation** | **Confirming/ rejecting a causal relation (yes/no)** | **Type of information providing the background to the confirmation or rejection of the causal relation** | **Strength of evidence: strong/ rather strong/ rather weak/ weak** | **Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected** |
|---|---|---|---|---|
| e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

# 4. Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

# 5. Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that

they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design** – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all

the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

- The capability to act and commit;
- The capability to deliver on development objectives;
- The capability to adapt and self-renew;
- The capability to relate (to external stakeholders);
- The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed. A detailed overview of capabilities with outcome domains and indicators is attached in Appendix 3.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Appendix 3 Changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

**Endline Description of Indicators Rifka Annisa**

**Capability to act and commit**

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'
*This is about leadership within the organization (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organization.*

Rifka Annisa experienced changes in the leadership, both at the board level and executive level (director). The change in leadership brought a positive atmosphere to the organization dynamic of Rifka Annisa. The communication between board and the management was very active; they made use of every opportunity to discuss organizational development issues. The current board members were actively providing support to the organization. The new directors also provided more opportunities for the staff to participate in decision making processes, including discussions on proposal development. The leadership of Rifka Annisa continues to practice participatory decision-making, and everyone can give their opinion as well as develop themselves within the organization. There is good cooperation and effective coordination between staff and manager. The relation between staff and leaders can be described as a good familial relationship which also plays an important role in program implementation.

Score: 2.5 to 3.5 (improvement)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'
*This is about the extent to which the leader(s) provide strategic directions*

Rifka Annisa gained a lot of benefit from the more active participation of the board, the director, and the managers in strategic guidance and decision making mechanisms. Board members joined in the meetings of management to discuss SOP, budgeting, and strategic planning. Issues, problems, and progress were well communicated. In these meetings, board members provided advisory support and strategic guidance about program implementation and development. The board has intensive meetings every one or two months with the directors and managers to discuss the work plan and budget. . Staff is free to choose which program activities they prioritize and want to work on first.

The organization has begun to conduct program evaluation for staff performance through staff appraisal regarding staff and manager's performance. The leader is more active in providing strategic direction which is not only provided during the monthly meetings, but also every time the staff requests it. This affects how programs are executed.

More action is undertaken to increase the influence of beneficiaries and the organization has opened itself up for new issues such as LGBT (lesbian, gay, bisexual, and transgender), without compromising the focus on existing issues.

Score: 2 to 3.5 (considerable improvement)

1.3. Staff turnover: 'Staff turnover is relatively low'
*This is about staff turnover.*

After experiencing a high staff turnover in 2012, Rifka Annisa tried to find a solution. However, this was postponed and added as an issue to be discussed in the upcoming revision of the strategic planning which is planned in the end of 2014. The staff turnover, especially the senior ones, left a lesson learned for Rifka Annisa to find mechanism to prevent the turn over. Most of the senior staff who resigned has received capacity building as benefit of being Rifka Annisa's staff, such as scholarship and overseas training. The situation left a gap between remaining senior staff and the junior ones. More capacity building was needed to fill in the capacity gap. Another focus point was to find ways to improve human resource management. For the last two years the tur over was relatively lower than previous years, as Rifka Annisa made an effort to maintain the remaining staff by providing capacity building trough training.

Score: 3 to 3.25 (slight improvement)

1.4 . Organisational structure 'Existence of clear organization structure reflecting the objectives of the organization"
*Observable indicator: Staff have copy of org. structure and understand this*

Nothing has changed in Rifka Annissa in terms of organizational structure. The functions for director and some of the board members have been taken over by new individuals.
Rifka Annisa continues to work from within existing institutions, for example by setting up a women's desk inside hospitals and community centers. This allows them to develop an integrated management system for women and children victims of violence by involving the various organizations. It also helps to build the community's capacity to deal with violence issues. During the baseline it was reported that Rifka Annisa has too many layers, which can lead to miscommunication, this remains to be a potential problem.

Score: From 3 to 3 (no change)

1.5 Articulated Strategies. Strategies are articulated and based on good situation analysis and adequate M&E
*Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.*

The baseline of the men's care program funded by MSF II gave an insight to adopt the same M&E mechanism for all of Rifka Annisa's programs. Rifka Annisa made an effort to adopt baseline in every program in order to have a more systemized mechanism on the endline. It helped them to conduct regular monitoring and evaluate the program. However, there is still no formal M&E person at the organizational level, although staff members collect information on an individual case basis. Strategies are now based on the vision and mission, in combination with baseline recommendations and findings, as well as input from stakeholders and staff on impacts on the target group.

Score: From 2.5 to 3 (slight improvement)

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'
*This is about the extent to which day-to-day operations are aligned with strategic plans.*

The management of the last two years has been very active in providing operational planning directives. Annual (work) planning includes a detailed budget plan to ensure that operational activities are financed in accordance with the strategic plan.
Daily operations in general are considered to be in line with strategic plans, but sometimes there are deviations as a result of engagement in unplanned activities or the absence of guidance from the leaders. Most of the work plans in the observed period have been successfully achieved. Particularly the media division has scored well in terms of alignment with the strategic plan.The staff is committed to

finish their projects on time and within budget, but when an activity is not donor-funded this may not always work well. So unplanned and delayed activities have resulted in some deviations from strategic plans.

Score: 3 to 4 (improvement)

1.7. Staff skills: 'Staff have necessary skills to do their work'
*This is about whether staff have the skills necessary to do their work and what skills they might need.*

Almost all staff had the ability to do their day to day tasks and responsibilities. Rifka Annisa had also mandated the staff to master the knowledge of gender issue. This gained through induction and continuous capacity building within the organization.

- The recruitment mechanism in Rifka Annisa has been strengthened in the last two years. The Human resource manager has carefully selected. This was done due to finding a proffesoinal who was able to assist Rifka Annisa in developing human resource department.
- The new human resource manager and the consultant developed a recruitment standard which strictly requiring a certain professional capacity to fill in the certain posts. For example, every staff of Rifka Annisa should have writing capacity as the basic skill. Rifka Annisa considered writing skill as the basic skill of knowledge management. Another strict requirement in the staff selection process was that the person must show great interest on the gender issue, women issues, and children issues. This mechanism has been enabled Rifka to recruit staff who has capacity needed by the program.
- The capacity building through training has also supporte Rifta Annisa's staff to conduct their role and responsibility better. English training for staff was intended to improve communication and wrting skill of the staff when they have to deal with Donors. Other thematic training such as, monitoring and evaluation training, the training on LGBT issues, feminism training, and men's care training was provided for all staff, starting from the office boy, security, and managerial level.
- The trainings have resulted in the improvement of staff capacity to accomplish the responsibilities, such as monitoring and evaluation capacity, facilitation skill, negotiation skill, proposal development skill, program planning skill, etc.
- Currently Rifka Annisa applied a very strict facilitator selection. The process of the facilitator used to conduct without rigid selection criteria, but now, Rifka Annisa used an assessment and mechanism to determine feasibility of being a facilitator. A staff had to go through certain assessment to be a facilitator, meaning that not all staff hold a "license" to be a facilitator. This mechanism has encouraged staff to improve their facilitation capacity and conduct their job more professionally.
- Rifka Annisa also applied a new mechanism to build staff's capacity by mainstreaming all values in each program to be shared to all staff. The new mechanism was intended to keep all staff with the shared values or capacity to conduct a program. The mastery of an issue or a program used to be attached to the staff of a certain program, but now, it was expected that Rifta Annisa shared the same value or capacity in conducting the program. Rifka Annisa built a sharing process mechanism through regular meeting between managers and staff. a very celar example of this mechanism was LGBT program fubded by MSF II. The capacity building of LGBT in which all staf of Rifka annisa involved in the training. Staff indicated that they applied the LGB perspectives in all program of Rifka Annisa.

Score: 3 to 4 (improvement)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'
*This is about whether staff at the SPO are offered appropriate training opportunities*

Rifka Annisa provided more training opportunities for staff in the last two years, some of which are provided directly by Rifka Annisa (in house training), donors or network partners..
During the last two years, Rifka Annisa provided various training to all staff, such as: English training for all staff, thematic training such as; monitoring and evaluation training, the training on LGBT issues, feminism training, and men's care training. The training was provided for all staff, starting from the office boy, security, and managerial level. Staff also enthusiastically joined the training provided by donors such as, children trafficking training, certified mediator training, client monitoring tools development, and human resource management analysis training. MSF II funding also provided staff

capacity building through trainings on LGBT mainstreaming, counseling training, internship in Ardhanary Institute, monitoring and evaluation training, Men's care training, youth advocacy training, and communication and advocacy training. While from other institution, Rifka Annisa also joined child protection policy training and human resource within CSO training. The last two training was provided by VSO.Managers shared any training opportunities to the staff and the mechanism of training opportunity were managed by Human resource division.
Rifka Annisa has prioritized the focus of capacity building on specific issues where there are more challenges and competition with other organisations. Overall, compared to the baseline, more training has been attended by staff members. Additionally, where in the baseline evaluation staff and management indicated that sharing knowledge was insufficient, the organization has now implemented a sharing mechanism for staff every Friday.

Score:3 to 4 (improvement)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'
*This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.*

The staff indicated that incentives was not only about salary, but also opportunity for capacity building, and knowledge. They considered training as one of the incentives working in Rifka Annisa. The organization now provides free accommodation, a basic salary and allowance, as well as loans through salary deduction. There is a standard mechanism for financial incentives for staff and also a standard evaluation mechanism to be included in the payroll system. There was an improvement regarding the reward and punishment system in April of 2014. Remuneration now considers staff's education, background and work performance.

Score: 3 to 4 (improvement)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'
*This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.*

Rifka Annisa remained involved with many donor organizations and local governments and as such have a diversity of funders, such UNTF, Rutgers WPF, Oxfam, TDH Netherland, AWO. They are a well-known as a leading organization on women issues. As a result they have sufficient funding from various donors, although this does not cover all of their expenses and programs. What can be improved according to some staff members is independent fundraising. Rifka currently has business programs in place aimed at generating income for the organization in order to become less dependent on donors and more self-sufficient. For example, they now actively run the business division by renting out the guesthouse.

Score: 4 to 4.25 (very slight improvement)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'
*This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.*

Compared to baseline, Rifka Annisa now encouraged all program staff to write and develop proposals. It used to be managers who had responsibility to write proposals. A number of staff members indicated not being aware of any procedures on developing proposals. Staff involeved in the proposal development was limited from the certain division to develop the current program. For example, all staff in the media division was involved in the program development to AWO International.

Score: 3 to 3 (no change)

**Summary Capability to act and commit**
Rifka Annisa experienced changes in the leadership, both at the board level and executive level (director). The change in leadership brought a positive atmosphere to the organization dynamic of Rifka Annisa. The management of the last two years has been very active in providing operational planning

directives. Annual (work) planning includes a detailed budget plan to ensure that operational activities are financed in accordance with the strategic plan. Rifka Annisa still needs to improve their Strategic Planning and complete the plan with comprehensive external risk (threats) assessment and categorize the threats into low, medium and high risks, plus possible ways to overcome those threats. The organization also needs to regularly analyse the effectivity of budget spent (Budget vs. Actual Analysis), and this duty is part of the Board's responsibility.

Rifka Annisa gained a lot of benefit from the more active participation of the board, the director, and the managers in strategic guidance and decision making mechanisms. Strategies are now based on the vision and mission, in combination with baseline recommendations and findings, as well as input from stakeholders and staff on impacts on the target group. Almost all staff had the ability to do their day to day tasks and responsibilities. Rifka Annisa had also mandated the staff to master the knowledge of gender issue. This gained through induction and continuous capacity building within the organization. The capacity building through training has also supporte Rifka Annisa's staff to conduct their role and responsibility better. English training for staff was intended to improve communication and wrting skill of the staff when they have to deal with Donors. Other thematic training such as, monitoring and evaluation training, the training on LGBT issues, feminism training, and men's care training was provided for all staff, starting from the office boy, security, and managerial level. The trainings have resulted in the improvement of staff capacity to accomplish the responsibilities, such as monitoring and evaluation capacity, facilitation skill, negotiation skill, proposal development skill, program planning skill, etc.

There is a standard mechanism for financial incentives for staff and also standard evaluation mechanism to be included in the payroll system. There is also an improvement regarding the reward and punishment system since April 2014. Remuneration now considers staff education background and work performance. Rifka Annisa is involved with many donor organizations and local governments and as such have a diversity of funders.  A clear funding procedure was still not in place, however, staff indicated that they have more opportunities in developing proposals to get funding from donors.

Score: from 2.9 to 3.6 (slight improvement)

**Capability to adapt and self-renew**
2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'
*This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).*

In the last two years M&E tools have been developed by the program division, and the information obtained has been used to improve and enrich existing programs. The evidence and results based M&E approach that is required by the donor encourages the staff to create programs in which information can be tracked and obtained up until the activity level. This can be considered an improvement since the baseline situation two years ago where no formal M&E system nor mechanism was in place. Rifka annisa started to adopt baseline for all the programs, not only programs funded by MSF II. They became more aware of the need to conduct carefull monitoring and evaluation mechanism.

Score: 2 to 3 (improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'
*This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.*

This indicator has slightly improved. The development and implementation of M&E tools indicates that understanding about M&E has improved. Although there is still no dedicated staff member in place tasked with this particular role, the basis for M&E to fulfill the donor's requirements is now in place. Previously, it was director and manager who conducted evaluation, but now Rifka annisa applied a participatory evaluation. Every division evaluated other division. The evaluation was conducted within division and reported to the manager. In addition to that, the monitoring and evaluation training

provided by donors have contributed to the increased staff capacity to conduct internal monitoring and evaluation. The training has assisted staff to see the impact of a program. Indicators achievement was reflected in the field report. The currentt weakness in monev was the documentation system, data was not documented well so that the knowledge management was hard to do.

Score: 2.5 to 3 (slight improvement)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'
*This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.*

Although there is no organizational level M&E aimed at measuring final impact. There is however attention for outcomes and impact at the project level which is incorporated into reports.M&E tools have been developed and applied at the activity level. A slight change has occurred in the M&E practice for particular programs because it has to be actively synchronized with the objectives, indicators, and field findings. Field activities are used to identify the outputs and to measure whether the goal has been achieved or not. The result of the monev in every project was always used as a reference to develop new program, including development of program planning.
Score: 2 to 3 (improvement)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'
*This is about whether staff talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staff are comfortable raising issues that are problematic.*

There has been no new mechanism for the staff on reflection meetings during the last two years. There was a formal and informal meetings, such as organization meetings, managers meetings, annual staff meeting, evaluation and planning meeting  to report the program development, its challenges, and its problems. The change was not so significant, becaue no new mechanism take place, however, HRD was now involved in the informal communication. Rifka Annisa took benefit of the new technology as a means of communication such as whats App. The communication mechanism was more clear than previous.

Score: 3 to 3 (no change)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives
*This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.*

Rifka Annisa provided open and free opportunities for the staff to express their ideas on Wednesday and Friday. There was no gap between staff and the managerial levels. A number of staff members indicate that ideas are not often put into practice, but others contradict this and mention that when an idea is relevant it will be implemented.The new director gives more opportunity for more staff by asking them to attend capacity building or training. This attitude may change this indicator in the future, but for now no change could be found.

Score: 3 to 3 (no change)

2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and developments in its operating environment'
*This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.*

Rifka Annisa has more extensive networking during the last two years. The networking has been expanded in village up to national level., and also more networking in certain themes such as women migrant, women and election, and widowers.

More attention is now paid on this aspect through the organization of public discussions and by sharing knowledge regarding the newest issues which has influenced the organization's perspective.

Score: 3.5 to 4 (slight improvement)

2.7. Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and the general public'
*This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.*

Rifka Annisa worked very closly with the networking. Maintaining networking was the priority of the organization. The program implementation was based on the input and feedback from the networkings, as well as based on the evidence from the stakeholders, iclusding the beneficiaries. Rifka Annisa conducted interview to beneficiaries about the impact of the program to beneficiaries' life. Rifka Annisa works closely together with its beneficiaries in order to best serve their needs. They are also open to their feedback and input, as well as from other network partners, even though there is no standardized or systematic way for doing so. The organization is service-oriented and focused on beneficiary needs. The baseline has contributed the organization to determine strategy of meeting the beneficiaries needs.

Score: 3.5 to 3.5 (no change)

**Summary of capability to adapt and self-renew**
In the last two years M&E tools have been developed by the program division, and the information obtained has been used to improve and enrich existing programs. The evidence and results based M&E approach that is required by the donor encourages the staff to create programs in which information can be tracked and obtained up until the activity level. The CFA has stated that although the M&E system is in place, Rifka Annisa needs to step further in order to build and effective MIS, data-base and knowledge management due to its leading position amongst similar organizations in Indonesia. A mechanism for sharing not only data, but also lessons learned to strategic stakeholders should be developed.

Previusly, it was director and manager who conducted evaluation, but now Rifka annisa applied a participatory evaluation. Every division evaluated other division. The evaluation was conducted within division and reported to the manager. In addition to that, the monitoring and evaluation training provided by donors have contributed to the increased staff capacity to conduct internal monitoring and evaluation.

M&E tools have been developed and applied at the activity level. A slight change has occurred There has been no new mechanism for the staff on reflection meetings during the last two years. There was a formal and informal meetings, such as organization meetings, managers meetings, annual staff meeting, evaluation and planning meeting to report the program development, its challenges, and its problems. Rifka Annisa provided open and free opportunities for the staff to express their ideas on Wednesday and Friday. There was no gap between staff and the managerial levels.
Rifka Annisa has more extensive networking during the last two years. The networking has been expanded in village up to national level.

The program implementation was based on the input and feedback from the networkings, as well as based on the evidence from the stakeholders, iclusding the beneficiaries. Rifka Annisa conducted interview to beneficiaries about the impact of the program to beneficiaries' life.

There is no formal M&E system in place, although M&E tools have been developed and are utilized at the activity level in order to meet donor requirements. There is a detailed annual work plan and financial plan, and they have to report on activities and expenditures. There is no organizational level M&E aimed at measuring impact. There is however attention for outcomes and impact at the project level which is incorporated into reports. There is no dedicated person in place for M&E. There are conflicting statements onwhat M&E entails and how it is used. Discussions can be held at monthly staff meetings, at the managers' meetings, at the annual evaluation meeting and the annual members' meeting. The gap between managerial level, and staff has reduced and they are now more informal discussions with staff members. Rifka Annisa staff engages in network activities with various organizations, invites experts to

share information, follows the media, maintains contacts through discussions and email, and shares this information internally. Rifka Annisa works closely together with its beneficiaries in order to best serve their needs. They are also open to their feedback and input.

Score: from 2.8 to 3.2 (slight improvement)

**Capability to deliver on development objectives**
3.1. Clear operational plans: 'Organization has clear operational plans for carrying out projects which all staff fully understand'
*This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.*

During the last two years, the development of the workplan was more rigid and there has been an annual activities planning funded by donor and by organization. Each donor-funded project has a budget and work plan that is used in day to day operations. Every program now has a clear work plan, budget, and target for each activity which is implemented by the staff. The work plan and budget plan are understood by the staff.

Score: 3 to 3.5 (slight improvement)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'
*This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.*

Rifka Annisa applied an efficient cost activity, such as combining two activities at once to reduce transpotation cost. Rifka Annisa also developed voluntarily system or mechanism to implement the program, having a low cost resource by opening internship. Rifka Annisa also built partnership with private sectors and media to get low cost price when conducting the program. The overall opinion of the staff is that the resources are used as effectively and efficiently as possible, and they sometimes even put in their own money. The organization has resources which are used effectively and efficiently. The management suggests through clear policy to each staff to skimp for the continuity of the organizational budget. There is a slight improvement in terms of having developed a voluntary program through internship and more partnership with media to get a low-cost program.

Score: 3 to 3.25 (very slight improvement)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'
*This is about whether the SPO is able to carry out the operational plans.*

The condition did not change much, although now some activities were delivered as planned. Staff members mentioned that there are too many activities and too few staff, whereas others mention that operational plans are carried out due to sufficient organizational resources and commitment. External factors suct as late funding disbursement contributed to the delay program implementation. However, Rifka Annisa has also made an effort to deliver the output in a timely manner by conducting more assistance to junior staff and sypervision, conducting staff capacity building, and involving external consultants such as editor, translator, and writer.

Score: 2.5 to 3 (slight improvement)

3.4. Mechanisms for beneficiary needs: 'The organization has mechanisms in place to verify that services meet beneficiary needs'
*This is about how the SPO knows that their services are meeting beneficiary needs*

Rifka Annisa had a mechanism in place to measure whether services meet beneficiary needs. The organization developed tools, such as tools to measure clients's resilience, pre test and post test of a training, etc to measure whether their service has met beneficiaries's expectation. The counseling service has an exit interview which was developed to measure client satisfaction. Testimony was collected to measure the quality of service in the community. The community assistance division

conducted annual evaluation to get feedback from the beneficiaries. The RTC (research and training center) division also provided evaluation forms to stakeholders. The media division measures the response from the public on the public campaigns done by Rifka Annisa. Rifka Annisa continues to engage in community outreach activities and field visits. When they have handled a case, they do an exit interview with the beneficiary to assess the effectiveness and success of the service, and ask for critsicism and suggestions.In cooperation with RTC, the organization provides the M&E form for the client. Previously, their baseline used secondary data but now the information is gathered through arranged primary data. Program design follows the consultancy plan with beneficiaries, baseline and assessment.

Score: 3.5 to 4 (slight improvement)

3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratio's)'
*This is about how the SPO knows they are efficient or not in their work.*

This indicator did not change since the baseline. There has been no specific mechanism to measure the effectivity of input and output. Progress and expenditures continue to be discussed in monthly meetings, and this is seen by the staff as their approach to ensuring that they work efficiently. Results achieved, client feedback and time spent are elements used to evaluate efficiency.

Score: 2 to 2 (no change)

3.6. Balancing quality-efficiency: 'The organization aims at balancing efficiency requirements with the quality of its work'
*This is about how the SPO ensures quality work with the resources available*

Rifka Annisa have conducted staff evaluation based on the job description of each staff to see the work effectivity of the staff. Rifka Annisa has evaluated the human resource management and remuneration system, but there no specific tools available to measure the staff quality and efficiency.
In other case, Rifka Annisa compared the workplan and the achievement based on the indicators from the workplan. The different from the baseline was that all staff was involved in providing evaluation to other staff.

Score: 2 to 2.25 (very slight improvement)

**Summary of Capability to deliver on development objectives**
The development of the work plan was more rigid and there has been an annual activities planning funded by donor and by organization. Every program now has a clear work plan, budget, and target for each activity which is implemented by the staff. The work plan and budget plan are understood by the staff. Rifka Annisa also developed voluntarily system or mechanism to implement the program, having a low cost resource by opening internship. Rifka Annisa also built partnership with private sectors and media to get low cost price when conducting the program. Under the MFS II program Rifka had opened internship opportunities for other members of Aliansi Satu Visi (ASV), providing excellent chances to learn about management and SGBV case handling. Vice versa, RA had also sent its staff to Ardhanary Institute to learn more about Lesbian Bisexual and Transgender (LBT) issues. Based on this experience RA realized the need to improve SRH services for their clients, developing better referral networks with other members of ASV particularly in Yogyakarta (PKBI DIY and currently CD Bethesda) in order to provide more comprehensive services for SGBV survivors. Related to this need and situation, RA need to invest more in capacity building for staff as well as clients' data management. Furthermore the CFA stated that Rifka Annisa should focus in developing itself as a center of excellence in SGBV areas, as well as work with Theory of Change and using Result-based Management approaches in order to improve operations.

The organization has resources which are used effectively and efficiently. However, Rifka annisa has also made an effort to delivere the output in atimely manner by conducting more assistance to junior staff and sypervision, conducting staff capacity building, and involving expetrnal consultant such as editor, translator, and writer,  Rifka Annisa had a mechanism to measure the quality of the service. The

organization developed tools, such as tools to measure clients's resilience, pre test and post test of a training, etc to measure whether their service has met beneficiaries's expectation.

Score: from 2.7 to 3.0 (very slight improvement)

**Capability to relate**
4.1. Stakeholder engagement in policies and strategies: 'The organization maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organization'
*This is about whether the SPO engages external groups in developing their policies and strategies, and how.*

Rifka Annisa continued to work with external groups (stakeholders) to get and collect input to develop organization strategy and policy by conducting consultative meeting with related party. For example, Rifka annisa invited the stakeholders, especially the government of Kulonprogo and Gunugkidul, in a meeting to gain feedback on the program implementation strategy and the development of recommnedation to government. The donors, including MSF II, also supported Rifka Annisa to conduct the consultative meeting with stakeholder.Rifka Annisa also maintained good communication with religious court and justice and seek clarity on certain issues form religious view.

Score: 3 to 3 (no change)
4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'
*This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.*

During the ast two years, staff indicated that Rifka Annisa has extended the networking, Rifka Annisa did not only work with hospitals, police, court, but also built relationship with Ministry of Religious Affair (religious Affair Office), BPPM (women and community empowerment board), Supreme Court, dan some of the government institution, not only in national and provincial level, but also government in sub district and village level.

In adition to that, Rifka Annisa built networking with schools, media, not only in Yogyakarta but also in other provinces, such as Nusa Tenggara Timur and Nusa tenggara Barat. Donors through the program implementation has made networking extension possible.

Score: 4 to 4.5 (very slight improvement)

4.3. Engagement with target groups: 'The organization performs frequent visits to their target groups/ beneficiaries in their living environment'
*This is about how and when the SPO meets with target groups.*

Rifka Annisa continues to frequently engage in campaigns and outreach activities as part of the strategy and organization culture. They do home visits and surveys, or invite clients for workshops and meetings. They also directly interact with beneficiaries in the community-based crisis centers and clinics.
The growth of technology through social media also helps the organization meet with the beneficiaries, for example through WhatsApp messenger or Twitter.

Score: 4 to 4.25 (very slight improvement)

4.4. Relationships within organization: 'Organizational structure and culture facilitates open internal contacts, communication, and decision-making'
*How does staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?*

The organization has committed to provide good atmosphere for the staff to share ideas freely. Rifka Annisa built spaces as a meeting point for the staff where they can have activities together. There are formal and informal meetings to discuss issues and exchange information. For example the monthly staff

meetings and shared lunches. However, due to their busy time schedules field workers rarely meet, and communicate via SMS, phone, email and social media (What's App, Facebook, Twitter groups). Everyone is free to discuss what they want, but some psychological barriers do exist. There has been an increase in internal bonding sthrough events uch as out bound, outing, annual holiday, social gathering, and even karaoke.

Score: 3 to 3.5 (slight improvement)

**Summary of Capability to relate**

The organization expanded its network and develops good relationships from local level to national level. During the ast two years, they al also built relationship with schools, with Ministry of Religious Affair (religious Affair Office), BPPM (women and community empowerment board), Supreme Court, and some of the government institution, not only in national and provincial level, but also government in sub district and village level. The organization has done a lot in involving communities in their various activities, including to prevent violence against women. However, the CFA has stated that further development of the network and collaboration with private sectors is encouraged.

Rifka frequently engages in campaigns and outreach activities. They do home visits and surveys, or invite clients for workshops and meetings and hereby engage with the clients frequently. There are formal and informal meetings to discuss issues and exchange information and this is now also supported by the use of social media.

Score: from 3.5 to 3.8 (very slight improvement)

**Capability to achieve coherence**
5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organization'
*This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.*
No change has occurred with respect to the vision and mission. Rifka Annisa had a mechanism to re discussed the vision, mission, and strategy in an annuall staff meeting, and three year cycle in a general assembly meeting. The program implementation strategy was discussed as needed. All staff is involved in the vision and mission meeetings in order for the staff to understand them.

Score: 3.5 to to 3.5 (no change)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'
*This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.*

In the last two years the manual of the Research Training Center (RTC; a training center within Rifka Annisa for capacity building) and Rifka Women Crisis Center (RCC; service to the beneficiaries) have been combined. Operational guidelines are laid down in standard operational procedures (SOP), for example in a finance manual and a method for setting up a referral system to other organizations. The SOPs do not cover each organizational aspect though, and some need updating too.

Score: 3 to 3.5 (slight improvement)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'
*This is about whether the operations and strategies are line with the vision/mission of the SPO.*
The staff members mentioned that programs were all well in line with vision, mission, and strategic planning. Program planning and proposal development sessions always considered vision, mission, and strategic planning as a basic value of the program implementation. Some think that there is a lack of focus however, partly as a result of running too many projects.

Score: 4 to 4 (no change)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'
*This is about whether the efforts in one project complement/support efforts in other projects.*

Programs continued to be connected with each other. The connected program has assisted staff to implement day to day activities easily as they did not need to repeat the same activities. At this moment, Rifka Annisa made an effort to implement the program in certain areas in order to be able to integrate some programs. They conducted integrative planning as many programs are interrelated with other programs.  to c staff indicated that projects are now more mutually supportive and aligned based on the vision and mission.

Score: 3.5 to 3.5 (no change)

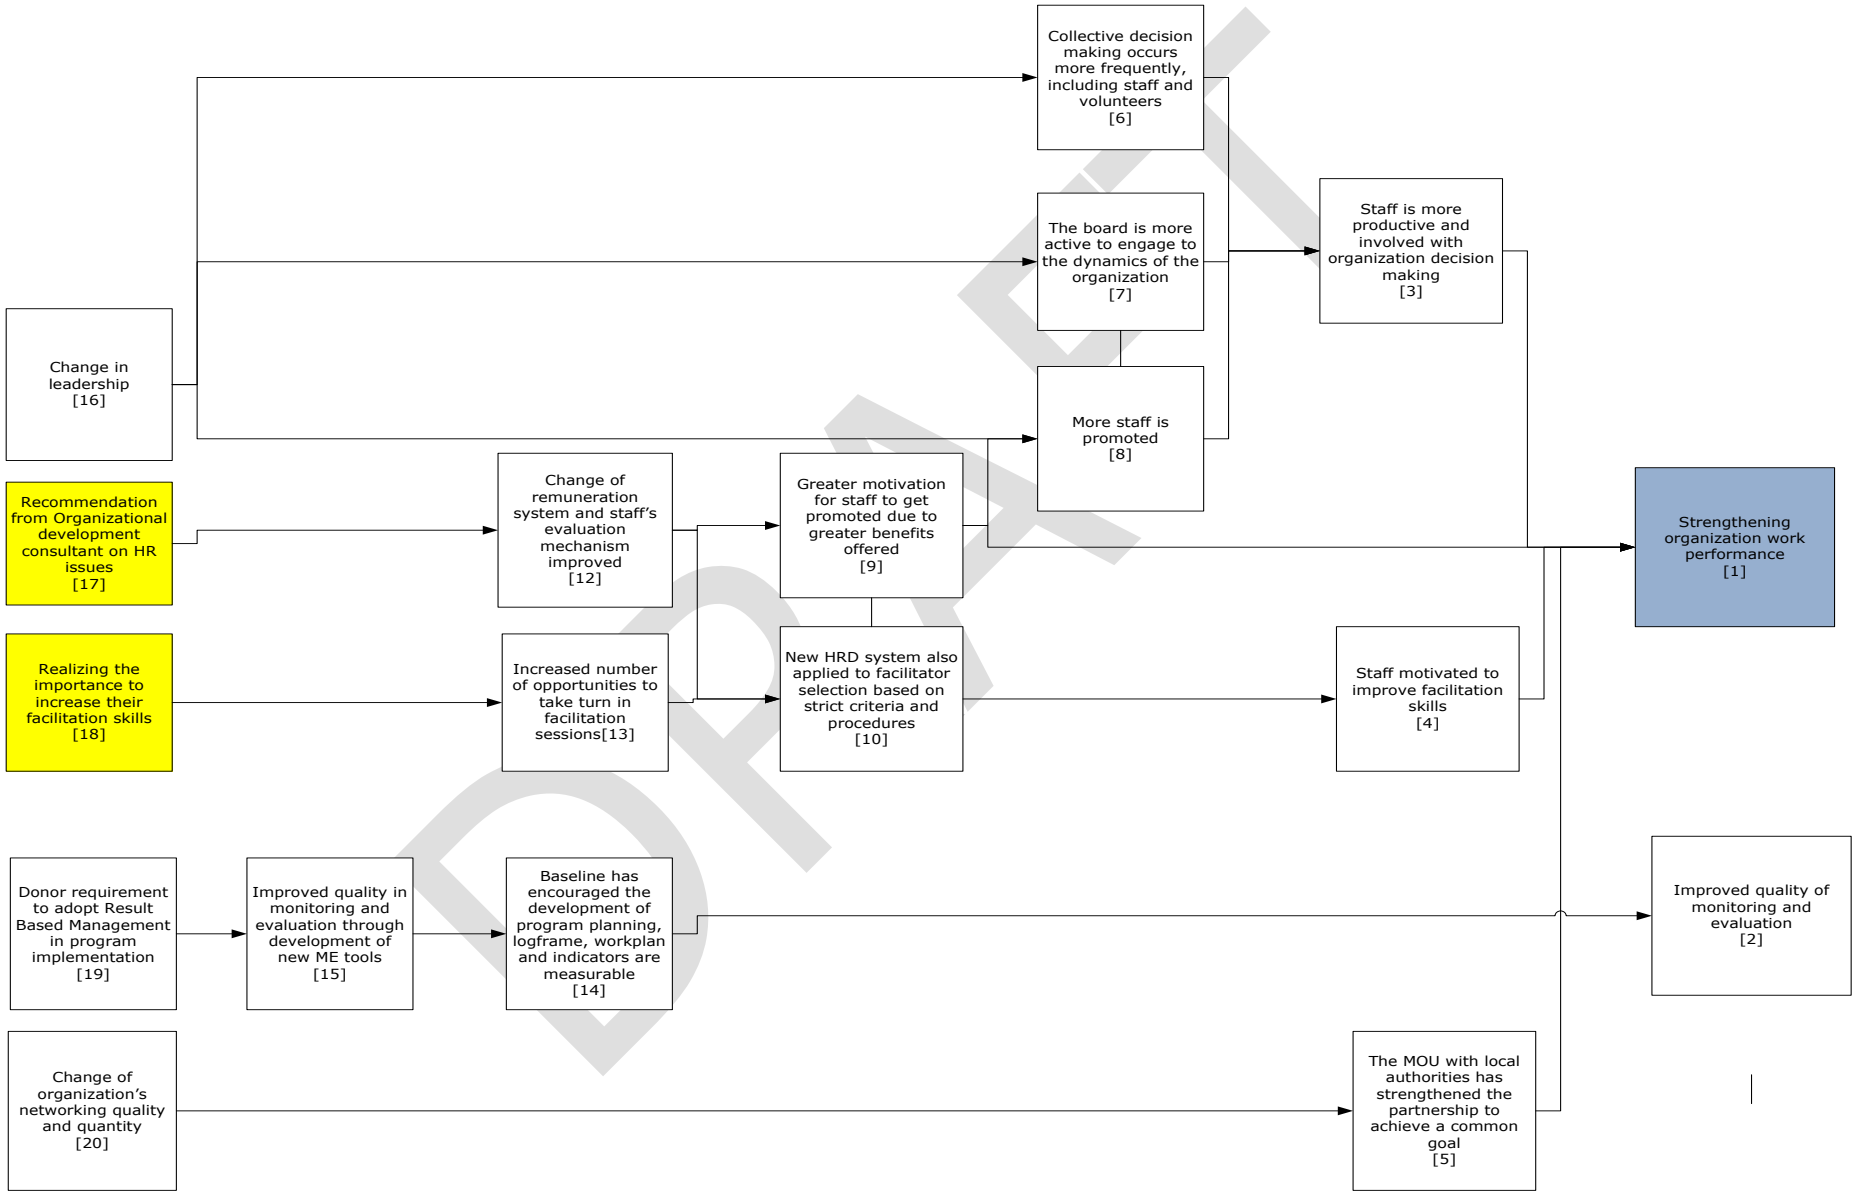
**Summary Capability to achieve coherence**
The vision and mission of the organization are reviewed in the three-year general assembly meeting and the annual members' meeting, and all staff were involved in the annual strategic planning meeting. Operational guidelines are now laid down in standard operational procedures (SOP), now that manual of RCT and Rifka WCC have been combined. Almost all of the staff members hold the opinion that the programs are in line with the vision and mission and the long term strategic plan. Programs are connected with each other through their efforts to eliminate violence against women, as outlined in the vision and mission, and hereby complimentary in nature.

Score: from 3.5 to 3.6 (very slight improvement)

# Appendix 4 Results - key changes in organisational capacity - general causal map

**Narrative of Rifka Annisa Indonesia General Causal Map**

The evaluation team carried out an end line assessment at Rifka Annisa from 25th March to 27th March 2014. During this end line workshop, the team made a recap of key features of the organisation in the baseline in September 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline. The main changes that happened in the organisation since the baseline, as identified by the staff during the end line workshop were:



1. Staff being more productive and involved in the organization's decision-making [3]
2. Greater motivation for staff to get promoted [9]
3. Staff being motivated to improve their facilitation skills [4]
4. Improved quality of monitoring and evaluation [2]
5. A stronger partnership with local authorities in form of a signed MoU [5].

All of these organisational capacity changes are expected to lead to strengthening the performance of the organisation [1].

1. Strengthening of the organization's work performance capacity [1];

Each of these changes in the organisation, and related organisational capacity changes and other factors are further explained below. The numbers in the narrative correspond to the numbers in the visual.

## Rifka Annisa General Causal Map

DRAFT

According to staff present at the end line workshop, **staff became more productive and involved in the organization's decision making** [3] since the baseline in 2012. This was enabled by an increase in collective decision making meetings where both regular staff and volunteers attended [6], a more active and engaged board of directors to deal with internal issues [7], and more staff members being promoted [8]. Each of these factors came about from an overall change in leadership in 2012 where both the acting director as well as the individual board members was replaced with new candidates [16].

The other organisation capacity change is that **staff became more motivated to get promoted** [9], which was due to a change in the HR policy and remuneration system. In this new system staff was evaluated differently, and compensated more fairly according to the tasks and responsibilities they possessed [12]. Prior to this, the salary difference between junior and senior level staff was almost negligible, providing little incentive for junior staff to opt for promotion. This change in the remuneration system was implemented following one of the recommendations from the organizational development consultant who Rifka Annisa hired in 2013 [17].

Another organisational capacity change that happened since the baseline was that staff became more **motivated to contribute to and develop facilitation sessions** [4]. Being an organization who focuses on capacity building, Rifka Annisa has a lot of scheduled time dedicated to training local communities, other organizations and internal staff. So whilst the need for facilitation skills was high, staff often considered the task of facilitation secondary to their other program activities. However, there was a change in the organisation in terms of realising the importance of increased facilitation skills [18] and this finally staff being more motivated to engage in facilitation [4]. There were three reasons for this change in motivation to facilitate. First of all the there was a new HRD system which now also included facilitation skills and volunteering as evaluation criteria[10].This was the result of an overall change in the staff's evaluation mechanism and remuneration system [12]. Secondly, there were now more opportunities for staff to take turns in facilitation sessions [13], which helped the staff in being able to actively contribute to facilitation [4]. This was a direct result of realizing the need to improve facilitation skill [18]. Thirdly, the new HRD regulation set a higher standard of being a facilitator [11] which encouraged staff to improve their facilitation skill.

A significant change in terms of an **improvement of the quality of monitoring and evaluation** in Rifka Annisa took place [2]. As mentioned before, this came about from a much more structural approach towards M&E in the form of specific tools such as program planning, log frame tracking and analysis, work plans and the development and monitoring of specific indicators [14]. These tools were developed [15] following strict donor requirements to adopt a result-based management approach in the implementation of the organization's programs [19].

Lastly, **the partnership with local authorities was significantly strengthened** after signing a Memorandum of Understanding (MoU) with sub-district government officials and the police [5]. This came about from an active effort to increase the networking quality and quantity of Rifka Annisa [20]. Results of this could be clearly seen in the contribution of Rifka Annissa to the LGBT – Lesbian, Gay, Bi-sexual, and Transgender) program where several organizations were drawn together to commit to the cross cutting issues of disability, LGBT and sexual abuse..

Report CDI-15-046

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Report CDI-15-047

Kusters, C., Wieriks, M., Dwi Andari, B., Suprobo, N., Priyahita, W., Sihombing, R.R., Rokhmatulloh, S.W., Rosita, I., 2015. *Endline report – Indonesia, WII. MFS II country evaluations; Capacity of Southern Partner Organisations (5C) component.* Centre for Development Innovation, Wageningen University & Research centre. Report CDI-15-047. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Indonesia, WII. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

# Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation WII and the Co-Financing Agency Red Cross for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to WII, Red Cross, the synthesis team, IOB and NWO/Wotro.

The Indonesia 5C evaluation team

# 1 Introduction & summary

## 1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: WII in Indonesia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1.Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps describe the identified key organisational capacity changes that are possibly related to MFS II

interventions in these two capabilities, and how these changes have come about. More detailed information can be found in appendix 5.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR: Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

## 1.2 Brief summary of analysis and findings

Since the baseline, two years ago, Wetlands International Indonesia (WII) has seen an improvement in the capability to act and commit. The leader has gained extensive experience, is strong and dedicated, and able to maintain good relationships with other parties. Staff turnover has improved and more staff members now work for WII with permanent contracts. Overall, employment benefits have increased and the organization is now more in line with the Indonesian labour law. Strategic plans at project level have been well developed and implemented. Funding procedures have been improved slightly after 2012. The capacity to adapt and self-renew has improved the most out of all capabilities. Systematic M&E is applied at the project level consistently, and M&E competencies have increased slightly. WII is employed by other NGO's to evaluate and monitor other projects in Indonesia. Considerable improvement was made in terms of tracking the organization's environment: WII has increased their networks and is up to date about development in various areas and fields of work. In the capability to deliver on development objectives, a slight improvement took place. Cost-effective resource use has slightly improved, as well as a slight improvement in mechanisms to meet beneficiary needs: WII now determine field projects based on thorough assessment of needs and perspectives of local communities and stakeholders. Considerable improvement has occurred in terms of balancing quality and efficiency, as WII in some cases used the organization's own money to cover budget gaps in case of cost-exceeding projects to maintain good quality of results. The capability to relate has also slightly improved. Stakeholders are more involved in policies and strategies and engagement with government and NGO's has intensified. Internal relations have improved through a policy to communicate more face-to-face, and less through email and telephone calls. The capability to achieve coherence has slightly improved through the adoption of new operational procedures related to finance and HRM. Staff agrees that WII has been able to successfully align it's vision and mission with that of Wetlands International. Mutually supportive efforts have been considerably improved through the cross-project coordination.

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team. During the endline workshop some key organisational capacity changes were brought up by WII's staff:

1. Improved staff capacity in their respective roles and fields of work
2. Increased communication on WII and wetlands issues
3. Improved collaboration and networking with local and international partners
4. A healthier and safer financial condition of the organization
5. Increased organizational management capacity

SPO staff attributed the above mentioned organizational capacity changes partly to MFS II capacity development interventions. WII staff experienced these as the most important capacity changes in the organisation since the baseline.

Improved staff capacity resulted from joining the "community of practice". This is an international community whose members are organizations with similar focus (global warming-wetlands). This was the result of the change of vision and mission of Wetlands International, which in turn can be attributed to the development of the global agenda for wetlands.

Increased communication on WII and wetlands issues was attributed by the SPO staff, to improving media content and packages as well as strengthening media relations. Both these developments sprung from the need for stronger communication and publication which resulted from a change of vision and mission of Wetlands International.

Improved collaboration and networking was attributed by the SPO to joining the joint community of practice, the strengthening of activities of advocating policies and other strategic activities, and more extensive and diverse programs. Whilst the work area expansion was due to the change of vision and mission of Wetlands International, the increased accountability resulted from an orderly financial administration. This was an important conclusion from the OD consultant who was hired after Wetlands International provided coaching and a capacity development workshop through MFS II funding.

The improved and healthier financial condition of WII occurred through an increasing number of donations, and increased staff capacity to manage responsibilities. The greater number of donations was already explained above. The increased staff capacity to manage responsibilities resulted from increased experience and knowledge sharing. Both of these were enabled by staff placement in project management, and staff being sent to trainings and workshops. Both these were recommended by the organizational capacity scan and HQ workshop on capacity development.

The increased organization management capacity resulted from an increased ability of staff to manage responsibilities, strengthening the existence and recognition of the organization in front of the government, an increased number of managerial staff, and improved supporting facilities. Strengthening the existence and recognition of the organization in the eyes of the government was due a revision and addition of Employment SOP as well as an adjustment of employment welfare according to Indonesian labor laws after a series of formalizations in the employment policy and contracts. Both can be attributed to the recommendations made by the consultant regarding integration of Indonesian laws and regulations as well as recommendations regarding reviewing and revising SOP's. This in turn resulted from the MFS II sponsored CD scan in March 2013.

In conclusion MFS II interventions have been tied to key organization capacity changes, as experienced by the SPO, although they were only in part responsible for all changes that have occurred. The redevelopment of the global agenda of Wetlands International has also had profound impact on the organization's capacity changes, particularly in the field of program quality and focus, as well as networks addressed. The development of a more structured, accountable and transparent organization that adheres to Indonesian law and has increased its' organizational management capacity can however for a large part be attributed to MFS II, according to SPO staff present at the endline workshop. However, it must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect.

# 2 General Information about the SPO – Name SPO

## 2.1 General information about the Southern Partner Organisation (SPO)

| **Capacity development of Southern partner organisations** | X |
| **Efforts to strengthen civil society** | |

## 2.2 The socio-economic, cultural and political context in which the partner operates

**The socio-economic, cultural and political context in which the partner operates**
Earthquakes, floods, volcanic eruptions, drought, landslides and tsunamis are natural hazards that occur in Indonesia almost every day, causing a large number of casualties every year. In 2011 according to the National Disaster Management Agency (BNPB), 1598 natural disasters happened in Indonesia. Hydro-meteorological disasters such as floods, flash floods, drought, landslides, cyclones and tidal waves are the dominant type of disaster in Indonesia, and constituted 89% of all disasters in 2010-2011. In the same year 834 people died or were missing due to disasters; while 325,361 people had to be displaced. Regarding material costs, 15 166 houses were heavily damaged, 3302 houses were damaged and 41,795 houses were slightly damaged.[1]

The above numbers show that disasters are a serious and constant threat to people, bringing about heavy economic losses every year, and affecting social and economic activities all over the country. Most natural disasters have one thing in common: they usually occur suddenly and unexpectedly. In order to mitigate the risk from such disasters, state institutions, civil society organizations and specialized institutions have carried out many activities from assessing disaster risks to mitigation measures. However, the risks are still increasing, damages are greater and an ever increasing number of especially poor people are exposed to natural hazards.

This situation is particularly true for the province of Nusa Tenggara Timur (NTT), which Partners for Resilience chose as their program area for MFS II. The province is characterized by dry ecosystem and it is prone to various natural hazards, such as landslides, floods, earthquakes, tsunamis, drought and cyclone. This condition has led to many difficulties for the lives of local communities in the province. The tsunami event in 1994 has created a traumatic experience where thousands of islanders have lost their lives and some more thousands have lost their shelter and livelihood. However, communities that live in the surroundings of relatively dense mangrove forests have been spared from substantial damage. This is an indication that mangroves have a vital function in the protection from heavy waves

[1] Source: http://healthmdgs.wordpress.com/2012/01/04/bnpb-1-598-bencana-alam-terjadi-di-tahun-2011/

of tsunamis. The first efforts at mangrove reforestation on the island of Flores were inspired by this traumatic event.

Disaster risk management reduces the environmental risk and economic burden of natural hazards on society. Therefore, the Government of Indonesia has declared its determination to fight the risks from natural hazards by introducing pro-active measures (e.g. early warning systems) to enhance the resilience of society. It is also realized that local communities have to be involved in the assessment and implementation of disaster risk reduction measures if they become resilient.

As the above example indicates, the resilience of coastal communities can be increased by integrating the ecosystem rehabilitation/restoration into the current disaster risk reduction strategy. National and local governments are supportive of the restoration and rehabilitation efforts, for example through the mainstreaming of tree planting into the program of the Ministry of Forestry, as well as other pro-environment initiatives. This was also supported by the GoI initiative on the establishment of the National Mangrove Working Group and Forest Land Restoration Partnership Working Group at the national level. At provincial/district level, a Regional Mangrove Working Group was also encouraged to be established in the regions with mangrove areas, including the one in Ende district (Nusa Tenggara Timur), which has just been established in 2012. Together with Sikka district in Nusa Tenggara Timur, Ende district is the location of the MFS II project areas of WI-IP. In Sikka district, a decree of the head of district has been released on 29 September 2012 that put a moratorium on destroying mangrove forests with the aim to protect the remaining mangrove forests in the district. In addition to the government's initiative, the enabling environment has also been developed by local communities, where various local communities' initiatives have carried out mangrove restoration programs, during the consultation stage, prior to the formal implementation of the MFS II in the related villages. Restoration and rehabilitation of wetlands have in the most recent years been more widespread and politically recognized activities in a number of countries including Indonesia.

The restoration and rehabilitation of wetlands provides not only protection of the vital environment and its resources but also a source of livelihood for locals if managed sustainably. Mangrove forests are rich in crab and fish, the fruit of certain types is edible, but also honey can be harvested. In addition, the timber is a valuable building and construction material. Hence, providing sustainable livelihoods mangrove forests contributes to the resilience of local communities.

Mangroves are a crossroad where oceans, freshwater, and land realms meet. They are among the most productive and complex ecosystems on the planet, growing under environmental conditions that would just kill ordinary plants very quickly. In general, mangroves have specialized root structures (breathing roots or pneumatophores) as a result from their physical adaptation to oxygen-poor or anaerobic sediments/soils.

Degradation and loss of mangroves has caused coastal abrasion, sea water intrusion, flood, loss of settlements due to storm, loss of natural fishing areas, and opportunities to mitigate greenhouse gas emissions. The above conditions are generally caused by:

- Over-harvesting of wood from mangrove forests.
- Conversion to aquaculture.
- Unsustainable urban and agricultural development.
- Neglected deforested mangrove areas.

Indonesia has large coastal zones which are rich with various coastal vegetations such as mangrove forests (the country, in fact, has the largest mangrove forests in the world with an area of 3,2 million hectares). Unfortunately, since the mid-1980s, a large part of Indonesia's coastal zones has been severely damaged due to conversion to aquacultures and other purposes.

To reverse the functions, values and environmental services of mangrove forests and other coastal ecosystems, there is a need to restore and to implement sustainable coastal zone management. One of them is through the silvo fishery concept, which combines the replanting of mangroves near and inside shrimp and fishponds.[2]

[2] Wetlands Indonesia. http://indonesia.wetlands.org/Infolahanbasah/SpesiesMangrove/tabid/2835/language/en-GB/Default.aspx

Finally, it is also important to mention that wetlands are one of the world's most important environmental assets.[3] They are a highly complex and fragile kind of ecosystem, which contains a great variety of plants and animals, and plays an essential role in the history of human development.[4] Wetlands can be found across the whole world and make up for 10% of all fresh water on the planet.[5] This ecosystem is the only one dealt with under an exclusive global environmental treaty, the Ramsar Convention. This treaty has been signed in 1971, in Ramsar (Iran). Under this treaty, wetlands are defined as "areas of marsh, fen, peatland or water, whether natural or artificial, permanent or temporary, with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed six meters". Although not being of regulative nature or enforcing punishment by non-compliance, the Treaty signed by 163 countries formed the "framework for national action and international cooperation".[6]

Wetlands International – Indonesia Program (WIPP) works on peatland as their focus but for MFS II funded project they work on mangrove.

## 2.3 Contracting details

When did cooperation with this partner start: 2010.

What is the MFS II contracting period: 1-1-2011 to 31-12-2015

Did cooperation with this partner end: No

If yes, when did it finish: Not applicable

What is the reason for ending the cooperation with this partner: Not applicable

Is there expected cooperation with this partner after 31st of December 2015: Yes.

## 2.4 Background to the Southern Partner Organisation

**History**

WII is part of the umbrella organization WI. The organization that later became WI was founded in 1937 under the name of Wildfowl Inquiry. The organization has been involved in environmental protection since then. Initially, the organization was a part of the British Section of the International Committee of Bird Preservation. In 1954, besides expanding its scope of action to also include the protection of wetland areas, the organization had its name changed to International Waterfowl & Wetlands Research Bureau (IWRB). Under this name the organization was based in the United Kingdom at first, then in France and later in the United Kingdom once again. The IWRB work in Indonesia started in the beginning of the 1980's. At that time all members were volunteers and the activities were mainly scientific[7]. In 1987 the organization changed its name to Asian Wetlands Bureau (AWB) and it signed a Memorandum of Understanding with the Indonesian Ministry of Forestry for having 'wetlands' as its specific issue [8]. Since the end of the 1980's, other organizations around the world have started working together with the AWB in an effort to protect wetland areas across the globe. In the 1990's, as a result of this worldwide collaboration, one global organization was

[7] Historical Timeline Developed by Evaluation Team (2012)

[8] Historical Timeline Developed by Evaluation Team (2012)

established under the name Wetlands International. In 1996 Wetlands International established its headquarters in the Netherlands[9].

As a change from the Global Agenda, WI changed their logo, vision and mission: Over the entire agreement of global offices, WI changed global visibility. The impact was, that strategic changes, has been extended to the field of resilience. In 2013, WII replaced the logo that has been used since 1996. It did so, since they began to focus on their concern to social and humanitarian issues as an integral part of environmental activities . [10]

WII works with communities at village to district level, assessment on community vulnerability and capacity, maintaining of group dynamic and works, trainings, environmental campaign, development of village regulation as well as development of community livelihood and ecosystem restoration (Bio-Rights). Wetlands International Indonesia works with 194 households/ communities in 6 coastal villages and 1 upland village in Flores Island and 1 learning site in Banten Province.

During this period, WII put many efforts to develop good networking on the integration of Climate Change Adaptation, Disaster Risk Reduction and Ecosystem Restoration and Management. Partnerships have also been built with various relevant stakeholders, including land lords, enabling better environment for the introduction and implementation of the proposed programme. Continued efforts on communication and consultation with relevant local government institutions have resulted into good progress on the development of village regulation and establishment of Village level Disaster Response Team.[11]

**Mission :**
To preserve and maintain wetlands , including resources and biodiversity

**Vision :**
Wetlands and water resources are conserved and managed wisely so that the various values and environmental services can provide benefits for biodiversity and human life in a sustainable manner

**Global Strategies :**
**1. Build up and disseminate wetlands information :**
a. Developing various outreach materials , such as posters , print off , and comics
b . Publishing news on wetland conservation ( WKLB )
c .Developing electronic materials , such as movies , slide kits and broadcast media .
d . Organizing and facilitating meetings and related training .
e .Developing a data base of important wetlands in Indonesia.

**2. Introducing the role of wetlands in sustainable development:**
a. Study and research on wetlands that have not been generally known , for example, studies and providing information on peat and carbon content.
b .Facilitating strategic management of wetland ecosystems at national and regional level , such as the National Strategy for Management of Wetlands , National Strategy for Management of Peatlands , and the ASEAN Peatland Management.
c .Facilitating the integration and harmonization of wetland ecosystems in the General Spatial Plan at the district level .

**3. Integrating wetlands into water resources management**
a. facilitating the development of alternative livelihoods for communities around the protected area of wetlands or other important wetlands.
b .facilitating the preparation of management plans for protected area wetlands or other important wetlands

[9] Wetlands International (2012), "History". Available at: http://www.wetlands.org/Aboutus/Ourorganization/History/tabid/64/Default.aspx, Accessed on 13.11.2012
[10] Annex D, MFS II Endline Evaluation, 2014.
[11] WII (2013). Annual Report January - December

**4. Wetland biodiversity conservation and ecological networks**

a. The development of a variety identification guidelines , studies , and surveys for some kind of important wetlands.

b .facilitating various network related to various of important wetland species , especially migrant species.

c .integrating restorationactivities and rehabilitation of wetlands that had been or was damaged.

# 3 Methodological approach

## 3.1 Overall methodological approach

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- Changes in the 5C indicators since the baseline: standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- Key organisational capacity changes – 'general causal map': during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

## 3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012[12].

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See

[12] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

## 3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)? and the fourth evaluation question: "What factors explain the findings drawn from the questions above?"

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

### 3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);

- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;

Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

### 3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in

time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

### 3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified

organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design** – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to

generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

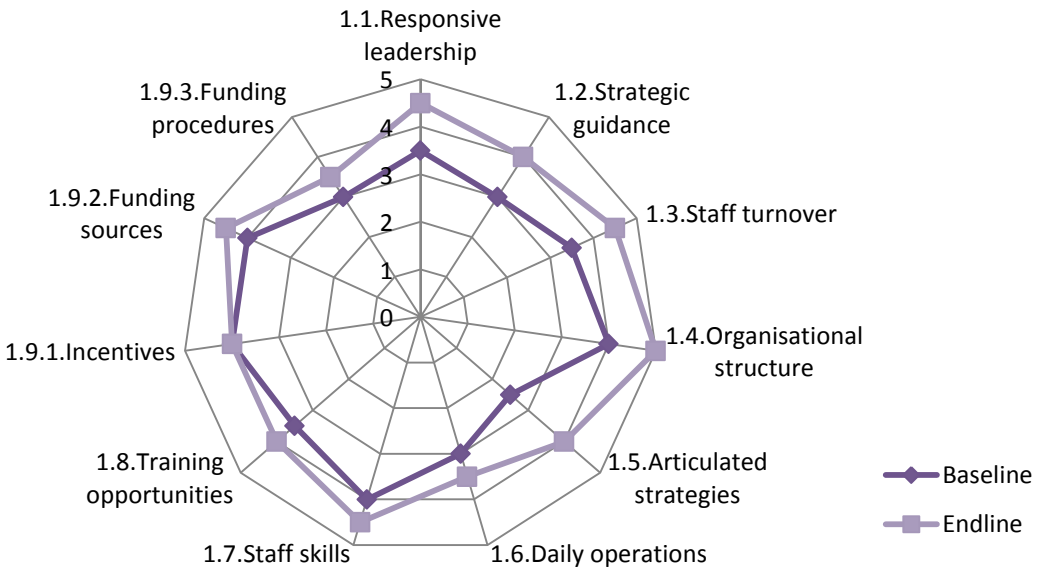
# 4 Results

## 4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of WII that have taken place since 2011 are described. The information is based on the information provided by Red Cross.

Table 1
*Information about MFS II supported capacity development interventions since baseline*

| Title of the MFS II supported capacity development intervention | Objectives | Activities | Timing and duration | Budget |
|---|---|---|---|---|
| Capacity Development Scan and Workshop | Workshop was meant to set priorities for capacity development during the (remaining) MFS perioed | Workshop, scan and plan capacity development directions | March 2013 | 4000 Euro |



Source: 5C endline_support to capacity development sheet_CFA perspective_Indonesia_WII

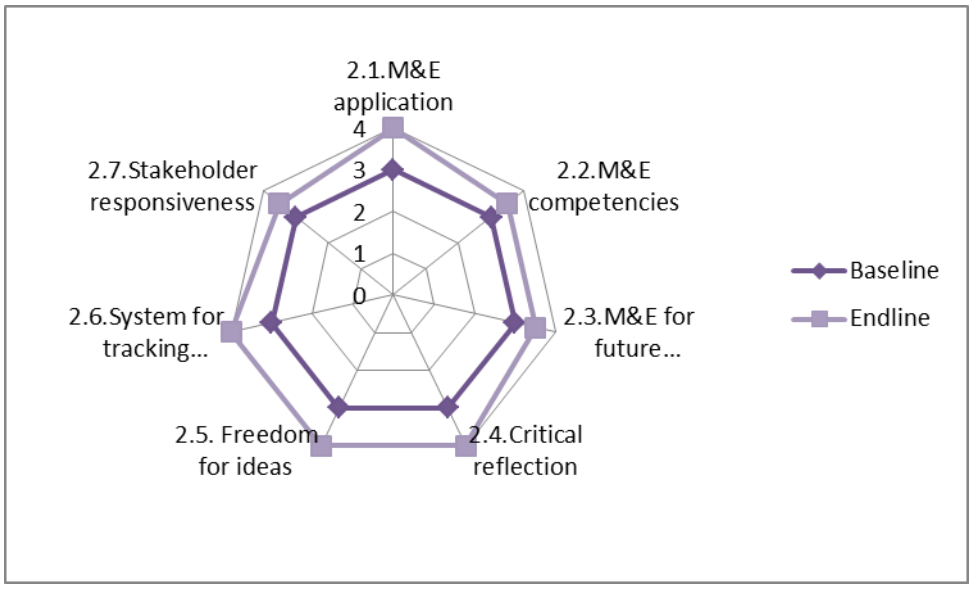
## 4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities. This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also annex 3.

### 4.2.1 Changes in the five core capabilities

**Capability to act and commit**

The leader has extensive experience, is strong and dedicated, and is able to maintain good relationships with other parties, both within as well as outside the organization. There are three leaders at the managerial level: the Program Director, the Programme Manager, and the Finance Manager. The Program Director, in collaboration with the Programme Manager, provides good strategic guidelines for the implementation of projects (i.e. through work plans), through which staff performance can be maximized. Currently, communication between leadership and staff has intensified and management and communication responsibilities have been delegated to the project staff. Currently, the strategic plan is still under development. There are more strategic consolidations in proposal development with the Head Quarter. The running projects are in line with the main goal and targets set by the global office.



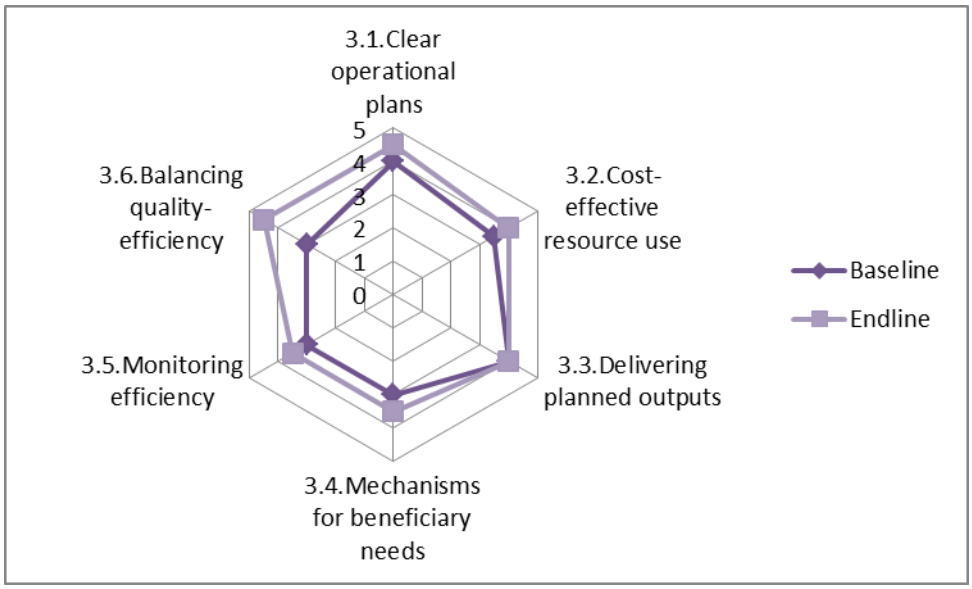
In terms of staff turnover, one senior person who was with the organization for a long time has left the organization since the baseline but a HR consultant has been hired. Having the HR consultant is led to changes in the staff's working contracts, that affect staff motivation: key personnel is now working as permanent staff; salary and benefits are reviewed and adjusted; and the internal human resources policy is in line with the Indonesian labor law. A good working environment, opportunities for training and internal motivation have also contributed to staff being highly motivated to work with WII, but on the whole there is not much change since the baseline.

WII has technical and academically skilled staff with appropriate educational background and general skills (English language, administration, projects, multitasking). There are opportunities to attend formal and informal training – informal training occurs when staffs exchange knowledge during joined projects with other organization and university; whilst there is also formal ad hoc training.

Some projects are close to end in 2015 which will affect the organization finance. However, there are some strategic efforts in the Head Quarter, supported with the good reputation in program implementation, and the organization expects to get some funding in the next years. In term of funding procedures there is no much change since the baseline. The organization still has no clear funding procedures. However it does not affect the ability of WII to get new funds.

Score: from 3.4 to 4.2 (slight improvement)

**Capability to adapt and self-renew**

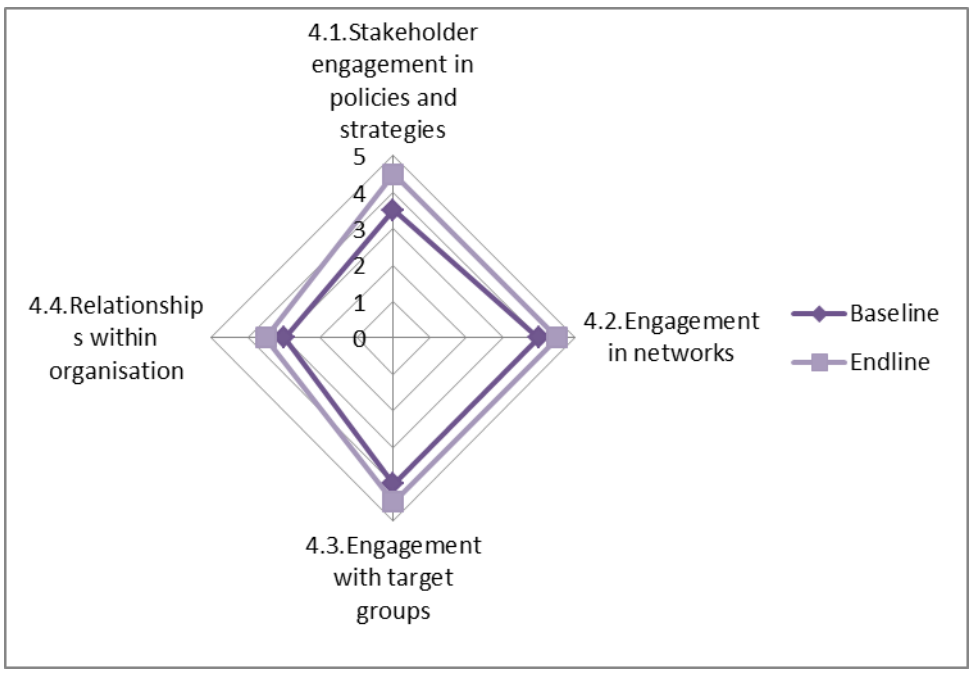


Overall the M&E is conducted in organizational that is done by the Management and project level which is done by Program Manager. In addition that internal M&E also supported by independent consultant and Project Manager of Wetlands International. In term of process all the staff are involved an interactive discussion and encouraged for self reflection. The staffs have more freedom to express their ideas equally in many organizational forum including in policy making process. In addition, there is more room for the staff and management to communicate, mainly dealing with project implementation.

Regarding system for tracking environment, WII has a considerable improvement. During this period (2012-2014), WII highly put any possible efforts to develop good networking on the integration of Climate Change Adaptation, Disaster Risk Reduction and Ecosystem Restoration and Management. Partnerships have also been built with various relevant stakeholders, including land lords, enabling better environment for the introduction and implementation of the proposed program. Continued efforts on communication and consultation with relevant local government institutions have resulted into good progress on the development of village regulation and establishment of Village level Disaster Response Team.

WII is well respected by its partners, which is proven by the increased efforts to be involved in a number of local, national and international initiatives. Before, during, and after project implementations, the organization always communicates intensively and extensively with their stakeholders to ensure their relevance with stake holders' need.

Score: from 3.0 to 3.8 (improvement)

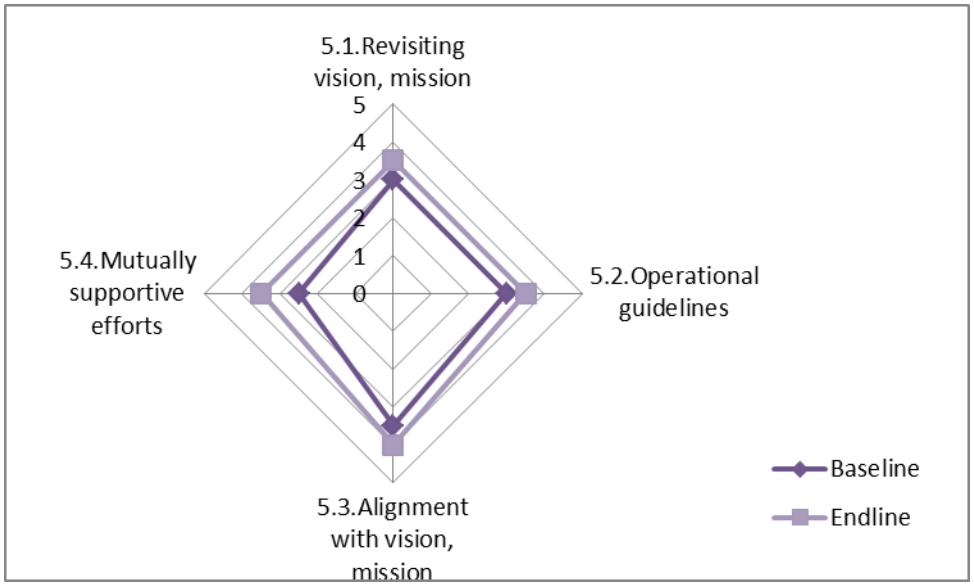


**Capability to deliver on development objectives**

WII has a systematic way of delivering results through clear plans, log frames, outlines, agreements and continuous re-examination. Projects run based on operational work plans and budgets. WII has a strong and good reputation in providing satisfying results in accordance to the agreement with funders and partners. Particularly the clear project plans and skilled staff play an important role in this. By having field staff to stay in the project locations, the organization ensures that there is involvement and active ownership within the community, which assists WII in ensuring that project activities meet the needs of the communities. Although there is no formal system to measure efficiency and quality, WII is able to deliver high quality results within the given budget or even with additional budget from the organization were needed. WII is known with donors for delivering high-quality results and using resources cost effectively.

Score: from 3.4 to 4 (slight improvement)

**Capability to relate**



WII closely considers the needs of their stakeholders, including different ministries, NGOs and communities in the development of policy. WII has been involved in the activities initiated by the different ministries, and is part of the different national and local networks. WII developed cooperation

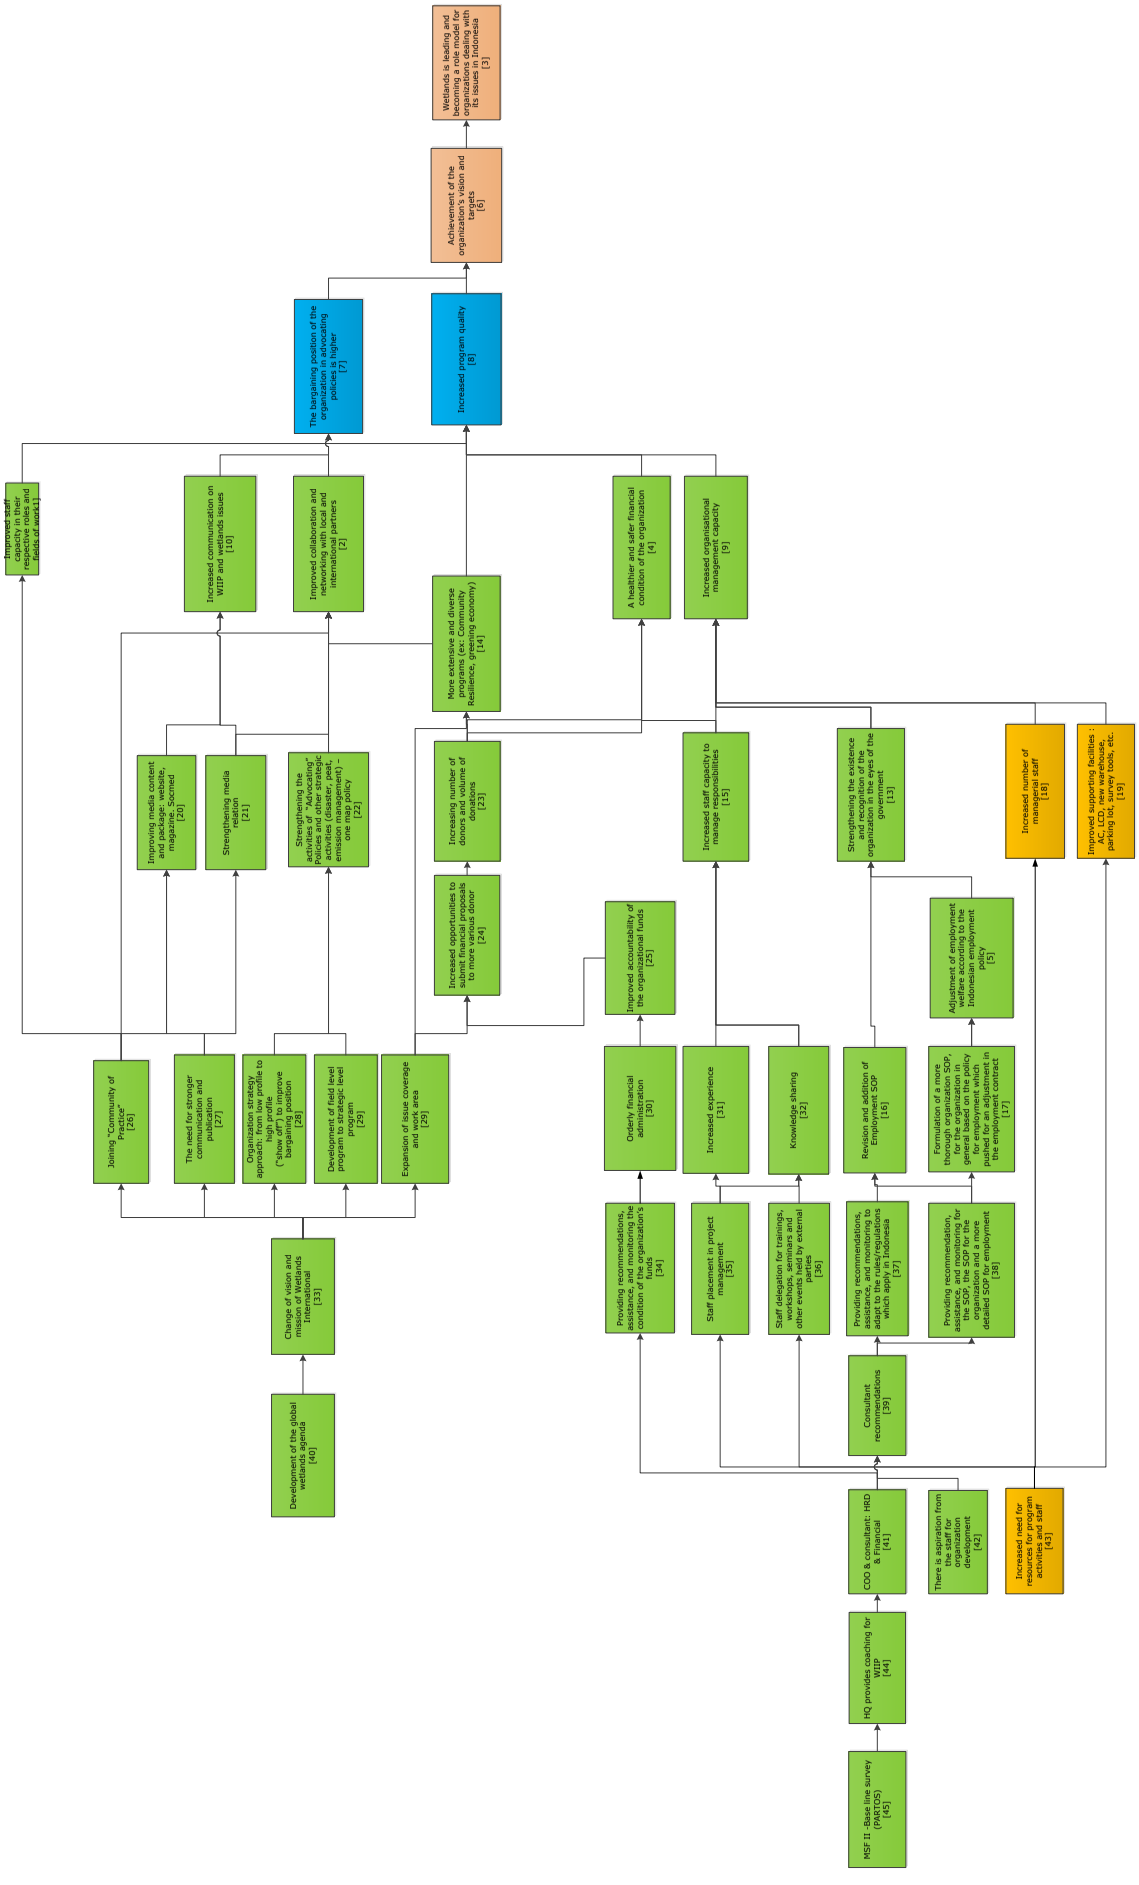
with other organizations (government and non-government) which have the same concerns: forest mapping, carbon sequestration, conservation and restoration of wetlands and other environmental issues. WII works directly with the communities by establishing community based organization and by having project staff that live in the project areas so that issues are well known to the project staff, and can be acted upon.

Score: from 3.6 to 4.2 (slight improvement)

**Capability to achieve coherence**

WII operates in a playing field of many competing interests and needs which makes coherence a challenging task. For example, vision and mission have been changed at the international level which has profound impact on the work activities in Indonesia, since the strategies need to be contextualized to the Indonesian context. Staff is not actively involved in the revision of the International vision and mission. In other term, overall staff members agree however that program implementation is in line with the set vision and mission also there is a better and more productive relationship between the various projects.

Score: from 3 to 3.6 (slight improvement)



### 4.2.2 General changes in the organisational capacity of the SPO

The evaluation team carried out an end line assessment at Wetlands International Indonesia (WII) from 2 to 3 July 2014. During this workshop, the team made a recap of key features of the organisation in the baseline in September 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline. The main changes that happened in the organisation since the baseline, as identified by the staff during the end line workshop were:

1. Improved staff capacity in their respective roles and fields of work [1]
2. Increased communication on WII and wetlands issues [10]
3. Improved collaboration and networking with local and international partners [2]
4. A healthier and safer financial condition of the organization[4]
5. Increased organizational management capacity [9]

These changes have helped the organization to improve the quality of the programs [8] and thereby contributed to reaching the organization's vision and targets [6]. According to WIP staff, they expect that this contributes to WII to become a leading organization and a role model for organizations dealing with wetlands and climate change issues in Indonesia.

Each of the five organizational capacity changes is further described below. The numbers in the narrative correspond to the numbers in the visual.

Wetlands is leading and knowledge resource network for organizations dealing with its issues in Indonesia [3]
Achievement of the organization's vision and targets [6]
The bargaining position of the organization in advocating policies is higher [7]
Increased program quality [8]
Improved staff capacity in their respective roles and fields of work[11]
Increased communication on WIIP and wetlands issues [10]
Improved collaboration and networking with local and international partners [2]
A healthier and safer financial condition of the organization [4]
Increased organisational management capacity [9]
More extensive and diverse programs (ex: Community Resilience, greening economy) [14]
Improving media content and publication (website, magazine, Socmed) [20]
Strengthening media relation [21]
Strengthening the activities of "Advocating" policies and other strategic issues (Mangrove - emission management) - one map policy [22]
Increasing number of donors and volume of donations [23]
Increased opportunities to submit financial proposals to more various donor [24]
Increased staff capacity to manage responsibilities [15]
Strengthening the existence and position of the organization in the eyes of the government [13]
Increased number of managerial staff [18]
Improved supporting facilities : office, car, new warehouse, parking lot, sewing room, etc. [19]
Improved accountability of the organizational funds [25]
Adjustment of employment welfare according to the increasing minimum wage policy [5]
Joining "Community of Practice" [26]
The need for stronger communication and publication [27]
Organization strategy approach to increase profile to high profile ("show off") to improve bargaining position [28]
Development of field level program to strategic level program [29]
Expansion of issue coverage and work area [30]
Orderly financial administration [39]
Increased experience [31]
Knowledge sharing [32]
Revision and addition of Employment SOP [16]
Formulation of a more thorough organization SOP, which is more in-depth in general based on the policy for employment which pushes for a short amount in the employment contract [17]
Change of vision and mission of Wetlands International [33]
Providing recommendations, assistance, and monitoring the the organization's condition of funds [34]
Staff placement in project management [35]
Staff delegation for trainings, workshops, seminars and other events held by external parties [36]
Providing recommendations, assistance, and monitoring to adapt to the regulations with employment [37]
Providing recommendations, assistance, and monitoring for the SOP, the SOP for the organization and a more detailed SOP for employment [38]
Development of the global wetlands agenda [40]
Consultant recommendations [39]
COO & consultant: HRD & Financial [41]
There is aspiration from the staff for organization development [42]
Increased need for resources for program activities and staff [43]
HQ provides coaching for WIIP [44]
MSF II - Base line survey (PANTAS) [45]

**Improved staff capacity in their respective roles and fields of work [1]**
Staff present at the end line workshop indicated that staff capacities in the respective roles and fields of work have improved since the baseline in 2012. They indicated that this is mainly the result of joining the "community of practice"[26]. This is an international community developed by Wetlands International whose members are individuals with similar focus (wetlands – climate change issues). Their activities include: face to face meetings and regular webinars; huddle (joint data sharing mechanism), the access and maintenance of a virtual library. Through their involvement in this community, WII greatly benefited in both the development of individual staff competences. Joining the "community of practice" initiative was the result of the change of vision and mission of wetlands international [33], which in turn was influenced by the global development agenda for wetlands [41].

**Improved communication about WII and wetlands issues [10]**
More and higher quality news items about WII's activities was spread by distributing improved media content and packages through social media [20] and stronger ties with traditional media relations [21]. Better information could be provided through the cooperation in the "community of practice" initiative [26], but was driven by the need for stronger communication and publication [27]. Similarly, the strengthening of relations to traditional media was the result of this need [27]. The need for stronger communication was the direct result of the change of vision and mission at Wetlands International [33]. This change entitled to become more high-profile and visible in media, as well making the issues of wetlands more related to human needs.

The bargaining position of Wetlands International Indonesia increased due to an increase of spreading news about Wetlands International Indonesia and the issues dealt with [10] and expanding the network of stakeholders that the organization deals with [11] to include government, local communities, the private sector, civil society and the scientific community.

**Increased collaboration in networking with local and international partners [2]**
Since the baseline in 2012 WII has expanded its network and collaborating with a wide range of partners, both locally as well as internationally. This includes government, local communities, the private sector, civil society, the scientific community and organizations similar to WII internationally.

The expansion of WII's stakeholder network resulted from joining the international community of practice [26], better ties to the media [21], an overall strengthening of "advocating" policies related to not just wetlands [22] and having more extensive and diverse programs [14]. The overall strengthening of 'advocating' policies [22] related to not just wetlands, but also related areas like disasters, peat and emission management [22]. One of the WII contribution is the development of Indonesia's one map policy led by Indonesia's Geo-spatial Information Agency (BIG). One map policy is an integrated policy on the map production and utilization in Indonesia which covers all wetlands maps, including peat and mangroves. This in turn was enabled by the organizations approach to move its strategy and image from low profile to high profile ("show off") [28] and the development of field level activities to more strategic level program activities [29]. Both developments fit in with the new vision and mission of Wetlands International [33].

WII formulated more extensive and diverse programs [14]. These included for instance community resilience programs or green economy development initiatives. With this a greater amount of new stakeholders was reached. The move to these broader program initiatives was on the one hand related to the expansion of the issue coverage and work area [29] as projected in the new vision and mission of the organization [33], but also driven by an increasing number of donors and volume of donations, that resulted from increased opportunities to submit proposals to a wide range of donors [24], which was related to covering more issues and a wider work area [24]. This was in line with the new vision and mission of Wetlands International [33]. WII submitted more proposals to donors because WII has improved the accountability of the funds [25], which greatly increased confidence amongst potential donors for successful application of their funds. This improved accountability was due to having a more orderly financial administration in place [30]. Overall the greater accountability came about from an orderly financial administration of the organization's activities [30], as could be seen in the improved financial reports. This was largely due to the close monitoring of the organization's activities and funds, and the recommendations and assistance given by the Chief of Organization Officer (COO) of Wetland International (WI) Head Quarter (HQ) with an independent financial and HR consultant as recommended by WI HQ[41]. This was the result of getting coaching from headquarters [44]. After

findings from the MFS II baseline in 2012 financial issues became clear [45]. Furthermore, WII staff wanted the organization to develop [42] which supported the organization to improve upon their financial administration.

**A healthier and safer financial condition of the organization [4]**
WII has become a healthier and safer organization in financial terms [4]. This was largely enabled by the increasing number and amount of donations [23], which is explained above. It is also related to increased staff capacity to manage responsibilities [15]. This is further explained below.

**Increased organizational management capacity [9]**
Finally, WII staff indicated that there was an overall increase in organizational management capacity [9]. Four factors affected this increase:

1. Increased staff capacity to manage responsibilities [15]
2. Strengthening the existence and recognition of the organization in the eyes of the government [13]
3. An increase in the number of managerial staff [18]
4. Improved supporting facilities [19]

First, overall staff capacity to manage their activities and responsibilities [15] increased as a result of greater experience [31] and through knowledge sharing amongst colleagues [32]. Both were enabled by better staff placement in project management [35]. Moreover, staff management capacity increased due to additional training and capacity development events for staff members [36]. The consultant that was hired by WII as follow up of the MFS II baseline for the Alliance, provided recommendations to enhance staff management capacity [39].

The other reason for increased organizational management capacity [9] was that WII's recognition and image was strengthened in the eyes of the government [13]. This was due to the revision and addition of employment standard operating procedures (SOPs) to conform better to Indonesian law and regulations [16]. The drafting of these SOPs was the immediate result of a proactive stance to comply and adapt to Indonesian law and regulation in terms of human resources management and benefits [37]. All of these decisions were based on recommendations [37] made by an external consultant in the period between 2012 and 2014 [39] in an effort to evaluate organizational development of finances and human resources development [41] based on coaching and recommendations from Wetlands International HQ [44] after having reviewed the 5C baseline evaluation results by MFS II in 2012 [45].

Strengthening the recognition and image in the eyes of the government was also due to adjustment of the employment welfare according to the Indonesian employment policy [5]. As mentioned earlier, WII made a proactive case to comply and adjust to the employment welfare laws and regulations of Indonesia. This adjustment was sustained and successfully implemented [5] through the formulation of organization specific standard operating procedures [17] and based on specific recommendations [38] for having a more specific SPO for employment. This was suggested by the consultant is hired to improve management capacity, including finance, administration, human resources and other SPO related to its [39].

Thirdly, the number of managerial staff increased, providing additional resources and capacity for the management of the organization [18], due to an increasing need for resources for program activities and its' staff [43].

Fourthly, improved supporting facilities in the form of a new warehouse, parking lot, survey tools and supporting office materials [18] enabled an environment to manage operations in a more professional and efficient manner. This too, was based on a greater need for resources that matched the new ambitions and program activities of WII.

# 5 Discussion and conclusion

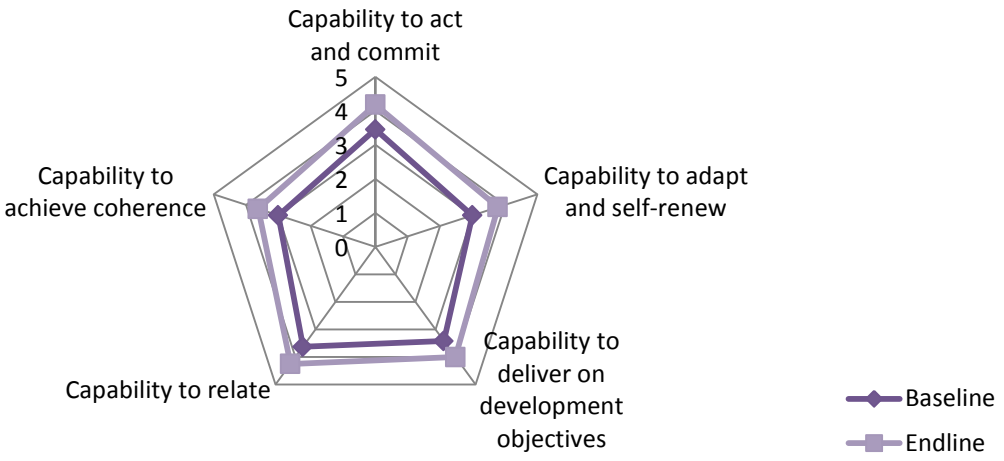
## 5.1 Methodological issues

**General: Applied to all or most SPOs**

With regard to the methodology, Indonesia has made some data collection adjustment based on the context. The first adjustment was related to the type of instrument used. To assess the organizational capacity, the study has provided self-assessment, observation and interview sheets. These all were used during the baseline with all SPOs. During the end line the team used self-assessment, interview and observation sheets. However the evaluator applied interview sheets as self-assessment—where participants were asked to fill these sheets by themselves. For the participants who did not attend the workshop, the interviews were done separately using the interview sheet and the results from the interview were included in the subgroup interview sheet that was already filled by the staff member. Were combined into the relevant sub categories in the interview sheet. Interview sheets were also applied for interviews with the CFAs, partners and consultants.

The baseline study showed that having two similar instruments (self assessments, and interview sheets) did not have any effect in relation to obtaining adequate and quality data.

To have some clarification post visit to all SPOs, the evaluator used email and phone interviews.



**WII**

The evaluator sent out all the interview sheets and most of them (six out of seven) were returned back before the field visit. WII did not have any M&E staff in place and so this particular interview sheet was not filled. The field visit started with the development of the general causal map, based on key organisational capacity changes since the baseline in 2012. There were 10 staff members who participated in the workshops, they were: 3 management staff (director, program manager, and finance manager), 3 program staff, 2 admin and HRM staff, and 2 field staff. Reviewing the historical timeline from 2012-2014 helped to initiate this process. Overall there was not much adjustment of the endline methodological guidelines. Furthermore, generally the same staff who participated in the baseline, also participated in the endline process.

## 5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Whilst changes took place in all of the five core capabilities, the greatest improvements have taken place in the capability to adapt and self renew. Below the changes in each of the capabilities are further explained, by referring to the specific indicators that changed.

Over the last two years an improvement took place the capability to act and commit. Responsive leadership has improved. The leader has extensive experience, is strong and dedicated, and is able to maintain good relationships with other parties. Strategic guidance has also improved as the leader provides good strategic guidelines related to the implementation of projects (i.e. work plan). Staff turnover has improved as well: key staff members that were hired as contractual staff has now been hired to work as permanent staff. Salary and benefits have been reviewed and adjusted; besides that, the human resources policy is now more in line with the Indonesian labour law. WII' organisational structure has improved as well due to an additional staff member at the country program level. Articulation of strategies has improved considerably since 2012. At the project level, decisions on future activities are based on a situational analysis (e.g. rapid ecosystem assessments). The strategic plans at project level have been well developed and implemented. Daily operations have slightly improved, since the running projects are now in line with the main goal and targets set by the global office. Staff skills have improved slightly; at present the staff's capacity to deal with strategic issues has improved due to the more complex activities and projects, which the organization has taken on board in order to survive. Training opportunities have slightly improved. Informal training occurs when staff exchange knowledge during joint projects with other organizations and universities. Formal training occurs more ad hoc. A slight improvement in the sources for funding has occurred. Some projects are close to end in 2015, which will affect the organization's finance. This is however being anticipated in Head Quarters where some strategic efforts are currently being formulated. Combined with the good reputation of the organization in program implementation, WII is expected to get sufficient funding in the next years. This is also supported by the wider scope of work as described in the organization's visibility change (logo, vision and mission) at the global level. Funding procedures have improved slightly after 2012 as there is now an initiative to have strategic consolidation from Wetland International to create umbrella programs that enable its members to access funds.

The capability to adapt and self-renew has improved the most compared to the other 4 capabilities. At the project level, monitoring and evaluation (M&E) is done systematically and on time. All WII projects have a log frame which has been agreed upon with the funders. Similarly, M&E competencies improved slightly: M&E at the project level runs smoothly but at the organizational level there is still room for improvement. In some cases, WII is employed by other International NGOs (i.e. Oxfam, Novib, IUCN NL) to evaluate and monitor their projects in Indonesia. M&E for future strategies has improved slightly; M&E at the outcome level is now done by the consultant hired by the funder, for example during the midterm review. Compared to 2012, the learning process in terms of critical reflection has been better developed and accommodated at the project level. The freedom for ideas has improved as staff now experience more freedom to express their ideas at the project level. In terms of a system for tracking the environment, WII has a considerable improvement. During this period (2012-2014), WII put its efforts in developing good networks in the areas of Climate Change Adaptation, Disaster Risk Reduction and Ecosystem Restoration and Management. In terms of

stakeholder responsiveness, WII is well respected by its partners, which is proven by the increased efforts to be involved in a number of local, national and international initiatives.

In the capability to deliver on development objectives, an overall slight improvement has taken place. In terms of clear operational plans, WII remains well known for having good performance in implementing and conducting the log frame at the project level which is acknowledged by both partners and donors. Cost-effective resource use has been slightly improved. WII works with a time writing system, and staff frequently works on more than one project at once to optimize their work schedules. In terms of mechanisms to meet beneficiary needs, a slight improvement has taken place as field projects are now determined based on thorough assessment of the needs and perspectives of local communities and stakeholders. In terms of balancing quality and efficiency, WII has shown considerable improvement: in a number of cases where the financial needs exceeded the proposal, the organization would disregard efficiency and use the organization's own money to cover the budget gap and maintain the quality of the result.

The capability to relate has slightly improved. First, stakeholder engagement is more involved in policies and strategies. The Ministry of Forestry, National Working Group on Mangrove, Ministry of Environment, Ministry of Marine and Fishery, National Council of Climate Change, National Disaster Management Agency, Community Disaster Management Indonesia, have been some of the parties that WII has engaged with since the baseline. In terms of engaging networks, WII has slightly improved 2012. There has been an increase in invitations from parties in WII's network to become partners with WII and more cooperation initiatives have been launched. The engagement with target groups has improved as well. Local communities and the other stakeholders are still always involved in implementation in the field. Relationships within the organization have slightly improved. There has been an emphasis on face to face communication and limiting information sharing through email and phone calls.

Finally the capability to achieve coherence has slightly improved as well. In terms of operational guidelines new operational procedures related to finance and HRM have been adopted by the management since the baseline. A slight improvement also took place in the alignment with vision and mission: staff agrees that the vision and mission of WII have been successfully aligned with Wetlands International after a global change in recent years. Mutually supportive efforts have been considerably improved through the cross-project coordination.

**General organisational capacity changes related to MFS II Interventions**

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. Please note that this information is based only on the information provided by WII staff during the endline workshop, but no validation of this information has been done like with the process tracing causal maps. For details in relation to attribution, we refer to the next section (5.3).

During the endline workshop some key organisational capacity changes were brought up by WII staff, these have been captured in the general causal map in 4.2.2:

1. Improved staff capacity in their respective roles and fields of work
2. Increased communication on WII and wetlands issues
3. Improved collaboration and networking with local and international partners
4. A healthier and safer financial condition of the organization
5. Increased organizational management capacity

All of these are expected to contribute to WII becoming a leading organization and a role model for organizations dealing with global warming and wetlands issues in the Indonesia. WII staff experienced these as the most important capacity changes in the organisation since the baseline.

Improved staff capacity resulted from joining the "community of practice". This is an international community whose members are organizations with similar focus (global warming-wetlands). This was

the result of the change of vision and mission of Wetlands International, which in turn can be attributed to the development of the global agenda for wetlands.

Increased communication on WII and wetlands issues was attributed by the SPO staff, to improving media content and packages as well as strengthening media relations. Both these developments sprung from the need for stronger communication and publication which resulted from a change of vision and mission of Wetlands International.

Improved collaboration and networking was attributed by the SPO to joining the joint community of practice, the strengthening of activities of advocating policies and other strategic activities (disaster, peat, emissions management) as part of a "one map policy" to include other subsectors, and more extensive and diverse programs. The strengthening of advocating activities was enabled by the shift in organizational approach from "low profile" to "high profile" as well as the development of field based programs to more strategic level programs. Both these shifts were the result of the change of vision and mission of Wetlands International, which occurred after the development of the global wetlands agenda. More extensive and diverse programs were the result of an increasing number of donors and the volume of donations, which in turn resulted from increased opportunities to submit financial proposals to various donors. This can be attributed to an expansion of issue coverage and work area on the one hand, and improved accountability of the organizational funds on the other. Whilst the work area expansion was once again due to the change of vision and mission of Wetlands International, the increased accountability resulted from an orderly financial administration. This was an important conclusion from the OD consultant who was hired after Wetlands International provided coaching and a capacity development workshop through MFS II funding.

The improved financial condition of WII occurred through an increasing number of donations, and increased staff capacity to manage responsibilities. The greater number of donations was already explained above. The increased staff capacity to manage responsibilities resulted from increased experience and knowledge sharing. Both of these were enabled by staff placement in project management, and staff being sent to trainings and workshops. Both these were recommended by the organizational capacity scan and HQ workshop on capacity development.

Finally, the increased organization management capacity resulted from an increased ability of staff to manage responsibilities, strengthening the existence and recognition of the organization in front of the government, an increased number of managerial staff, and improved supporting facilities. The latter two changes resulted from an increased need for resources for program activities and staff. Increased staff capacity to manage responsibilities was already explained in the previous paragraph. Strengthening the existence and recognition of the organization in the eyes of the government was due a revision and addition of Employment SOP as well as an adjustment of employment welfare according to Indonesian labor laws after a series of formalizations in the employment policy and contracts. Both can be attributed to the recommendations made by the consultant regarding integration of Indonesian laws and regulations as well as recommendations regarding reviewing and revising SOP's. This in turn resulted from the MFS II sponsored CD scan in March 2013.

In conclusion MFS II interventions have been tied to key organization capacity changes, as experienced by the SPO, although they were only in part responsible for all changes that have occurred. The redevelopment of the global agenda of Wetlands International has also had profound impact on the organization's capacity changes, particularly in the field of program quality and focus, as well as networks addressed. The development of a more structured, accountable and transparent organization that adheres to Indonesian law and has increased its' organizational management capacity can however for a large part be attributed to MFS II, according to SPO staff present at the endline workshop. However, it must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect.

# Appendix 1 Methodological approach & reflection

## Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

## Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.[13] Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

[13] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
   - -2 = Considerable deterioration
   - -1 = A slight deterioration
   - 0 = No change occurred, the situation is the same as in 2012
   - +1 = Slight improvement

- +2 = Considerable improvement

2. *Please describe what exactly has changed since the baseline in 2012*
3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
   - Intervention, actor or factor at the level of or by **SPO**: ..... .
   - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
   - Intervention, actor or factor at the level of or by the **other funders**: ..... .
   - **Other** interventions, actors or factors: ..... .
   - Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;

- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;
- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5.* ***Prepare and organise the field visit*** *to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6.* ***Interview the CFA*** *– CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

*Step 7.* ***Run the endline workshop*** *with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit,

so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

***Purpose of the fieldwork*:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

***Brainstorm on key organisational capacity changes and influencing factors***: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative.This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

***Self-assessments*:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8.* ***Interview SPO staff*** *– in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9.* ***Fill-in observation sheets*** *– in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

*Step 10.* ***Interview externals*** *– in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11.* ***Upload and auto-code all the formats*** *collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the* ***overview of information*** *per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13.* ***Analyse the data and develop a draft description*** *of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14.* ***Analyse the data and finalize the description*** *of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15.* ***Analyse the information*** *in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

## Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

- Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.
- Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.
- Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on

17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

*The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia*

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

*SPOs selected for process tracing – Ethiopia*

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| AMREF | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| CARE | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| ECFA | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| FSCE | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| HOA-REC | Sustainable Energy project (ICCO Alliance): 2014 Innovative WASH (WASH Alliance): Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| HUNDEE | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| NVEA | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |
| OSRA | C4C Alliance project (farmers marketing): December 2014 ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| TTCA | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

*The extent to which the Dutch NGO explicitly targets the following capabilities – India*[14]

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

*SPOs selected for process tracing – India*

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BVHA | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| COUNT | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| DRISTI | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| FFID | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |

14 RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Jana Vikas | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| NEDSF | | | | | | | No – delayed baseline |
| RGVN | | | | | | | No - delayed baseline |
| Samarthak Samiti (SDS) | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| Shivi Development Society (SDS) | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| Smile | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| VTRC | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

*The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia*

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | PT. PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, PT.PPMA, YPI, YRBI.

Table 6

*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| ASB | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| Dayakologi | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| ECPAT | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| GSS | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| Lembaga Kita | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| PT.PPMA | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| Rifka Annisa | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| WIIP | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Yayasan Kelola | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| YPI | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| YRBI | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| Yadupa | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

*The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia*

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

*SPOs selected for process tracing – Liberia*

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BSC | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| DEN-L | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| NAWOCOL | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| REFOUND | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| RHRAP | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

- A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
- A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
- **Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
- **Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and

then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for coding documents received from SPO and CFA in NVivo on the following:

- 5C Indicators: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the capacity development interventions implemented by the CFA (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
  - In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
  - During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;
  - During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
  - During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on

climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.
The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

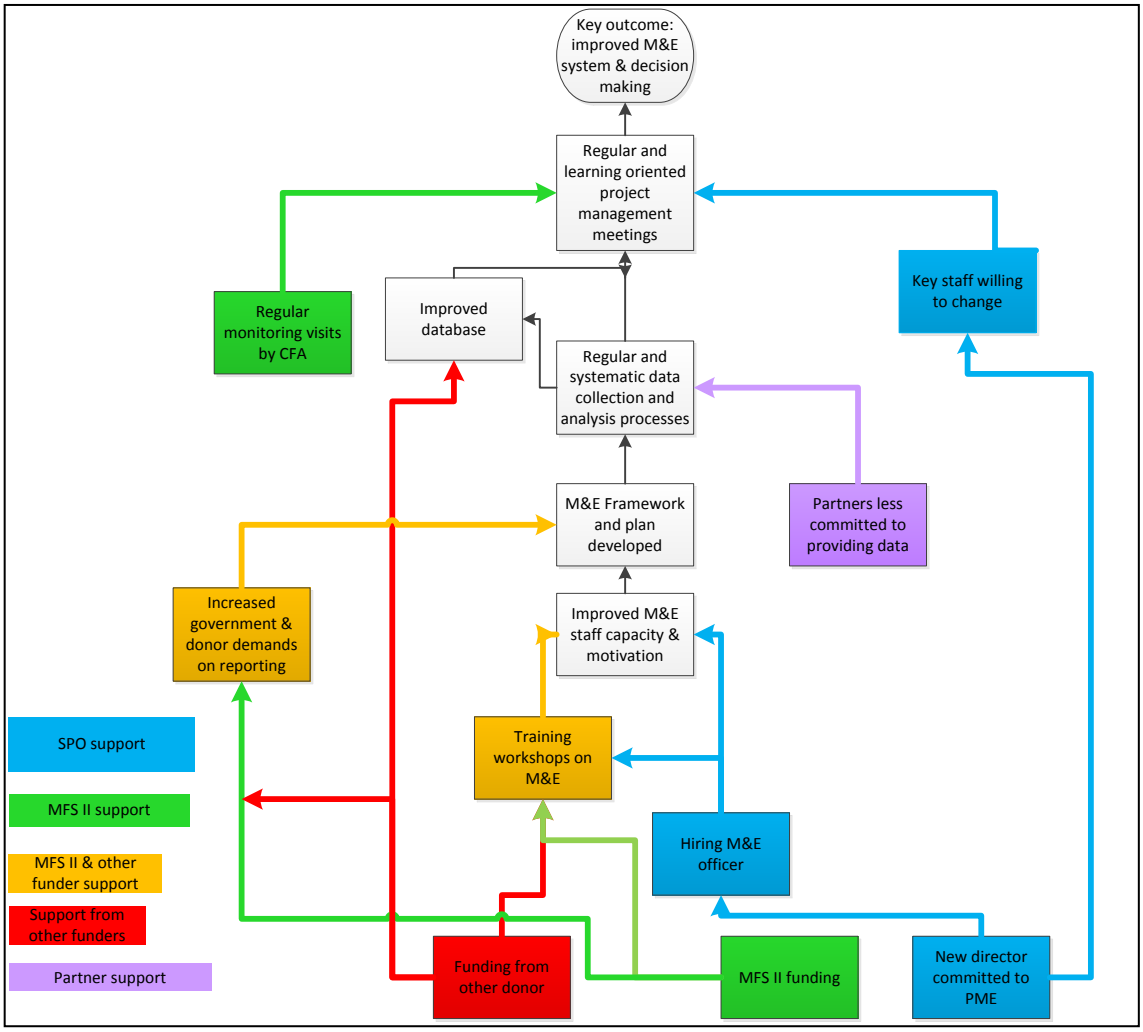

***Figure 1*** *An imaginary example of a model of change*

*Step 5. Identify **types of evidence** needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, *"What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?"*. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

- **Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.
- **Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
- **Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.
- **Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

*Format for identifying types of evidence for different causal relationships in the model of change (example included)*

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| Describe relationship between the subcomponents of the model of change | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions.<br>Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y?<br>Can we find this information by means of :<br>Pattern evidence;<br>Sequence evidence;<br>Trace evidence;<br>Account evidence? | Describe where you can find this information |
| Example:<br>Training workshops on M&E provided by MFS II funding and other sources of funding | Example:<br>What type of training workshops on M&E took place?<br>Who was trained?<br>When did the training take place?<br>Who funded the training?<br>Was the funding of training provided before the training took place?<br>How much money was available for the training? | Example:<br>Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br><br>Sequence evidence on timing of funding and timing of training<br><br>Content evidence: what the training was about | Example:<br>Training report<br>SPO Progress reports<br>interviews with the CFA and SPO staff<br>Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or

discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality** of data and **analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

| *Example format for the adapted evidence analysis database (example included)* **Description of causal relation** | **Confirming/ rejecting a causal relation (yes/no)** | **Type of information providing the background to the confirmation or rejection of the causal relation** | **Strength of evidence: strong/ rather strong/ rather weak/ weak** | **Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected** |
|---|---|---|---|---|
| e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

## Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

## Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has

provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is

crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design –** mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture

details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

- The capability to act and commit;
- The capability to deliver on development objectives;
- The capability to adapt and self-renew;
- The capability to relate (to external stakeholders);
- The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed. A detailed overview of capabilities with outcome domains and indicators is attached in Appendix 3.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Appendix 3 Changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

**Description of Endline Indicators WII**

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'
*This is about leadership within the organization (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organization.*

The leader has extensive experience, is strong and dedicated, and is able to maintain good relationships with other parties. There are currently three leaders at the managerial level. The management is now more inclusive and pays more attention to the needs of organizational development compared to the baseline situation in 2012. Most of the staff stated that the delegation of tasks and leadership roles amongst the managers are distributed more evenly, and not fulfilled by the Program Director alone. Program Managers are responsible for the technical reports, while the budget is managed by the Finance Manager in cooperation with the Project Coordinator. Project staffs are also encouraged to improve their capacity dealing with the projects. This situation affects the information distribution and decision making process. In addition, the leaders have positive concerns towards the staff and vice versa. Staffs has also gained trust in their leaders. Nonetheless, leadership is considered strong and hierarchical

WII holds a strategic position in influencing the wetland policy in Indonesia as the organization became the active member of National Committee of Wetland Ecosystem Management, the secretary of National Mangrove Working Group, member of Regional Mangrove Working Group in Sikka and Serang (Banten), and the only NGO member of One Map Policy (apart from Government Agencies) led by National Geospatial Agency (BIG)

Score: from 3.5 to 4.5 (improvement)

1.2.Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'
*This is about the extent to which the leader(s) provide strategic directions*

The leader provides good strategic guidelines related to the implementation of projects (i.e. work plan), which staff considered extremely helpful in getting the best out of their work activities. Staff has indicated that communication with leadership has become easier since the baseline in 2012, partially due to the more active use of organization's communication facilities (e.g. office server) and informal discussions. Besides that, the leader has disaggregated meetings into three levels in order to make it more effective. The multi layers meeting were initiated also to accommodate the Program Director's limited time and workload. Therefore, he is not necessary to attend all meetings. The meetings are as follows; *Firstly,* between the Program Director and the management. *Secondly,* between the management and the project coordinator/project manager, and thirdly between project coordinator/project manager and project staff.

In addition, the Program Director understands the importance of capacity building for staffs, particularly field staffs which most of them are junior. There are considerable gap of capacity between senior and junior staff. Therefore to increase their capacity the Program Director provides greater

autonomy for staff to work independently i.e working independently for project. To help them, the Program Director along with the program manager and finance manager developed detailed operational guidelines for the project coordinator/project manager that has improved staff skill to manage project significantly

Score: from 3 to 4 (improvement)

1.3.Staff turnover: 'Staff turnover is relatively low'
*This is about staff turnover.*

A senior staff member who already worked for WII for years left the organization for further education in 2013. The organization hired a HR independent consultant which resulted in general changes to staff's work contracts. Key staff members that was hired as contractual staff have now been hired to work as permanent staff. Salary and benefits have been reviewed and adjusted; beside that the human resources policy is now more in line with the Indonesian labor law. These changes have had positive effects for the staffs' working motivation within the organization. Staff has indicated that they hope that this will lead to positively support the organization's long term strategic planning. Staff placement and roles are now based on their expertise through which they can contribute optimally to the organization.

The organization considers its internal relationships as a strong familial bond and atmosphere as most of the staffs have been working for the organization for more than 10 years. Most of staffs have also a very good sense of belonging to the organization. That's why staff turnover is very low. A very few permanent staffs left just for education reason.

Score: from 3.5 to 4.5 (improvement)

1.4 .Organisational structure 'Existence of clear organization structure reflecting the objectives of the organization"

The organizational structure of WII did not change much. There was only one addition of personnel at the Country Programme level. This increased the total number of responsible people in the organization to three: the Programme Program Director, Programme Manager, and Finance Manager. They are also linked to the staff at Wetlands International global headquarters in the Netherlands. Global objectives and strategies are implemented through partnership agreements with the country offices, and these are ultimately implemented in the field through cooperation with local government, local NGOs and community-based organizations.

The organizational structure at the project management level reflects the activities that are undertaken by WII. In terms of field office management, the office set-up which has been realized at the end of 2011 remains solid and working properly. A total of five full-time project personnel have been settled in the Maumere Office and one other staff member in the Serang (Banten) office for Partners for Resilience Project (PfR), all supported by the management team in the Bogor Office. They have successfully managed and implemented the project components as planned.

During this period (2011-2014), WII highly put any possible efforts to develop good networking on the integration of Climate Change Adaptation, Disaster Risk Reduction and Ecosystem Restoration and Management. Partnerships have also been built with various relevant stakeholders, including land lords, enabling better environment for the introduction and implementation of the proposed programme. In addition, WII attempt to bring their partners in to a more globally integrated working atmosphere. The strategy is bringing their partners to be a part of *Partners for Resilience (PfR).* Wetlands International has worked closely with Red Cross, Cordaid, Red Cross Climate Centre and CARE to implement a range of activities in Asia, Latin America and Africa to increase people's resilience against (climate related) disasters via ecosystem restoration and management. They named the alliance by PfR.

Score: from 4 to 5 (improvement)

1.5 Articulated Strategies. Strategies are articulated and based on good situation analysis and adequate M&E

Development of the Wetland International global agenda has forced WII to adapt themselves and to incorporate strategic planning. WII was assisted by the capacity assessment under the MFS II programme in the context of Partners for Resilience (PfR). However, findings from regular M&E are still insufficiently adopted into the strategic planning.

At the project level, decisions on future activities are based on a situational analysis (e.g. rapid ecosystem assessments) disregard the fact that the WII strategic plan 2013 has not fully aligned with the global agenda yet. However, the strategic plans at projects level have been well developed and implemented. Nonetheless, there is a basic strategy set out in the Strategic Plan and grouped around 5 themes. All WII projects reflect the 5 strategies: Sustainable livelihoods, Biodiversity, Water, Climate, Greening the Economy).

Score: From 2.5 to 4 (considerable improvement)

1.6.Daily operations: 'Day-to-day operations are in line with strategic plans'
*This is about the extent to which day-to-day operations are aligned with strategic plans.*

There has not been any significant change from the baseline situation in 2012. Currently, the strategic plan is still in the process of being adapted from the global strategic plan to the national situation. The running projects are in line with the main goal and targets set by the global office. Some staff members are familiar with the existing strategic plan while some are not, particularly if it does not directly relate to their activities and responsibilities. Only the technical staff and some supporting staff members are familiar with the strategic plan due to their involvement in its implementation. Daily activities are set based on the monthly and daily plans to ensure that all targets are achieved.

Score:  from 3 to 3.5 (slight improvement)

1.7.Staff skills: 'Staff have necessary skills to do their work'
*This is about whether staff have the skills necessary to do their work and what skills they might need.*

Wetlands International Indonesia (WII) has technical and academically skilled staffs with appropriate educational background and general skills (English language, administration, project management). Most of the technical staff has a background in environmental education. At present the staff's capacity to deal with strategic issues has improved due to the more complex activities and projects which the organization has taken on in order to survive. Wetlands International Indonesia was previously the leading organization in Indonesia concerning wetlands but now other organizations are emerging within the sector who addresses similar issues. The competition with these organizations has proven to be a key factor for staff to be willing to increase their capacity and stay competitive in the market place.

The Program Director has delegated the authority to communicate about particular issues in the media to some of the technical and junior staff whom he deemed skillful enough to do so.

Score:  from 4 to 4.5 (slight improvement)

1.8.Training opportunities: 'Appropriate training opportunities are offered to staff'
*This is about whether staffs at the SPO are offered appropriate training opportunities*

There are many opportunities to attend formal and informal training. Informal training occurs when staff exchanges knowledge during joint projects with other organizations and knowledge institutions. Formal training occurs more ad hoc. Nevertheless, the organization has no budget for sending staff members for training. Staff therefore has to fund the training they attend by themselves or looking for scholarship. WII only sends staff to attend training related to program development for the organization. On the other hand, WII has also sent staff for further education abroad through

scholarship. There are some staff members with Master of Science degrees and one staff member is studying for a PhD in Australia with support from the organization. The management facilitated in seeking the scholarship for staffs with highly potential capacity by establishing cooperation with some universities abroad. The most minimal support given is providing institutional recommendation letter for the staff. Beside that in some cases where long trainings opportunities are available, the staff chooses not to participate because their attendance is required for their respective programs.

Score: from 3.5 to 4 (slight improvement)

1.9.1.Incentives: 'Appropriate incentives are in place to sustain staff motivation'
*This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.*

So far there has not been much change in the incentives given to WII staff. Currently, there is an adjustment related to salary and allowance in line with the addition of workload and inflation. Some temporary/project staff has stated that they receive sufficient remuneration. Overall staff motivation to work for WII missions is high. The inclusion of health allowance for field staff who works in risky environments adds to this motivation. Another incentive appreciated by the staff is the fact that WII offers the freedom to work in a warm office environment whilst having the opportunity to travel around Indonesia or abroad. Career and training opportunities are offered to particular staff members.

The organization hired a HR consultant which resulted in general changes to staff's work contracts. Contractual project staff members that positively appraised by the management have now been hired to work as permanent staff. Salary and benefits have been reviewed and adjusted, and the human resources policy is now more in line with the Indonesian labor law. These changes have had positive effects for the staffs' working motivation within the organization. Staff has indicated that they hope that this will lead to positively support the organization's long term strategic planning. Staff placement and roles are now based on their expertise through which they can contribute optimally to the organization. Furthermore, the organization considers its internal relationships as a strong familial bond and atmosphere as most of the staffs have been working for the organization for years.

Score: from 4 to 4 (no change)

1.9.2.Funding sources: 'Funding from multiple sources covering different time periods'
*This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.*

In the last decade, WII was able to increase the variety of funding. This included sources from the government, private sectors, and international foundations. These are including the Netherlands, CIDA/Canada, World Bank and international foundations such as IUCN, Oxfam, WWF, AccioNatura, and the Rockfeller Brother Funds. These funding sources have significantly stabilized the budget of the organization. Most of them are used for particular projects. WII has a good reputation with respect to budget management which makes it relatively easy for them to find funding. However, as a part of Wetland International (which is listed in Indonesia as an international NGO), WII is not allowed to get funding from within Indonesia which is narrowing the potential funding resource. Most staffs said that it will prevent conflict of interest and maintain independency.

Some projects are close to end in 2015 which will affect the organization's finance. This is however being anticipated in Head Quarters where some strategic efforts are currently being formulated. Combined with the good reputation of the organization in program implementation, WII is expected to get sufficient funding in the next years. This is also supported by the wider scope of work as described in the organization's visibility change (logo, vision and mission) at the global level.

Score: from 4 to 4.5 (slight improvement)

1.9.3.Funding procedures: 'Clear procedures for exploring new funding opportunities'

*This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.*

Overall there are no clear procedures for exploring new funding opportunities. However, after 2012 there is initiative to have strategic consolidation from Wetland International to have umbrella programs that enable its members to access funds.

In addition, staffs has the opportunity to create proposals and to approach potential funders, it also comes the other way around where the funders approach the organization because of its good reputation. Although it seems that WII easy to get new funds, however staffs indicated that the clear funding procedure is required.

Score: from 3 to 3.5 (Slight Improvement)

**Summary Capability to act and commit**
The leader has extensive experience, is strong and dedicated, and is able to maintain good relationships with other parties, both within as well as outside the organization. There are three leaders at the managerial level: the Program Director, the Programme Manager, and the Finance Manager. The Program Director, in collaboration with the Programme Manager, provides good strategic guidelines for the implementation of projects (i.e. through work plans), through which staff performance can be maximized. Currently, communication between leadership and staff has intensified and management and communication responsibilities have been delegated to the project staff. Currently, the strategic plan is still under development. There are more strategic consolidations in proposal development with the Head Quarter. The running projects are in line with the main goal and targets set by the global office.

In terms of staff turnover, one senior person who was with the organization for a long time has left the organization since the baseline but a HR consultant has been hired. Having the HR consultant is led to changes in the staff's working contracts, that affect staff motivation: key personnel is now working as permanent staff; salary and benefits are reviewed and adjusted; and the internal human resources policy is in line with the Indonesian labor law. A good working environment, opportunities for training and internal motivation have also contributed to staff being highly motivated to work with WII, but on the whole there is not much change since the baseline.

WII has technical and academically skilled staff with appropriate educational background and general skills (English language, administration, projects, multitasking). There are opportunities to attend formal and informal training – informal training occurs when staffs exchange knowledge during joined projects with other organization and university; whilst there is also formal ad hoc training.

Some projects are close to end in 2015 which will affect the organization finance. However, there are some strategic efforts in the Head Quarter, supported with the good reputation in program implementation, and the organization expects to get some funding in the next years. In term of funding procedures there is no much change since the baseline. The organization still has no clear funding procedures. However it does not affect the ability of WII to get new funds.

Score: from 3.4 to 4.2 (slight improvement)

**Capability to adapt and self-renew**
2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'
*This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).*

At the project level, monitoring and evaluation (M&E) is done systematically and on time. All WII projects have a log frame which has been agreed upon with the funders. The result of the log frame analysis is monitored and evaluated in a midterm evaluation by a consultant hired by the funder. So far, M&E is done well at the project level, as well as at the organization level. Even though they realize the importance of M&E for reasons of transparency, efficiency, cost effectiveness, and learning and

improvement. There are still need to have a more comprehensive M&E system that incorporates organizational performance and carries out M&E more systematically.

Score: from 3 to 4 (improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'
*This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.*

Up to now, the M&E is conducted in organizational and project level. In the organizational level M&E is conducted to measure the output of the implementation of finance, administration and services. It is done by the management (Program Director, Program Manager, and Finance Manager and they sometimes assisted by other staff based on their expertise). While, in the project level, the M&E measures the output and outcomes and done by Program Manager.

In addition to the internal M&E, the organization has hired the independent consultant to conduct the M&E for both organizational and project level annually. It measures the output, outcome and impact of the both domains. The similar M&E has also conducted by Project Manager of Wetlands International.

There is no staff particularly trained on M&E. Nonetheless, some staff members do understand the basics of M&E. There is still a need to increase the staff capacity in this area. M&E at the project level runs smoothly but at the organizational level there is still room for improvement. In some cases, WII is employed by other International NGOs (i.e. Oxfam, Novib, IUCN NL) to evaluate and monitor their projects in Indonesia. In particular cases, WII staff is employed to perform M&E duties abroad, for example in Thailand.

Score: from 3 to 3.5 (slight improvement)

2.3.M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'
*This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.*

The organization staff is actively involved in the M&E process of the implemented projects but has not been able to apply it at the organizational level within particular structure and schedule. M&E at the outcome level is done by the consultant hired by the funder, for example during the midterm review. Output and impact measurement at organizational level is still missing.

Score: from 3 to 3.5 (slight improvement)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'
*This is about whether staffs talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staffs are comfortable raising issues that are problematic.*

Compared to 2012, the learning process is better developed and accommodated at the project level. Staff is fully involved in the meetings during which critical reports towards the current project status and also proposals for further improvements are discussed. These opportunities are used appropriately by the staff and have impact on the implementation of projects.

Score: from 3 to 4 (improvement)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives
*This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.*

The staffs have more freedom to express their ideas in the project level. There is more room for the staff and management to communicate, mainly dealing with project implementation. Though in the organization level, there is no formal forum to share the ideas. Another factor is the seniority which is not applied to those three managerial staffs. In other words, staff has more equal opportunity to share and express their ideas. Generally the working atmosphere within the organization is good.

Score: from 3 to 4 (improvement)
2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and developments in its operating environment'
*This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.*

In terms of system for tracking environment, WII has a considerable improvement. During this period (2012-2014), WII highly put any possible efforts to develop good networking on the integration of Climate Change Adaptation, Disaster Risk Reduction and Ecosystem Restoration and Management. Partnerships have also been built with various relevant stakeholders, including land lords, enabling better environment for the introduction and implementation of the proposed programme. Continued efforts on communication and consultation with relevant local government institutions have resulted into good progress on the development of village regulation and establishment of Village level Disaster Response Team.

The specific achievement were: 1) The Bio-Rights approach has been fully implemented to all Community Group in 8 villages of Ende and Sikka, and Serang, Banten; 2) The early success of Bio-Rights approach has been more visible, both restoration and livelihood activities; 3) Better atmosphere for integration of the three PfR working pillars (CCA-DRR-EMR) on Wetlands International works as well as more coordinated communication among Partners with local government. As previously described PfR is an Alliance to increase people's resilience against (climate related) disasters via ecosystem restoration and management; 3) The successful advocacy efforts on Sikka District regulation on mangrove protection has been shared during various national and international meetings; 4) Additional supports for community group from local government and private sector through CSR programme; 5) Introduction of Climate Change Adaptation scenarios at community level (including re-introduction of Sorghum as staple for communities in NTT and provision of clean water facility in Banten); 6) Better working and planning coordination and alignment with all Partners; 7) Early result on the development of village regulation and establishment of Village Disaster Preparedness Team.

Score: from 3 to 4 (improvement)

2.7.Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and the general public'
*This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.*

WII is well respected by its partners, which is proven by the increased efforts to be involved in a number of local, national and international initiatives. Before beginning projects, they begin with quick assessments on the ecosystem, the beneficiaries, and the local leaders in the planned activities through dialogs with local communities and governments. They participate in dialogues with the multi-sectoral government regarding planning, which allows them to exchange information and provide feedback. Their operation in Indonesia is established in a Memorandum of Understanding with Ministry of Forestry. However, means to reach out to the community remain limited.

Score: from 3 to 3.5 (slight improvement)

**Summary of Capability to adapt and self-renew**
Overall the M&E is conducted in organizational that is done by the Management and project level which is done by Program Manager. In addition that internal M&E also supported by independent consultant and Project Manager of Wetlands International. In term of process all the staff are involved

an interactive discussion and encouraged for self reflection. The staffs have more freedom to express their ideas equally in many organizational forum including in policy making process. In addition, there is more room for the staff and management to communicate, mainly dealing with project implementation.

Regarding system for tracking environment, WII has a considerable improvement. During this period (2012-2014), WII highly put any possible efforts to develop good networking on the integration of Climate Change Adaptation, Disaster Risk Reduction and Ecosystem Restoration and Management. Partnerships have also been built with various relevant stakeholders, including land lords, enabling better environment for the introduction and implementation of the proposed program. Continued efforts on communication and consultation with relevant local government institutions have resulted into good progress on the development of village regulation and establishment of Village level Disaster Response Team.

WII is well respected by its partners, which is proven by the increased efforts to be involved in a number of local, national and international initiatives. Before, during, and after project implementations, the organization always communicates intensively and extensively with their stakeholders to ensure their relevance with stake holders' need.

Score: from 3.0 to 3.8 (improvement)

**Capability to deliver on development objectives**

3.1.Clear operational plans: 'Organization has clear operational plans for carrying out projects which all staff fully understand'

*This is about whether each project has an operational work plan and budget, and whether staffs use it in their day-to-day operations.*

There are still clear plans, including log frames, outline, agreement, and examination. Projects run based on operational work plans and budgets. Operational plans are used as guidelines to implement the daily activities together with M&E schedule and report writing. Operational planning at the project level functions as the reference to maximize outputs. Log frames for each project have been arranged and implemented at the Bogor office and in the field. WII is well known for having good performance in implementing and conducting the log frame at the project level which is acknowledged by both partners and donors.

Score: from 4 to 4.5 (slight improvement)

3.2.Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

*This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.*

WII is aware of the needs to work effectively using the resources related to the budget. An effective and efficient working habit in making the best of time and staff capacity is WII's strengths. They have a time writing system, and staff frequently works on more than one project at once to optimize their work schedules. Some staff members indicated that they have worked effectively and efficiently, whereas some other staff members stated that the lack of strategic management leads to an inefficient "*fire fighting"* approach – program manager will take over the works when crisis happen such as the project has not reach the target while the deadline is already approaching, having to attend to ad-hoc issues.

Score: from 3.5 to 4 (slight improvement)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

*This is about whether the SPO is able to carry out the operational plans.*

WII has a strong and good reputation in providing satisfying results in accordance to the agreement with funders and partners. Particularly the clear project plans and skilled staffs are appreciated in this

regard. If any changes in the external environment arise that may impact the project result, the organization will discuss a change in the plan and the time with the donors. So far there have not been any complaints made to WII dealing with these agreements.

Score: from 4 to 4 (no change)

3.4. Mechanisms for beneficiary needs: 'The organization has mechanisms in place to verify that services meet beneficiary needs'
*This is about how the SPO knows that their services are meeting beneficiary needs*

Field projects are determined based on thorough assessment of the needs and perspectives of local communities and stakeholders. The organization's approach ensures that there is involvement and active ownership within the community. WII has an internal policy to require the field staff to stay at the project location so they can work efficiently and integrate the ideas within the community. Through structured monitoring and evaluation practices, WII verified that the community and stakeholders' needs is fulfilled trough the intensive participatory meeting between WII and stakeholders that conducted regularly before, during and after project implemented.

Score: from 3 to 3.5 (slight improvement)

3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratio's)'
*This is about how the SPO knows they are efficient or not in their work.*

There is not much change but the efficiency is more strictly applied since 2012. WII is able to develop budgets based on the high quality results which enable them to stay within the confines of the allocated budget. WII is also able to prevent idle time by counting of the operational cost and arrange payroll. One of the strategies is to employ people in several projects at one time. Payroll is done by monthly fixed salary mechanism instead of by project mechanism. Besides that, the organization's planning system supports efficient work. Efficiency is monitored by the project coordinator/project manager or by a consultant hired by the funder. It is not clear whether the measurement of efficiency is conducted by specifically linking the related outputs and inputs.

Score: from 3 to 3.5 (slight improvement)

3.6. Balancing quality-efficiency: 'The organization aims at balancing efficiency requirements with the quality of its work'
*This is about how the SPO ensures quality work with the resources available*

This organization still considers quality as the highest priority when implementing their projects. In a number of small cases where the financial needs exceeded the proposal, the organization would disregard efficiency and use the organization's overhead money to cover the budget gap and maintain the quality of the result. Formally, there is no system to measure the quality and efficiency of the result but WII has so far continued to satisfy the donors' expectations so that they have very good reputation. More than that, WII then become one of the role model organization for others organization on Wetland International link.

Score: from 3 to 4.5 (considerable improvement)

**Summary of Capability to deliver on development objectives**
WII has a systematic way of delivering results through clear plans, log frames, outlines, agreements and continuous re-examination. Projects run based on operational work plans and budgets. WII has a strong and good reputation in providing satisfying results in accordance to the agreement with funders and partners. Particularly the clear project plans and skilled staff play an important role in this. By having field staff to stay in the project locations, the organization ensures that there is involvement and active ownership within the community, which assists WII in ensuring that project activities meet the needs of the communities. Although there is no formal system to measure efficiency and quality,

WII is able to deliver high quality results within the given budget or even with additional budget from the organization were needed. WII is known with donors for delivering high-quality results and using resources cost effectively.

Score: from 3.4 to 4 (slight improvement)

**Capability to relate**

4.1.Stakeholder engagement in policies and strategies: 'The organization maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organization'
*This is about whether the SPO engages external groups in developing their policies and strategies, and how.*

After 2012, WII has been more involved in a number of activities initiated by the government and other institutions. The involvement of stakeholders occurs in the collaboration with the government institutions. The Ministry of Forestry, National Mangrove Working Group, Ministry of Environment, Ministry of Marine and Fishery, National Planning Agency, National Council of Climate Change, National Disaster Management Agency, Community Disaster Management Indonesia, have been some of the parties that WII has engaged with since the baseline. WII closely considers the needs of their stakeholders, including different ministries, NGOs and communities involved in the development of policy (as for example was the case in Aceh after the tsunami). Besides that, as previously explained that WII has greater networking also at global level.

Wetlands International has worked closely with Red Cross, Cordaid, Red Cross Climate Centre and CARE to implement a range of activities in Asia, Latin America and Africa to increase people's resilience against (climate related) disasters via ecosystem restoration and management. They named the Alliance by PfR (Partners for Resilience) which was WII joined in. That networking has given a big influence in developing WII's policies and strategies. WII want to always update their policies and strategies not only in line with the needs on the field but also with the PfR's trend.

Score: from 3.5 to 4.5 (improvement)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'
*This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.*

In general, the condition has slightly improved from 2012. There has been an increase in invitations from parties in WII's network to become partners with WII. The organization has focused on developing their network and cooperation with other organizations (government and non-government) with similar areas of work, including: forest mapping, carbon sequestration, conservation and restoration of wetlands and other environmental issues. Nearly all projects are implemented through cooperation with other organizations. WII supports the establishment of community based organizations and invests in their capacity development.

WII is an active member of the National Committee of Wetlands Ecosystem Management (chaired by the Directorate General of Forest Protection and Nature Conservation (PHKA), the Ministry of Forestry). Through their membership, WII aids in the improvement of Strategic Planning and Action for National Wetlands. Furthermore, WII acts as the secretary of the National Mangrove Working Group which provides input and directions in arranging coastal (particularly mangrove) areas. WII also actively helps the Ministry of Internal Affairs and other ministries in the establishment of National Stratgies and Action Plan for Peatlands Management and distributes the documents into all regencies with peat lands. WII is also a member of the Regional Mangrove Working Group in Sikka (NTT) and Serang (Banten). In addition, Wetlands International Indonesia is also the chair of National Secretariat on Partnership on Migratory Bird Management. The operation in Indonesia is established through a Memorandum of Understanding with Ministry of Forestry.

Score: from 4 to 4.5 (slight improvement)

4.3.Engagement with target groups: 'The organization performs frequent visits to their target groups/ beneficiaries in their living environment'
*This is about how and when the SPO meets with target groups.*

Generally, there is still a good relationship between WII and local communities similar to the baseline situation. Local communities and the other stakeholders are still always involved in the arrangement and initiative implementation in the field. WII works directly with the communities by establishing community based organizations. The intensity and effectiveness of the communication has increased due to the increasing number of facilitators that stay with the community to obtain high involvement from the targeted community. WII also has monthly visits to the field in order to monitor the targeted communities. Generally, the organization is focused on long term projects in one area, not in a particular village or community.

Score: from 4 to 4.5 (slight improvement)

4.4.Relationships within organization: 'Organizational structure and culture facilitates open internal contacts, communication, and decision-making'
*How does staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?*

The communication with the field staff still runs well which greatly supports the success of the programs. Field staff is sometimes invited to attend meetings at the head office of WII in Bogor. Conversely, management staffs sometimes also visit project locations to meet with field staff. At the program or organization level, there is an exchange of limited information via e-mail or phone calls. Remote field project locations sometimes do not allow connecting through these means.

Score: from 3 to 3.5 (slight improvement)

**Summary of Capability to relate**
WII closely considers the needs of their stakeholders, including different ministries, NGOs and communities in the development of policy. WII has been involved in the activities initiated by the different ministries, and is part of the different national and local networks. WII developed cooperation with other organizations (government and non-government) which have the same concerns: forest mapping, carbon sequestration, conservation and restoration of wetlands and other environmental issues. WII works directly with the communities by establishing community based organization and by having project staff that live in the project areas so that issues are well known to the project staff, and can be acted upon.

Score: from 3.6 to 4.2 (slight improvement)

**Capability to achieve coherence**
5.1.Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organization'
*This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.*

In 2013, Wetlands International changed the organizational vision. The vision and mission are described at global level through the representatives in all offices once every five years. In addition to this, annual meetings are held to discuss and determine priority strategies. However, the strategies are not always well adapted into specific strategies for Indonesia. The improvement of strategic planning is still under development. Staff members are informed about the vision and mission but not actively involved in their development. The change in the global vision has stimulated the staff to adapt to a new way to working based on this new vision.

Score: from 3 to 3.5 (slight improvement)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'
*This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.*

There is a slight improvement in the availability of operational guidelines at the organizational level. There are some new operational procedures related to finance and HRM which have been adopted by the management since the baseline. However, not all the staff members agree to those particular procedures. WII has had financial guidelines and HRM since 1987 which have been renewed last October (2014) and are still under development.

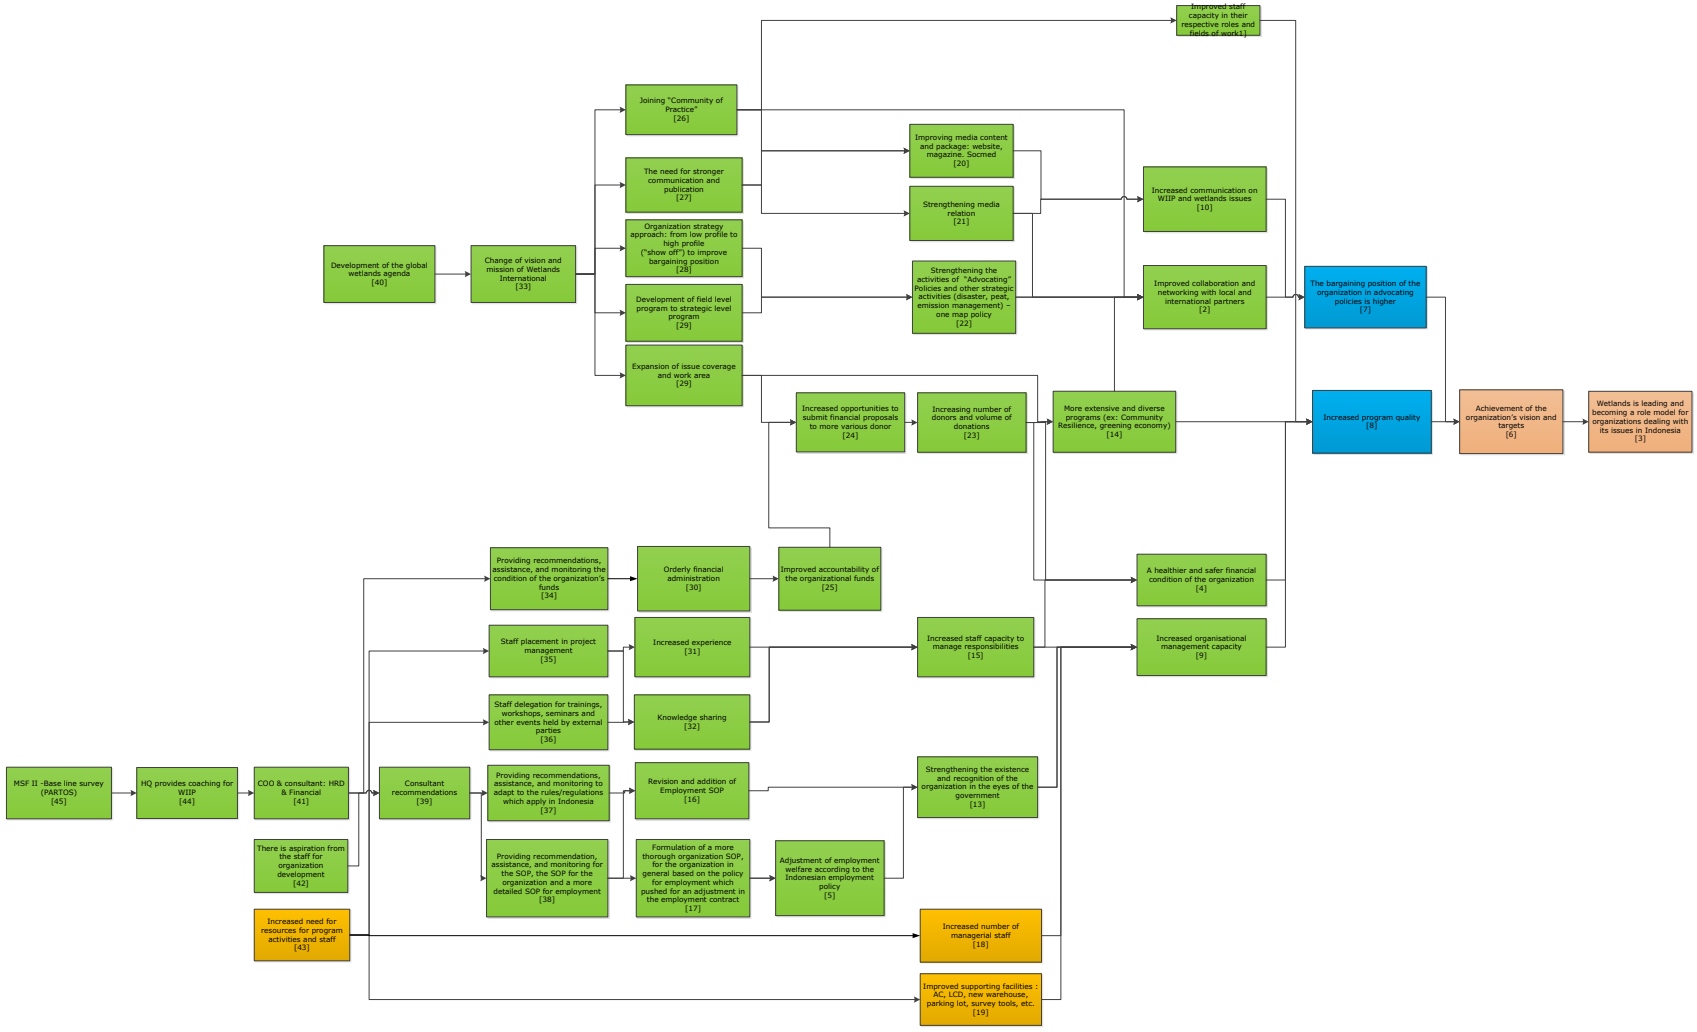
Score: from 3 to 3.5 (slight improvement)

5.3.Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'
*This is about whether the operations and strategies are line with the vision/mission of the SPO.*

Staff agrees that program implementations are in line with the vision and mission of WII, which is the same as the vision and mission of WI. This positive condition is still sustained to this day. It can be reached because of WII very strict to refer their vision, mission, strategies, and log frame when they developed programs and activities.

Score: from 3.5 to 4 (slight improvement)

5.4.Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'
*This is about whether the efforts in one project complement/support efforts in other projects.*



There is a better and more productive relationship between the various projects. This is an improvement. This can be achieved due to cross-project coordination is getting better. Sharing knowledge is not only done through meetings, but also through a variety of media, especially the Internet: organization server, email, dropbox, etc. It makes coordination easier and cheaper (efficient). In addition, there are also cross-cutting stakeholders between the various projects. It is good because it can mutually support each other.

Score: from 2.5 to 3.5 (considerable improvement)

**Summary of Capability to achieve coherence**
WII operates in a playing field of many competing interests and needs which makes coherence a challenging task. For example, vision and mission have been changed at the international level which has profound impact on the work activities in Indonesia, since the strategies need to be contextualized to the Indonesian context. Staff is not actively involved in the revision of the International vision and mission. In other term, overall staff members agree however that program implementation is in line with the set vision and mission also there is a better and more productive relationship between the various projects.

Score: from 3 to 3.6 (slight improvement)

# Appendix 4 Results - key changes in organisational capacity - general causal map

**Narrative of Wetlands International Indonesia Program Causal Map**

The evaluation team carried out an end line assessment at Wetlands International Indonesia (WII) from 2 to 3 July 2014. During this workshop, the team made a recap of key features of the organisation in the baseline in September 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline. The main changes that happened in the organisation since the baseline, as identified by the staff during the end line workshop were:

1. Improved staff capacity in their respective roles and fields of work [1]
2. Increased communication on WII and wetlands issues [10]
3. Improved collaboration and networking with local and international partners [2]
4. A healthier and safer financial condition of the organization[4]
5. Increased organizational management capacity [9]

These changes have helped the organization to improve the quality of the programs [8] and thereby contributed to reaching the organization's vision and targets [6]. According to WIP staff, they expect that this contributes to WII to become a leading organization and a role model for organizations dealing with wetlands and climate change issues in Indonesia.

Each of the five organizational capacity changes is further described below. The numbers in the narrative correspond to the numbers in the visual.

**Improved staff capacity in their respective roles and fields of work [1]**

Staff present at the end line workshop indicated that staff capacities in the respective roles and fields of work have improved since the baseline in 2012. They indicated that this is mainly the result of joining the "community of practice"[26]. This is an international community developed by Wetlands International whose members are individuals with similar focus (wetlands – climate change issues). Their activities include: face to face meetings and regular webinars; huddle (joint data sharing mechanism), the access and maintenance of a virtual library. Through their involvement in this community, WII greatly benefited in both the development of individual staff competences. Joining the "community of practice" initiative was the result of the change of vision and mission of wetlands international [33], which in turn was influenced by the global development agenda for wetlands [41].

**Improved communication about WII and wetlands issues [10]**

More and higher quality news items about WII's activities was spread by distributing improved media content and packages through social media [20] and stronger ties with traditional media relations [21]. Better information could be provided through the cooperation in the "community of practice" initiative [26], but was driven by the need for stronger communication and publication [27]. Similarly, the strengthening of relations to traditional media was the result of this need [27]. The need for stronger communication was the direct result of the change of vision and mission at Wetlands International [33]. This change entitled to become more high-profile and visible in media, as well making the issues of wetlands more related to human needs.

The bargaining position of Wetlands International Indonesia increased due to an increase of spreading news about Wetlands International Indonesia and the issues dealt with [10] and expanding the network of stakeholders that the organization deals with [11] to include government, local communities, the private sector, civil society and the scientific community.

**Increased collaboration in networking with local and international partners [2]**

Since the baseline in 2012 WII has expanded its network and collaborating with a wide range of partners, both locally as well as internationally. This includes government, local communities, the private sector, civil society, the scientific community and organizations similar to WII internationally.

The expansion of WII's stakeholder network resulted from joining the international community of practice [26], better ties to the media [21], an overall strengthening of "advocating" policies related to not just wetlands [22] and having more extensive and diverse programs [14]. The overall strengthening of 'advocating' policies [22] related to not just wetlands, but also related areas like disasters, peat and emission management [22]. One of the WII contribution is the development of Indonesia's one map policy led by Indonesia's Geo-spatial Information Agency (BIG). One map policy is an integrated policy on the map production and utilization in Indonesia which covers all wetlands maps, including peat and mangroves. This in turn was enabled by the organizations approach to move its strategy and image from low profile to high profile ("show off") [28] and the development of field level activities to more strategic level program activities [29]. Both developments fit in with the new vision and mission of Wetlands International [33].

WII formulated more extensive and diverse programs [14]. These included for instance community resilience programs or green economy development initiatives. With this a greater amount of new stakeholders was reached. The move to these broader program initiatives was on the one hand related to the expansion of the issue coverage and work area [29] as projected in the new vision and mission of the organization [33], but also driven by an increasing number of donors and volume of donations, that resulted from increased opportunities to submit proposals to a wide range of donors [24], which was related to covering more issues and a wider work area [24]. This was in line with the new vision and mission of Wetlands International [33]. WII submitted more proposals to donors because WII has improved the accountability of the funds [25], which greatly increased confidence amongst potential donors for successful application of their funds. This improved accountability was due to having a more orderly financial administration in place [30]. Overall the greater accountability came about from an orderly financial administration of the organization's activities [30], as could be seen in the improved financial reports. This was largely due to the close monitoring of the organization's activities and funds, and the recommendations and assistance given by the Chief of Organization Officer (COO) of Wetland International (WI) Head Quarter (HQ) with an independent financial and HR consultant as recommended by WI HQ[41]. This was the result of getting coaching from headquarters [44]. After findings from the MFS II baseline in 2012 financial issues became clear [45]. Furthermore, WII staff wanted the organization to develop [42] which supported the organization to improve upon their financial administration.

**A healthier and safer financial condition of the organization [4]**

WII has become a healthier and safer organization in financial terms [4]. This was largely enabled by the increasing number and amount of donations [23], which is explained above. It is also related to increased staff capacity to manage responsibilities [15]. This is further explained below.

**Increased organizational management capacity [9]**

Finally, WII staff indicated that there was an overall increase in organizational management capacity [9]. Four factors affected this increase:

1. Increased staff capacity to manage responsibilities [15]
2. Strengthening the existence and recognition of the organization in the eyes of the government [13]
3. An increase in the number of managerial staff [18]
4. Improved supporting facilities [19]

First, overall staff capacity to manage their activities and responsibilities [15] increased as a result of greater experience [31] and through knowledge sharing amongst colleagues [32]. Both were enabled by better staff placement in project management [35]. Moreover, staff management capacity

increased due to additional training and capacity development events for staff members [36]. The consultant that was hired by WII as follow up of the MFS II baseline for the Alliance, provided recommendations to enhance staff management capacity [39].

The other reason for increased organizational management capacity [9] was that WII's recognition and image was strengthened in the eyes of the government [13]. This was due to the revision and addition of employment standard operating procedures (SOPs) to conform better to Indonesian law and regulations [16]. The drafting of these SOPs was the immediate result of a proactive stance to comply and adapt to Indonesian law and regulation in terms of human resources management and benefits [37]. All of these decisions were based on recommendations [37] made by an external consultant in the period between 2012 and 2014 [39] in an effort to evaluate organizational development of finances and human resources development [41] based on coaching and recommendations from Wetlands International HQ [44] after having reviewed the 5C baseline evaluation results by MFS II in 2012 [45].

Strengthening the recognition and image in the eyes of the government was also due to adjustment of the employment welfare according to the Indonesian employment policy [5]. As mentioned earlier, WII made a proactive case to comply and adjust to the employment welfare laws and regulations of Indonesia. This adjustment was sustained and successfully implemented [5] through the formulation of organization specific standard operating procedures [17] and based on specific recommendations [38] for having a more specific SPO for employment. This was suggested by the consultant is hired to improve management capacity, including finance, administration, human resources and other SPO related to its [39].

Thirdly, the number of managerial staff increased, providing additional resources and capacity for the management of the organization [18], due to an increasing need for resources for program activities and its' staff [43].

Fourthly, improved supporting facilities in the form of a new warehouse, parking lot, survey tools and supporting office materials [18] enabled an environment to manage operations in a more professional and efficient manner. This too, was based on a greater need for resources that matched the new ambitions and program activities of WII.

Report CDI-15-047

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Report CDI-15-049

Kusters, C., Wieriks, M., Dwi Andari, B., Suprobo, N., Priyahita, W., Sihombing, R.R., Rokhmatulloh, S.W., Rosita, I., 2015. *Endline report – Indonesia, Yayasan Kelola. MFS II country evaluations; Capacity of Southern Partner Organisations (5C) component.* Centre for Development Innovation, Wageningen University & Research centre. Report CDI-15-049. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Indonesia, Yayasan Kelola. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

# Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation Yayasan Kelola and the Co-Financing Agency Hivos for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to Yayasan Kelola, Hivos, the synthesis team, IOB and NWO/Wotro.

# 1 Introduction & summary

## 1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: Yayasan Kelola in Indonesia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1.Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps

describe the identified key organisational capacity changes that are possibly related to MFS II interventions in these two capabilities, and how these changes have come about. More detailed information can be found in appendix 5.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR: Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

## 1.2 Brief summary of analysis and findings

Since the baseline, two years ago, Yayasan Kelola has seen a slight increase in the capability to act and commit. The director's leadership is more approachable and attentive, staff skills have improved, and new funding sources have been acquired. In terms of the capability to adapt and self renew a slight improvement has also occurred as M&E is performed more regularly and systematically. The capability to deliver on development objectives has very slightly improved as a result of more cost-effective use of resources. The capacity to relate has improved slightly as well as the organization has engaged in more networking activities with prominent organizations and is now starting to get more recognized. No changes have occurred in the capability to achieve coherence compared to 2012.

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. During the endline workshop some key organisational capacity changes were brought up by Yayasan Kelola's staff: increase of staff capacity, and becoming an organization with an international reputation. According to the SPO staff, these key organisational capacity changes can only to a minor extent be attributed toMFS II capacity development interventions.  The involvement of Hivos to support Kelola with the arts coalition initiative since 2012 has helped in building connections to government and lobbying and advocating activities, although this was not executed in the form of a specific MFS II capacity development intervention. Also a small role of MFS II continues to exist in trainings and workshops. Hivos has stated that they were able to reduce their fundraising from 30% to 5% in recent years due to the increased fundraising capacity of the organization. This is difficult to attribute to MFS II interventions without going into more detail through for example process tracing.

# 2 General Information about the SPO – Yayasan Kelola

## 2.1 General information about the Southern Partner Organisation (SPO)

## 2.2 The socio-economic, cultural and political context in which the partner operates

**The socio-economic, cultural and political context in which the partner operates**

Yayasan Kelola is a *"national arts service organization"*[1] operating in Indonesia. Out of a population of approximately 240 million inhabitants over 2800 Indonesian cultural organizations are registered[2]. Still a legacy of the Soeharto era, Indonesia has laws and regulations (normally implying high fees and charges) which limit and weaken the activities of art and cultural organizations[3]. On the other hand, more recent laws also made the development of arts in Indonesia more difficult, for instance the Anti-Pornography bill passed in 2009 by the Muslim party[4]. Public and financial support for arts and cultural enterprises remains rather limited and sporadic. This is mainly due to the fact that there are no incentives from the government for private organizations to invest in arts and culture. Nor is there a system for using some of the tax money for investing in arts and cultural objectives[5]. Moreover, the small public funding available for artists is rather inaccessible since it is *"channelled through a complex, slow and uncooperative bureaucracy"*[6].

Kelola Foundation encourages and facilitates arts. The focus is taken not without the reason, which is in Indonesia many artists only restrict the meaning on the performance or creation of the artwork. But it is less concern on the management. It is how the performance must be managed in such a way, by including the arrangement of financial report done properly so that this is the role of Kelola Foundation to stimulate the progress and increase vitality of arts in Indonesia by providing the access to the

[6] Yayasan Kelola (2011) *"Narrative Proposal for Activities of Kelola 2011-2013: Application for funding from HIVOS"*.

learning and knowledge, access to the information and fund. Due to the focus is in management, Kelola Foundation is the organization of arts which never produce artworks, does not perform the art activities itself. [7]

Kelola's programs range from workshops on management of cultural organizations and festivals to lighting, stage design, business partnership as well as offering learning opportunities through National Internships and International Residencies. The Art Grants offer monetary assistance to individual artists and ensembles. Through its website, Kelola opens access to information for and about the arts communities.[8]

Since Yayasan Kelola's current project implies five different programs, it is worth it describing the particular contexts relevant to each program. The program called *"Empowering Women Artists, Giving Voice to Women Artists"* consists of *"developing untapped potential of women artists by supporting their work and facilitating access to knowledge and networks"*[9]. Generally, this program aims at providing a platform for female artists where relevant topics can be discussed and translated into action. Developing female artists in a leadership position (like film directors and choreographers) is the main focus of this program[10]. One of the biggest challenges faced by the people involved in this program is that of social norms that dictate gender differences. For example, figures from the Kelola's Art Grant program revealed that only 25% of the recipients of the grant were female[11], which reflects how women are under-represented in leading positions in arts. In order to tackle this inequality the Empowering Women Artists program must be carried out over a long term (9 years), what poses another challenge since raising funds for such long periods is a challenge in itself.

The program "*Performing Arts Grants: Stimulating Innovation and Appreciation of different forms"* relates to a core activity of Yayasan Kelola and already exists for eleven years[12]. The relevance of this program in the artistic context in Indonesia, besides stimulating competition in the sector, is the fact that this is the only current grant program carried out in transparency and fair selection processes[13]. The main challenge faced in Indonesia in relation to this program is the fact that, despite having a long tradition in performing arts, the public and financial support for such activities has experienced a downturn in the past decade[14]. In this context, Yayasan Kelola aims at raising awareness both about the importance of Indonesian performing arts and about the need for regular funding in the artistic sector.

"*National Internships: Developing Human Resources for the Art Sector*" is the third program currently being carried out. As in the above programs, the main limiting challenge is the lack of funding. The National Internships have been elaborated as a solution for the lack of a common platform for Indonesian artists[15]. The program aims at bringing art students, performers, art and cultural organizations together, so that knowledge and inspiration can be shared and improved. Also, with this program Yayasan Kelola aims at preparing young Indonesian artists for a work life. The first Internship took place in 2000 and 12% of the total applicants have had the chance to participate[16]. The small amount of participants does not reflect a lack of will from Yayasan Kelola to place more candidates. Rather, the limited amount of participants is a result of Yayasan Kelola's limited resources.
The "*Series of One Day workshop: Building Skills and Knowledge*" is aimed at improving actors' communication and management skills, so as to ensure that the coming generations of artists can be as autonomous as possible[17]. Also in this case, limited resources form a barrier to the broadening and improvement of the program.

Also, there is the Theatre for Development and Education (TDE), which started as a pilot project in 2010. TDE is a program which uses theatre as a method to discuss social issues. Its methods are based on those of Augusto Boal's Theater Forum. Boal believes that theatre can find alternatives and solutions to the ongoing problems of society by involving individual people and communities directly. Recently, a large program implemented by the Kelola Foundation concerns PNPM Support Facility (PSF) for Creative Community program using the method of created empowerment process by using the cultural expression in voicing their aspiration through the theater of empowerment and participative video to empower the marginalized community and increase their participation. The program is the grant of creative community and a process of creative empowerment. The project is divided into 2 phases. The first phase will end in September, working in 3 locations, Landak in West Kalimantan, Bone in South Sulawesi, and North Lombok in NTB. The second phase between October-December 2015 we will work in 50 locations in 8 Provinces.[18]

All programs still continue until now. And all Kelola programs are open and competitive. The program is announced to the wide community and whoever fulfilling the requirement can apply. The applicants are then selected by the independent team which consists of the experts of art, and the selected applicants are announced through Kelola's website.[19]

## 2.3 Contracting details

When did cooperation with this partner start: 2003

What is the MFS II contracting period: 31-12-2010 to 30-12-2013

Did cooperation with this partner end: Not applicable

If yes, when did it finish: Not applicable

What is the reason for ending the cooperation with this partner: Not applicable

Is there expected cooperation with this partner after 31st of December 2015: Yes.

[19] Kelola Foundation Activities Report 2013

## 2.4 Background to the Southern Partner Organisation

**History**

Yayasan Kelola was established in 1999 in Solo (Indonesia)[20]. In collaboration with Indonesia's leading management school, Lembaga Manajemen PPM, it offered art modules for art organizations. To enhance and promote the vitality of Indonesian arts, Kelola works directly with Indonesian arts practitioners, across nationwide communities, in response to the needs by providing access to learning opportunities, funding, and information. Kelola also promotes cultural exchange by facilitating artists and art practitioners to engage in dialogue, gain and share skills and knowledge, as well as to build networks within Indonesia and with the international cultural communities.[21]

In 2004 Yayasan Kelola moved to Jakarta and kept on expanding the scope of its interventions. Nowadays Yayasan Kelola has five running programs and has reached more than 15000 people through it, direct and indirectly. Yayasan Kelola has sent 37 arts practitioners in residency programs to the USA and Australia and has supplied 90 arts practitioners with internships in 14 established institutions in Jakarta, Bandung, Yogyakarta, Jambi and Lampung. Finally, Yayasan Kelola has more than 1,000 arts practitioners in workshops and international conferences in 26 provinces[22]. Yayasan Kelola has regularly received support from HIVOS, the Ford Foundation and the Asian Cultural Council. Yet these organizations form only a fraction of the impressive network this organization has built up throughout the years of its existence[23].

Led by Director whose capacity has been well-recognized both in National and International level, the working pattern from Kelola Foundation is not similar to the other art organizations, but more similar to the formal agency instead, in which the staffs working with the artists receiving the grant, have the duty to maintain the order of management from all the artists.[24]

Kelola Foundation is the initiator of the artists gathering which then born the Indonesian Art Coalition (KSI) in 2010. There are 60 members, both personal and agencies throughout Indonesia. This coalition is the part of the learning due to the absence of association for the artists. The goal in the future is in order that the artists can be the legal entity. Thus with the existence of Indonesian Art Coalition, it is as the effort to the information access regarding the policy especially the art in Indonesia, and has the advocacy function for the art in Indonesia. [25]

Kelola programs drafted in response to the need and the problems uncovered by the visual arts, dance, Indonesian music and theatre society. If the need of art and cultural society shifts and turns, the Kelola program will also about to change.[26]

Please see appendix A for more details in the historical time line that was developed during the baseline workshop.

**Vision**

**"**Kelola aims to celebrate, nurture and promote the creativity of Indonesian artists and arts practitioners working in visual arts, music, dance, theatre and film. Through programs with a focus on educational activities, while engaging in cross-cultural dialogue, Yayasan Kelola aims at promoting cultural diversity"[27].

**Mission**

"To develop its programs in response to the needs and concerns articulated by the Indonesian visual and performing arts as well as by the film communities. As the needs of the communities shift and change, Kelola's programs change in response. Promoting cultural exchange by facilitating artists and

art practitioners' engagement in dialogue, so as to gain and share skills and knowledge is also a focus of Yayasan Kelola. Finally, Yayasan Kelola aims at building networks within Indonesia as well as in the international cultural communities"[28].

**Strategies**

Yayasan Kelola's strategies vary per program. Nevertheless, there are a few features based on Kelola's guiding principles, which outline all strategies carried out by Yayasan Kelola. Yayasan Kelola's guiding principles are: respect for diversity, fairness and accountability. The features that outline the specific program strategies are:

- a work ethic is based on impartiality, clarity and transparency.
- clear organizational objectives and structure,
- a focused program delivery system and
- financial accountability.

# 3 Methodological approach and reflection

## 3.1 Overall methodological approach and reflection

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected

capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

## 3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and

indicate whether and how the endline situation (2014) is different from the described situation in 2012[29].

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

[29] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

## 3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question*: **To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia*** **(i.e. measuring effectiveness)?** and the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

### 3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

### 3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

### 3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in

the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a

result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design** – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

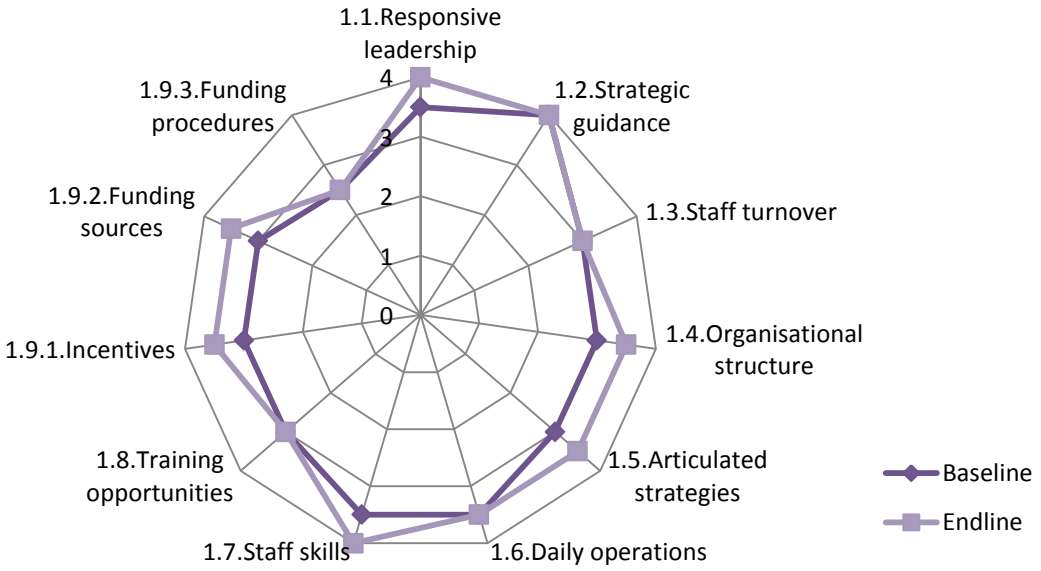
# 4 Results

## 4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of Yayasan Kelola that have taken place since 2011 are described. The information is based on the information provided by HIVOS.

Table 1
*Information about MFS II supported capacity development interventions since baseline*

| Title of the MFS II supported capacity development intervention | Objectives | Activities | Timing and duration | Budget |
|---|---|---|---|---|
| Empowering Women artists | Support Women artists in Indonesia | Artistic and gender assistance, leadership training and production support | 2011-2013 | IDR 315,300,000 |
| Organizational support | Support the organization in various ways | 6-8 managers supported and given internships in local/foreign cultural institutions. Funding support for national media coverage. Fundraising efforts supported | 2011-2013 | IDR 433,000,000 (for all organizational support activities) |
| Series of workshops | Improve performance art related knowledge | Workshops | 2011-2013 Annually | IDR 23,000,000 |



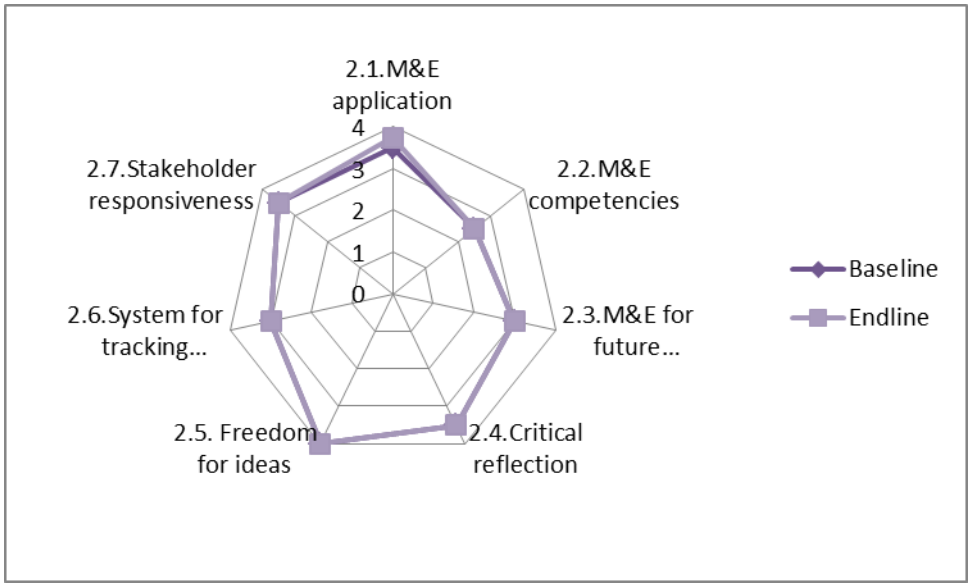
Source: 5C endline_support to capacity development sheet_CFA perspective_Indonesia_Yayasan Kelola – Exchange rate: 1 Euro = IDR 12,200

## 4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities. This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also annex 3.

### 4.2.1 Changes in the five core capabilities

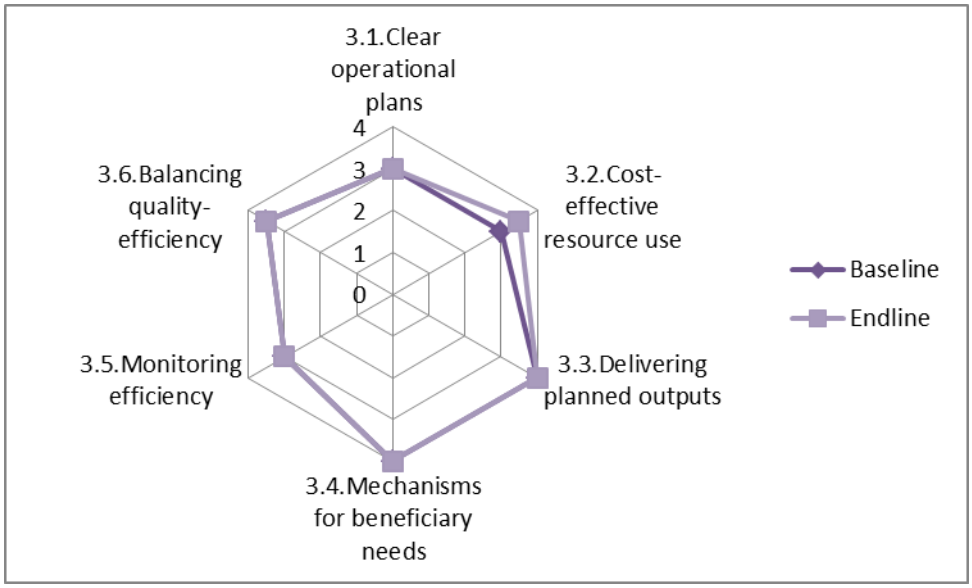
**Capability to act and commit**



Kelola has a limited number of staff and only a few separate divisions, making it an effective and efficient organization.The Director has been a great asset for the foundation as she can encourage her staffs to improve their skills and go beyond their limit. She is well connected to the target groups and also the funders which has positive impact on the organization. Compared to the baseline the director is now more approachable and attentive, especially for those who feel uncomfortable to talk to her directly. She has been able to attract additional funding, from FirstState Investment, and consequently new staff have been recruited. These include two staff members with finance and procurement expertise and two staff members with foreign language skills. These have improved the overall level of knowledge and skills in the organisation, but with the new project, there are also new competences that need to be addressed and training opportunities are more limited having more staff are not enough funds available. However, Kelola also offers them a number of incentives in the form of larger network exposure and great experiences. Even though new staff has been recruited the organisational structure hasn't changed. New staff with specific expertise is expected to provide more advantages in the long run especially in acquiring more funds for the organization. Whilst the strategic plan continues to be the basis for guiding staff in their work, the staff themselves receive clear guidance to achieve their goals through bi-weekly meetings and SOPs. Program activities all derive from the vision and mission, and the design and implementation are always based on the results of the evaluations. Kelola's evaluation mechanism itself is clear and structured. Since the funding is limited, their main programs are their priority and the scale of the projects depends on the funds.

Note: As it is quite difficult to find a replacement for the Director who is approaching the time for her retirement, Kelola may be on the edge of a managerial crisis that needs to be taken care of as soon as possible for the long run.

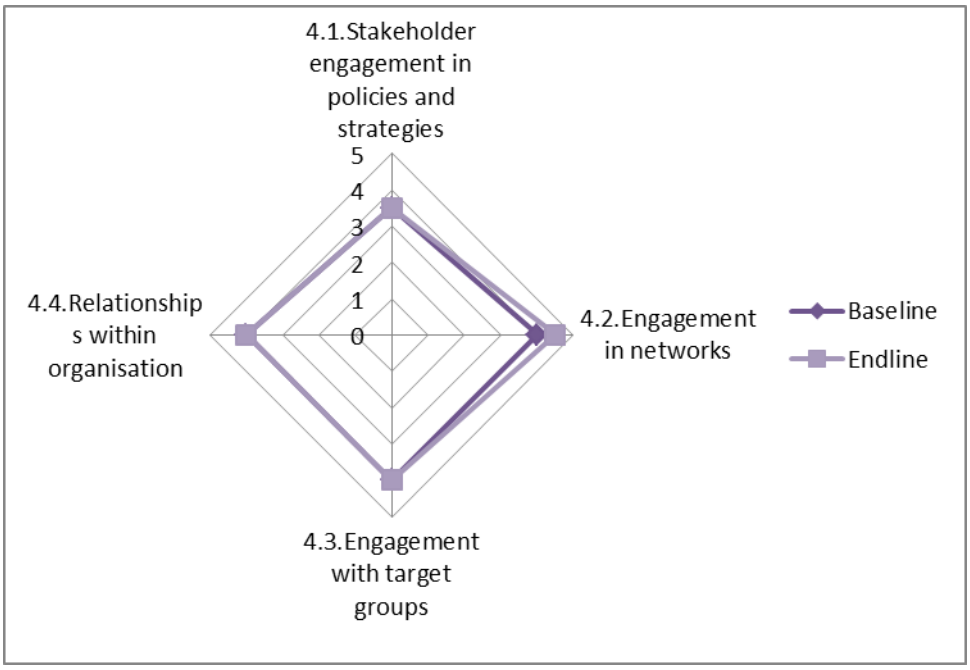
Score: 3.2 to 3.4 (very slight improvement)



**Capability to adapt and self-renew**

YAYASAN KELOLA still needs to make efforts to improve its M&E system especially with regards to the education and appointment of individual staff members dedicated to this area, but also to have a more strategically oriented, monitoring and evaluation that helps in making strategic decisions. YAYASAN KELOLA continues to have regular evaluations and discussions with their beneficiaries and stakeholders (media, artists, public, etc). The outcomes of these sessions are used to develop future strategies. The system enables them to meet the beneficiaries' needs and to measure the effectiveness of their programThere is no significant change in terms of internal culture or critical reflection and sharing of ideas. The staff still feels free to share their ideas and offer feedback. The cooperation with stakeholders has proven to have great impact on the operational and strategic decision-making. YAYASAN KELOLA is responsive to the changes in their environment, including the needs of stakeholders and the networks. The good relationship they have with stakeholders and networks help them to be aware of what is happening in their environment. Overall there is no significant change compared to the baseline in 2012.

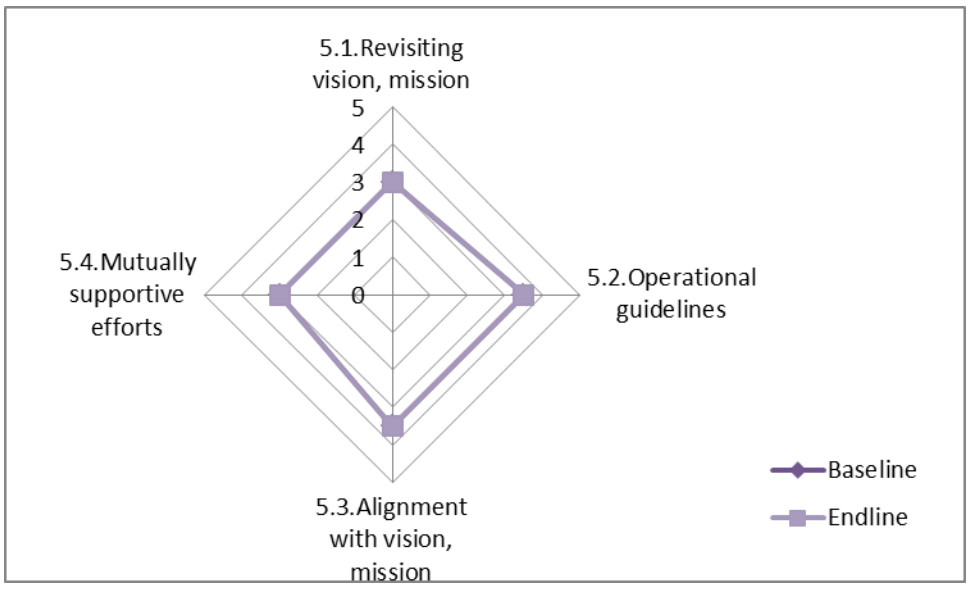
Score: 3.3 to 3.3 (no change)



**Capability to deliver on development objectives**

YAYASAN KELOLA has clear operational plans in place. YAYASAN KELOLA has been working under budget constraints for a long time forcing the organization to focus on using resources efficiently and focussing on what's important. All the staff is aware of the limited funds received and attempt to use their resources optimally. It has good system to respond to the need of the beneficiaries and meet the funders' qualifications. Although there is no formal system yet for its monitoring and evaluation to assess the beneficiary needs, efficiency and quality of their work, they show efforts to use minimal resources as best as they can. Outputs have generally still been implemented according to plan.

Score 3.4 to 3.5 (very minor improvement)



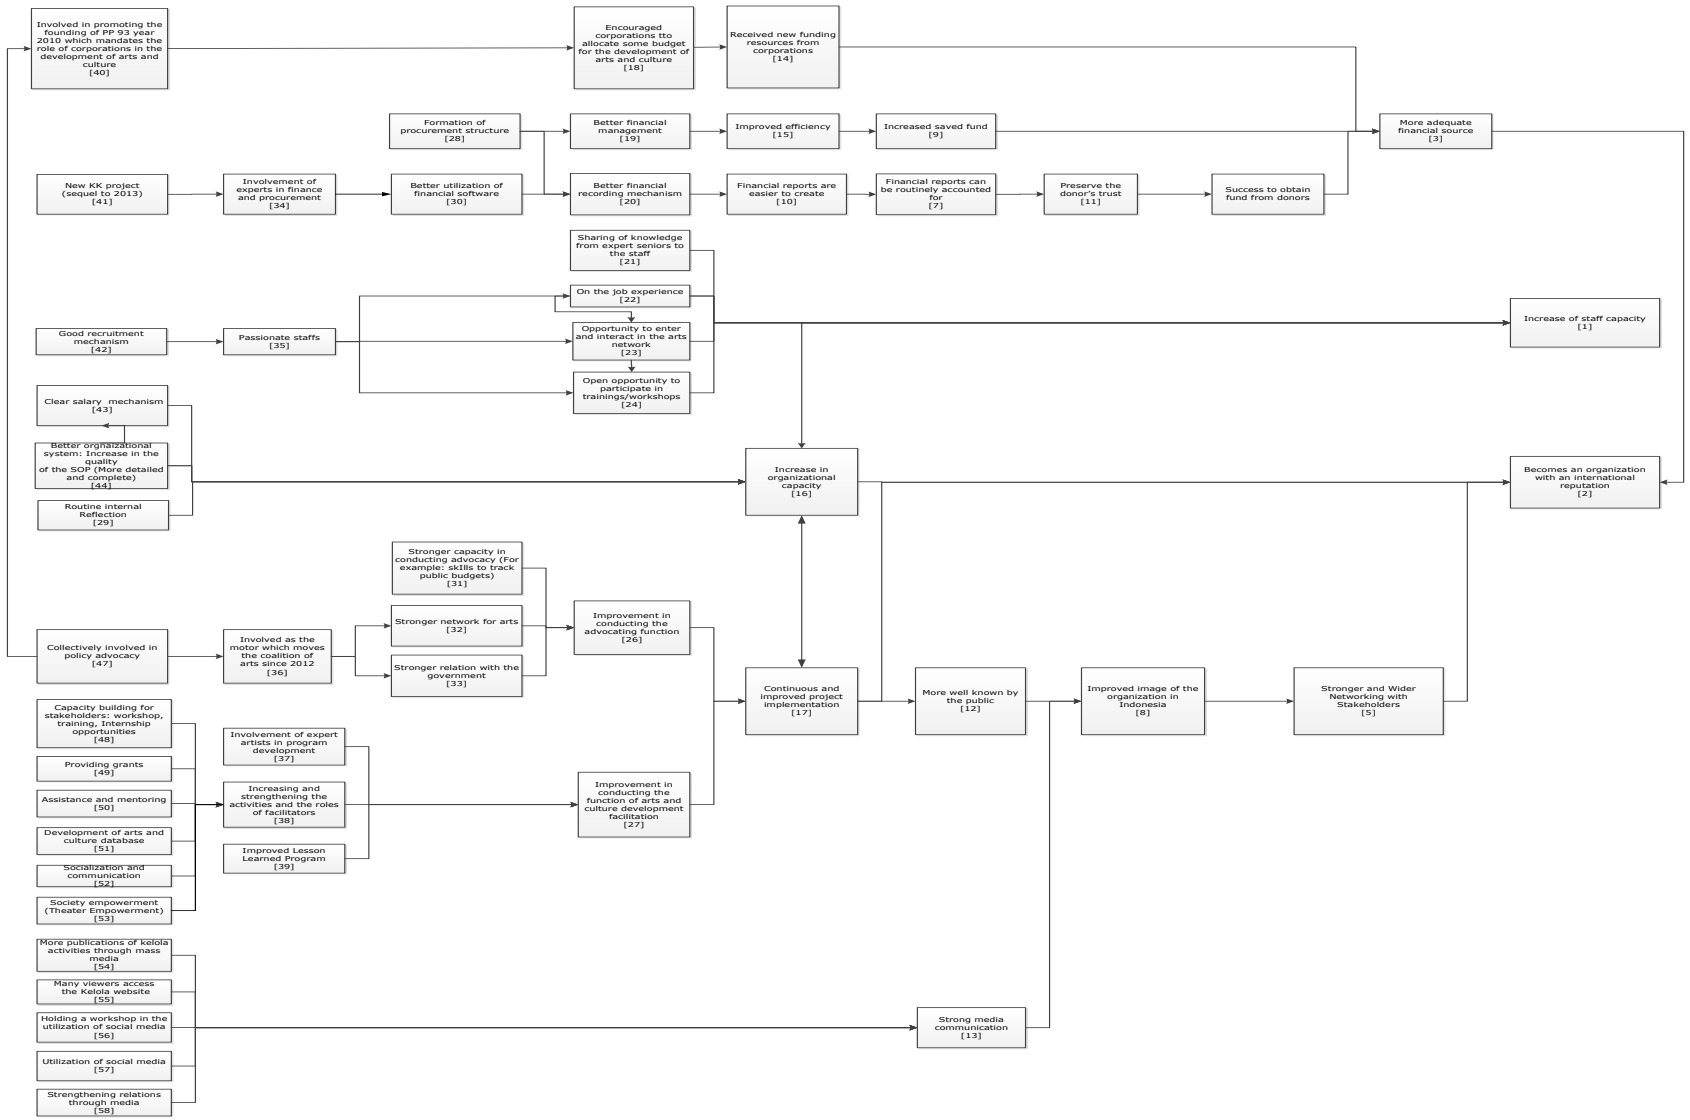
**Capability to relate**

The capability to relate has hardly improved mainly due to having a Director who is very active and well connected with the organization's network. As the result of good networking, YAYASAN KELOLA is getting more acknowledged both nationally as well as internationally. YAYASAN KELOLA continues to work closely with the target groups through dialogue, performances, information sharing, skills improvement, and networking. Internal relationships facilitate open communication, both formally and informally. Yayasan Kelola also actively work with the Koalisi Seni in particular to advocate the government policy collectively to run PP No 93 /2010.

Score: 3.9 to 4.0 (very minor improvement)

**Capability to achieve coherence**

Overall this organization has a good understanding on how to achieve coherence. They have a vision and mission which is reviewed every two years, and adjusted to the national needs and global trends. Nonetheless, changes have not been made since 2008 because the organization's vision and mission are still considered relevant and applicable. Each of the programs Kelola develops is derived from the vision and mission and even though Kelola makes innovations, they are all within the field of "arts and cultural development" framework of the organization's vision. Because all the programs are in line with their vision and mission, all of the programs support and complement each other. Furthermore staff members and partners are encouraged to share and conduct cross-program learning, as to apply lessons learned across all programs. YAYASAN KELOLA is a well-established organisation and since long as has adequate Standard Operating Procedures in place which are utilized by new staff members to start their work.



Score: 3.2 to 3.2 (no change)

### 4.2.2 General changes in the organisational capacity of the SPO

The evaluation team carried out an endline assessment at Yayasan Kelola from 26 to 27 June 2014. During this workshop, the team made a recap of key features of the organization in the baseline in September 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organization since the baseline. The two main changes that happened in the organization since the baseline in 2012, as identified by the staff during the endline workshop were:

1. Increase of staff capacity [1]
2. Becoming an organization with an international reputation [2]

Each of these organizational capacity changes is elaborated in detail below.

Involved in promoting the founding of PP 93 year 2010 which mandates the role of corporations in the development of arts and culture [40]
Encouraged corporations tto allocate some budget for the development of arts and culture [18]
Received new funding resources from corporations [14]
Formation of procurement structure [28]
Better financial management [19]
Improved efficiency [15]
Increased saved fund [9]
More adequate financial source [3]
New KK project (sequel to 2013) [41]
Involvement of experts in finance and procurement [34]
Better utilization of financial software [30]
Better financial recording mechanism [20]
Financial reports are easier to create [10]
Financial reports can be routinely accounted for [7]
Preserve the donor's trust [11]
Success to obtain fund from donors
Sharing of knowledge from expert seniors to the staff [21]
On the job experience [22]
Opportunity to enter and interact in the arts network [23]
Open opportunity to participate in trainings/workshops [24]
Increase of staff capacity [1]
Good recruitment mechanism [42]
Passionate staffs [35]
Clear salary mechanism [43]
Better orgnaizational system: Increase in the quality of the SOP (More detailed and complete) [44]
Routine internal Reflection [29]
Increase in organizational capacity [16]
Becomes an organization with an international reputation [2]
Stronger capacity in conducting advocacy (For example: skills to track public budgets) [31]
Stronger network for arts [32]
Stronger relation with the government [33]
Improvement in conducting the advocating function [26]
Collectively involved in policy advocacy [47]
Involved as the motor which moves the coalition of arts since 2012 [36]
Continuous and improved project implementation [17]
More well known by the public [12]
Improved image of the organization in Indonesia [8]
Stronger and Wider Networking with Stakeholders [5]
Capacity building for stakeholders: workshop, training, Internship opportunities [48]
Providing grants [49]
Assistance and mentoring [50]
Development of arts and culture database [51]
Socialization and communication [52]
Society empowerment (Theater Empowerment) [53]
Involvement of expert artists in program development [37]
Increasing and strengthening the activities and the roles of facilitators [38]
Improved Lesson Learned Program [39]
Improvement in conducting the function of arts and culture development facilitation [27]
More publications of kelola activities through mass media [54]
Many viewers access the Kelola website [55]
Holding a workshop in the utilization of social media [56]
Utilization of social media [57]
Strengthening relations through media [58]
Strong media communication [13]

**Increase of staff capacity [1]**

According to staff present at the endline workshop, overall staff capacity within Yayasan Kelola has increased [1] which has also influenced the increase in the organizational capacity [16].

The following underlying factors can be related to this development. *First,* sharing of knowledge from senior staff to junior staff took place [21]. *Secondly,* staff gained significant experience on the project [22] therefore staff learned through the opportunity to enter and interact with members of the arts network [23] that Yayasan Kelola is involved in. *Thirdly,* the benefit of staff close relation with the art networks makes them get invitation to participate in trainings and workshops held by other organizations within Yayasan Kelola network [24].

The staffs that have very good passion [35] on art see these opportunities for them to increase their capacities therefore Yayasan Kelola does not need to develop their staffs through internal capacity building. The passion in staff was in turn one of the qualities looked for during the recruitment of staff [42]. This is the cause why all staffs' passion on arts has supported their capacities both for the job and for their own developments.

**Becoming an organization with an international reputation [2]**

According to staff, Yayasan Kelola has significantly raised its profile and international reputation through various activities and developments. These developments have resulted in the director of the organization receiving an international award from Fullbright, USA.

The *first* factor that affected the organizational reputation was obtaining more adequate financial sources therefore the organization can operate continuously [3]. There are at least three folds influenced the first factor.

1. New funding resources were for instance obtained from corporations [14] as an effect of the establishment of PP 93 year 2010 which mandates the role of corporation in the form of art and culture [40]. This regulation effectively encourages corporations to allocate some budget for art and culture [18]. It was not solely a public effort to bring about the formulation of this policy however, as a collective effort to be involved in policy advocacy was a clear target for Yayasan Kelola to be achieved in the years prior [47].
2. Increase saved fund [9] as the result of improved financial efficiency [15] as an effect of better financial management [19]. It is caused by formation of procurement structure [28], and better utilization of financial software [30].
3. Yayasan Kelola has good ability in fund management resulted in the ability to fund some projects which has no donors. The fund from donors is used efficiently for a project, and the remained fund will be used as cross subsidy for other projects. The efficiency in fund use is the factor contributes to adequate financial sources. Whilst the frequent and accountable financial reports supports the organization to gain international reputation
4. Succeed in obtaining fund from international donors because of the trust from the donors [11]. The organization can preserve the trust due to the following:
    a. Routine and accountable financial reports. The financial reports are easier to create [10] after the implementation of a better financial recording mechanism [20]. The implementation of this mechanism was enabled by better utilization of the financial software [30] after the involvement experts in finance and procurement [34] through the new establishment of *Komunitas Kreatif* (Creative Community) project in 2013 [35].
    b. Increase in organizational capacity (will be elaborated in other paragraph) [16]
    c. Continuous and improved project implementation [17]

The *second* factor is the increase in organizational capacity [16], as is explained further below in this narrative. There are fourfold influenced the second factor:

1. Internal reflection [29] in monthly, quarterly, semester, annual organizational meetings, and also in project meetings based on the needs.
2. Increase staff capacity [1].
3. Better organizational system – complete standard operating procedures (SOPs) [44], including payroll mechanism - staffs' salaries increase based on Cost of Living Adjustment mechanism [43].
4. Continuous and improved project implementation (16), as elaborated below:
    a. There is an improvement in conducting the advocating function of the organization [26]. The advocating function of the organization improved through stronger capacity in advocacy such as the skill to keep track of public budgets [31]. But also through a stronger network in the

arts sector [32] as well as stronger relations with the government and authorities [33]. Both these factors were enabled by Kelola's role as the driving actor in the coalition of arts since 2012 [36]. This role was obtained after taking a leading position in the collective policy advocacy initiative [47].

b. There is an improvement in conducting the facilitation of arts and cultural development on the other hand [27], was improved through an improved lesson program [39] and the involvement of experts and artists themselves in the program's development [37]. Another factor that played an important role in improved facilitation was through strengthening and increasing the activities of facilitators themselves [38]. Six developments enabled this:
   - Capacity building for stakeholders through workshops, trainings, internships and other opportunities in which facilitators were directly applied [48].
   - Providing grants to fund their development [49]
   - Direct assistance and mentoring [50]
   - Development of an arts and culture database accessible to facilitators to enable learning and knowledge sharing [51]
   - Socialization and communication amongst facilitators [52]
   - Society empowerment through art activities [53].

The *third* factor affecting Yayasan Kelola's reputation was the stronger and wider networking efforts that the organization undertook. Not only were networking activities intensified, they were also applied to a broader range of organizations in a variety of fields of work [5].The improved image of Yayasan Kelola in Indonesia played a significant role in reaching out to these parties and broadening the network as a whole [8]. The greater image of the organization in turn came about from being better known amongst the public [10] through successful project implementation [13], but also through strong communication with the media [30]. Communication with the media was a carefully devised strategy consisting of a range of activities namely:

1. More publications and articles relating to Kelola's activities in mass media [50]. The number of publications regarding EWA in the media up to December 2013 are 81 articles (including news on the performances of the grantees, and also profiles on Kelola), and 61 publications for *Hibah Seni*.

2. An increase in online content leading to a greater audience on the organization's website [51]. Due to improvements in the content of the website, the number of visitors of Kelola's website up to December 2013 increased more than 20% with the total visitors : 160,457 117,606 and total clicks : 2,324,644 1,824,977.

3. The organization of a workshop through the utilization of social media [52]

4. Utilization of social media [53]. Since 2013, the Kelola newsletter was improved by sending several news in one email with attractive photos. The appearance of the newsletter with attractive visuals and layout caused a 25% increase in newsletter subscribers from 3,600 to 4,532. In addition, Kelola has 5000 friends on Facebook and 1697 followers on Twitter.

5. Approaching media as one of the organization stakeholders [54]. In 2013, Kelola succeeded in collaborating with five medias: Dewi, Femina, The Jakarta Globe, Suara Pembaruan and www.beritasatu.com. Through these collaborations, three performances of the Kelola grantees in Jakarta (Theater Performance "Mada" by Bambang Prihadie; Dance Performance "*Ruang Waktu*"by Nabilla Rasul; and Dance Performance "This Cycle We're In" by Andara F. Moeis) received support in the form of print ad, and publication before and after the performances in printed and online media. If counted, the value of Kelola's collaboration with the five media partners above are a total of IDR 480.300.00,- .

# 5 Discussion and conclusion

## 5.1 Methodological issues

**General: Applied to all or most SPOs**

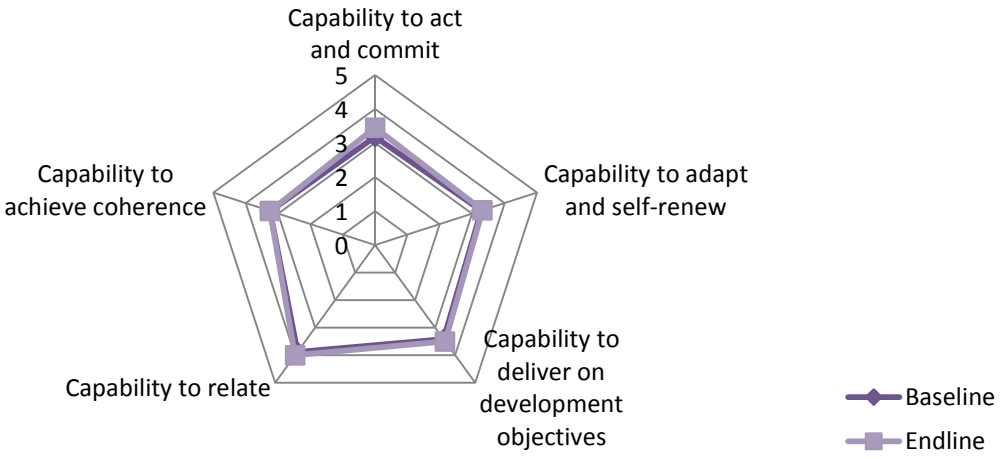
With regard to the methodology, Indonesia has made some data collection adjustment based on the context. The first adjustment was related to the type of instrument used. To assess the organizational capacity, the study has provided self-assessment, observation and interview sheets. These all were used during the baseline with all SPOs. During the end line the team used self-assessment, interview and observation sheets. However the evaluator applied interview sheets as self-assessment—where participants were asked to fill these sheets by themselves. For the participants who did not attend the workshop, the interviews were done separately using the interview sheet and the results from the interview were included in the subgroup interview sheet that was already filled by the staff member. Were combined into the relevant sub categories in the interview sheet. Interview sheets were also applied for interviews with the CFAs, partners and consultants.

The baseline study showed that having two similar instruments (self assessments, and interview sheets) did not have any effect in relation to obtaining adequate and quality data.

To have some clarification post visit to all SPOs, the evaluator used email and phone interviews.

**Yayasan Kelola**

The endline workshop in Kelola started with the brainstorm on key organisational capacity changes since the baseline in 2012 and factors influencing these changes, which resulted in the general causal map for the organisation. The discussion on this general causal map, was initiated by discussing the *historical time* line (from the baseline in 2012), and how this has changed over the years: critical changes in the organization, development of vision, mission and strategies; target groups; numbers and functions of staff; total budget and funders; important influencing factors and actors. This resulted in a broad range of organisational capacity changes.



In-depth interviews were held with SPO staff to follow up the information that was provided on the self-assessment sheets and also to further explore issues discussed during the workshop. There were six staff members who participated in the workshop: 2 management staffs, 3 program staffs and 1 administration and HRM staffs. The evaluator did not conduct interview with M&E staff because Kelola did not have specific M&E staff. However, the M&E issue was discussed with other staff, specifically with the management, who has taken over the M&E role.

There were no differences in the baseline and endline respondents because Kelola Foundation staff turnover was very low. The external partner respondents were selected together by the evaluator and Kelola Foundation. They were a member of Koalisi Seni as a partner; a cultural specialist involved in one of the project as a consultant; and an art curator who had received a grant from Kelola as a beneficiary. The consultant and beneficiary were not located in Jakarta (Kelola's office), so the interview with them was conducted at different time.

## 5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Below the changes in each of the capabilities are further explained, by referring to the specific indicators that changed.

Over the last two years most improvements took place in the indicators under the capability to act and commit for Yayasan Kelola. A slight improvement occurred in the responsiveness of leadership. After an effort to cover the gap between senior and junior staff with management, the director is now more approachable and attentive, especially for those who feel uncomfortable to talk to her directly. This enabled all the staff to give input and feedback comfortably. In terms of articulation of strategies a slight improvement took place through even greater integration of program activities in relation to strategic objectives and vision and mission. Staff skills improved slightly through the hiring of newly skilled staff, but also through the continuous learning of staff members in the issues related to local artists as well as report writing. Incentives have slightly improved at the organization by offering exposure to a large professional network which allows for significant personal growth of the staff members. Funding sources have slightly improved as well, true the long term cooperation with First State Investment which started in 2012.

The capability to adapt and self-renew has only very slightly improved compared to the baseline situation in 2012. The application of M&E for instance is still done informally, although now more regularly. Every program activity is reviewed by a third party to ensure the objectivity of the analysis, but further analysis and implementation is needed for M&E to be truly useful for the organization.

The capability to deliver on development objectives has demonstrated a very minor improvement. A slight improvement has occurred in the cost-effective use of resources of Yayasan Kelola. Since every staff member now understands the difficulty of obtaining funds and managing them, they are even more motivated to be precise in their estimations as well as utilizing their resources as effectively as possible.

The capacity to relate has a very minor improvement resulting from Yayasan Kelola's engagement in networks. The organization has engaged in more networking activities with prominent organizations is now starting to get more recognized.

No change has occurred in the capability to achieve coherence compared to 2012.

**General organisational capacity changes related to MFS II Interventions**

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. Please note that this information is based only on the information provided by the SPO staff during the endline workshop, but no validation of this information has been done like with the process tracing causal maps. For details in relation to attribution, we refer to the next section (5.3).

During the endline workshop some key organisational capacity changes were brought up by Yayasan Kelola staff, these have been captured in the general causal map in 4.2.2:

1. Increase of staff capacity
2. Becoming an organization with an international reputation

Yayasan Kelola staff experienced these as the most important capacity changes in the organisation since the baseline.

An increase in staff capacity was due to sharing of knowledge from expert seniors to the staff; on the job experience; the opportunity to enter and interact in the arts network; and opening the opportunity to participate in trainings and workshops. Each of these was enabled by passionate staff, which can be attributed to the good recruitment mechanism of Yayasan Kelola.

Becoming and organization with an international reputation was due an increase in organizational capacity, more adequate financial sources and a stronger and wider network with stakeholders. Increased organizational capacity was due on the job experience, a clear salary mechanism, better organizational systems through higher quality SOPs, routine internal reflection and continuous and improved project implementation. The latter was due improvements in advocating and improvements in arts and culture development facilitation. Improvements in advocating can be attributed to stronger capacity in advocacy skills, a stronger network for arts, as well as better relations with the government. This in turn was enabled by Yayasan Kelola acting as the engine which drove the coalition of arts since 2012 and the organization being collectively involved in policy advocacy. This was a Hivos sponsored MFS II activity, but could not be identified as a specific capacity development intervention. The improved function of arts and culture development facilitation resulted from involvement of expert artists in program development, improved lessons learned program, and increasing and strengthening the activities and roles of facilitators. This was due to a variety of interventions namely; capacity building for stakeholders, workshops, training and internship opportunities (partially funded by MFS II), providing grants, assistance and mentoring, development of arts and culture database, Socialization and communication as well as society empowerment.

More adequate financial sources were enabled by new funding from corporations, increased saving funds, as well as additional donor funding. Corporations were encouraged to allocate budget for the development of arts and culture due to Yayasan Kelola being involved in promoting the government regulation PP93 which encouraged corporations to do so. Increased savings were made possible by improved efficiency in operations due to better financial management. This was enabled by the formation of a procurement structure. The successful acquisition of new donor funds were enabled by preserving donor trust, accountable financial reports as a result of a simplified mechanism to do financial recording. This was enabled by the utilization of financial software after the involvement of finance experts as part of the KK project in 2013.

The stronger and wider network of stakeholders that Yayasan Kelola that was developed since the baseline was due an improved image of the organization in Indonesia. This can be attributed to it being better known by the public, as well as the strong media communication that took place. Public awareness increased as a result of continuous and improved project implementation, as was already explained above. The strong media communication can be attributed to more publications of Kelola activities through mass media, an increase in website traffic, holding a workshop in the utilization of social media, utilizing social media and strengthening media relations.

In conclusion, and based only on the information provided by the SPO staff during the endline workshop, only a small part of MFS II capacity development interventions can be related to the key organizational capacity changes that have taken place. The involvement of Hivos to support Kelola with the arts coalition initiative since 2012 has helped in building connections to government and lobbying and advocating activities, although this was not executed in form of a specific MFS II capacity development intervention. Also a small role of MFS II continues to exist in trainings and workshops.It must be noted that the information provided has not been verified through other sources of information. However Hivos has stated themselves that they were able to reduce their fundraising from 30% to 5% in recent years due to the increased fundraising capacity of the organization. This is difficult to attribute to MFS II interventions without going into more detail through for example process tracing.

# Appendix 1 Methodological approach & reflection

## Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

## Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.[30] Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

[30] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
   - -2 = Considerable deterioration
   - -1 = A slight deterioration
   - 0 = No change occurred, the situation is the same as in 2012
   - +1 = Slight improvement
   - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*

3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
   - Intervention, actor or factor at the level of or by **SPO**: ..... .
   - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
   - Intervention, actor or factor at the level of or by the **other funders**: ..... .
   - **Other** interventions, actors or factors: ..... .
   - Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;

- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5.* ***Prepare and organise the field visit*** *to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6.* ***Interview the CFA*** *– CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

*Step 7.* ***Run the endline workshop*** *with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

***Purpose of the fieldwork*:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

***Brainstorm on key organisational capacity changes and influencing factors***: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative.This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

***Self-assessments*:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8.* ***Interview SPO staff*** *– in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9.* ***Fill-in observation sheets*** *– in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

*Step 10.* ***Interview externals*** *– in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11.* ***Upload and auto-code all the formats*** *collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the **overview of information** per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13. **Analyse the data and develop a draft description** of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14. **Analyse the data and finalize the description** of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15. **Analyse the information** in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

## Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

- Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.
- Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.
- Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on

17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

*The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia*

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

*SPOs selected for process tracing – Ethiopia*

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| AMREF | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| CARE | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| ECFA | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| FSCE | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| HOA-REC | Sustainable Energy project (ICCO Alliance): 2014<br>Innovative WASH (WASH Alliance): Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| HUNDEE | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| NVEA | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |
| OSRA | C4C Alliance project (farmers marketing): December 2014<br>ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| TTCA | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

*The extent to which the Dutch NGO explicitly targets the following capabilities – India*[31]

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

*SPOs selected for process tracing – India*

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BVHA | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| COUNT | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| DRISTI | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| FFID | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |

[31] RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Jana Vikas | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| NEDSF | | | | | | | No – delayed baseline |
| RGVN | | | | | | | No - delayed baseline |
| Samarthak Samiti (SDS) | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| Shivi Development Society (SDS) | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| Smile | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| VTRC | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

*The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia*

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | Pt. PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, Pt.PPMA, YPI, YRBI.

Table 6

*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| ASB | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| Dayakologi | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| ECPAT | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| GSS | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| Lembaga Kita | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| Pt.PPMA | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| Rifka Annisa | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| WIIP | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Yayasan Kelola | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| YPI | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| YRBI | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| Yadupa | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

*The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia*

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

*SPOs selected for process tracing – Liberia*

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BSC | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| DEN-L | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| NAWOCOL | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| REFOUND | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| RHRAP | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

- A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
- A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
- **Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
- **Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and

then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for **coding** documents received from SPO and CFA in NVivo on the following:

- **5C Indicators**: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the **capacity development interventions implemented by the CFA** (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
  - In the 2012 **theory of change** on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
  - During the baseline the CFA indicated a link between **the planned MFS II support** to organisational development and the expected short-term or long-term results in one of the selected capabilities;
  - During the endline the **CFA** indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
  - During the endline the **SPO** indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on

climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.
The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

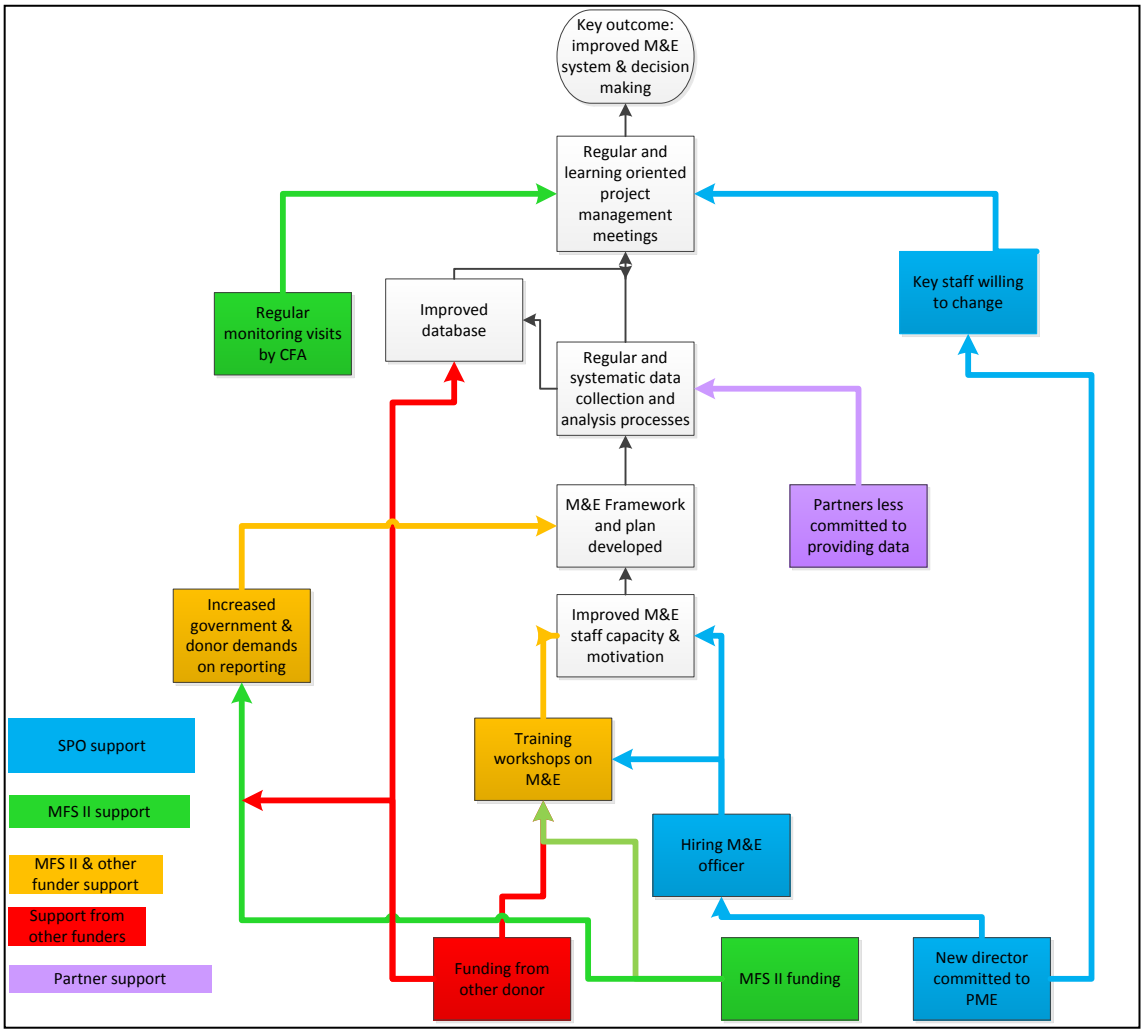

***Figure 1*** *An imaginary example of a model of change*

*Step 5. Identify* ***types of evidence*** *needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, *"What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?"*. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

- **Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.
- **Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
- **Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.
- **Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

*Format for identifying types of evidence for different causal relationships in the model of change (example included)*

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| Describe relationship between the subcomponents of the model of change | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions.<br>Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y?<br>Can we find this information by means of :<br>Pattern evidence;<br>Sequence evidence;<br>Trace evidence;<br>Account evidence? | Describe where you can find this information |
| Example:<br>Training workshops on M&E provided by MFS II funding and other sources of funding | Example:<br>What type of training workshops on M&E took place?<br>Who was trained?<br>When did the training take place?<br>Who funded the training?<br>Was the funding of training provided before the training took place?<br>How much money was available for the training? | Example:<br>Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br><br>Sequence evidence on timing of funding and timing of training<br><br>Content evidence: what the training was about | Example:<br>Training report<br>SPO Progress reports<br>interviews with the CFA and SPO staff<br>Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or

discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality** of data and **analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

| *Example format for the adapted evidence analysis database (example included)* **Description of causal relation** | **Confirming/ rejecting a causal relation (yes/no)** | **Type of information providing the background to the confirmation or rejection of the causal relation** | **Strength of evidence: strong/ rather strong/ rather weak/ weak** | **Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected** |
|---|---|---|---|---|
| e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

## Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

## Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has

provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is

crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process

tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

- The capability to act and commit;
- The capability to deliver on development objectives;
- The capability to adapt and self-renew;
- The capability to relate (to external stakeholders);
- The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed. A detailed overview of capabilities with outcome domains and indicators is attached in Appendix 3.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Appendix 3 Changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

**Description of Endline Indicators Yayasan Kelola**

**Capability to act and commit**

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

*This is about leadership within the organisation (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organisation.*

The Director of Yayasan Kelola is an experienced professional with good managerial skills and vision. Since she is quite senior, there is sometimes a gap the junior staff, although the gap is basically in terms of content (vision, mission, the future and infrastructure of Indonesian arts & culture). In regard to this problem already recognized in the baseline, the second in command has increased efforts to cover the gap between senior and junior staff and the Director. The director is now more approachable and attentive, especially for those who feel uncomfortable to talk to her directly. This enabled all the staff to give input and feedback comfortably.

The Director has also performed intensive weekly meetings to reduce the gap with junior staff and to assist the staff to improve themselves by delegating tasks as budgeting and joining workshops or discussions. She is highly respected and considered as a very important and valuable person for the organization.

Score: from 3.5 to 4 (slight improvement)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

*This is about the extent to which the leader(s) provide strategic directions*

The strategic plan continuous to be the guidance for the activities within the YAYASAN KELOLA. Vision and mission remain clear and the Director has supervised all work performance. Staff has received clear guidance to achieve their goals through bi-weekly meetings and standard operating procedures (SOPs) (consists of all procedures in the organization). Although the implementation might be differed based on the personal style of individual staff members, the guidelines have been standardized.

As for the project teams, the meetings are held once a month as some of the staff members are located in different cities such as Jakarta and Yogyakarta. There is also standard guidance for the team to run the project i.e. *Manual Operasional Proyek or* MOP/Project Operational Manual or POM, which is one of the donor requirements.

Score: from 4 to 4 (no change)

1.3. Staff turnover: 'Staff turnover is relatively low'

*This is about staff turnover.*

Several changes have occurred in terms of staff turnover. Whereas in the baseline YAYASAN KELOLA was struggling with limited funding, the addition of new programs and funds have helped change this situation. Two new staff members have been recruited between 2012-2013 to fill vacant positions in the program. The positions opened up after former staff members were transferred to other new projects. Ten new staff openings were created due to the new projects. To date three staff members have left the organization, two of them left of family reasons and one for accepting a higher paying job elsewhere  Hiring occurs by project demand. But on the whole turnover in permanent staff is still low, whilst there is a high turnover in temporary staff since these are project based and externally funded.

Score: from 3 to 3 (no change)

1.4. Organisational structure: 'Existence of clear organisational structure reflecting the objectives of the organisation'

Yayasan Kelola is a small foundation that runs programs aimed at the Indonesian arts. It has a limited number of staff and only a few separate divisions, making it an effective and efficient organization. In 2013, Kelola gradually employed 5 new staff members (project based staff) for their Komunitas Kreatif (KK) project, making a total of 12 staff members (10 women and 2 men). Despite this growth, Kelola did not undergo a significant change in the organizational formation and structure, such as the board, executive officer and auditor. The organization continues to work effectively towards its objectives.

The loyalty of Kelola's staff is high. Having a good recruitment mechanism directly controlled by the director contributes to selecting loyal staff. Passion has always been the main qualification requested. The activities at Kelola are not just considered as work, but also personal development,  dedication and engagement for the development of arts in  Indonesia.

Score: from 3 to 3 (no change)

1.5. Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E'

*Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.*

All the programs are derived from the vision, mission and strategic plan. In addition, program design and implementation are always based on the results of the evaluations conducted with stakeholders. In the annual evaluation Kelola used to invite external expert such as art experts. Kelola has a clear and structured evaluation mechanism. Kelola hires a public accountant for their finance. Kelola always asks for suggestions from their stakeholders, such as involving art experts, to increase the quality of their programs. Internally, Kelola conducts regular meetings every month, three months, and year for purposes of evaluation and strategic and operational decision-making. Evaluations are also supported by supervision from their Donor in term of input to program content, admin and finance. The demands for written reports force Kelola to conduct routine and systematic reflections. This is what has been improving Kelola's working performance.

Score: from 3 to 3.5 (slight improvement)

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'

*This is about the extent to which day-to-day operations are aligned with strategic plans.*

The strategic plan continues to be the guidance for the activities within the YAYASAN KELOLA. YAYASAN KELOLA has been working under budget constraints for a long time forcing the organization to focus on using resources efficiently and focussing on what's important. Program objectives as lined out in the work plans and strategic plans are key to this approach. Little to no deviation from these plans occurs.

To date the routine programs still run even though new funds have been acquired.

Score: from 3.5 to 3.5 (no change)

1.7. Staff skills: 'Staff have necessary skills to do their work'

*This is about whether staffs have the skills necessary to do their work and what skills they might they need.*

The organization has recruited four new program staff members of which 2 with finance and procurement expertise and two with foreign language skills. The finance officer has done excellent bookkeeping and used IT optimally for financial record purposes. The ability to correspond in English has been improved with the arrival of new staffs.

Over the years staff has improved their skills in issues related to local artists and making reports.

The organization has accepted new funding from First State Investments Indonesia and the World Bank for new projects with a bigger scale than Kelola's previous programs. Therefore, new staff members with specific qualifications are needed.

Score: from 3.5 to 4 (slight improvement)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

*This is about whether staffs at the SPO are offered appropriate training opportunities*

So far the Kelola Foundation has organized several trainings for their target groups. The staff is allowed to join these trainings as well to enhance their knowledge. Other training has been provided by sponsors and funders. Unfortunately, limited funds and the increased number of staff members make it difficult to send staff to join more training.

Score: from 3 to 3 (no change)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

*This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.*

One of the staff incentives that Kelola has offered is in the form of exposure to a large professional network and through offering great working experience. Some of the staff members have significantly grown in terms of skill and experience due to the exposure to this network, and as a result now receive salaries to compensate accordingly. Further incentives stated by staff members were the flexibility and freedom in working in a comfortable work environment.

Score: from 3 to 3.5 (slight improvement)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

*This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.*

It remains a difficult task in Indonesia to get funding for art and culture. However, Kelola is actively involved in fund raising, though mostly in small amounts or for short period projects. Over the past two years there has been an increase in funding received and in the number of donors. First State Investment started showing interest in YAYASAN KELOLA in 2012, and has developed a long-term cooperation with the organization. And also with the World Bank for new projects with a bigger scale than Kelola's previous programs.

Score: from 3 to 3.5 (slight improvement)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'

*This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.*

There is no change in fund raising procedures. The Director and Board of Directors continue to play the most important role in acquiring funding, with a limited role for subordinate staff members. Nonetheless, any ideas related to new funding opportunities are accepted and considered.

Score: from 2.5 to 2.5 (no change)

**Summary Capability to act and commit**

Kelola has a limited number of staff and only a few separate divisions, making it an effective and efficient organization.The Director has been a great asset for the foundation as she can encourage her staffs to improve their skills and go beyond their limit. She is well connected to the target groups and also the funders which has positive impact on the organization. Compared to the baseline the director is now more approachable and attentive, especially for those who feel uncomfortable to talk to her directly. She has been able to attract additional funding, from FirstState Investment, and consequently new staff have been recruited. These include two staff members with finance and procurement expertise and two staff members with foreign language skills. These have improved the overall level of knowledge and skills in the organisation, but with the new project, there are also new competences that need to be addressed and training opportunities are more limited having more staff are not enough funds available. However, Kelola also offers them a number of incentives in the form of larger network exposure and great experiences. Even though new staff has been recruited the organisational structure hasn't changed. New staff with specific expertise is expected to provide more advantages in the long run especially in acquiring more funds for the organization. Whilst the strategic plan continues to be the basis for guiding staff in their work, the staff themselves receive clear guidance to achieve their goals through bi-weekly meetings and SOPs. Program activities all derive from the vision and mission, and the design and implementation are always based on the results of the evaluations. Kelola's evaluation mechanism itself is clear and structured. Since the funding is limited, their main programs are their priority and the scale of the projects depends on the funds.

Note: As it is quite difficult to find a replacement for the Director who is approaching the time for her retirement, Kelola may be on the edge of a managerial crisis that needs to be taken care of as soon as possible for the long run.

Score: 3.2 to 3.4 (very slight improvement)

**Capability to adapt and self-renew**

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

*This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organisational).*

M&E is done informally although regularly, much as was already done during the baseline two years ago. YAYASAN KELOLA is however learning to improve its M&E capacity, by focussing on project evaluations together with their beneficiaries as part of their project management cycle. Every program activity is reviewed by a third party to ensure the objectivity of the analysis. There is also a supervision session every two months with the Empowerment Woman Artist (EWA) association. Every project is completed with M&E, either qualitative or quantitative. YAYASAN KELOLA continues to have regular evaluations and discussions with their beneficiaries and stakeholders (media, artists, public, etc). The outcomes of these sessions are used to develop future strategies. The system enables them to meet the beneficiaries' needs and to measure the effectiveness of their program. However, further analysis and implementation of M&E is needed

Score: from 3.5 to 3.75 ( very slight improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

*This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.*

Kelola still needs to improve staff competency in relation to M&E. There is still no particularly dedicated or trained staff on the subject. All staff are involved in evaluation, in the form of a collective process. Every year an external Auditor evaluates all the projects since the audits are important to get more funds.

Score: from 2.5 to 2.5 (no change)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

*This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.*

Due to the lack of a clear M&E procedure and system, its application and relation to future strategies remains limited. M&E is mostly done through end of project evaluations, but lessons learned are applied mostly at the operational level, not the strategic level. End of project findings in the form of reports are shared with stakeholders and beneficiaries for feedback. YAYASAN KELOLA continues to have regular evaluations and discussions with their beneficiaries and stakeholders (media, artists, public, etc). The outcomes of these sessions are used to develop future strategies. The system enables them to meet the beneficiaries' needs and to measure the effectiveness of their programThis allows some degree of feedback and trend monitoring that is helpful in deciding on future strategies, but it is not yet systematic

Score:  from 3 to 3 (no change)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

*This is about whether staffs talk formally about what is happening in their programmes; and, if so, how regular these meetings are; and whether staffs are comfortable raising issues that are problematic.*

YAYASAN KELOLA continues to hold bi-weekly meetings where the staff can critically reflect upon what they have achieved and discuss issues and their solutions. In depth analysis of results, feedback and other issues remain open for improvement.

Score: from 3.5 to 3.5 (no change)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives

*This is about whether staffs feel that ideas they bring for implementation of the programme are welcomed a*

Staff is comfortable to share ideas and give suggestions during meetings. Suggestions and feedback are often considered and addressed by management. An example of this was one of the suggestions by staff to share more supporting materials between office and field staff, as better coordination affects the organization as a whole. This was addressed and encouraged, which has resulted in a simpler implementation and reporting process. Overall the freedom to express ideas has remained unchanged.

Score: from 4 to 4 (no change)

2.6. System for tracking environment: 'The organisation has a system for being in touch with general trends and developments in its operating environment'

*This is about whether the SPO knows what is happening in its environment and whether it will affect the organisation.*

YAYASAN KELOLA continuous to monitor media and utilize their network to keep in touch with general trends in the are of performing arts and their other program activities. Nothing has changed in this regard over the last two years.

Score: from 3 to 3 (no change)

2.7. Stakeholder responsiveness: 'The organisation is open and responsive to their stakeholders and the general public'

*This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.*

Close stakeholder involvement and interaction allows YAYASAN KELOLA to continuously adapt programs to their needs. Particularly in regards to providing funding for admin and finance staff training. Regular contact through discussions with local government, organizations and the public continue to be held, as well as the steady progression of expanding the network by meeting new stakeholders. Practices have remained unchanged over the last two years in this regard.

Score: from 3.5 to 3.5 (no change)

**Summary capability to adapt and self-renew**

YAYASAN KELOLA still needs to make efforts to improve its M&E system especially with regards to the education and appointment of individual staff members dedicated to this area, but also to have a more strategically oriented, monitoring and evaluation that helps in making strategic decisions. YAYASAN KELOLA continues to have regular evaluations and discussions with their beneficiaries and stakeholders (media, artists, public, etc). The outcomes of these sessions are used to develop future strategies. The system enables them to meet the beneficiaries' needs and to measure the effectiveness of their programThere is no significant change in terms of internal culture or critical reflection and sharing of ideas. The staff still feels free to share their ideas and offer feedback. The cooperation with stakeholders has proven to have great impact on the operational and strategic decision-making. YAYASAN KELOLA is responsive to the changes in their environment, including the needs of stakeholders and the networks. The good relationship they have with stakeholders and networks help them to be aware of what is happening in their environment. Overall there is no significant change compared to the baseline in 2012.

Score: 3.3 to 3.3 (no change)

**Capability to deliver on development objectives**

3.1. Clear operational plans: 'Organisation has clear operational plans for carrying out projects which all staff fully understand'

*This is about whether each project has an operational work plan and budget, and whether staffs use it in their day-to-day operations.*

All team members are responsible for their work plan and budget. Every division proposes a work plan completed with budget needed. Furthermore, they have to manage the fund under the supervision of their direct supervisor and the finance team. Therefore, whenever a change of plan occurs, appropriate decisions can be taken faster. The individual responsibility of staff over work plans and their budgets, encourages understanding and effective use of them.

Score: from 3 to 3 (no change)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

*This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.*

YAYASAN KELOLA has been working under budget constraints for a long time forcing the organization to focus on using resources efficiently and focussing on what's important. The individual responsibility of staff over work plans and their budgets, encourages understanding and effective use of them. The work plans are still made with realistic expectations and the scope of most projects remains in line with the funds provided. Since every staff member now understands the difficulty of obtaining funds and managing them, they are motivated to be even more precise in their estimations as well utilizing their resources as effectively as possible. This sense of awareness has improved compared to the baseline situation two years ago, resulting in a minor improvement with respect to this indicator.

Score: from 3 to 3.5 (slight improvement)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

*This is about whether the SPO is able to carry out the operational plans.*

No changes have occurred with respect to this indicator. Overall YAYASAN KELOLA remains able to deliver on planned outputs, although some delays take place at times due to problems in the field. YAYASAN KELOLA closely coordinates their plans with the donors which improves their overall quality and balances expectations. Systematic planning according to a clear set of indicators provided by the donor, allow for realistic goal setting and delivery in practice.,

Score: from 4 to 4 (no change)

3.4. Mechanisms for beneficiary needs: 'The organisation has mechanisms in place to verify that services meet beneficiary needs'

*This is about how the SPO knows that their services are meeting beneficiary needs*

YAYASAN KELOLA continues to have regular evaluations and discussions with their beneficiaries and stakeholders (media, artists, public, etc). The outcomes of these sessions are used to develop future strategies. For instance as the result of inputs received, YAYASAN KELOLA has been responsive to the need of a special program for women: theater for empowering. The system enables them to meet the beneficiaries' needs and to measure the effectiveness of their program. Government is also included in stakeholder consultation sessions.

Score: from 4 to 4 (no change)

3.5. Monitoring efficiency: 'The organisation monitors its efficiency by linking outputs and related inputs (input-output ratio's)'

*This is about how the SPO knows they are efficient or not in their work.*

Monitoring efficiency has remained unchanged. Outcomes and targets are tested to the objectives in the work plans, but no further analysis is done in terms of what this means for efficiency. Donors remain closely involved in the formulation of targets and work plans, ensuring a quality check for realistic expectations.

Score: from 3 to 3 (no change)

3.6. Balancing quality-efficiency: 'The organisation aims at balancing efficiency requirements with the quality of its work'

*This is about how the SPO ensures quality work with the resources available*

No change has occurred in this indicator. YAYASAN KELOLA has been working under budget constraints for a long time forcing the organization to focus on using resources efficiently and focussing on what's important. Limited funding encourages the organization and its staff to operate efficiently, this can create quality concerns. Nonetheless the stringent preparation in work plans and goal setting in cooperation with the donor allow for setting up minimum quality targets. Kelola always asks for suggestions from their stakeholders, such as involving art experts, to increase the quality of their programs. Through these mechanisms both efficiency and quality are to some degree ensured, however a conscious balancing decision is not made.

Score: from 3.5 to 3.5 (no change)

**Summary of capability to deliver on development objectives**

YAYASAN KELOLA has clear operational plans in place. YAYASAN KELOLA has been working under budget constraints for a long time forcing the organization to focus on using resources efficiently and focussing on what's important. All the staff is aware of the limited funds received and attempt to use their resources optimally. It has good system to respond to the need of the beneficiaries and meet the funders' qualifications. Although there is no formal system yet for its monitoring and evaluation to assess the beneficiary needs, efficiency and quality of their work, they show efforts to use minimal resources as best as they can. Outputs have generally still been implemented according to plan.

Score 3.4 to 3.5 (very minor improvement)

**Capability to relate**

4.1. Stakeholder engagement in policies and strategies: 'The organisation maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organisation'

*This is about whether the SPO engages external groups in developing their policies and strategies, and how.*

The Director is actively interacting with stakeholders and beneficiaries to analyze their needs to fit the program. Furthermore, YAYASAN KELOLA has initiated and is actively involved in the Coalition of Indonesian Art (Koalisi Kesenian Indonesia) in particular to advocate the government policy collectively to run PP No 93 /2010.

Score: from 3.5 to 3.5 (no change)

4.2. Engagement in networks: 'Extent to which the organisation has relationships with existing networks/alliances/partnerships'

*This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.*

YAYASAN KELOLA has cooperated with many organizations, both domestically and internationally, such as with KSI, Centre Culturel Français, Goethe Institute, Asian Cultural Council and Centre for Civic Education from US. The network meets every 2 months to share information, make programs, and offer apprenticeships.

As a result of good networking, YAYASAN KELOLA is getting more acknowledged. Last year the Director has been invited to three different countries (Czechoslovakia, South Korea and Hong Kong) as a speaker and Indonesian representative. She also received an award for Art Management from Rockefeller, NY.

Some testimonials from local and international NGOs prove that YAYASAN KELOLA has great credibility.

Score: from 4 to 4.5 (slight improvement)

4.3. Engagement with target groups: 'The organisation performs frequent visits to their target groups/ beneficiaries in their living environment'

*This is about how and when the SPO meets with target groups.*

YAYASAN KELOLA continues to work closely with the target groups through dialogue, performances, information sharing, skills improvement, and networking. The organization is always open to any email or contact made. With limited funds, the organization tries its best to assist the target group optimally through regular meetings and end of project evaluations. No significant changes have occurred with respect to this indicator since the baseline evaluation in 2012.

Score: from 4 to 4 (no change)

4.4. Relationships within organisation: 'Organisational structure and culture facilitates open internal contacts, communication, and decision-making'

*How do staffs at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?*

Generally the relation within the organization is good and comfortable. Staff is free to share their ideas informally at the lunch table as well as formally in bi-weekly meetings. YAYASAN KELOLA has recruited capable staff to close the gap between the senior and junior staff members. Although this addition of staff members to bridge the gap has been effective in mitigating potential problems, it has not contributed to a significant change in terms of organizational structure and culture.

Score: from 4 to 4 (no change)

**Summary capability to relate**

The capability to relate has hardly improved mainly due to having a Director who is very active and well connected with the organization's network. As the result of good networking, YAYASAN KELOLA is getting more acknowledged both nationally as well as internationally. YAYASAN KELOLA continues to work closely with the target groups through dialogue, performances, information sharing, skills improvement, and networking. Internal relationships facilitate open communication, both formally and informally. Yayasan Kelola also actively work with the Koalisi Seni in particular to advocate the government policy collectively to run PP No 93 /2010.

Score: 3.9 to 4.0 (very minor improvement)

**Capability to achieve coherence**

5.1.Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organisation'

*This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.*

YAYASAN KELOLA has a clear and unique scope of work which are well formulated in the organization's vision and mission. Both vision and mission are regularly reviewed and if needed, adjusted to national needs or global trends. All of the staff members are familiar with the vision and mission because they are involved in designing programs which are in line with that vision. The vision and mission are reviewed every two years. However, changes have not been made since 2008 because they are still considered relevant and applicable.

Score: from 3 to 3 (no change )

5.2.Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

*This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.*

YAYASAN KELOLA is a well-established organization and adequate Standard Operating Procedures have been in place for a long time. New staff members have indicated to find this extremely helpful in getting started in their new positions. YAYASAN KELOLA has maintained its level of professionalism since the baseline. Overall no significant change has occurred with respect to the operational guidelines of the organization.

Score: from 3.5 to 3.5 (no change)

5.3.Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organisation'

*This is about whether the operations and strategies are line with the vision/mission of the SPO.*

No change has occurred in the last two years related to this indicator. YAYASAN KELOLA continues to be very selective in designing programs. Each one is derived from their vision and mission, ensuring that they are well aligned with the organization's purpose and strategy. In the last two years, YAYASAN KELOLA has expanded their stakeholder network and scope of work. The organization works in advocating arts and cultural policies in Indonesia. In addition, Kelola also has a new program called Komunitas Kreatif which is a form of empowerment through the arts. It is all within the framework of "arts and cultural development in Indonesia" as the organization's vision.

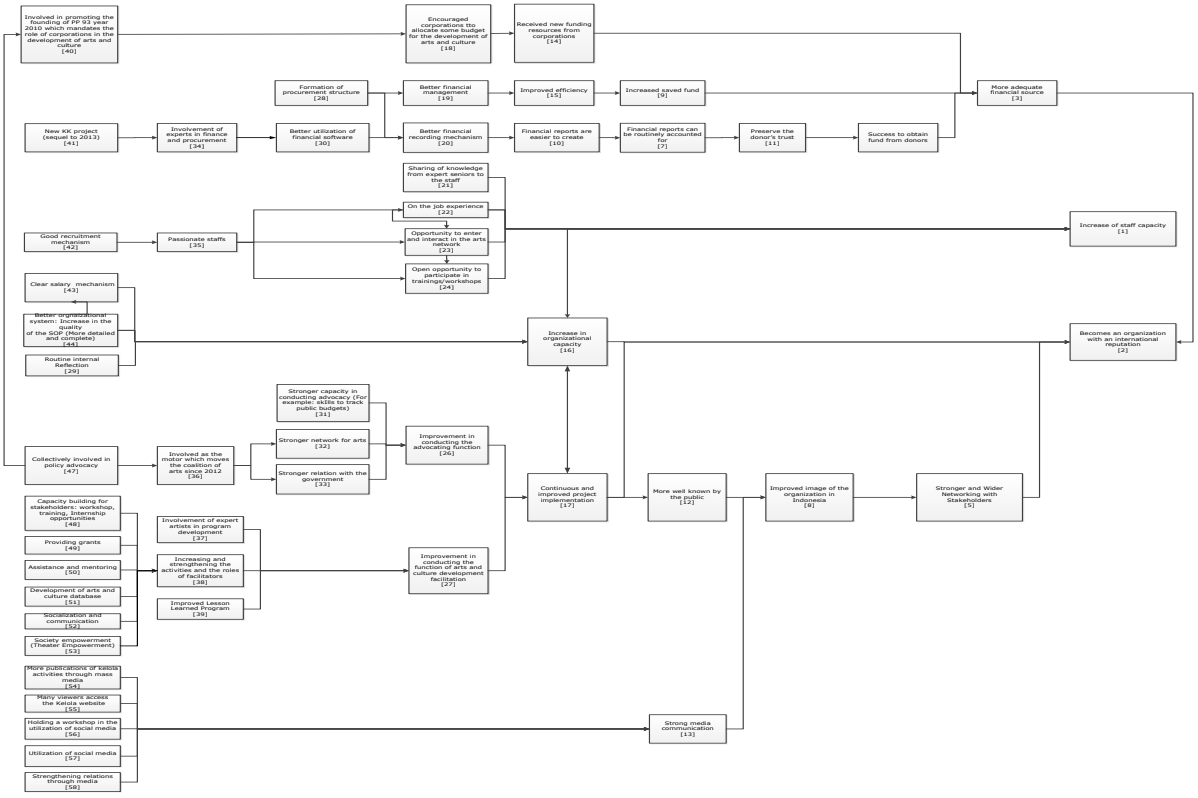
Score: 3.5 to 3.5 (no change)

5.4.Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

*This is about whether the efforts in one project complement/support efforts in other projects.*

No change has occurred since the baseline evaluation in 2012. Because all the programs are in line with the organization's vision and mission, all of the programs support and complement each other. Kelola gives special attention so that generation of art and culture in Indonesia continues to live and to be competitive in the international world. This is done by providing opportunities of learning, funding and information. Kelola also realizes cultural exchange with the cooperation between artists for dialogue, sharing skills and knowledge, and building working networks with national and international arts and cultural communities. The programs are *Magang Nusantara, Hibah Seni, Komunitas Kreatif, Pemberdayaan Seniman Perempuan* and *Hibah Cipta Perempuan*. Close relations with partners and work amongst colleagues ensures that cross-program learning occurs which allows the application of lessons learned amongst all programs

Score: from 3 to 3 (no change)



**Overall description of the capability to achieve coherence**

Overall this organization has a good understanding on how to achieve coherence. They have a vision and mission which is reviewed every two years, and adjusted to the national needs and global trends. Nonetheless, changes have not been made since 2008 because the organization's vision and mission are still considered relevant and applicable. Each of the programs Kelola develops is derived from the vision and mission and even though Kelola makes innovations, they are all within the field of "arts and cultural development" framework of the organization's vision. Because all the programs are in line with their vision and mission, all of the programs support and complement each other. Furthermore staff members and partners are encouraged to share and conduct cross-program learning, as to apply lessons learned across all programs. YAYASAN KELOLA is a well-established organisation and since long as has adequate Standard Operating Procedures in place which are utilized by new staff members to start their work.

Score: 3.2 to 3.2 (no change)

# Appendix 4 Results - key changes in organisational capacity - general causal map

**Yayasan Kelola General Causal Map**

**Narrative of Yayasan Kelola General Causal Map**

The evaluation team carried out an endline assessment at Yayasan Kelola from 26 to 27 June 2014. During this workshop, the team made a recap of key features of the organization in the baseline in September 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organization since the baseline. The two main changes that happened in the organization since the baseline in 2012, as identified by the staff during the endline workshop were:

1. Increase of staff capacity [1]
2. Becoming an organization with an international reputation [2]

Each of these organizational capacity changes is elaborated in detail below.

**Increase of staff capacity [1]**

According to staff present at the endline workshop, overall staff capacity within Yayasan Kelola has increased [1] which has also influenced the increase in the organizational capacity [16].

The following underlying factors can be related to this development. *First,* sharing of knowledge from senior staff to junior staff took place [21]. *Secondly,* staff gained significant experience on the project [22] therefore staff learned through the opportunity to enter and interact with members of the arts network [23] that Yayasan Kelola is involved in. *Thirdly,* the benefit of staff close relation with the art networks makes them get invitation to participate in trainings and workshops held by other organizations within Yayasan Kelola network [24].

The staffs that have very good passion [35] on art see these opportunities for them to increase their capacities therefore Yayasan Kelola does not need to develop their staffs through internal capacity building. The passion in staff was in turn one of the qualities looked for during the recruitment of staff [42]. This is the cause why all staffs' passion on arts has supported their capacities both for the job and for their own developments.

**Becoming an organization with an international reputation [2]**

According to staff, Yayasan Kelola has significantly raised its profile and international reputation through various activities and developments. These developments have resulted in the director of the organization receiving an international award from Fullbright, USA.

The *first* factor that affected the organizational reputation was obtaining more adequate financial sources therefore the organization can operate continuously [3]. There are at least three folds influenced the first factor.

1. New funding resources were for instance obtained from corporations [14] as an effect of the establishment of PP 93 year 2010 which mandates the role of corporation in the form of art and culture [40]. This regulation effectively encourages corporations to allocate some budget for art and culture [18]. It was not solely a public effort to bring about the formulation of this policy however, as a collective effort to be involved in policy advocacy was a clear target for Yayasan Kelola to be achieved in the years prior [47].
2. Increase saved fund [9] as the result of improved financial efficiency [15] as an effect of better financial management [19]. It is caused by formation of procurement structure [28], and better utilization of financial software [30].
3. Yayasan Kelola has good ability in fund management resulted in the ability to fund some projects which has no donors. The fund from donors is used efficiently for a project, and the remained fund will be used as cross subsidy for other projects. The efficiency in fund use is the factor contributes to adequate financial sources. Whilst the frequent and accountable financial reports supports the organization to gain international reputation
4. Succeed in obtaining fund from international donors because of the trust from the donors [11]. The organization can preserve the trust due to the following:
    a. Routine and accountable financial reports. The financial reports are easier to create [10] after the implementation of a better financial recording mechanism [20]. The implementation of this mechanism was enabled by better utilization of the financial software [30] after the involvement experts in finance and procurement [34] through the new establishment of *Komunitas Kreatif* (Creative Community) project in 2013 [35].
    b. Increase in organizational capacity (will be elaborated in other paragraph) [16]

c. Continuous and improved project implementation [17]

The *second* factor is the increase in organizational capacity [16], as is explained further below in this narrative. There are fourfold influenced the second factor:

1. Internal reflection [29] in monthly, quarterly, semester, annual organizational meetings, and also in project meetings based on the needs.
2. Increase staff capacity [1].
3. Better organizational system – complete standard operating procedures (SOPs) [44], including payroll mechanism - staffs' salaries increase based on Cost of Living Adjustment mechanism [43].
4. Continuous and improved project implementation (16), as elaborated below:

    a. There is an improvement in conducting the advocating function of the organization [26]. The advocating function of the organization improved through stronger capacity in advocacy such as the skill to keep track of public budgets [31]. But also through a stronger network in the arts sector [32] as well as stronger relations with the government and authorities [33]. Both these factors were enabled by Kelola's role as the driving actor in the coalition of arts since 2012 [36]. This role was obtained after taking a leading position in the collective policy advocacy initiative [47].

    b. There is an improvement in conducting the facilitation of arts and cultural development on the other hand [27], was improved through an improved lesson program [39] and the involvement of experts and artists themselves in the program's development [37]. Another factor that played an important role in improved facilitation was through strengthening and increasing the activities of facilitators themselves [38]. Six developments enabled this:

        - Capacity building for stakeholders through workshops, trainings, internships and other opportunities in which facilitators were directly applied [48].
        - Providing grants to fund their development [49]
        - Direct assistance and mentoring [50]
        - Development of an arts and culture database accessible to facilitators to enable learning and knowledge sharing [51]
        - Socialization and communication amongst facilitators [52]
        - Society empowerment through art activities [53].

The *third* factor affecting Yayasan Kelola's reputation was the stronger and wider networking efforts that the organization undertook. Not only were networking activities intensified, they were also applied to a broader range of organizations in a variety of fields of work [5].The improved image of Yayasan Kelola in Indonesia played a significant role in reaching out to these parties and broadening the network as a whole [8]. The greater image of the organization in turn came about from being better known amongst the public [10] through successful project implementation [13], but also through strong communication with the media [30]. Communication with the media was a carefully devised strategy consisting of a range of activities namely:

1. More publications and articles relating to Kelola's activities in mass media [50]. The number of publications regarding EWA in the media up to December 2013 are 81 articles (including news on the performances of the grantees, and also profiles on Kelola), and 61 publications for *Hibah Seni*.
2. An increase in online content leading to a greater audience on the organization's website [51]. Due to improvements in the content of the website, the number of visitors of Kelola's website up to December 2013 increased more than 20% with the total visitors : 160,457 117,606 and total clicks : 2,324,644 1,824,977.
3. The organization of a workshop through the utilization of social media [52]
4. Utilization of social media [53]. Since 2013, the Kelola newsletter was improved by sending several news in one email with attractive photos. The appearance of the newsletter with attractive visuals and layout caused a 25% increase in newsletter subscribers from 3,600 to 4,532. In addition, Kelola has 5000 friends on Facebook and 1697 followers on Twitter.

Approaching media as one of the organization stakeholders [54]. In 2013, Kelola succeeded in collaborating with five medias: Dewi, Femina, The Jakarta Globe, Suara Pembaruan and www.beritasatu.com. Through these collaborations, three performances of the Kelola grantees in Jakarta (Theater Performance "Mada" by Bambang Prihadie; Dance Performance "*Ruang Waktu*"by Nabilla Rasul; and Dance Performance "This Cycle We're In" by Andara F. Moeis) received support in the form of print ad, and publication before and after the performances in printed and online media. If

counted, the value of Kelola's collaboration with the five media partners above are a total of IDR 480.300.00,- .

Report CDI-15-049

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Report CDI-15-050

Kusters, C., Wieriks, M., Dwi Andari, B., Suprobo, N., Priyahita, W., Sihombing, R.R., Rokhmatulloh, S.W., Rosita, I., 2015. *Endline report – Indonesia, YPI. MFS II country evaluations; Capacity of Southern Partner Organisations (5C) component.* Centre for Development Innovation, Wageningen University & Research centre. Report CDI-15-050. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Indonesia, YPI. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

# Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation YPI and the Co-Financing Agency RutgersWPF for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to YPI, RutgersWPF, the synthesis team, IOB and NWO/Wotro.

The Indonesia 5C evaluation team

# 1 Introduction & summary

## 1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: YPI in Indonesia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1.Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps

describe the identified key organisational capacity changes that are possibly related to MFS II interventions in these two capabilities, and how these changes have come about. More detailed information can be found in appendix 5.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR: Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

## 1.2 Brief summary of analysis and findings

Since the baseline, two years ago, YPI has seen a slight improvement in the capability to act and commit. The merging of offices has made coordination between staff and management easier. Leadership has become more responsive and open. Better M&E approaches in developing work plans and strategies has aided in terms of articulating strategies. Staff skills improved slightly due to several trainings and YPI's funding procedures have improved slightly through the construction of a self-sustaining business unit that assists in fundraising and ensures financial sustainability of the organization. The capability to adapt and self renew improved slightly as well. This occurred mainly through more structured M&E practices in terms of a clear reporting and monitoring system. Staff has become more skilled in data collection and reporting. On the capability to deliver on development objectives, YPI has shown the greatest improvement. The cost-effective use of resources has greatly improved through a variety of new policies. The implementation of operational plans has improved resulting in better delivery of planned outputs, and a monitoring system is in place to ensure that quality and efficiency in activities remains balanced. The capability to relate has slightly improved due to greater engagement with stakeholder groups and beneficiaries, particularly youths and government. The capability to achieve coherence has only resulted in very slight improvements, particularly as in 2013 the organization's vision, mission and strategies were reviewed and re-evaluated.
The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team. During the endline workshop some key organisational capacity changes were brought up by YPI's staff:

1. An increase in staff working performance
2. An improved network maintenance
3. Strengthened organization independency

According to YPI staff in the endline workshop, all of these are expected to contribute to YPI's improvement in service quality. YPI staff experienced these as the most important capacity changes in the organisation since the baseline.

Increased staff working performance resulted from increased frequency of controlling beneficiaries for YPI program improvement; staff having opportunities to attend training; comparative studies and courses; ideas from staff being accepted; response to problems in the field; increased job security. The increased frequency of controlling of beneficiaries was enabled by the greater number of staff proficient in M&E, which was enabled by more training, such as the MFS II capacity intervention for a

PME workshop funded by Rutgers WPF. This could be attributed to an overall improvement of the organizations' professionalism due to donor requirements. Staff has had more opportunities to attend trainings and develop due to YPI's leaders willingness to send staff to more training opportunities as well as more funding to do so being available as a result of external funding. This was enabled by incentives from the leaders and the openness between staff and board due to the close internal relationships between management, board and staff. Both these factors can be attributed to the change in leadership style. Ideas from staff were more accepted which can again be attributed to the greater openness between staff and management. Quicker response to problems in the field was enabled by a more responsive organization, which was made possible by the new leadership style. Appropriate action responses from staff were enabled by more detailed working descriptions, which can be attributed to the change of leadership on the one hand, and by better guidelines in the form of revisions of SOPs and new SOPs on the other.

Increased job security was due the implementation of a salary standard and improving employment status to full time contracts. Both were enabled by utilizing savings from other costs to improve employment benefits. These resources were freed up through simplifying the organizational structure and optimizing the use of resources. This efficiency initiative was enabled by the change in leadership.

Improving YPI's network resulted from the use of social media as a communication tool to address stakeholders, and extending networks through other alliances and partners. Both were enabled by the existence of new partners for the YPI program due to good relationships with related organizations as a result of more intense networking activities. The network also extended to new groups through YPI's proactive stance to find network partners and funds. This can be attributed to the urgency imposed on the organization by the decreasing of donors.

Increased independency of YPI was enabled by the founding of a private company to provide services in training, facilitation, health services and accommodation. With this business, new more sustainable funding sources are being attempted.

In conclusion, the general key changes causal map only provides limited information about the relation between MFS II interventions with the organizational capacity changes that YPI considered most important since the baseline. During the endline process tracing workshop, YPI did not mention specific MFS II capacity interventions that in their opinion had affected the key changes. However, it must be noted that this workshop was held very early on in the evaluation process and that YPI struggled in developing the initial maps and relating them to capacity development. In the course of their involvement in the endline evaluation process, this has changed, and additional insights were developed. The process tracing maps in section 5.3 provide more detailed information about the relation between MFS II funded capacity interventions and key organizational capacity changes. For a more detailed analysis on this matter, please refer to section 5.3 where process tracing findings are presented which can answer the attribution question with more certainty and validity.

In terms of process tracing (attribution question), three organisational capacity changes have been focused on: more motivated staff at YPI; staff being confident in giving training and in delivering SRHR information to beneficiaries; and improved reporting. On the whole, more motivated staff at YPI, due to improved staff welfare and improved management working mechanisms, where the result of many internal changes brought about by a change in leadership, after understanding organisational gaps which were identified in an internal evaluation that was set up after realising organisational capacity gaps with the external 5C baseline (MFS II) in 2012. Staff being confident in giving training and in delivering SRHR information to beneficiaries, can to a large extent be attributed to the MFS II capacity interventions that were carried out by RutgersWPF since the baseline in 2012. Specifically, these capacity interventions were a SRHR training; the training for youth friendly services; and a workshop on strategic communication, all held in 2013. In addition to that, having new volunteer staff members also played a role in this improved capacity. The key organisational capacity change "improved reporting" can to a large extent be attributed to MFS II funded capacity development interventions, in particular the M&E trainings in 2012 and the writing skills training in 2013, since these are related to

enhanced capacity to collect robust data and enhanced capacity to write reports. Furthermore, the organisation has taken steps to improve their meetings after realising the importance of this during the 5C baseline study (MFS II).

## 2.2 The socio-economic, cultural and political context in which the partner operates

**The socio-economic, cultural and political context in which the partner operates**

Yayasan Pelita Ilmu (YPI) focuses on improving Sexual and Reproductive Health and Rights (SRHR) knowledge among the youth (15 – 24 year old) in Indonesia. With this aim YPI fills a much needed gap as SRHR education for youths is not widespread in Indonesia. The lack of widespread SRHR education is illustrated by figures of the Basic Health Research who revealed that only 25.1% of young people have ever received SRHR education.[1] Boys and girls aged 10-14 years received the least SRHR education (13.7%) and youths living in urban areas received more SRHR education that those living in rural areas (32.2% compared to 17.3%).[2] The Indonesian Young Adult Reproductive Health Survey (IYARHS) (2007) also investigated SRHR-educational programs within schools among their study population. 59% of the females and 50% of the males reported to have received information in Junior High School about their reproductive system. However, fewer respondents reported to receive information on family planning methods, sexual transmitted diseases and HIV/AIDS. Respectively 16.5% and 13% of the females and males in the age of 15-24 years old reported to be educated on family planning methods in Junior High school; percentages for education on sexual transmitted diseases are respectively 16.4% and 16%; and for HIV/AIDS education percentages are respectively 32% and 26%. In addition, the IYARHS (2007) investigated to what extent 15-24 year old males and females discussed sexual and reproductive health issues. IYARHS (2007) shows that 15% of the females and 29% of the males never discussed sexual and reproductive health issues with anyone. The males and females, who did discuss such matters, did this with mainly their peers, respectively 58% and 71%. About 40% of the females and 37% of the males discussed sexual and reproductive health matters with their teacher; unfortunately it is not clear if such a discussion took place during the curriculum or in private conversations between teacher and students. [3]

[1] Riskedas, 2010
[2] Riskedas, 2010
[3] Indonesian Young Adult Reproductive Health Survey (IYARHS), (2007)

Low levels of SRHR education might result in low levels of SRHR knowledge. However, the figures for Indonesia show a mixed picture as on the one hand knowledge on fertility is low while most 15-24 year old male and females have heard of (modern) family planning methods. For example, when looking at pregnancy risk perceptions, the figures show that only about 50% of males and females in the age of 15 – 24 years old know that one-time-sexual intercourse can lead to a pregnancy, thereby indicating a lack of knowledge, while 96% of females and 93% of males have heard about modern contraception methods which is a very positive signal of SRHR knowledge.[4] The National Family Planning and Population Board (BKKBN) conducted a survey in 2010, part of which focused on SRHR knowledge. They found that only 32.3% of male and 29% of female respondents know about the existence of a fertile period. In addition, they measured relatively low levels of HIV/AIDS as only 57.5% of the population indicated to have heard of HIV/AIDS. HIV/AIDs knowledge among youths appears to be higher. IYARHS (2007) presents higher figures on HIV/AIDS knowledge; they state that 77% of male and 80% of female respondents have heard about HIV/AIDS. However, they also show that only about 54 -55% knows how to prevent HIV/AIDS. Riskesdas (2010) also studied HIV/AIDS knowledge among youths, and focused especially on HIV transmission. The study shows that, 71% of the study population knows that HIV transmission can occur through unsafe sex, 68.4% mentioned transmission through virus-contaminated needle sharing, and 61% knows transmission can occur through unprotected blood transfusion. However, only 50.2 % of the study population knows how to prevent HIV. [5] Moreover, UNICEF (2010) presents much lower figures on HIV/AIDS comprehensive HIV/AIDS knowledge: 15% of the males between 15-24 years old and 10% of females in that same category have comprehensive HIV/AIDS knowledge[6].[7] When looking at adolescents 15-19 years old these figures drop considerable, UNICEF (2010) reports that 2% of the males and 6% of the females have comprehensive HIV/AIDS knowledge. [8] IYARHS (2007) also investigated the knowledge on other Sexual Transmitted Infections (STIs) and its symptoms. They report that 71% of the females and 62% of the males could not name a STI other than HIV/AIDS. [9] Between 8-9% of the women could mentions symptoms of STIs for men and/or women; 13-15% of the male respondents could mention symptoms for men, but only 30-5% of the males knew about STI symptoms for women.[10]

Low levels of SRHR knowledge might result in low levels of perceived risk and subsequently into risky sexual behavior. The data available for Indonesia on risky sexual behavior of youths in inconclusive, one of the reason is that sex before marriage is unacceptable and surveys are susceptible to socially desirable answers. However, some data exists on sexual behavior of youths in Indonesia exists. For example, the outcomes of a survey on Young People Sexual behavior in Jakarta and nearby areas (*Jabodetabek*), conducted by BKKBN in 2010, reported that 51 % of them had sexual intercourse. The IYARHS (2007) reported lower levels of sexual intercourse. Among their unmarried study population between 15 -24 year old, 1.3% of the females and 6.4% of the males indicated that they ever had sex. It is highly likely that this figure is underreported and social acceptable answers were given. Especially, because this concerns the unmarried population and the general believe is that one should not have sexual intercourse before marriage. Although the following percentages are based on relatively low levels of respondents, the figures are indicative for risky sexual behavior. From the women who ever had sex, 21% indicated that they were forced by their partner. [11] Date-raping is a much debated topic in Indonesia, as figures are yearly increasing. According to Annual Report from National Women Commission (2012), dating violence reached 1,405 cases in 2011, increasing from earlier year 2010 with 1,299 cases. When talking about consensual sex, only 8 % of female and 21% of male sexually active respondents said that they used a condom during their first sexual intercourse.

[4] Indonesian Young Adult Reproductive Health Survey (IYARHS), (2007)
[5] Riskedas, 2010
[6] Comprehensive age knowledge: a) correctly identifying the two major ways of preventing the sexual transmission of HIV (using condoms and limiting sex to one faithful, uninfected partner),b) rejecting the two most common local misconceptions about HIV transmission, c) who know that a healthy-looking person can have HIV.

[10] Indonesian Young Adult Reproductive Health Survey (IYARHS), (2007)
[11] Indonesian Young Adult Reproductive Health Survey (IYARHS), (2007)

A higher rate of condom use was reported for their last sexual intercourse: 10 % of female and 18 % of male respondent reported to have used a condom during last sexual intercourse. [12]
Unintended pregnancy is a direct result of unsafe sexual behavior and has large consequences in Indonesia. When a pregnancy outside marriage occurs, women will be confronted with stigmatization and social discrimination, for example, she might not be able to continue a normal education. [13] The Guttmacher Institute (2008) reports an estimation of unintended pregnancies: about 17% of all live births in Indonesia are resulting from a mistimed or unwanted pregnancy. Unintended pregnancies often result in abortions, which is illegal in Indonesia (except when the pregnancy is a result of rape, it is necessary for medical reasons or a severely impaired infant is expected). Although illegal in most cases, the rate of abortions in Indonesia is among the highest in the region. It was estimated that 2 million abortions occurred in 2000, which means about 37 abortions per 1000 women of reproductive age (15-49), compared to the regional average of 29 abortions per 1000 women, this figure for Indonesia is high.[14] The Guttmacher Institute (2008) mentions that about half of the women, who are seeking for abortion, most probably go to traditional birth attendants, traditional healers or masseurs to terminate the pregnancy. It is unknown how many women induce an abortion themselves. [15] Such abortion practices are considered unsafe and are often leading to all sorts of complications. The WHO estimated that in the South-East Asian Countries with strong restrictive abortion regulation, 16% of maternal mortality is caused by unsafe abortions. [16] Unfortunately, there are no large scale – country wide studies on unintended pregnancies and abortions in Indonesia. Hence it is not possible to report how many females in the age of 15-24 experience unintended pregnancy and resort in unsafe abortions. Another consequence of unsafe sexual behaviour is the contraction of HIV/AIDs and STIs. A report from Ministry of Health in Indonesia of June, 2012 indicated that the population aged 15-29 year population are most vulnerable of contracting HIV.

When looking at the rate of youth access to public health service, we see that only 10 % of youth have ever heard about public health services delivered to young people.[17] Another survey conducted for designing National Mid Term Development Planning (RPJMN) in 2010 showed that only 28 % of young people ever heard about Information and Counselling Centre For Youth (PIK-Remaja) served by BKKBN.[18]

The attitude of the state and religious leaders towards SRHR issues for young people is considered to be unsupportive as well as stigma-*laden*. For example, the Chief of Indonesian Parliament stated that "*sexy*" clothes of women are the cause of rape. He also rejected a proposal for including Sexual Education in school curriculum, by arguing that there is a social taboo on sexuality.[19] Some eminent Indonesian religious leaders, such as NU and Muhammadiyah, objected against an idea of *Harm Reduction* by the MoH that included giving condoms to sexual active youth. They refused the idea because they belied it would interpreted as if promiscuity (*zina*) was permitted, which is highly forbidden in religious teachings.

In line with the attitude of leaders, Indonesia also has many policies that hinder young people to get comprehensive SRHR services and even put them into risky situation. Regarding to the latest mentioned situation, Indonesia is still imposing Marriage Act (no 1/1974) that allow 16 years teen to get married. Unsupportive policies toward SRHR are [1] Family Welfare and Population Development Law (no 52/2009) which limits SRHR comprehensive services only for married couples, [2] Health Law

(no 36/2008) which limits safe abortion for 6 weeks and only for medical reason, rape and suspected impaired infant. [3] Social Welfare Law (no 11/2009) uses stigmatizing terms, like "socially impaired groups" to name Sex Workers, transgender and gays.

In 2005, facilitated by UNFPA, a national policy on SRHR was signed by 4 related ministries (Social, Health, Education, and BKKBN).This policy aims to target SRHR for youth through two programs. First, BKKBN's developed a program, called PIK-R, that targets counselling centres or. In 2010, the PIK-R has reached 9,195 centres, consisting of 7,455 centres in tumbuh (growth) phases, 1,337 centres in tegak (steady) phase, and 403 centres in tegar (firm) phase.[20] Secondly, MoH developed program, called PKPR (Youth Friendly Health Service Centres) that ensures that a Public Health Centre is based in each sub-district. In December 2008, it was reported that 26 provinces were having 1611 centres, and 2,256 health-centre attendants have been trained accordingly. However, both programs are of school curriculum. Recently, the Ministry of Education and Culture allows SRHR education in school. SRHR education will not be offered through a separate course, but will be increasingly included in other courses, such as Science (IPA), Biology, Physical Health and Sport Subjects (Penjaskes), Social Sciences (IPS) and Religious themes. [21]

Utomo and McDonald et al. (2008) concluded that the SRHR courses have been delivered in first grade of Elementary School until 12 grade of High School. Unfortunately, the courses are still normative in essence, relying on morality and deemed to bear social stigma related to sexuality, gender and HIV/AIDS issues. In addition, the Biology subject is delivered in strictly scientific way and lacks social and cultural aspect of SRHR.

## 2.1 Contracting details

When did cooperation with this partner start: 2000.

What is the MFS II contracting period: 1-4-2011 to 31-12-2015

Did cooperation with this partner end: No

If yes, when did it finish: Not applicable

What is the reason for ending the cooperation with this partner: Not applicable

Is there expected cooperation with this partner after 31st of December 2015: Yes.

## 2.2 Background to the Southern Partner Organisation

**History**

Yayasan Pelita Ilmu (The Pelita Ilmu) was established on December 4, 1989. YPI was initiated by Dr. Zubairi after attending an international training on immunology in the mid-1980s. Together with his wife Sri Wahyuningsing, a public health expert, and his friend at FKUI/RSCM Dr. Samsuridjal, who had organizational skills to establish a NGO in the field of prevention of HIV transmission, they founded YPI. The name Pelita Ilmu arose spontaneously as in the early days, the activities carried out were located in schools, so as to be "light" for high school students to gain "knowledge" about healthy living as well as be responsible to prevent themselves from HIV infection. YPI was the first organization in Indonesia, working on the issue of HIV/AIDS. In the first two years, YPI received no core funding by donor organizations but searched for funding for every activity it undertook.[22]

Partnership between Yayasan Pelita Ilmu (YPI) and Rutgers WPF started in 2000 through a program of campaigning SRHR through peer educators. YPI initially visited mainly Senior High Schools near YPI office. YPI trained both students and teachers on the issues of SRHR and HIV prevention, and motivated them to be peer educators. Meanwhile, the teachers were also trained to support the campaign program in the schools. Since 2005, YPI has introduced a school based program for SRH education called DAKU (Dunia Remaja Seru- the lively Youth world). Collaboration between YPI and WPF continued through implementing Dance4life program, another SRHR education for youth, started in 2010.

The current project is a follow-up on implementing the Dance4Life program. It now also includes DAKU. YPI implements the DAKU and dance4life programs in a total of 14 schools in South and Central Jakarta in the 2012-2013 school year. Among these schools are 3 junior high schools participating in the dance4life program, and the remaining 11 are at senior high level: 6 in dance4life, 3 in DAKU and 2 in both DAKU and dance4life.

YPI obtained the funds from several donors , one the donors is MFS II . Most of intervention is used for increasing beneficiaries' capacity rather than organizational capacity. Nevertheless, YPI thought that improving skills for staffs is very important.
Besides running program and conducted training for teachers and students, this institution also provided opportunity for staffs to attend the training. The trainings for staffs are : journalistic , documentation, finance, and SRHR (Sexual Reproductive Health and Rights) training from PKBI (Perkumpulan Keluarga Berencana Indonesia)-an association for Family Planning in Indonesia.[23]

YPI sees that staffs' skill has been improved through training. Staffs have more responsibility in handling youth group ,being more skillful in report writing, being more skillful in giving technical assistance for youth in creating website, flyers, and leaflet and crating documenter film.[24]

**Vision**

To be a reputable and consistent institution in creating a society that has healthy-life behaviour, is independent and productive as well as providing quality health services.[25]

**Mission**

Empowering society to combat HIV and AIDS through education, assisting, outreach, and livelihood based on the principles of participation, partnership, equality, transparency and accountability.[26]

**Strategies**

- Providing Information and Data,
- Expanding the continuum of SRHR education,
- Increasing knowledge and access on ARV ,
- Increasing earned income of women with HIV-AIDS,
- Strengthening Services for Children with HIV-AIDS,
- Developing the Management for Supporting PWAs,
- Strengthening the Organization Management,
- Mobilizing Funding Resources and Earned Income, and Developing Monitoring and Evaluation System.[27]

YPI has 4 major programs:

1. HIV / AIDS and SRHR Prevention Program
2. This program aims to prevent HIV transmission in the community, especially those who are at risk of contracting HIV from both work and behaviors such as medical providers, injectable drug users, sex workers, migrant workers candidates, youth, street children and others. In addition to HIV / AIDS program also aims at preventing unwanted pregnancies among adolescents, unsafe abortion, drug abuse, child involvement in drugs, and prevention of HIV transmission from mother to fetus / baby.
3. Counseling Program, HIV Testing and Health Services
   This program aims to provide quality services for those who require consultation, testing, and basic treatment for HIV / AIDS, drugs, and reproductive health. Most of them who benefited from this program, were referrals from other prevention programs and NGOs.
4. Community Support Program for People with HIV.
   This program is specifically carried out to foster public and government support for people living with HIV / AIDS (PLHIV) and their families. YPI currently own a shelter for people living with HIV until their family / community welcome them back or during treatment in Jakarta, as well as a model in addressing HIV / AIDS problems in family.
5. Communication and Development Program
   This program was developed not only to address reproductive health problems, drug abuse and HIV / AIDS, but also designed to meet the needs of local communities and future YPI development. The program includes life-skills training, publication of books and magazines, education / schools and free courses for public, and development of training center and business unit facilities.[28]

# 3 Methodological approach and reflection

## 3.1 Overall methodological approach and reflection

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

## 3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012[29].

[29] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

## 3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question*: **To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia* (i.e. measuring effectiveness)?** and the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

### 3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.
For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

### 3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in

time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

### 3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during

the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design** – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# 4 Results

## 4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of YPI that have taken place since 2011 are described. The information is based on the information provided by Rutgers WPF.

Table 1
*Information about MFS II supported capacity development interventions since baseline*

| Title of the MFS II supported capacity development intervention | Objectives | Activities | Timing and duration | Budget |
|---|---|---|---|---|
| Workshop Strategic Communication | To promote effective communication towards clients utilizing a broad range of communication tools | Workshop | September 2013 | n/a – partially funded by MenCare and ASK |
| Workshop on writing skills | Improve reporting skills | 9 sessions, weekly | April-June 2013 | n/a |
| Training for youth friendly services | To promote new means of communication with modern youth | Targeted training on communications. Social Media utilization was emphasised | November 2013 | n/a |
| PME Workshop | Develop project monitoring and evaluation skills | 3 day workshop<br>Reflective workshop | July 2013<br>7-11 January 2014 | n/a |
| SRHR Module development + training of trainers | Evaluate module implementation. Learn from other partners. Learn about context of SRHR education | Present work, discuss current development of SRHR module implementation and challenges in Indonesia | 8-10 october 2013 | n/a |

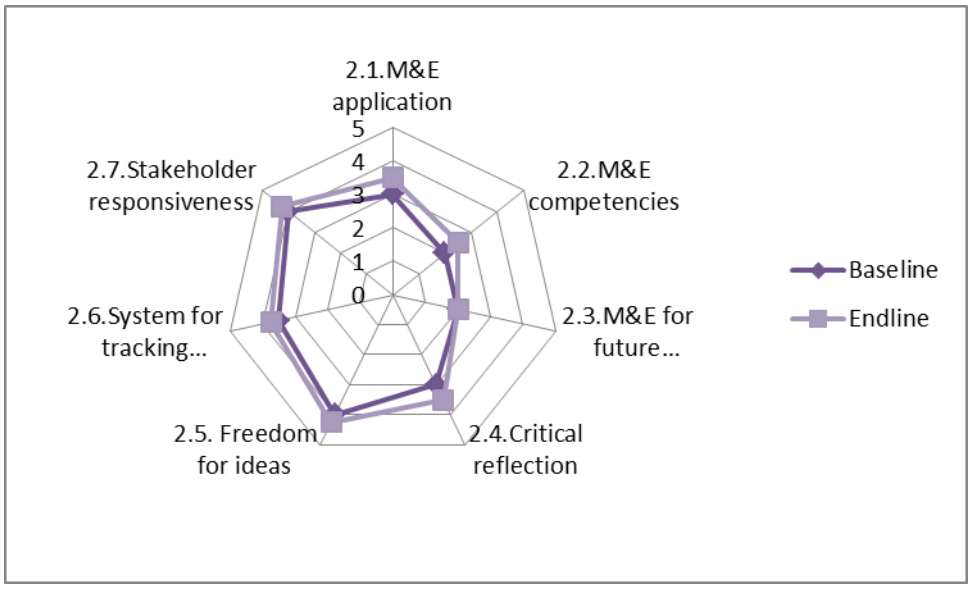
## 4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities. This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also annex 3.

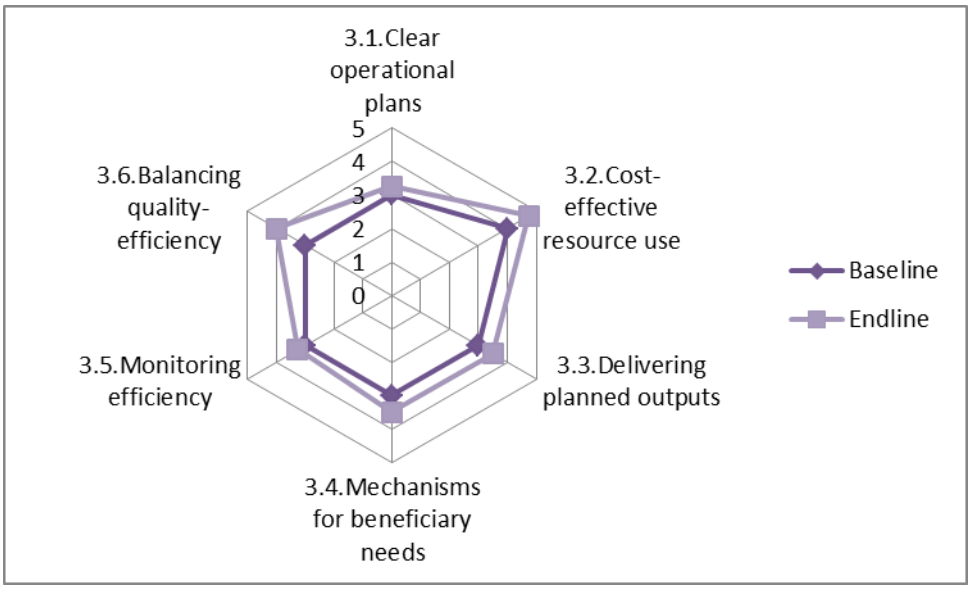
### 4.2.1 Changes in the five core capabilities



**Capability to act and commit**

The leadership of YPI has improved slightly in terms of their responsiveness and openness to organizational and programmatic issues. The areas of leadership improvements are program and strategic management, communication and partnership. The strategic guidance has become more specific and consistent with program strategic plans. Furthermore, strategic guidance has improved in terms of improved coordination by merging 3 offices to 2, by making decisions more promptly and firmly and by stimulating creative and inspiring program design. The Programme's strategies are now more based on monitoring and evaluation. Operations are based on the organizational strategies and by having a small budget it is possible to also keep running the activities even when funding is delayed. The structure of the organization hasn't changed since the baseline. There is no staff turnover during 2012-2014. However, staff is motivated by having more benefits compared to the baseline. The staff skills improved through training as well as informal sharing in weekly meetings on SRHR, data collection and reporting, and strategic communication Whilst diversity of funding sources hasn't really changed, YPI has developed a business unit named PT. Pelita Niaga Mandiri to assist in fundraising and ensure financial sustainability for the organization. The CFA has recommended that YPI further improve their strategic planning, external risk assessments and Budged vs. Actual (BvA) analysis.

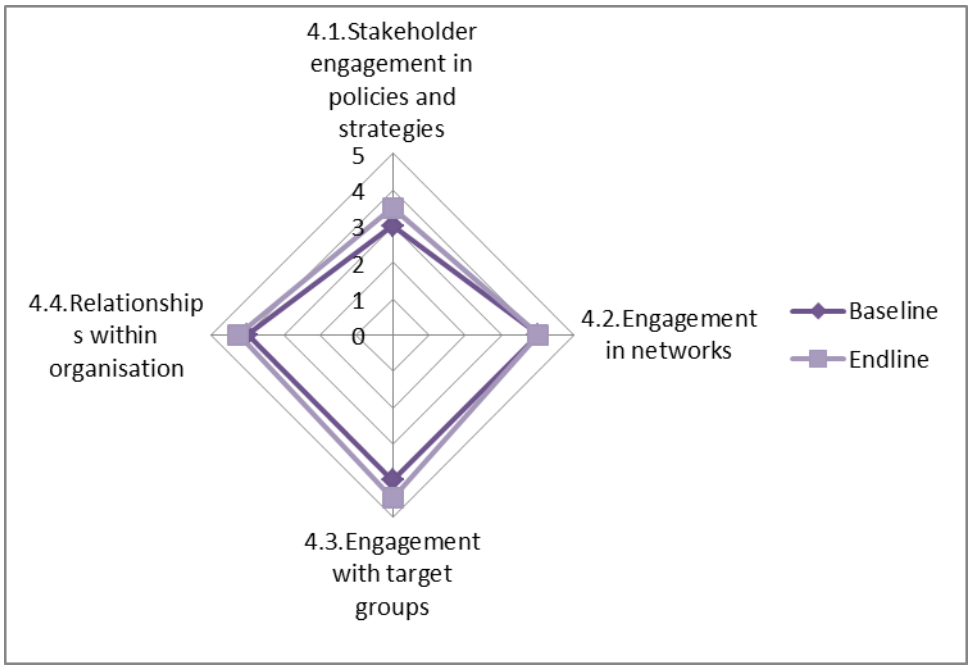
Score: From 3.4 to 3.7 (very slight improvement)



**Capability to adapt and self-renew**

Monitoring and evaluation (M&E) is now more structured, particularly in relation to having a reporting system and a monitoring visit mechanism in place. However, monitoring and evaluation is still focused on activities and outputs rather than outcomes and impact. However, improved networking and relationships with partners as well as having a monitoring visit mechanism in place can inform YPI on trends and developments in the operational environment. Staff competencies have improved in terms of data collection and reporting, but there are still no dedicated M&E person in place, and staff have to combine these tasks with their program implementation tasks. Having more regular meetings have helped the organization to reflect on progress and adjust plans. Staffs are still able to share their ideas freely and this is even improved since merging three buildings into two. The CFA has also recommended that YPI further improve their M&E system and knowledge management, as well as improve their analytical skill to improve their reports and other documents.

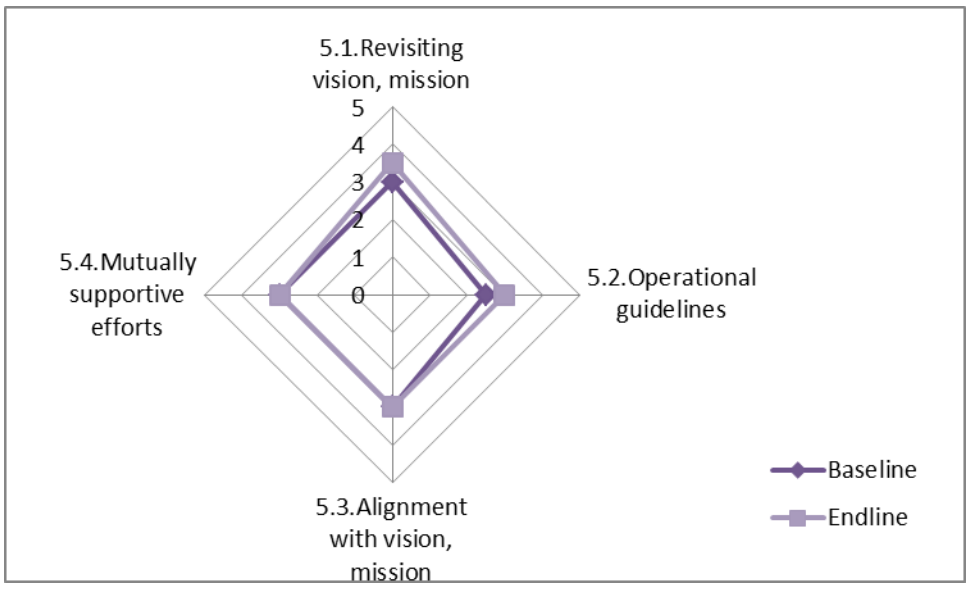
Score: From 3.1 to 3.4 (slight improvement)



**Capability to deliver on development objectives**

All projects still have a work plan and budget which is used in day-to-day operations. Resources are now used more cost effectively by having less staff with more programme implementation responsibilities, by merging three offices into two offices, and by reducing printing costs and stationary costs. Implementation has improved due to improved staff capacity, and by having operational, financial plans in place, but the lack of analytical skills in implementation. Beneficiaries are now more involved in programme planning and by having the way discussions on their needs. The basis for monitoring efficiency lies in the work plans and budgets that exist for all projects. A comparison is made between expenditures and achievements, and this is discussed in the team coordination meeting. Moreover since the baseline and the united the three offices become two offices, the board of trustees is more involved in the progress implementation evaluation. However, there is no specific monitoring of the relation between the level of output (results) and the level of input (time and money spent). YPI needs to further improve their HR policy and carefully design training and capacity building for staff according to the CFA in order to manage the vast growing number of people with HIV/AIDS in Indonesia. Additionally annual planning needs further improvement, and stronger relationships with strategic stakeholders must be built.

Score: From 3.2 to 3.7 (slight improvement)

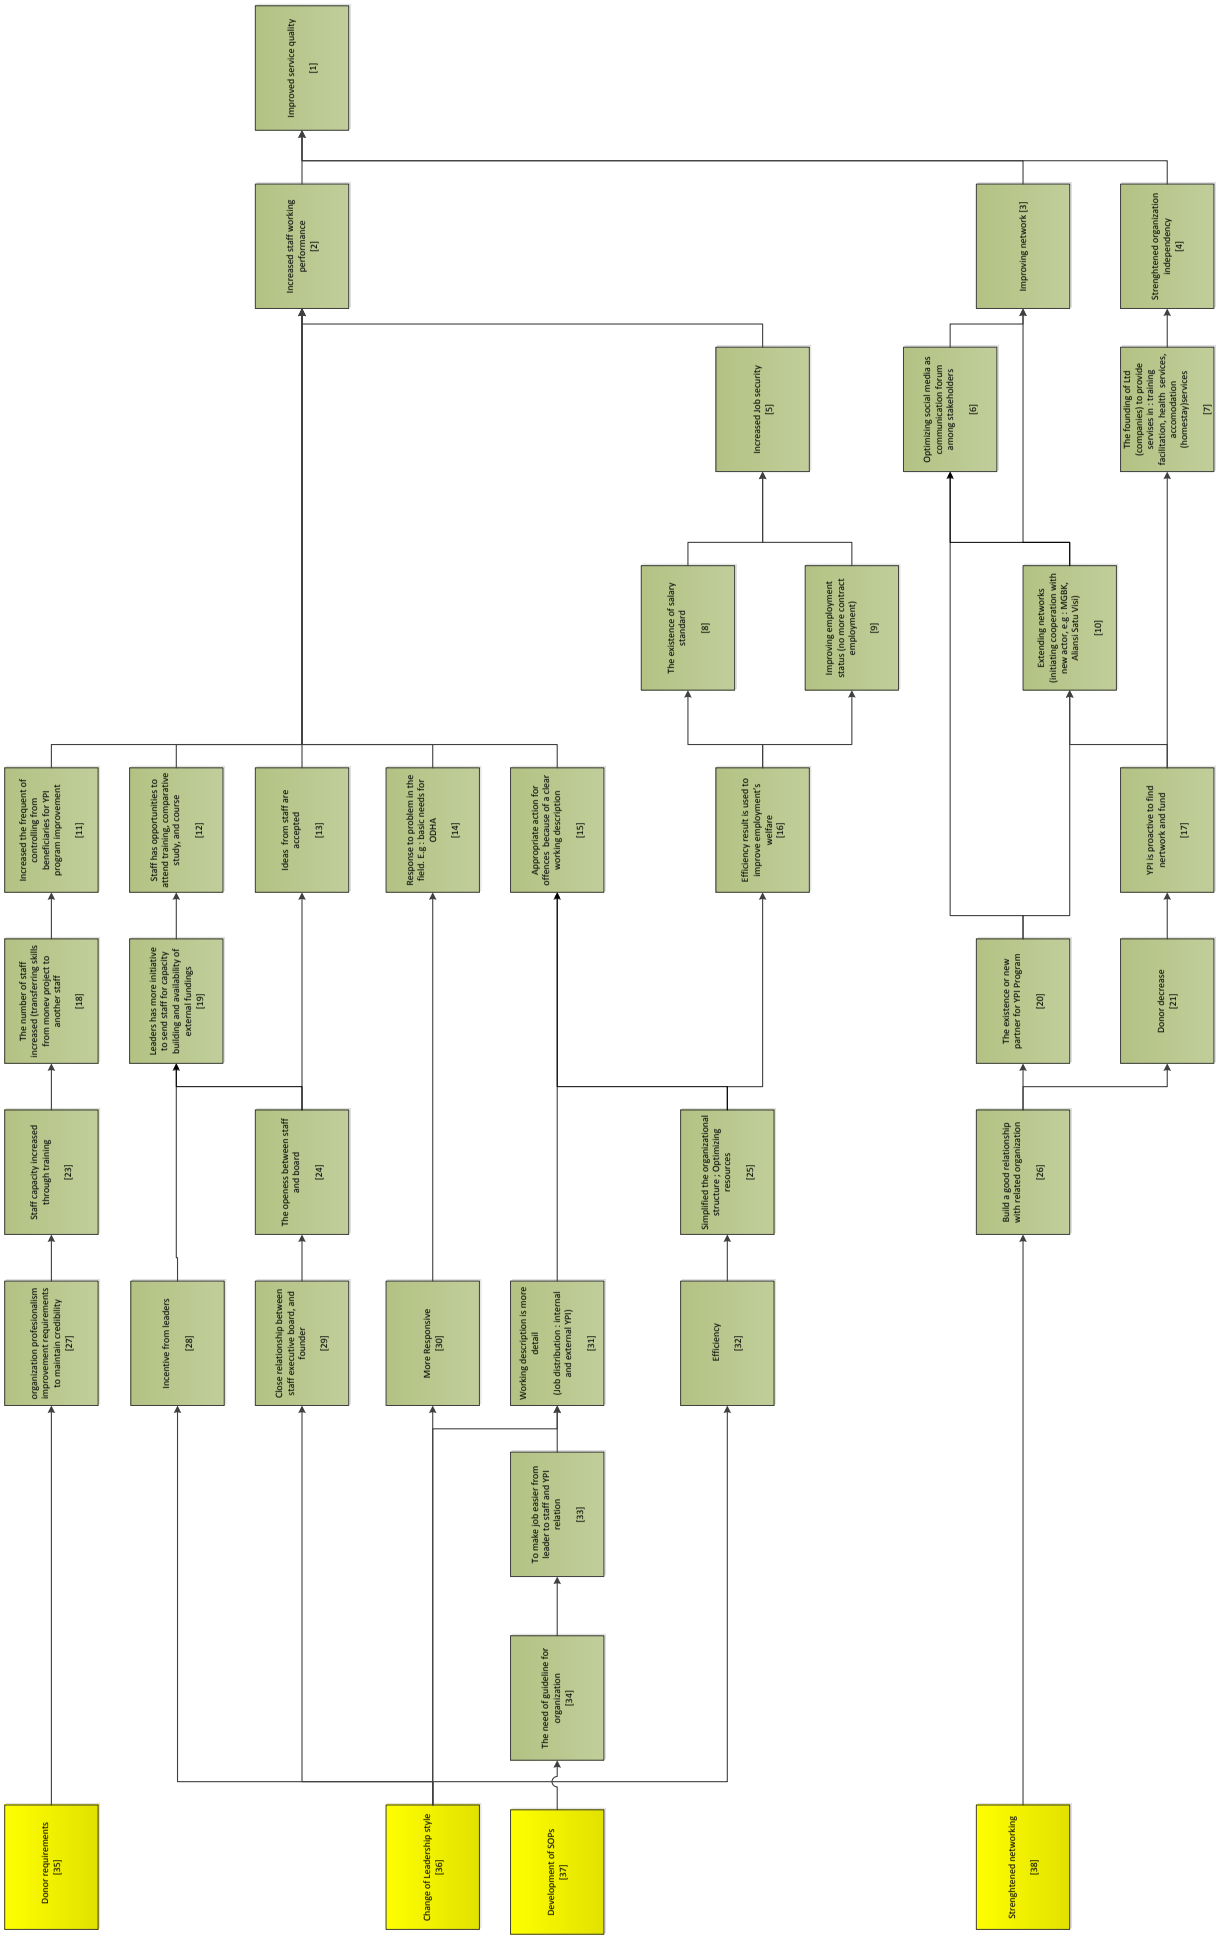


**Capability to relate**

YPI still collaborates with many stakeholders and target groups for learning and support, and to some extent for developing its policies. This is both at the international and national level. There are additionally close contacts with beneficiaries, which they even visit in their homes in remote areas. They have improved upon engaging with youth by having three-yearly meetings and performing school visits and youth meetings in the community. Within the organization communication is well developed and open and this has been further stimulated by a change in leadership, which stimulates openness as well as having 3 to 2 offices which has improved internal conclusion and coordination. There are regular staff meetings but communication can also occur using SMS, email or even Facebook. A mechanism for public accountability does not yet exist and can greatly benefit the organization. Stakeholders should be more involved in program planning and in sharing lessons-learned.

Score: From 3.7 to 4.1 (slight improvement)

**Capability to achieve coherence**



The vision, mission and strategies were discussed in 2013. In terms of operational guidelines, these are in place in terms of HRM and finance and there has been a decree on the status of staff employment since the baseline. Since that the job descriptions is more clearly. Projects, strategies and activities are still in line with the vision and mission of the organisation and to project activities are still mutually supportive. Operational planning and clear job descriptions are still areas that require further improvement as mentioned by the CFA.

Score: From 2.9 to 3.1 (very slight improvement)

### 4.2.2 General changes in the organisational capacity of the SPO

The evaluation team carried out an end line assessment at YPI. During the end line workshop, the team made a recap of key features of the organisation in the baseline in 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline.

Improved service quality [1]
Increased staff working performance [2]
Improving network [3]
Strenghtened organization independency [4]
Increased Job security [5]
Optimizing social media as communication forum among stakeholders [6]
The founding of ltd (companies) to provide services in : training facilitation, health services, accomodation (homestay)services [7]
The existence of salary standard [8]
Improving employment status (no more contract employment) [9]
Extending networks (initiating cooperation with new actor, e.g : MGBK, Aliansi Satu Visi) [10]
Increased the frequent of controlling from beneficiaries for YPI program improvement [11]
Staff has opportunities to attend training, comparative study, and course [12]
Ideas from staff are accepted [13]
Response to problem in the field. E.g : basic needs for ODHA [14]
Appropriate action for offences because of a clear working description [15]
Efficiency result is used to improve employment's welfare [16]
YPI is proactive to find network and fund [17]
The number of staff increased (transfering skills from money project to another staff [18]
Leaders has more initiative to send staff for capacity building and availability of external fundings [19]
The existence or new partner for YPI Program [20]
Donor decrease [21]
Staff capacity increased through training [23]
The openess between staff and board [24]
Simplified the organizational structure ; Optimizing resources [25]
Build a good relationship with related organization [26]
organization profesionalism improvement requirements to maintain credibility [27]
Incentive from leaders [28]
Close relationship between staff executive board, and founder [29]
More Responsive [30]
Working description is more detail (job distribution : internal and external YPI) [31]
Efficiency [32]
To make job easier from leader to staff and YPI relation [33]
The need of guideline for organization [34]
Donor requirements [35]
Change of Leadership style [36]
Development of SOPs [37]
Strenghtened networking [38]

The key change in YPI's organizational capacity since the baseline is an improvement in service quality [1]. Three underlying factors caused this improvement:

1. An increase in staff working performance [2]
2. An improved network maintenance s [3]
3. Strengthened organization independency [4]

Each of these factors is explained in detail below.

First of all, the staff's working performance increased for six different reasons:

1. Increased frequency of controlling beneficiaries for YPI program improvement [11]
   a. YPI beneficiaries were frequented and monitored more intensely which lead to overall program improvement. This was enabled by a greater number of staff members with Monitoring and Evaluations skills from other projects [18]. Staff capacity in general increased through training, which enabled the sharing of Monitoring and evaluation skills [23] and application across other programs. The increased focus on developing staff skills came from a greater need to professionalize all aspects in the organization to maintain credibility in the field [27] and to adhere to donor requirements [35].
2. Staff has opportunities to attend training, comparative studies and courses [12]
   a. Generally staffs that do not have enough skills will be trained or given opportunity to attend seminars/course locally and abroad. The availability of external funding and also leaders initiative to send staff to attend trainings, course was the primary reason for staff to to attend training and courses [19].The leader is selective however in choosing who can follow courses, only those people that are willing and able are chosenIncreased staff motivation in turn came about from increased incentives from the leadership [28] and more openness between staff and board/management [24]. The latter was a logical consequence from the close relationship between the staff's executive board and the founder of the organization [29] which developed soon after the change in leadership style [36].
3. Ideas from staff are accepted [13]
   a. Similarly to the previous line of developments, ideas from staff became more accepted and encouraged due to the openness between staff and board [24].
4. Response to problems in the field [14]
   a. The organization was able to respond to more problems and issues in the field by generally becoming more flexible and responsive [30]. This can largely be attributed to the change of leadership style which caused a much flatter organizational structure [36]
5. Appropriate action for offences because of a clear working description [15]
   a. Much like the previous factor, staff members were not only able to respond faster to problems, but also able to act more effectively by taking appropriate action for offences [15]. This came about from clearer and more detailed job descriptions of work activities[31] on the one hand, and a simplified organizational structure on the other. The revision of job descriptions was performed to make jobs easier and responsibilities clearer [33] and generally provide more guidelines for the organization's work [34]. The development of Standard Operating Procedures (SOP's) lay at the foundation of all these formalization and specification actions [37]. The simplication of the organizational structure on the other hand happened for efficiency reasons [32], which went hand in hand with the change of leadership style [36].
6. Increased job security [5]
   a. Increased job security also played an important role in the increased staff working performance, which greatly impacted staff morale [5]. Since the baseline MFS2 5C evaluation, a salary standard was introduced [8] as well as an improvement in employment status (no more contract work) [9]. Both developments could be realized from cost-saving resulting from the simplification of the organizational structure [25].

The second factor that resulted in improved service quality of YPI was the improvement of YPI's network [3]. This resulted from an optimized use of social media as a communication platform for stakeholders [6] on the one hand, and due to expanding networks to other actors and beneficiaries [10] on the other. More actors could now be served more effectively. Both these developments came about from contacting and including the new partners in the YPI programs [20], which in turn

developed through the active networking and building of relationships with related organizations [26]. The latter resulted from the conscious decision of YPI to strengthen their networking activities.

The third and final factor affected YPI's improved service quality is the strengthened organization's independence from other organizations and stakeholders [4]. YPI achieved this by founding limited independent corporate entities to provide services such as training, facilitation, health services and accommodation. For example, YPI have done various fundraising activities such as giving trainings, organizing music events, acting as facilitator and developing a clinic. For example, one of YPIs field offices has already established a self-sustained training center successfully. The income generated from this initiative covers the operational expenses of the camp itself. This has not been practiced for the whole organization yet.However some plan has been initiated to make it in a larger scale [7]. The former was achieved by YPI's proactive stance in finding new funds and partners in their network [17] after a decrease in donor support became evident soon after the baseline [21]

## 4.3 Attributing changes in organisational capacity development - evaluation question 2 and 4

Note: for each country about 50% of the SPOs has been chosen to be involved in process tracing, which is the main approach chosen to address evaluation question 2. For more information please also see chapter 3 on methodological approach. For each of these SPOs the focus has been on the capability to act and commit and the capability to adapt and self-renew, since these were the most commonly addressed capabilities when planning MFS II supported capacity development interventions for the SPO.

For each of the MFS II supported capacity development interventions -under these two capabilities- an outcome area has been identified, describing a particular change in terms of organisational capacity of the SPO. Process tracing has been carried out for each outcome area. In the capability to act and commit the following two outcome areas have been identified, based on document review and discussions with SPO and CFA: 'more motivated staff' and 'more recognized capacity to deliver SRHR training'.

In the capability to adapt and self-renew the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'improved reporting'.

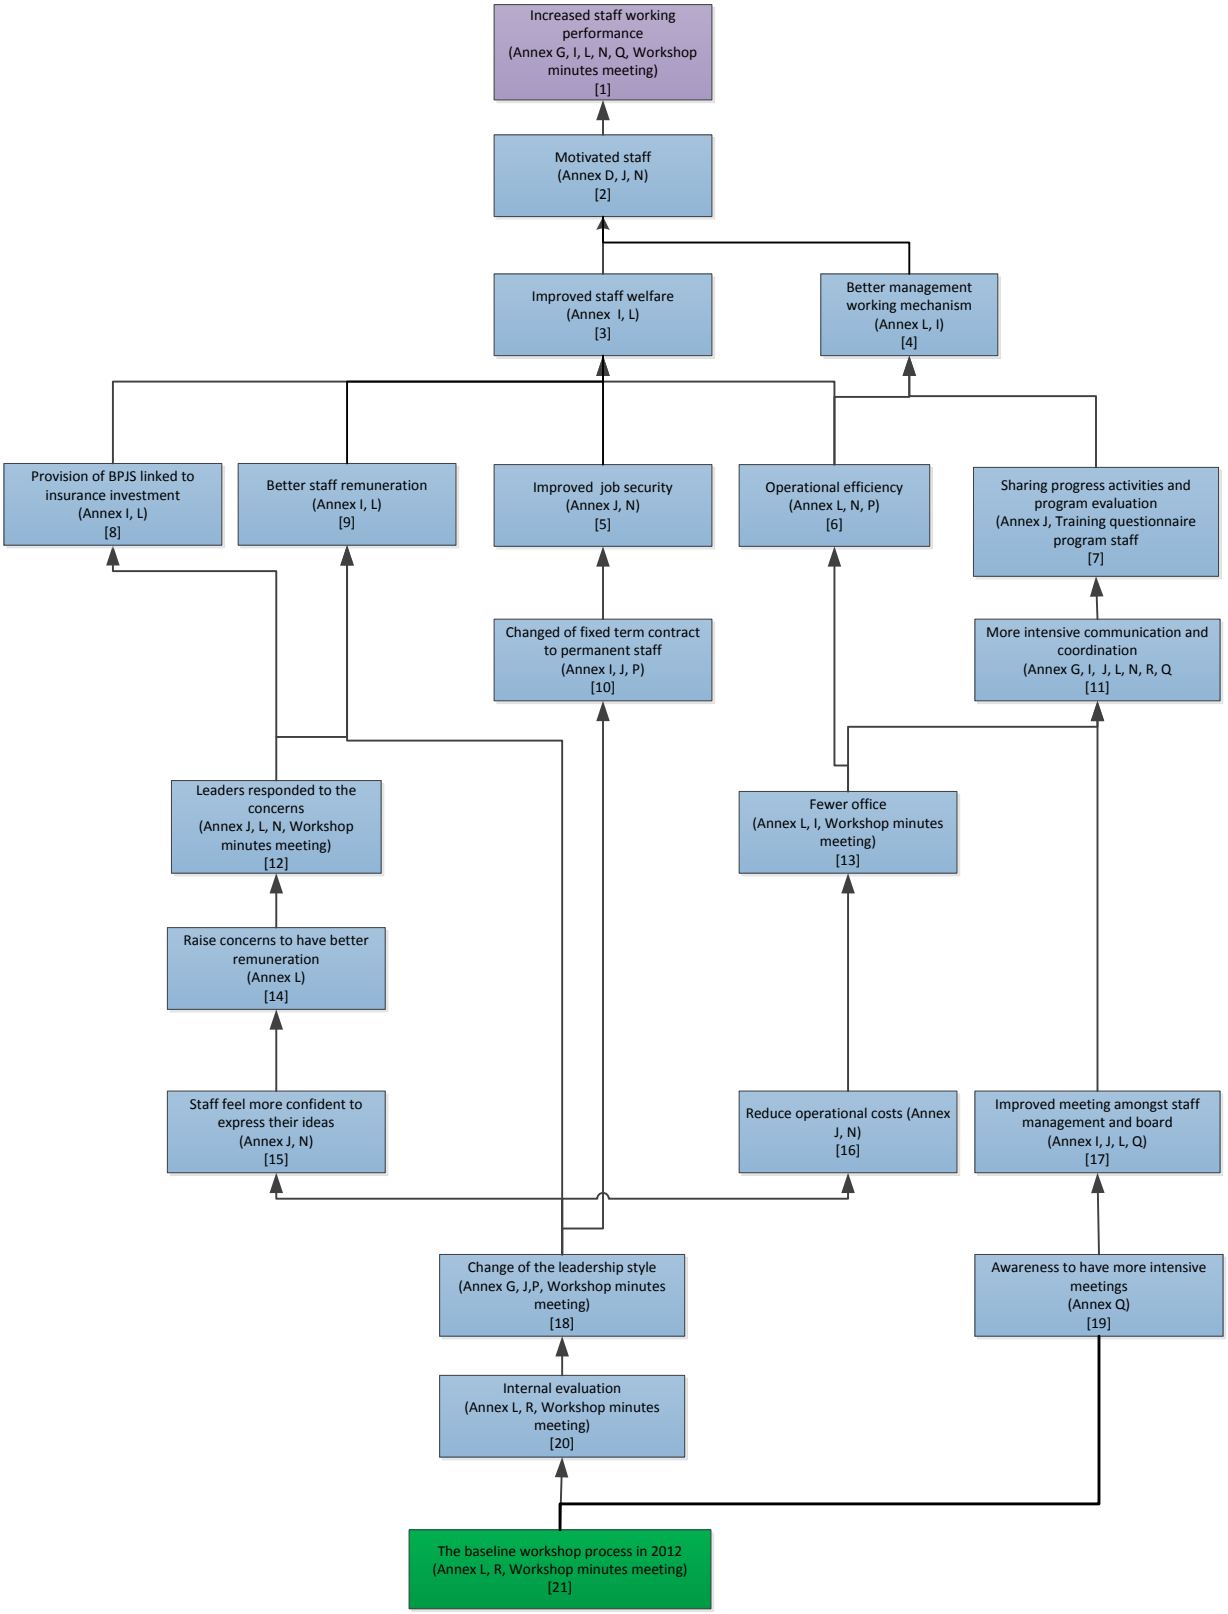


Table 2

*Information on selected capabilities, outcome areas and MFS II supported capacity development interventions since the baseline*

| Capability | Outcome area | MFS II supported capacity development intervention(2) |
|---|---|---|
| Capability to act and commit | More motivated staff | No related capacity development intervention found |
| Capability to act and commit | More recognized capacity to deliver SRHR training | 1. SRHR training in October 2013<br>2. Training for Youth friendly services in November 2013<br>3. Workshop on strategic communication in September 2013 |
| Capability to adapt and self-renew | Improved reporting | 1. M&E training workshop in 2013-2014<br>2. Writing skills training in 2013 |

The next sections will describe the results of process tracing for each of the outcome areas, and will describe to what extent these outcome areas have taken place as a result of MFS II supported capacity development interventions and/or other related factors and actors.

### 4.3.1 More motivated staff

During the endline workshop at YPI, a discussion was held around what staff perceived as the key changes in in the organisation since the baseline. This then led to a discussion on what were the key organisational capacity changes and why these changes have taken place according to staff present at the endline workshop. The discussion resulted in a 'general causal map' which is described below. The general causal map provides a comprehensive picture of organisational capacity changes that took place since the baseline, based on the perspective of SPO staff present at the endline workshop. Numbers in the narrative correspond to the numbers in the visual.

The identified organisational change under the capability to act and commit was ''more motivated staff [2] (Annex D, J, N), which is expected to contribute to increased work performance of staff to manage program activities [1] (Annex G, I, L, N, Q, workshop minutes meeting). The main underlying reason for this change is the MFS II organisational capacity development (5c) baseline process [21] (Annex L, R, workshop minutes meeting) which has inspired staffs, management and board management to improve some organizational aspects (Annex J), in particular, leadership [18] (Annex G, I, L, P, R, workshop minutes meeting) for example more responsive, decisive and open feedback. Staff has become more motivated due to improved staff welfare [3] (Annex I, L) and a better management working mechanism [4] (Annex I, J, L). Below you can find an explanation of how these changes have come about.

There were four main reasons for **improved staff welfare** [3] (Annex I, L): provision of BJS linked to investment [8] (Annex I, L); better staff remuneration [9] (Annex I, L); increased/improved job security [5] (Annex J, N); and operational efficiency [6] (Annex L, N, P).

Provision of BJS and insurance was linked to investment [8] (Annex I, L) which led to improved staff welfare by ensuring their insurance of health [3].

There has been better staff remuneration which was increased since December 2013 [9] (Annex I, L). The management acknowledged that the YPI remuneration is relatively low compared to other local organizations, but it is substituted by the provision of BPJS[30] and insurance linked to the investment [8] (Annex I,L). The investment insurance scheme is given to the staff with at least two-year service period. This improved staff remuneration is the result the leader's response to employee concerns, which were raised by staff [14] (Annex L). Staff would not have been able to raise such concerns without the new leader's ability to allow for such feedback [15] (Annex G, I, J, L, R). The main reason for this was that there was a change of leadership style. Previously the leader (the Director) was less responsive to staff concerns, and now the Director has better understanding to staff concerns [18] (Annex G, I, L, P, R, workshop minutes meeting).

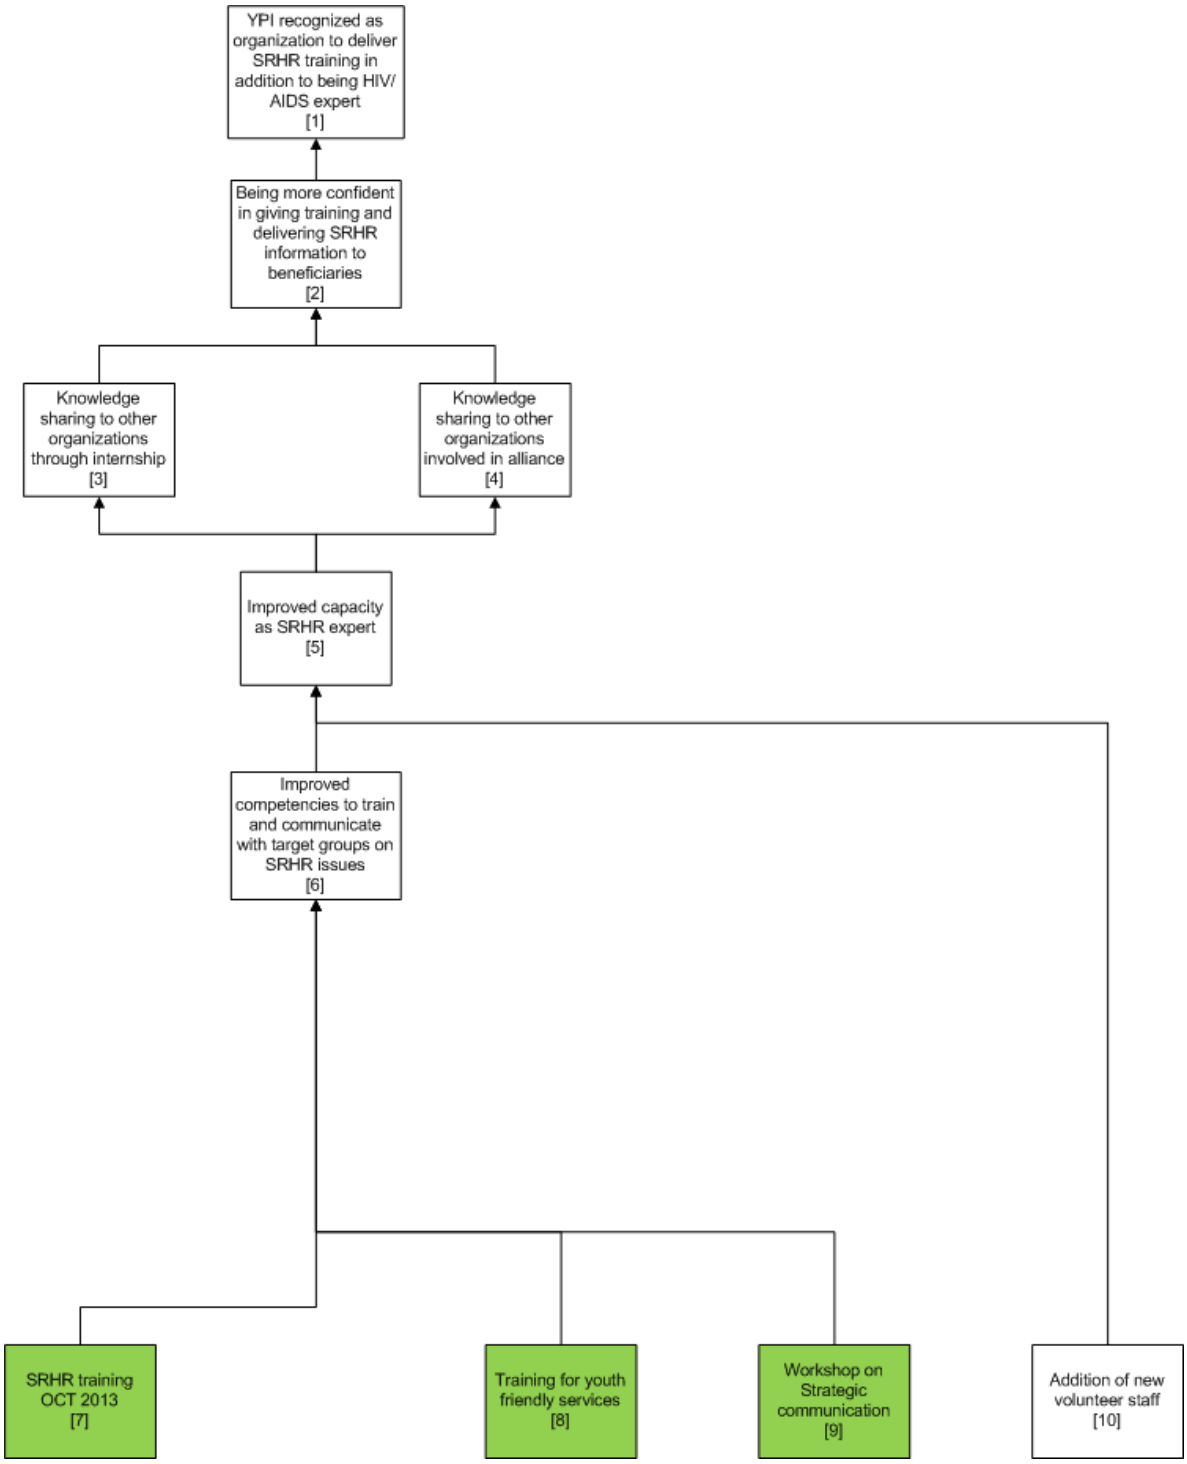
The third reason for improved staff welfare was improved job security [5] (Annex J, I, L, N). Staff perceived increased job security [5] (Annex J, I, L, N) due to a change from fixed term contracts to permanent staff employment [10] (Annex I, J, P). This too was one of the changes brought about by the change of leadership [18] (Annex G, I, L, P, R, workshop minutes meeting).

The fourth reason for improved staff welfare was improved operational efficiency [6] (Annex L, N, P). This was related to a reduction in the number of offices [13] (Annex L, I, R, Q, workshop minutes meeting), which had to happen to reduce operational costs [16] (Annex J, N). These reductions came straight from the process of internal evaluation [20] (Annex L, R, minutes endline workshop). In the internal evaluation there was discussion related to how to make the organization more efficient by reducing the number of offices (from 3 to 2) and using the saved money to increase staff welfare.

The second reason for improved staff motivation was having a **better management working mechanism** [4] (Annex I, J, L). This came about as a result of the active sharing of progress on activities and program evaluation results [7] (Annex J, training questionnaire_staff, training questionnaire_program manager, training questionnaire_secretary of executive board), which resulted from an increased staff habit to communicate and coordinate more intensively [11] (Annex G, I, J, L, N, R, Q). This habit resulted somewhat automatically from the fact that there was a reduction in the number of offices [13] (Annex L, I, R, Q workshop minutes meeting) allowing staff to communicate more easily. The reduction in the number of offices also affected to the operational efficiency [6] (Annex L,N,P) that led to better management working mechanism [4] (Annex L,I). Having fewer offices, reduced operational cost has enabled the management to manage the working mechanism better. In addition to this, the quality of meetings and relationships between staff management and the board also increased [17] (Annex I, L, Q, R). The latter resulted from an increased awareness to communicate more closely [19] (Annex Q), which was one of the results from the process of baseline workshop process conducted by MFS II in 2012 [21] (Annex L, R, workshop minutes meeting).

During the 5C baseline workshop in 2012 [21] (Annex L, R, workshop minutes meeting), the development of the *historical timeline* and the *theory of change*, made staff become more aware of

[30] BJPS is the Administrator for the Social Security System



the importance of having more intensive meeting amongst themselves, with management and with the executive board (source: CFA; additional sheet). The intensified meetings have increased staff's common understanding on the organization's current situation. It is also used as an internal forum for evaluation and at the same time as a means to strengthen the team work [20] (Annex L, R, workshop minutes meeting). YPI staff also said that they used to conduct regular meetings once in three months, but during the 5c baseline assessment, they became more aware of the importance of having more regular meetings. Intensive feedback and input through the internal evaluation has resulted to the change of leader's attitude. The leader is becoming more responsive, decisive and open to feedback [18] (Annex G, I, L, P, R, workshop minutes meeting).

The more intensive meetings also included an increased intensity of the board to have intensive interaction with staff [17] (Annex, I, L, Q, R). Through this, the board has better understanding on the updates of the organization. Before the baseline in 2012, meetings amongst management were not intensive and this was realized during the 5c baseline assessment in 2012 [19] (Annex L, R, workshop minutes meeting).

On the whole, the baseline 5c assessment in 2012 has had quite a big impact on the organisation in terms of a changed leadership style and ultimately motivated staff.

### 4.3.2 More recognized capacity to deliver SRHR training

Below you will find a description of the 'More recognized capacity to deliver SRHR training' and how this has come about.

YPI has been recognized and acknowledged by its peers in providing trainings on SRHR in addition to being already considered as an HIV-AIDS expert in Indonesia [1] (Annex A, B, C). The many invitations that YPI has received in which the organization was requested to act as a facilitator, resource person or consultant in various forums at the local, regional as well as national level, serves as proof for this. YPI's staff has become more confident in giving trainings and delivering SRHR information to beneficiaries [2] (Annex A,X) as a result of knowledge sharing to other organizations through internships [3] (Annex C,X), as well as knowledge sharing to other organizations involved in the alliance [4] (Annex A,X).

On the one hand knowledge was shared through the internship positions that YPI had created [3] (Annex C,X). In order to develop the issues of SRHR and HIV-AIDS amongst the youths, YPI initiated a *youth forum* within DKI Jakarta. The idea was to bring about one forum that comes from, was run by, and made for, youths who were working with these two issues as a basis. YPI performed the role of initiator and facilitator. This forum was the place where YPI staffs' learning process was disseminated to the members of the youth forum.

On the other hand, knowledge was shared through organizations involved in the alliance [4] (Annex X). YPI is involved in as a member, official or initiator in several alliances related to SRHR issues. Among the most important ones is the Independent Youth Alliance (ARI). Each alliance possesses communication mechanism both in the form of direct meetings and electronic media (social media). In general, these alliances were established as a place for various organizations in sharing their problems, insights, knowledge, information and agenda-setting. It is from and through these alliance forums that YPI's staff improved their capacity on SRHR training and communication. They often share what they have learnt from the forums they participated in, as well as being asked to join as committee members or facilitators of activities initiated by the alliance.

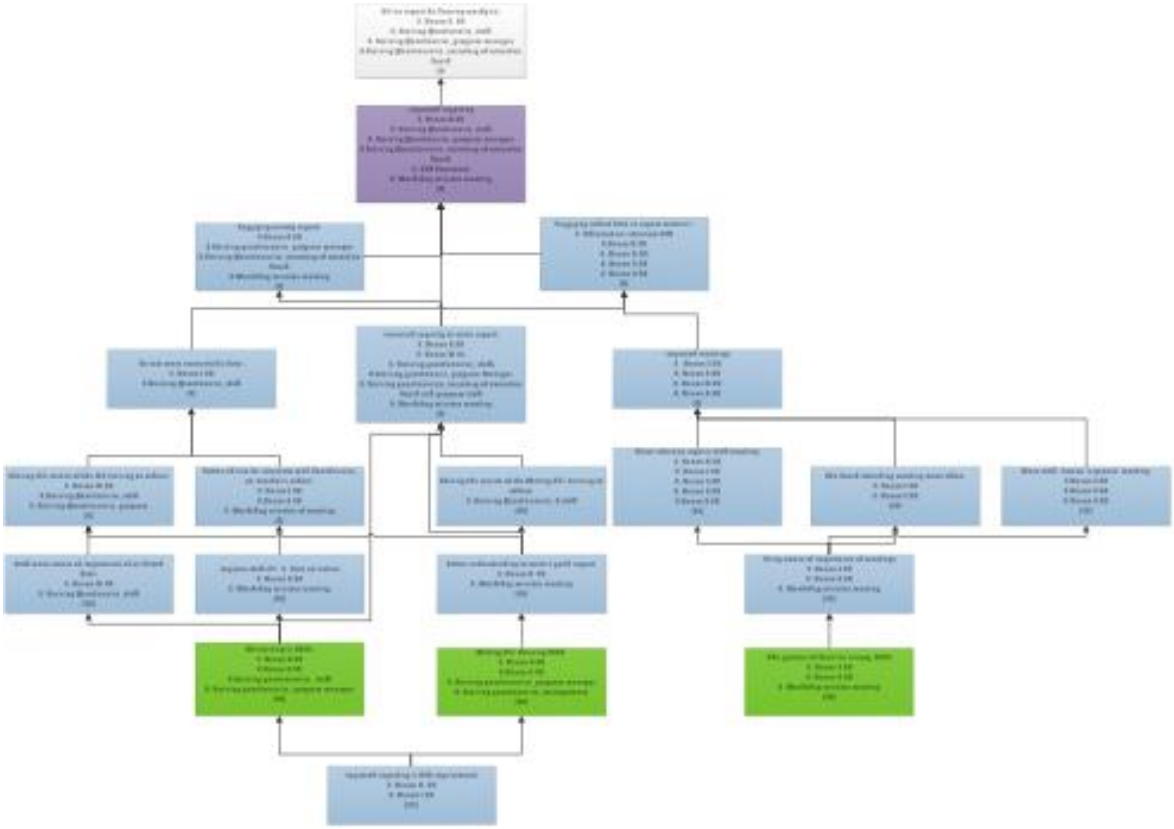
The sharing of knowledge and participation in these forums was enabled by the improved capacity as SRHR experts of the organization. During 2013, YPI increasingly participated in SRHR initiatives and venues next to practicing their existing expertise on HIV-AIDS, improving the capacity of the organizations SRHR expertise [5] (Annex A, X). This was enabled by the improved competencies to train and communicate with target groups on SRHR issues [6] (Annex A, B) on the one hand, but also through the addition of new staff members and volunteers who were increasingly involved in the SRHR programs and contributed to the capacity growth of the organization in the field of SRHR [10] (Annex A, X).

Improved competencies to train and communicate with target groups on SRHR issues can be attributed to three MFS II funded capacity interventions. In each training there was an unwritten agreement obliging them to share what they have learnt to others internally (Annex X).

**SRHR Training [7] (Annex A, B, X**

This training was held by RutgersWPF, on October 2013. YPI received an invitation for 3 participants. Who all attended. In the training emphasis was put on holistic understanding on everything related to SRHR. All partners who had implemented SRHR modules presented and shared their work which enabled them to learn from each other.

**Training for Youth Friendly Services [8] (Annex A,B,X)**



This training was held by PKBI in Cibubur on November 2013, and funded by MFS II and the ASK program. One YPI staff member attended the training, who was an active volunteer in YPI, and also a youth forum member. Targeted training to promote new means of communication to modern youth was given. The use of social media was emphasized.

**Workshop on Strategic Communication [9] (Annex A,B,X)**

This training was held in Bogor on September 2013 by One Vision Alliance. On YPI staff member attended the training. The training was focused on the development of a communication strategy, and how to strengthen the organization's standpoint to give communication more impact.

### 4.3.3 Improved reporting

The key organizational change in the capability to adapt and self renew was initially identified as 'improved monitoring and evaluation' but during the process was refined to 'improved reporting' since the focus was more on this part of monitoring and evaluation [2] (Annex A; training questionnaire_staff; training questionnaire program manager; training questionnaire secretary of the executive board; workshop minutes meeting); CFA Document). The improved reports help to develop work plans [1] (Annex P; training questionaire_staff; training questionaire_program manager; training questionnaire secretary of executive board).

Improved reporting has been influenced by three factors: getting more varied reports (report with more form of data such as more visual or pictures and photography) [3] (Annex C; workshop minutes meeting; training questionnaire secretary of executive board), an improved capacity to write reports [6] (Annex B; Annex M; training questionnaire program manager; training questionnaire staff; training questionnaire secretary of executive board) and getting more robust data for report writing [4] (Observation interview CFA; Annex G; Annex N; Annex I; Annex P; Annex R). Reports are getting more varied because they have lots of data and know how to present the data in their reports also the reporting format has become more complicated [3] (Annex A; C; workshop minutes meeting; training questionnaire secretary of executive board; workshop minutes of meeting).

Staff have improved their capacity to write reports [6] (Annex B; Annex M; training questionnaire program manager; training questionnaire staff, training questionnaire secretary of executive board; workshop minutes meeting), on the one hand because of the M&E training in 2012 [18] (Annex C; Annex B; training questionnaire program manager, training questionnaire staff), which came as a requirement by the CFA [21] (Annex D; Annex J). The second reason for improved reporting capacity was the sharing among staff of results of the writing skills training. One of the participants at workshop in YPI while facilitating sheet of perspective SPO said that they shared the training experience and knowledge to other colleagues) [10] (Training questionnaire_3 staffs). One of the managers indicated during an interview that staff who is responsible for the teenagers group, has better understanding in report writing (Annex C). One of the training participants admitted that before the training, she needed more guidance from the leader in report writing, while after the training she feels more independent and needs less guidance from the leader (training questionnaire program manager). The writing skills training itself was supported by RWPF in 2013 [19] (Annex C; Annex B; training questionnaire management; training questionnaire program manager), and led to better understanding of how to write a good reports [19] (Annex C; Annex B; training questionnaire management; training questionnaire program manager). Ultimately it was the requirement from the CFA for improved reporting which created the necessity to have the trainings on M&E and writing skills [21] (Annex D; Annex J).

The third reason for improved reporting [2] (training questionnaire staff; training questionnaire program manager; training questionnaire secretary of the executive board); CFA Document) is that more robust data are being supplied as material for the reports [4] (observation interview CFA; training questionnaire management; Annex G; Annex N; ; Annex R; workshop minutes of meeting). There are two reasons for getting more robust data: on the one hand more accountable data is being collected [5] (Annex J; Training questionnaire staff) and on the other hand meetings have improved [7] (Annex L; Annex P, Annex O, Annex R).

**More accountable data is being collected** [5] (Annex J; training questionnaire staff) by staff due to an increase in the competences to conduct interviews in the field, such as beneficiaries and teachers [9] (Annex M; Training questionnaire _staff), The competencies to has come as a result of improved awareness on the importance of validated data [14] (Annex M, Training questionnaire staff), not only by staff forward attended a training on monitoring and evaluation, but also staff who learned this from the people trained [8] (Annex M; training questionnaire program manager; training questionnaire program staff). This is mainly due to a training by RWPF on monitoring and evaluation, which was conducted in 2011 [18] (Annex C; Annex B; training questionnaire program manager; training questionnaire staff), and which was attended by the project officer, the program manager and the secretary of the executive board.

Other staff, who did not join the training also increased their awareness on the importance of data validation, since M&E training participants shared their training experience in organizational meetings [8] (Annex M; training questionnaire program manager; training questionnaire program staff). The need to share became clear to staff attending the training as their awareness of the importance of validated data collection increased [14] (Annex M, training questionnaire staff). Staff has begun to discuss with their colleagues about data collected in monthly discussions. The requirement from the CFA for improved reporting created the necessity to have the trainings on M&E and writing skills [21] (Annex D; Annex J).

**The second reason for having more robust data is that meetings have been improved** [7] (Annex L; Annex N; Annex P; Annex O; Annex R) for a variety of reasons. Firstly, the staff meetings are more intensive and regular, as stated by staff and executive board during the interview [11] (Annex D; Annex J; Annex L, Annex P; Annex R). YPI staff also said that they used to conduct regular meetings once in three months, but during the 5c baseline, they realized the importance of having more regular meetings [20] (CFA, Annex M, Annex R) and are now conducting monthly meetings as a result of baseline survey [11] (Annex D; Annex L; Annex L, Annex P).

Secondly, the executive board visits the YPI office more regularly [12] (Annex J; Annex L;). It is stated by the founder, that they initiate the meeting (Annex L). This statement is supported by one of the management, that the executive board is asking to conduct meetings to get information about the progress of activities (Annex L; Informal discussion with management) and is supported by admin staff [12] (Annex L) and by field staff (Annex J).

Thirdly, more staff are involved in regular meetings [13] (Annex L; Annex P; Annex N). In the last two years, YPI reduced the staff, which means that YPI doesn't have project staff anymore (Annex J; Annex L). Staff in YPI are permanent staff, who have rights and obligations based on YPI regulations. The smaller number of YPI staff, makes them being more involved in regular meetings.

During the 5C baseline workshop, and in particular the discussions on the historical time line and the theory of change, and during discussions with management [20] (Annex L, Annex R; Workshop minutes meeting), staff became aware of the importance of having intensive meetings among staff, management and the executive board [17] (Annex L, Annex R)

# 5 Discussion and conclusion

## 5.1 Methodological issues

**General: Applied to all or most SPOs**

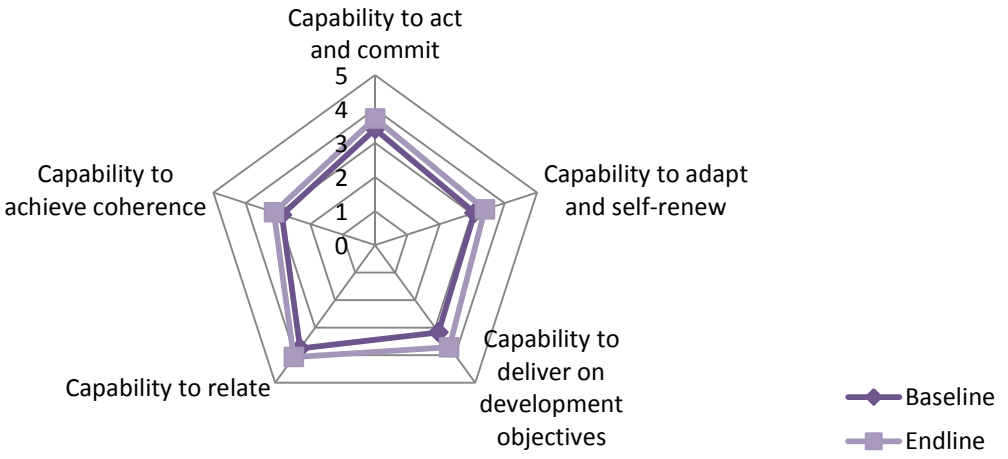
With regard to the methodology, Indonesia has made some data collection adjustment based on the context. The first adjustment was related to the type of instrument used. To assess the organizational capacity, the study has provided self-assessment, observation and interview sheets. These all were used during the baseline with all SPOs. During the end line the team used self-assessment, interview and observation sheets. However the evaluator applied interview sheets as self-assessment—where participants were asked to fill these sheets by themselves. For the participants who did not attend the workshop, the interviews were done separately using the interview sheet and the results from the interview were included in the subgroup interview sheet that was already filled by the staff member. Were combined into the relevant sub categories in the interview sheet. Interview sheets were also applied for interviews with the CFAs, partners and consultants.

The baseline study showed that having two similar instruments (self assessments, and interview sheets) did not have any effect in relation to obtaining adequate and quality data.

To have some clarification post visit to all SPOs, the evaluator used email and phone interviews.

**Yayasan Pelita Ilmu (YPI)**

Yayasan Pelita Ilmu was the first organizations visited during the data collection for the pilot. It was selected for process tracing, however the visit could only be conducted once. In relation to process tracing, seven staffs filled the training questionnaire related to MFS II funded training events since the baseline in 2012. It was filled in two ways, by calling and emailing them during the Surveymeter training workshop with CDI in Yogyakarta last April 2014. Some other training questionnaires were filled during the second field visit in June 2014. The seven staffs filled the training questionnaire on various different trainings; two staff on the PME training (in 2012), one staff on the PME training (in 2013), one staff on the Sexual and Reproductive Health Rights training (in 2014), and three staffs on the communication training (in 2014).



The self-assessment was conducted directly during the endline visit. The evaluator did not send the self-assessment sheet prior to the visit. However not all participants were able to complete the sheets at that time and it was followed up on by email for completion. The participants involved in the study were 2 management, 2 coordinators/program manager, 1 administration, 4 field staffs, 1 M&E program, and 1 partner.

When developing the general causal map of key organisational capacity changes in the organisation since the baseline, as experienced by the SPO, instead of identifying the key changes generally, the evaluator guided the team to have it one by one per capability. Therefore there were five different independent maps developed which were later combined into one general causal map and verified with the SPO during the feedback process. The documents for desk review collected from the organization were very limited due to low response from the organization on this particular aspect; most of the documents gathered were received from the CFAs.

## 5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Whilst changes took place in all of the five core capabilities, the greatest improvement took place in the capability to deliver on development objectives. Below the changes in each of the capabilities are further explained, by referring to the specific indicators that changed.

Over the last two years the capability to act and commit improved slightly. Leadership responsiveness has improved in terms of the board of executives demonstrating more openness to organizational and programme issues. Strategic guidance has slightly improved in terms of improved coordination by merging 3 offices in to 2, by making decisions more promptly and firmly, and by stimulating creative inspiring program design. In terms of articulating strategies, YPI improved slightly by utilizing results from new M&E approaches in developing work plans and strategies. Daily operations also improved very slightly due to allocating a small amount of budget to keep operations going, even when donor funding is pending. Staff skills improved slightly. YPI has responded to baseline findings on weaknesses in their staff' skills, by facilitating capacity building activities to address these weaknesses. In terms of incentives, YPI has been able to add secondary employment benefits in terms of annual bonuses, family support benefits and family excursions. YPI's funding procedures have also slightly improved through the construction of a self-sustaining business unit that assists in fundraising and ensure financial sustainability of the organization.

YPI's capability to adapt and self renew has improved slightly. The application of M&E is now more structured, particularly in relation to having a reporting system and a monitoring visit mechanism in place. M&E competencies have improved slightly too: Staff skills have improved in terms of data collection and reporting to for example the partners at provincial level. In terms of critical reflection, the organization's frequency of meetings has gone up in response to a need for more coordination amongst staff. This has resulted in a minor improvement on this particular indicator. Equally, the freedom for ideas has very slightly improved in that management is opening up to the idea to discuss ideas about program implementation with staff members. The system used to track the environment has been very slightly improved through more active networking of YPI in greater AIDS networks as well as utilizing social media more. YPI's best practice to involve partners and stakeholders in their program planning as a foundation to build long lasting relationships proves beneficial in terms of stakeholders responsiveness.

The capability to deliver on development objectives has shown the greatest improvement for YPI. In terms of clear operational plans, a very slight improvement has occurred as a result of YPI staff now being more aware of budget and funding sources and procedures. This resulted from open discussions with the Director. Cost-effective use of resources has greatly improved for YPI through a variety of policies. Amongst others, the merging of two offices, reduction of operational printing costs and fewer investments in computer hardware have greatly saved costs for the organization. In terms of delivering planned outputs, YPI has continued to improve its capacity to implement operational plans. YPI now highlights the importance of the relationship between work plan and financial plans prior to implementation to its staff members, which proves insightful for most. A slight improvement has occurred in terms of the mechanism for beneficiary needs through the introduction of two-way discussions. In balancing quality and efficiency, YPI has developed particularly the quality side of work through more structured work plans and program units. A monitoring system is in place to ensure that quality and efficiency remain balanced.

The capability to relate has slightly improved. Stakeholder engagement has slightly improved as a result of new collaborations with Aliansi Satu Visi, KPAN, KPAP DKI Jakarta and the Ministry of Social Affairs. Engagement with target groups has slightly improved as well, particularly through the organization of gatherings called OBRAS (lunch discussions) with particular guest speakers. Internal relationships have slightly improved due to more openness from management.

Finally, the capability to achieve coherence has only resulted in very slight improvements. In 2013 YPI facilitated a meeting to discuss and re-evaluate the organizations vision, mission and strategies. A slight improvement in terms of operational guidelines occurred since the baseline as board and management members now more frequently get involved in discussions about operational issues.

During the endline workshop some key organisational capacity changes were brought up by YPI's staff: more motivated staff and improved reporting. This paragraph has already shown some changes that are related to these issues. How the MFS II funding was linked to the two identified key organisational capacity changes will be further explained in section 5.3.

**General organisational capacity changes related to MFS II Interventions**

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. Please note that this information is based only on the information provided by YRBI staff during the endline workshop, but no validation of this information has been done like with the process tracing causal maps. For details in relation to attribution, we refer to the next section (5.3).

During the endline workshop some key organisational capacity changes were brought up by YPI staff, these have been captured in the general causal map in 4.2.2:

1. An increase in staff working performance
2. An improved network maintenance
3. Strengthened organization independency

All of these are expected to contribute to YPI's improvement in service quality. YPI staff experienced these as the most important capacity changes in the organisation since the baseline.

Increased staff working performance resulted from increased frequency of controlling beneficiaries for YPI program improvement; staff having opportunities to attend training; comparative studies and courses; ideas from staff being accepted; response to problems in the field; increased job security. The increased frequency of controlling of beneficiaries was enabled by the greater number of staff proficient in M&E, which was enabled by more training, such as the PME workshop funded by RutgersWPF. This could be attributed to an overall improvement of the organizations' professionalism due to donor requirements. Staff has had more opportunities to attend trainings and develop due to YPI's leaders willingness to send staff to more training opportunities as well as more funding to do so being available as a result of external funding. This was enabled by incentives from the leaders and the openness between staff and board due to the close internal relationships between management, board and staff. Both these factors can be attributed to the change in leadership style. Ideas from staff were more accepted which can again be attributed to the greater openness between staff and management. Quicker response to problems in the field was enabled by a more responsive organization, which was made possible by the new leadership style. Appropriate action responses from staff were enabled by more detailed working descriptions, which can be attributed to the change of leadership on the one hand, and by better guidelines in the form of revisions of SOPs and new SOPs on the other.

Increased job security was due the implementation of a salary standard and improving employment status to full time contracts. Both were enabled by utilizing savings from other costs to improve employment benefits. These resources were freed up through simplifying the organizational structure and optimizing the use of resources. This efficiency initiative was enabled by the change in leadership.

Improving YPI's network resulted from the use of social media as a communication tool to address stakeholders, and extending networks through other alliances and partners. Both were enabled by the existence of new partners for the YPI program due to good relationships with related organizations as a result of more intense networking activities. The network also extended to new groups through YPI's proactive stance to find network partners and funds. This can be attributed to the urgency imposed on the organization by the decreasing of donors.

Increased independency of YPI was enabled by the founding of a private company to provide services in training, facilitation, health services and accommodation. With this business, new more sustainable funding sources are being attempted.

In conclusion, the general key changes causal map only provides limited information about the relation between MFS II interventions with the organizational capacity changes that YPI considered most important since the baseline. During the endline process tracing workshop, YPI did not mention specific MFS II capacity interventions that in their opinion had affected the key changes. However, it must be noted that this workshop was held very early on in the evaluation process and that YPI struggled in developing the initial maps and relating them to capacity development. In the course of their involvement in the endline evaluation process, this has changed, and additional insights were developed. The process tracing maps in section 5.3 provide more detailed information about the relation between MFS II funded capacity interventions and key organizational capacity changes. For a more detailed analysis on this matter, please refer to section 5.3 where process tracing findings are presented which can answer the attribution question with more certainty and validity.

## 5.3 Attributing changes in organisational capacity development to MFS II

This section aims to provide an answer to the second and fourth evaluation questions:

2. *To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*
4. *What factors explain the findings drawn from the questions above?*

To address the question of attribution it was agreed that for all the countries in the 5C study, the focus would be on the capability to act and commit and the capability to adapt and self-renew, with a focus on MFS II supported organisational capacity development interventions that were possibly related to these capabilities. 'Process tracing' was used to get more detailed information about the changes in these capabilities that were possibly related to the specific MFS II capacity development interventions. The organisational capacity changes that were focused on were:

- More motivated staff
- More recognized capacity to deliver SRHR training
- Improved reporting

The first two organisational capacity changes fall under the capability to act and commit. The third organisational capacity change falls under the capability to adapt and self-renew. The organisational capacity change areas that were chosen are based on document review as well as discussions with the SPO and CFA. Each of these organisational capacity changes is further discussed below.

**The following issues are discussed for the MFS II funded activities that are related to the above mentioned organisational capacity changes:**

a. Design: the extent to which the MFS II supported capacity development intervention was well-designed. (Key criteria: relevance to the SPO; SMART objectives)
b. Implementation: the extent to which the MFS II supported capacity development was implemented as designed (key criteria: design, according to plans during the baseline);
c. Reaching objectives: the extent to which the MFS II capacity development intervention reached all its objectives (key criteria: immediate and long-term objectives, as formulated during the baseline);

d. the extent to which the observed results are attributable to the identified MFS II supported capacity development intervention (reference made to detailed causal map, based on 'process tracing').

**Please note that whilst (d) addresses the evaluation question related to attribution (evaluation question 2), the other three issues (a, b and c) have been added by the synthesis team as additional reporting requirements.** This was done when fieldwork for the endline process had already started and is also not the focus on this 5c evaluation. With the minimum information available the evaluation team tried to address these first 3 questions.

**More motivated staff**
Based on document review as well as interviews with CFA and SPO, more motivated staff was identified as a key organizational capacity change. However no specific MFS II funded capacity development interventions could be related to this organizational capacity change. Instead the change was mostly attributed to the external MFS II 5C baseline workshop process performed in 2012. Although was not designed as a MFS II funded organizational capacity intervention, it was experienced as an important capacity development intervention that triggered changes in terms of having more motivated staff. T

The questions regarding design, implementation, and reaching objectives are not applicable since this intervention wasn't planned and designed as a capacity development intervention funded by the CFA (MFS II). The attribution question will be answered however, in order to highlight how the baseline process invoked changes in organizational capacity at YPI, in particular in relation to having more motivated staff.

**Attribution of observed results to MFS II capacity development interventions**
YPI's more motivated staff occurred due to improved staff welfare and a better management working mechanism. Although neither of these factors relates to MFS II capacity development interventions, the MFS II baseline workshop process in 2012 triggered several changes in terms of organizational development that will be highlighted below (see also 4.3.1).

Staff welfare was improved after a series of changes in HR policies and operational efficiency which made work more enjoyable and effective. Since December 2013, better staff remuneration, new insurance benefits and improved job security through offering now permanent employment contracts are examples of implementations that occurred after a change of the leadership occurred in late 2012. This change in leadership style occurred after the organisation had performed a thorough internal evaluation. The director saw the value of changing his leadership style into a more responsive manner and open to his staff. He encouraged staff to express their ideas freely and raise concerns, which opened the door for discussion about remuneration and employment benefits.

In addition the new leadership style reduced operational costs and merged some of the YPI office, making communication and coordination of work much easier and greatly increasing operational efficiency. This too enabled improved staff welfare.

Finally the baseline evaluation workshop in 2012 forced staff and management to interact frequently, exchange ideas and thoughts and have more intensive meetings as this would result in more insight in to day to day activities, problems and opportunities. Meetings now also included more participants, including board members. This has led to better understanding amongst the board about what is occurring in the field.

On the whole, more motivated staff at YPI, due to improved staff welfare and improved management working mechanisms , where the result of many internal changes brought about by a change in leadership, after understanding organisational gaps which were identified in an internal evaluation that was set up after realising organisational capacity gaps with the external 5C baseline (MFS II) in 2012.

***More recognized capacity to deliver SRHR training***

The following MFS II capacity development interventions supported by Rutgers WPF are linked to the key organisational capacity change "More recognized capacity to deliver SRHR training" (please also see section 4.3):

1. SRHR training in October 2013

2. Training for Youth friendly services in November 2013
3. Workshop on strategic communication in September 2013

*SRHR training – 8-10 October 2013*

**Design**

This intervention was planned during the baseline, although no specific time was specified. The initiative was planned for YPI and other partners organizations of RutgersWPF, and intended to strengthen YPI's capacity to act and commit. Purposes of the workshop included: to evaluate the modules implementation and formulate various strategies for scaling up. And to learn from other partners about the hindrances in implementing sexuality modules in schools and best practices. Finally attendees were encouraged to learn about the context of SRHR education in Indonesia from a historical and social perspective.

The training was relevant for YPI as it relates closely to YPI's current expertise in HIV-AIDS issues. In the immediate term, RutgersWPF expected YPI to reach beneficiaries and advocate their needs to policy makers. In the long term, they expected YPI to enable program beneficiaries with improved knowledge and understanding of SRHR and ready to advocate their rights.

The expected effects and objectives were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). Then again, the evaluation team did not ask the CFA for SMART objectives specifically during the baseline, but rather asked about the expected or observed immediate and long term effects of the interventions.

**Implementation**

The SRHR training workshop was done between 8-10 October 2013 and attended by three YPI staff members. YPI presented their work at schools and juvenile institutions on SRHR education. In the workshop, all RutgersWPF partners that had implemented SRHR modules met and discussed the most current development of the modules implementation in different provinces in Indonesia.

**Reaching objectives**

Since the objectives haven't been formulated as SMART objectives, it is difficult to assess to what extent these objectives have been reached. However, RutgersWPF indicated that YPI picked up on the material quickly, and expected that in the long term, a solid SRHR education program would be implemented by YPI. Therefore both objectives appeared to have been met, although the long-term objective still has not been reached, but is on the right track. The CFA did indicate that competencies to train and communicate with target groups on SRHR issues had improved.

*Training for Youth friendly services – November 2013*

**Design**

This intervention was planned by the CFA during the baseline. The training was relevant for YPI as it was in line with the organization's objective to reach out to more youth in schools and local communities.

The immediate expected effect as stated by RutgersWPF in the baseline was that YPI would have a better perspective on SRHR services for youth. The long term objective was for YPI to have improved understanding of how to develop friendly services for their youth clients. None of the expected effects were formulated in a very SMART way (specific, measurable, achievable, relevant and time-bound). Then again, the evaluation team did not ask the CFA for SMART objectives.

**Implementation**

The training was held by PKBI in Cibubur on November 2013 and was funded by MFS II as well as the ASK program. One YPI member attended the training, who was also an active volunteer in YPI, and a permanent member of the youth forum. To the knowledge of the evaluation team, the session was carried out as planned.

**Reaching objectives**

Since the objectives were not formulated in a SMART way, it is difficult to assess to what extent they have been reached.

The CFA has stated that YPI has remained the expert on HIV-AIDS issues in Indonesa amongst all its partners. With the implementation of several youth related initiatives, such as the foundation of a youth forum and visits to schools, a stronger focus on youth services has been achieved. This aligns

with the short term expectation of the CFA. In regards to the long term objective, no evidence could be found that more friendly services for youth clients were achieved, but then this objective was not formulated in a very SMART way, and is difficult to measure without more specific SMART criteria. The CFA did indicate that competencies related to train and communicate with target groups had improved.

*Workshop on strategic communication – September 2013*

**Design**

This intervention was not planned during the baseline, and therefore no expected outcomes were formulated for the short and long term. The training itself concerned mostly the effective communication towards clients utilizing a broad range of communication tools, including social media. The training is therefore very relevant to YPI as it relates to the focus and objective to relate to new target beneficiaries, particularly youth.

**Implementation**

The workshop took place in Bogor in September 2013 and was aimed at RutgersWPF partners in the One Vision Alliance, and partially funded by ASK and MenCare. According to the CFA, YPI was included as their communication did not appear as structured as it could be. Additionally, the CFA intended to increase YPI's capacity in formulating more creative, innovative and popular messages to their target groups, particularly through the application of social media. One YPI staff member attended the training.

**Reaching objectives**

Since no (SMART) objectives have been formulated for this intervention, it is not possible to specifically say whether objectives were reached. The CFA has stated that following the workshop, they immediately observed a higher number of visits to health providers. The also stated that following the workshop they hoped that YPI would see a long term improvement in effective communication of HIV-AIDS and SRHR campaigns in different media channels. The CFA did indicate that competencies related to train and communicate with target groups had improved.

**Attribution of observed results to MFS II capacity development interventions**

YPI was recognized as an organization with the capacity to deliver SRHR training in addition to being an HIV-AIDS expert. This was due the greater confidence in giving trainings and delivering SRHR information to beneficiaries since the baseline. This increased capacity can be attributed to three specific MFS II funded capacity interventions which brought about a series of organizational capacity changes (see also 4.3.1).

Greater confidence in giving trainings and delivering SRHR information to beneficiaries was due an increase in knowledge sharing to other organizations through an internship program on the one hand and through knowledge sharing to other organizations involved in the alliance on the other. Both these knowledge sharing opportunities were possible as a result of improved capacity of the organization as an SRHR expert. This resulted from improved competencies to train and communicates with target groups on SRHR issues on the one hand, but also due to the addition of new volunteer staff actively involved in for instance the youth programs.

The improved competencies can to a large extent be attributed to the three MFS II funded capacity interventions in the form of SRHR training, training for youth friendly services and the workshop on strategic communication, all of which took place in 2013.

On the whole, staff being confident in giving training and in delivering SRHR information to beneficiaries, can to a large extent be attributed to the MFS II capacity interventions that were carried out by RutgersWPF since the baseline in 2012. Specifically, these capacity interventions were a SRHR training; the training for youth friendly services; and a workshop on strategic communication, all held in 2013. In addition to that, having new volunteer staff members also played a role in this improved capacity.  on SRHR;training competency and ability to communicate effectively about the issue with target beneficiaries.

***Improved reporting***

The following MFS II capacity development interventions supported by Rutgers WPF are linked to the key organisational capacity change "Improved reporting" (please also see section 4.3):

1. M&E training workshop in 2013-2014

*M&E training workshop – July 2013 and January 2014*

**Design**

This intervention was planned during the baseline as ' M&E training' with the following immediate objective "Partners are able to use monitoring tools to report their progress" and the following long term objective "Partners have improved understanding of how to utilize M&E tools and analyse findings". .

In the baseline workshop M&E was established in the theory of change as an important issue, which makes it relevant to the organisation

The expected effects and objectives were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). Then again, the evaluation team did not ask the CFA for SMART objectives specifically during the baseline, but rather asked about the expected or observed immediate and long term effects of the interventions.

**Implementation**

The M&E training workshop was organized in two sessions. The first session was a three day workshop in July 2013 with the focus on an outcome measurement (OM) survey. In this workshop together with partners, Rutgers WPF discussed the purpose of conducting the OM survey, adjusted the methods (questionnaires etc), and developed work plans. Measuring Outcomes was a new approach introduced by the donor, to allow partners to see their achievements and whether they are on track or not.

The second session took place between 7-11 January 2014. The session discussed thoroughly all result areas under the MFS II project. Included in the workshop was the evaluation of the process, approach, strategy, strengths and weaknesses of the project implementation.

In both sessions, one staff member from YPI has attended.

**Reaching objectives**

Since the objectives haven't been formulated as SMART objectives, it is difficult to assess to what extent these objectives have been reached. However, RutgersWPF indicated that an immediate change observed was that M&E approaches became more structured, a positive development which met their immediate objective of YPI being able to use monitoring tools to report their progress. With respect to the long term objective, which entailed the improved understanding of how to utilize M&E tools and analyse findings, it was found that more M&E understanding was shared amongst colleagues and the tools were used in practice. Both objectives have been met, although it is difficult to be specific in this regard without more SMART objectives.

*Writing skills training – April to June 2013*

**Design**

This intervention was not specifically planned by the CFA during the baseline, although it was observed in the baseline (and prior) that YPI's reporting skills were poor. With the writing workshop, Rutgers WPF intended to improve that need in the immediate future. For the long term, the CFA expected that the workshop would also improve analytical skills of the attendees.

The need for improved reporting skills were recognized by both the CFA and SPO, as well as a strict requirement from the Donor. The intervention was therefore very relevant for YPI.

None of the expected effects were formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). Then again, the evaluation team did not ask the CFA for SMART objectives.

**Implementation**

This training consisted of 9 sessions, weekly, with 2 mentors, between April – June 2013. Partners from DKI Jakarta were invited to join the sessions held in the current Rutgers WPF Indonesia office in South Jakarta. The sessions were attended by one staff member from YPI who described the trainings as useful, relevant and effective.

This intervention was not planned for by the CFA during the baseline and details about the specific design cannot be provided, since this wasn't the focus of the evaluation. Therefore, no further judgement can be made on whether this intervention was implemented as designed.

**Reaching objectives**
Since the objectives were not formulated in a SMART way, it is difficult to assess to what extent they have been reached.

The CFA has stated that reporting has improved, although not yet for all off YPI staff members. The CFA has not been able to assess whether the long-term objective has been reached as well, particularly in regard as to whether individuals have increased their analytical skills, which is difficult to measure without moreSMART criteria.

**Attribution of observed results to MFS II capacity development interventions**
Improved reporting occurred due to supplying a variety of reports, increased capacity to write such reports, and supplying robust data as report material (see 4.3.2). Each of these developments can be attributed to MFS II interventions, as is described in detail below.

Supplying a variety of reports occurs as more accountable data is collected and because staff has increased its capacity to report better. More accountable data can be attributed to the sharing of results of the M&E training sessions which took place in 2013 and the increased ability to interview beneficiaries. Sharing of training experiences and validated data in general has been a key lesson of the M&E training workshop in 2013, whilst better interviews can be attributed to the improved staff skill to collect data. This too was a key component of the M&E training workshop. The workshop was funded by MFS II.

Furthermore staff's capacity to write reports has been brought about through sharing of the results of the writing skill training to other colleagues, as well as better understanding to write a good report of the staff member who attended the writing skill training sessions in 2013. Increased capacity to write reports can therefore be fully attributed to the writing skills training, which was 100% funded as an MFS II intervention by Rutgers WPF.

Lastly, supplying robust data as report material resulted from the availability of more accountable data on the one hand, as discussed above. On the other hand improved meetings (in which staff had begun to discuss data collected with their colleagues) contributed to more robust data as well. Improved meetings occurred due to more intensive regular staff meetings, more board meetings, and more staff involved in the general meetings. This new meeting culture resulted from the staff and management becoming aware of the importance of having such meetings and making them more intensive and interactive to encourage dialogue and sharing of ideas and concerns. This awareness was created by the process of the 5C baseline survey which occurred in 2012, and was also an MFS II supported intervention, albeit not intended and directly sponsored by the CFA as a capacity development intervention.

In conclusion, the key organisational capacity change "improved reporting" can be to a large extent attributed to MFS II funded capacity development interventions, in particular the M&E trainings in 2012 and the writing skills training in 2013, since these are related to enhanced capacity to collect robust data and enhanced capacity to write reports. Furthermore, the organisation has taken steps to improve their meetings after realising the importance of this during the 5C baseline study (MFS II).

# Appendix 1 Methodological approach & reflection

## Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

## Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.[31] Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

[31] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
   - -2 = Considerable deterioration
   - -1 = A slight deterioration
   - 0 = No change occurred, the situation is the same as in 2012
   - +1 = Slight improvement
   - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*

3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
   - Intervention, actor or factor at the level of or by **SPO**: ..... .
   - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
   - Intervention, actor or factor at the level of or by the **other funders**: ..... .
   - **Other** interventions, actors or factors: ..... .
   - Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;

- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5.* ***Prepare and organise the field visit*** *to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6.* ***Interview the CFA*** *– CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

*Step 7.* ***Run the endline workshop*** *with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

***Purpose of the fieldwork*:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

***Brainstorm on key organisational capacity changes and influencing factors***: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative.This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

***Self-assessments*:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8.* ***Interview SPO staff*** *– in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9.* ***Fill-in observation sheets*** *– in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

*Step 10.* ***Interview externals*** *– in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11.* ***Upload and auto-code all the formats*** *collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the* ***overview of information*** *per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13.* ***Analyse the data and develop a draft description*** *of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14.* ***Analyse the data and finalize the description*** *of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15.* ***Analyse the information*** *in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

## Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

- Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.
- Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.
- Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on

17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

*The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia*

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

*SPOs selected for process tracing – Ethiopia*

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| AMREF | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| CARE | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| ECFA | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| FSCE | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| HOA-REC | Sustainable Energy project (ICCO Alliance): 2014<br>Innovative WASH (WASH Alliance): Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| HUNDEE | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| NVEA | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |
| OSRA | C4C Alliance project (farmers marketing): December 2014<br>ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| TTCA | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

*The extent to which the Dutch NGO explicitly targets the following capabilities – India*[32]

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

*SPOs selected for process tracing – India*

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BVHA | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| COUNT | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| DRISTI | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| FFID | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |

[32] RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Jana Vikas | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| NEDSF | | | | | | | No – delayed baseline |
| RGVN | | | | | | | No - delayed baseline |
| Samarthak Samiti (SDS) | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| Shivi Development Society (SDS) | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| Smile | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| VTRC | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

*The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia*

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | Pt. PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, Pt.PPMA, YPI, YRBI.

Table 6

*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| ASB | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| Dayakologi | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| ECPAT | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| GSS | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| Lembaga Kita | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| Pt.PPMA | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| Rifka Annisa | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| WIIP | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Yayasan Kelola | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| YPI | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| YRBI | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| Yadupa | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

*The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia*

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

*SPOs selected for process tracing – Liberia*

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BSC | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| DEN-L | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| NAWOCOL | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| REFOUND | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| RHRAP | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

7.

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

- A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
- A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
- **Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
- **Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and

then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for **coding** documents received from SPO and CFA in NVivo on the following:

- **5C Indicators**: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the **capacity development interventions implemented by the CFA** (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
  - In the 2012 **theory of change** on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
  - During the baseline the CFA indicated a link between **the planned MFS II support** to organisational development and the expected short-term or long-term results in one of the selected capabilities;
  - During the endline the **CFA** indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
  - During the endline the **SPO** indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on

climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.
The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

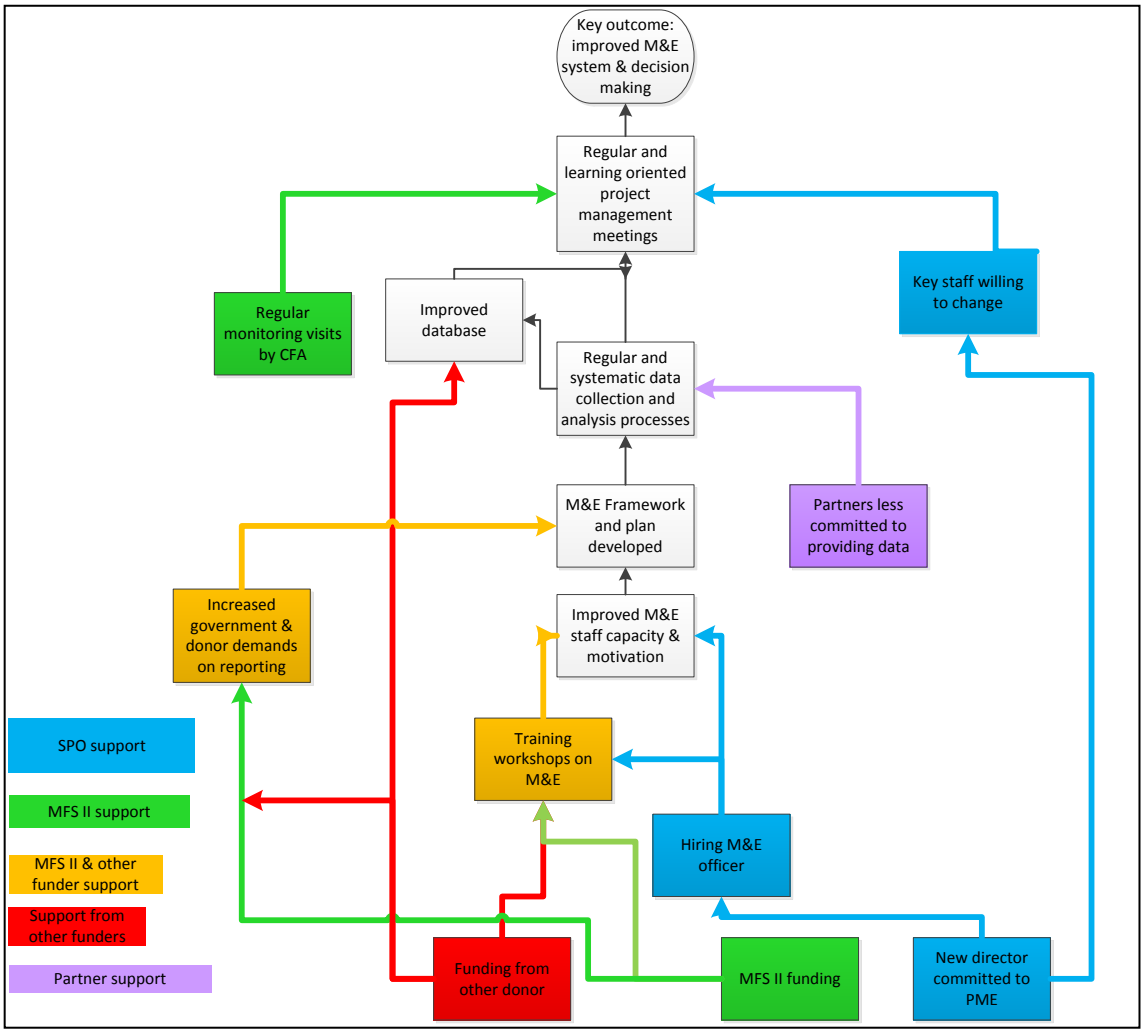

***Figure 1*** *An imaginary example of a model of change*

*Step 5. Identify* ***types of evidence*** *needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, *"What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?"*. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

- **Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.
- **Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
- **Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.
- **Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

*Format for identifying types of evidence for different causal relationships in the model of change (example included)*

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| Describe relationship between the subcomponents of the model of change | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions.<br>Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y?<br>Can we find this information by means of :<br>Pattern evidence;<br>Sequence evidence;<br>Trace evidence;<br>Account evidence? | Describe where you can find this information |
| Example:<br>Training workshops on M&E provided by MFS II funding and other sources of funding | Example:<br>What type of training workshops on M&E took place?<br>Who was trained?<br>When did the training take place?<br>Who funded the training?<br>Was the funding of training provided before the training took place?<br>How much money was available for the training? | Example:<br>Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br><br>Sequence evidence on timing of funding and timing of training<br><br>Content evidence: what the training was about | Example:<br>Training report<br>SPO Progress reports<br>interviews with the CFA and SPO staff<br>Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or

discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality** of data and **analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

| *Example format for the adapted evidence analysis database (example included)* **Description of causal relation** | **Confirming/ rejecting a causal relation (yes/no)** | **Type of information providing the background to the confirmation or rejection of the causal relation** | **Strength of evidence: strong/ rather strong/ rather weak/ weak** | **Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected** |
|---|---|---|---|---|
| e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

## Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

## Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has

provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is

crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process

tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

- The capability to act and commit;
- The capability to deliver on development objectives;
- The capability to adapt and self-renew;
- The capability to relate (to external stakeholders);
- The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed. A detailed overview of capabilities with outcome domains and indicators is attached in Appendix 3.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Appendix 3 Changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

**Endline Description of Indicators Yayasan Pelita Ilmu (YPI)**
**Capability to Act and to Commit**

1.1 Responsive leadership: 'Leadership is responsive, inspiring and sensitive'

*This is about leadership within the organisation (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organisation.*

As in the baseline, leadership is still considered to be flexible, familial and sensitive. At this stage the leadership of YPI (referred to the board of executives) has shown improvement in their responsiveness and openness to organizational and programmatic issues. . The areas of leadership where improvements took place, are in the areas of program and strategic management, communication and partnership. YPI staff appreciated the improvement on how management responded to: 1) appreciation to the staff' ideas and providing constructive feedback 2) program implementation improved by having staff meetings at least once a week; 3) decision in office management strategy by merging 3 offices into 2 offices that lead to improved coordination; 4) firmness and promptness in decisions made; 5) stimulating inspiring and creative program design and implementation and 6) changing the form or relationship in their partnership with Vesta.

Score : From 4 to 4.75 (improvement)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)

*This is about the extent to which the leader(s) provide strategic directions*

The changes indicated in strategic guidance have a strong relationship with the improvement in responsive leadership practiced over 2012-2014. Most of the findings presented that the leadership has practiced the same approach in strategic guidance where the formal and informal approaches are applied. The strategic guidance has become more specific and consistent with program strategic plans. The YPI's leadership has more attention to the program outputs delivered by Vesta. On the other hand, YPI has positioned themselves as equal partners to Vesta. It has created a change of their relationship. Vesta felt YPI has become more appreciative to their inputs, for example their advice to have more formal meetings at six monthly basis to facilitate program discussion has been taken into account. They are now using this event as an opportunity to review their program. On the other hand, the YPI leadership has been open to inputs and feedbacks that lead to their ability to respond creatively. This is shown by the approach of nurturing, sharing and learning amongst Vesta field office such as sharing data management. Furthermore, strategic guidance has improved in terms of improved coordination by merging 3 offices to 2, by making decisions more promptly and firmly and by stimulating creative and inspiring program design.

Score: From 3 to 3.5 (slight improvement)

1.3. Staff turnover: 'Staff turnover is relatively low'

*This is about staff turnover.*

In the baseline, there were 15 permanent staffs, 55 contract staffs, and 72 volunteers. However, since December 2013, the management decided after the contract staffs ended, there were no more contract staffs. Some contract staffs were given opportunities to become permanent staffs therefore the permanent staffs are 20 consists of 13 female and 7 male. Based on the amount of permanent staff, there is no staff resigned from YPI.

Score: From 3 to 3 (no change)

1.4 . Organisational structure 'Existence of clear organization structure reflecting the objectives of the organization"
*Observable indicator: Staff have copy of org. structure and understand this*

The organisational structure is still the same as during the baseline. There is a formal structure including a Board of Trustees, an Executive Board, staff and volunteers. Responsibilities and decision-making power are shared between these groups. The higher forums focus on policy aspects and lower forums on project implementation and day to day activities.

Score: From 3 to 3 (no change)

1.5 Articulated Strategies. Strategies are articulated and based on good situation analysis and adequate M&E
*Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.*

There is an improvement in monitoring and evaluation which assists YPI in developing work plans and strategies. They have quarterly meetings to follow up the data M&E. The findings in M&E will be followed up in each project. YPI strengthened the understanding of PME and the stages of implementation of project, knowing what a baseline survey is and how to do that, whilst also understanding how to use the field data which can be used for developing a new program.

Score: From 3 to 3.5 (slight improvement)

1.6. Daily operations: 'Day to day operations are in line with strategic plans'
*This is about the extent to which day-to-day operations are aligned with strategic plans.*

Leadership initiatives are supported by proactive staff, and now there is sufficient budget allocation from several funding sources. YPI has been implementing the activities in accordance with the organization's strategic plan, even though in implementation sometimes the operations depend on donor funding, but YPI now has a small budget allocation to ensure small activities keep going.

Score: From 3.5 to 3.75 (very slight improvement)

1.7. Staff skills: 'Staff have necessary skills to do their work
*This is about whether staff have the skills necessary to do their work and what skills they might they need.*

The staffs have the skills required to perform the work. Most of them are having related experience in implementing HIV/AIDS programs. YPI has responded to baseline findings on weaknesses in their staff' skills, by facilitating capacity building for their staff. Formally, the staffs are trained in several topics such as SRHR and strategic communication. The alternative approach to increase staff' skills through sharing sessions are regularly conducted at weekly meetings where one staff is appointed to deliver one relevant issue to be presented to colleagues. The management also facilitates the staff skills improvement through leading by example in terms of sharing experience and skills to the staff in an informal and less structured way. In addition to improve staff knowledge and skills on SRHR, staff skills has also improved in terms of data collection and reporting. Some staff also increases their capacity in managing program and financial management. However, staffs still lack analytical skills to understand problems in the field.

Score: From 3 to 3.5 (Slight improvement)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'
*This is about whether staff at the SPO are offered appropriate training opportunities*

The management is open to their staff in terms of training opportunities coming from related programs or as collaboration with other NGOs. The numbers of opportunities did increased slightly from 2012 onwards, and training are still based on selecting people were able and willing to attend training. The staff noted that most of the time the same persons are sent to several trainings. An MFS II funded training on monitoring and evaluation in 2012, has increased the competencies of staff as a project officer of MFS II to collect and report on more accountable data. Furthermore, a writing skills

training in 2013, which was funded by MFS II, has improved the capacity of program manager write reports.

Score: From 4 to 4 (no change)

1.9.1 Incentives: 'Appropriate incentives are in place to sustain staff motivation'
*This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.*

The staff still appreciates the many benefits like training opportunities; secondary benefits such as allowances and insurances; the warm atmosphere in the office; the contribution YPI makes to society; and the freedom at work and the ability to make decisions for yourself. In relation to changes in leadership capacity, additional benefits have been added such as annual bonuses, family support benefits and family excursions.

Score: From 4 to 4.5 (Slight improvement)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'
*This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.*
The funding from Global Fund and Rutgers WPF are still running toward the year of 2015. At least two funding sources from the Social Ministry and Social Services are secured for the HIV/AIDS program. In addition to that, a different approach is taken by having a business approach to fund YPI. This business unit transformed into a company named PT Pelita Niaga Mandiri. Staffs have concerns about the financial sustainability of YPI.

Score: From 4 to 4 ( no change)

1.9.3. Funding procedures: 'clear procedures for exploring new funding opportunities'
*This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.*

The YPI management has attempted to shift their approach of new funding and have explained to staff the importance of funding and the new funding mechanism. Furthermore, the management also has introduced the new business unit to support YPI's need for operational funding. This business unit operates under a name of PT Pelita Niaga Mandiri that assists in fundraising and ensures financial sustainability for the organization. This company supports the youth to be an entrepreneur through trainings and relate it with the provided programs.

Score: From 3 to 3.5 (Slight improvement)

**Summary Capability to Act and to Commit**
The leadership of YPI has improved slightly in terms of their responsiveness and openness to organizational and programmatic issues. The areas of leadership improvements are program and strategic management, communication and partnership. The strategic guidance has become more specific and consistent with program strategic plans. Furthermore, strategic guidance has improved in terms of improved coordination by merging 3 offices to 2, by making decisions more promptly and firmly and by stimulating creative and inspiring program design. Programmes strategies are now more based on monitoring and evaluation. Operations are based on the organizational strategies and by having a small budget it is possible to also keep running the activities even when funding is delayed. The structure of the organization hasn't changed since the baseline. There is no staff turnover during 2012-2014. However, staff is motivated by having more benefits compared to the baseline. The staff skills improved through training as well as informal sharing in weekly meetings on SRHR, data collection and reporting, and strategic communication Whilst diversity of funding sources hasn't really changed, YPI has developed a business unit named PT. Pelita Niaga Mandiri to assist in fundraising and ensure financial sustainability for the organization. The CFA has recommended that YPI further improve their strategic planning, external risk assessments and Budged vs. Actual (BvA) analysis.

Score: From 3.4 to 3.7 (very slight improvement)

**Capability to Adapt and Self Renew**
2.1. M&E Application: 'M&E is effectively applied to assess activities, outputs and outcomes'

*This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organisational).*
Monitoring and evaluation (M&E) is now more structured, particularly in relation to having a reporting system and a monitoring visit mechanism in place. However, monitoring and evaluation is still focused on activities and outputs rather than outcomes and impact. The monitoring and evaluation is embedded to program coordinator. However, staff indicated that the reporting template is implicated. There is however room for more improvement. A dedicated M&E person should be allocated in the program and more monitoring visits should be budgeted. Until now, M&E functions are implemented by staff including the management. Although staff has been trained in M&E (in particular, data collection and reporting). These tasks have to be performed along with other program implementation tasks. Monitoring results are only discussed and recorded at monthly meetings, quarterly meetings and annual evaluations.

Score: From 3 to 3.5 (slight improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'
*This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.*

Staff skills have improved in terms of data collection and reporting to for example the partners at provincial level. Currently YPI undertakes quantitative and qualitative data collection based on donor requirements and this is documented in their organization website - www.ypi.or.id. There is still no dedicated person for M&E but every program person in charge has responsibility for monitoring and evaluation of the program.

Score: From 2 to 2.5 (Slight improvement)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'
*This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.*

Since the baseline, there has been no change in relation to M&E for future strategies: this is still absent. YPI staffs are still confused about M&E in relation to strategic plans. M&E is mainly for operational management rather than strategic management. Operational management, however, has improved since now decisions are made based on monthly reports, quarterly reports and visits.

Score: From 2 to 2 (no change)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meeting that also deal with learning from mistakes'
*This is about whether staff talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staff are comfortable raising issues that are problematic.*

The quarterly-based meeting has been changed to monthly meeting as a response to a need of coordination among the staff. They can express their ideas in the meeting formally or informally according to what is more comfortable for them. An annual review was conducted in 2013. In this review, the staff presented their program achievement and their next planning. In addition to that, the management also presented about the foundation during the occasion.

Score: From 3 to 3.5 (slight improvement)

2.5. Freedom for ideas: 'staff feel free to come up with ideas for implementation of objectives'
*This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.*

The program staffs are now really discussing their ideas about program implementation with their supervisor or management. It is not something considered a new thing within the organization but the staff considered the trust and freedom in planning their individual implementation plan as improvement. Having merged offices, has also made it easier for staff to coordinate with others.

Score: From 4 to 4.25 (very slight improvement)

2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and development in its operating environment'
*This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.*

There has been an improvement in the way YPI is networking. YPI has been acknowledged as a partner with relevant knowledge and is often invited to the events related to their issues they are working on. The network with National AIDS Commission *(Komisi Penanggulangan AIDS Nasional)* and Jakarta AIDS Commissions for Youth Taskforce *(Pokja Remaja)* program. The use of social media has also improved along with improved of YPI website followers. Internally, YPI has intensified their relationship with beneficiaries and the networks. All of this has helped the organisation to be in touch with what is happening in their operating environment.

Score: From 3.5 to 3.75 (very slight improvement)

2.7. Stakeholders responsiveness: 'The organization is open and responsive to their stakeholders and general public'
*This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.*
There has been improvement in the way of YPI works with stakeholders. It started by building a good communication as well as involving partners and stakeholders to provide input for program planning purposes, which remained a best practice. A good example raised by Youth Forum that held a regular meeting every three years. Meanwhile, Rutgers WPF and YPI are also always invited by Ministry of Education in their meeting.

Score: From 4 to 4.25 (very slight improvement)

***Summary Capability to Adapt and to Self Renew***
Monitoring and evaluation (M&E) is now more structured, particularly in relation to having a reporting system and a monitoring visit mechanism in place. However, monitoring and evaluation is still focused on activities and outputs rather than outcomes and impact. However, improved networking and relationships with partners as well as having a monitoring visit mechanism in place can inform YPI on trends and developments in the operational environment. Staff competencies have improved in terms of data collection and reporting, but there are still no dedicated M&E person in place, and staff have to combine these tasks with their program implementation tasks. Having more regular meetings have helped the organization to reflect on progress and adjust plans. Staffs are still able to share their ideas freely and this is even improved since merging three buildings into two. The CFA has also recommended that YPI further improve their M&E system and knowledge management, as well as improve their analytical skill to improve their reports and other documents.
Score: From 3.1 to 3.4 (slight improvement)

**Capability to Deliver on Development Objectives**
3.1. Clear operational plans: 'Organization has clear operational plans for carrying out project which all staff fully understand'
*This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.*

There are no major improvements or changes in this indicator area since the baseline. All projects still have a work plan and budget which is used in day-to-day operations. Additionally, there are job descriptions, standard operational procedures, Terms of Reference and strategic plans that help in carrying out the programs. Sometimes the budget is revised when it is not sufficient for implementing the activities. All staff must understand the work plan. Moreover, YPI staffs are now also aware of the budget and funding sources for each program and how to obtain these funds. This was the result of openness shown by the Director.

Score: From 3 to 3.25 (very slight improvement)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'
*This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.*

There are many improvements shown in this area. YPI has made decisions in their human resources through having less staff members and increasing the programme responsibilities per staff. . Merging 3 offices to 2 has also reduced operational costs, for example by having improved communication and coordination. . Furthermore, operation costs are being reduced by having a policy to print only important documents, and to purchase stationary purchasing based on activities. Also, now new computer has been purchased since 2012.

Score: From 4 to 4.75 (improvement)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'
*This is about whether the SPO is able to carry out the operational plans.*

Since the baseline in 2012 the capacity to implement the operational plans has improved by having more regular meeting among them. Furthermore, having operational plans and financial plans prior to implementation has helped in the implementation of program in the field. However, staffs still lack analytical skills to understand problems in the field. Therefore, the management opened a room of discussion to facilitate this problem that directly related to operational plan.

Score: From 3 to 3.5 (slight improvement )

3.4. Mechanism for beneficiary needs: 'The organization has mechanism in place to verify that services meet beneficiary needs'
*This is about how the SPO knows that their services are meeting beneficiary needs*

YPI has changed their participatory approach to assess the partners or beneficiaries needs by having two-way discussions. Furthermore, beneficiaries are involved in the program planning discussions at the end of the implementation year. YPI also conducted a joint planning where their partner played them active role to provide inputs for future program planning.

Score: From 3 to 3.5 (slight improvement)

3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratio's)'
*This is about how the SPO knows they are efficient or not in their work.*

There are no major improvements or changes in this indicator area since the baseline. The basis for monitoring efficiency lies in the work plans and budgets that exist for all projects. A comparison is made between expenditures and achievements, and this is discussed in the team coordination meetings. Moreover since baseline and the united the three offices become two offices, the Board of Trustees is more involved in the progress implementation evaluation. However, there is no specific monitoring of the relation between the level of output (results) and the level of input (time and money spent).

Score: From 3 to 3.25 (very slight improvement)

3.6. Balancing quality-efficiency: 'The organization aims at balancing efficiency requirements with quality of its work'
*This is about how the SPO ensures quality work with the resources available*

There are slight improvements or changes in this indicator area since the baseline. For example in SRHR education for the young people program, YPI now create more structured plans and organizations which results in an improvement in quality. The balance between quality and efficiency is monitored by examining achievements, program interrelations, adherence to schedule and the expenditures. This is discussed in regular meetings, but there is no specific tool for quality assurance other than such staff discussions.

Score: From 3 to 4 (improvement)

**Summary Capability to deliver on development Objectives**
All projects still have a work plan and budget which is used in day-to-day operations. Resources are now used more cost effectively by having less staff with more programme implementation responsibilities, by merging three offices into two offices, and by reducing printing costs and stationary costs. Implementation has improved due to improved staff capacity, and by having operational,

financial plans in place, but the lack of analytical skills in implementation. Beneficiaries are now more involved in programme planning and by having the way discussions on their needs. The basis for monitoring efficiency lies in the work plans and budgets that exist for all projects. A comparisons is made between expenditures and achievements, and this is discussed in the team coordination meeting. Moreover since the baseline and the united the three offices become two offices, the board of trustees is more involved in the progress implementation evaluation. However, there is no specific monitoring of the relation between the level of output (results) and the level of input (time and money spent). YPI needs to further improve their HR policy and carefully design training and capacity building for staff according to the CFA in order to manage the vast growing number of people with HIV/AIDS in Indonesia. Additionally annual planning needs further improvement, and stronger relationships with strategic stakeholders must be built.

Score: From 3.2 to 3.7 (slight improvement)

**Capability to relate**
4.1. Stakeholder engagement in policies and strategies: 'The organization maintains relations-collaboration-alliances with its stakeholders for the benefit of the organization'
*This is about whether the SPO engages external groups in developing their policies and strategies, and how.*

YPI has escalated their position within their network. They have developed a training module and trained other organizations using it. An improved collaboration with *Aliansi Satu Visi, KPAN, KPAP* DKI Jakarta, Ministry of Social Affairs and District Social Offices demonstrates their capacity to engage stakeholders to play an active role in policies and strategies works. Moreover, YPI also involves their target groups in developing policies and strategies. One of the results is providing training for the medical assistant for ODHA as most of their family cannot assist them all day due to earning money for living.

Score: From 3 to 3.5 (slight improvement)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks-alliances-partnerships'
*This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.*

There are no major changes in this indicator. YPI keeps working with existing network identified in the baseline. YPI is still active in forums and networks that are suited to its mission and vision. At the international level, YPI is a member of Care for AIDS, and the CSO Forum. YPI has been supported by a number of foreign donor agencies (ICOM Malaysia, Rutgers WPF, Care for AIDS Community, International AIDS Committee) and has access to a number of others (including Ford Foundation, Global Fund, PLAN International). At the national level their partners are schools, hospitals and local forums like the Jabodetabek AIDS NGO Forum, One Vision Alliance (*Aliansi Satu Visi)*, and DKI Jakarta Youth Forum.

Score: From 4 to 4 (no change)

4.3. Engagement with target groups: 'The organization performs frequent visits to their target groups-beneficiaries in their living environment'
*This is about how and when the SPO meets with target groups.*

The situation is still very similar to the baseline situation. Every month, YPI has a gathering called OBRAS *(Obrolan Ringan dan Santap Siang/* Lunch Discussion), an activity where many people gather and have lunch together. In OBRAS they invite doctors to give any kind of information about specific health issues. There are also other gatherings, such as a gathering of female HIV patients every Wednesday, and a monthly gathering for children with HIV. Additionally, YPI makes visits to schools and hospitals, and even people's homes, and offer counseling. They do this also in remote areas and in lower class communities. Visits depend on the program but they also communicate via email and phone.
Apart from this, YPI extended their engagement with youth through a three-yearly meeting. On the other hand, they also performed school visits and youth meeting in the community.

Score: From 4 to 4.5 (slight improvement)

4.4. Relationships within organizations: 'Organisational structure and culture facilitates open internal contacts, communication, and decision-making'
*How do staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?*

The change in leadership openness has led to improvement in the staff communicating their ideas. The staff stated they can share their ideas openly using formal and informal ways of communication. The social gathering 'arisan' also contributed to the relationship among the staff where they can use this media to communicate the problem they faced. Furthermore, merging 3offices become 2 offices has further improved internal coordination and communication.

Score: From 4 to 4.25 (slight improvement)

**Summary Capability to relate**
YPI still collaborates with many stakeholders and target groups for learning and support, and to some extent for developing its policies. This is both at the international and national level. There are additionally close contacts with beneficiaries, which they even visit in their homes in remote areas. They have improved upon engaging with youth by having three-yearly meetings and performing school visits and youth meetings in the community. Within the organization communication is well developed and open and this has been further stimulated by a change in leadership, which stimulates openness as well as having 3 to 2 offices which has improved internal conclusion and coordination. There are regular staff meetings but communication can also occur using SMS, email or even Facebook. A mechanism for public accountability does not yet exist and can greatly benefit the organization. Stakeholders should be more involved in program planning and in sharing lessons-learned.

Score: From 3.7 to 4.1 (slight improvement)

**Capability to Achieve Coherence**
5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organisations'
*This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.*

YPI facilitated a meeting in 2013 to discuss and re-evaluate the organization's vision, mission and strategies. The meeting further discussed about the possibility of changing the activities if it is proven to conflict with the organization's vision, mission and strategies. The founder and the board of YPI realize about the situation that YPI is not the only institution working on HIV/AIDS issues. Therefore there are limitations to get funding. The board established the PT Pelita Niaga Mandiri as a business unit, so as to support fundraising.

Score: From 3 to 3.5 (slight improvement)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'
*This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.*

There are still operational guidelines in HRM and Finance. For the work in the programs, there are the work plans and budgets. Since the baseline a slight improvement showed in the work plans by having a regular discussion of implementing progress among the board trustees, the executive board and staff. On the other hand, a decree has been released relating to HR issues of deciding on the fixed employment status on December 2013. Since that the job descriptions is more clearly.

Score: From 2.5 to 3 (slight improvement)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organizations'
*This is about whether the operations and strategies are line with the vision/mission of the SPO.*

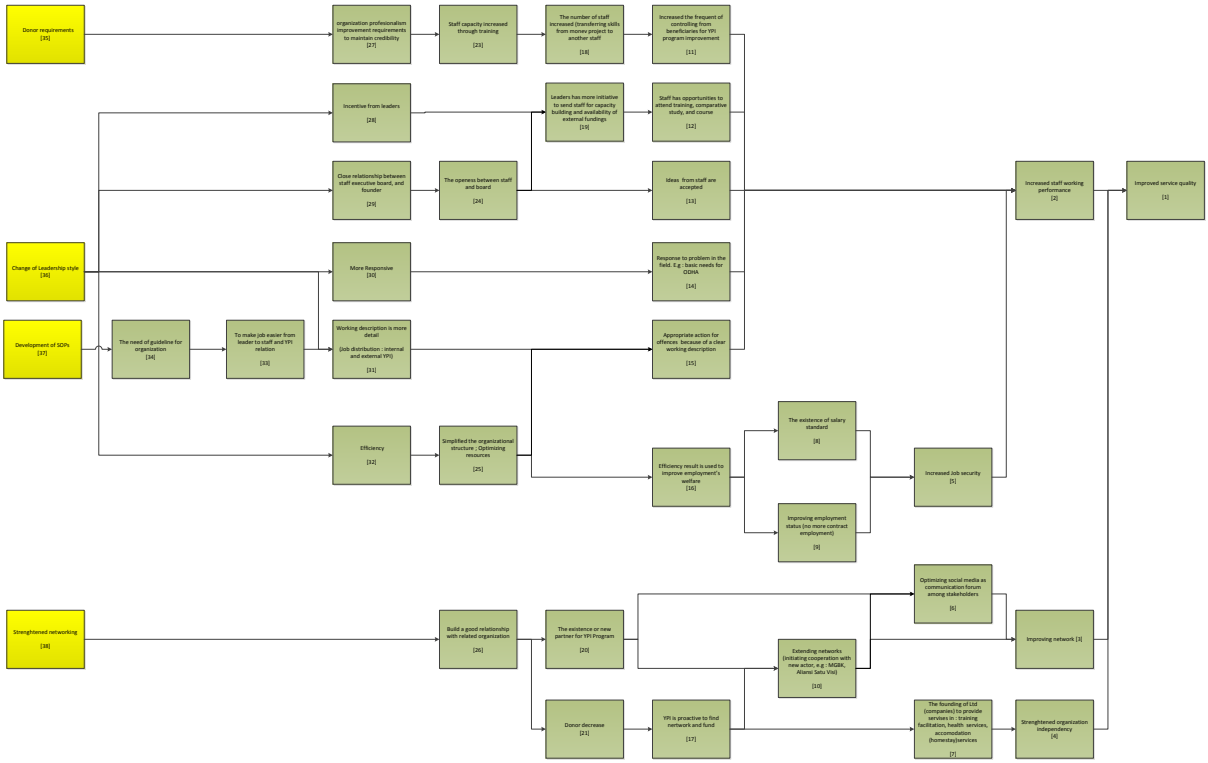
There is no change in alignment with vision and mission. It is still same as in baseline since most of the program is the same as during the baseline in 2012 when YPI considered their operations and

strategies in line with the vision and mission. Their focus is on HIV/AIDS which is enveloped with health and educational issues. Gender and gender violence are still not incorporated.

Score: From 3 to 3 (no change)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'
*This is about whether the efforts in one project complement/support efforts in other projects.*

There is no change in mutually supportive efforts. It is still same as in baseline due to most of the program being the same as during the baseline in that the programs in YPI are considered mutually supportive by most of the staff. Mostly this is related to providing a comprehensive service. If for example an HIV infected person is encountered during an outreach program in schools, he or she will be referred to one of YPIs partner clinics for a medical check-up.



Score: From 3 to 3 (no change)

**Summary Capability to Achieve Coherence**
The vision, mission and strategies were discussed in 2013. In terms of operational guidelines, these are in place in terms of HRM and finance and there has been a decree on the status of staff employment since the baseline. Since that the job descriptions is more clearly. Projects, strategies and activities are still in line with the vision and mission of the organisation and to project activities are still mutually supportive. Operational planning and clear job descriptions are still areas that require further improvement as mentioned by the CFA.

Score: From 2.9 to 3.1 (very slight improvement)

# Appendix 4 Results - key changes in organisational capacity - general causal map

**General key changes YPI**

**Narrative**

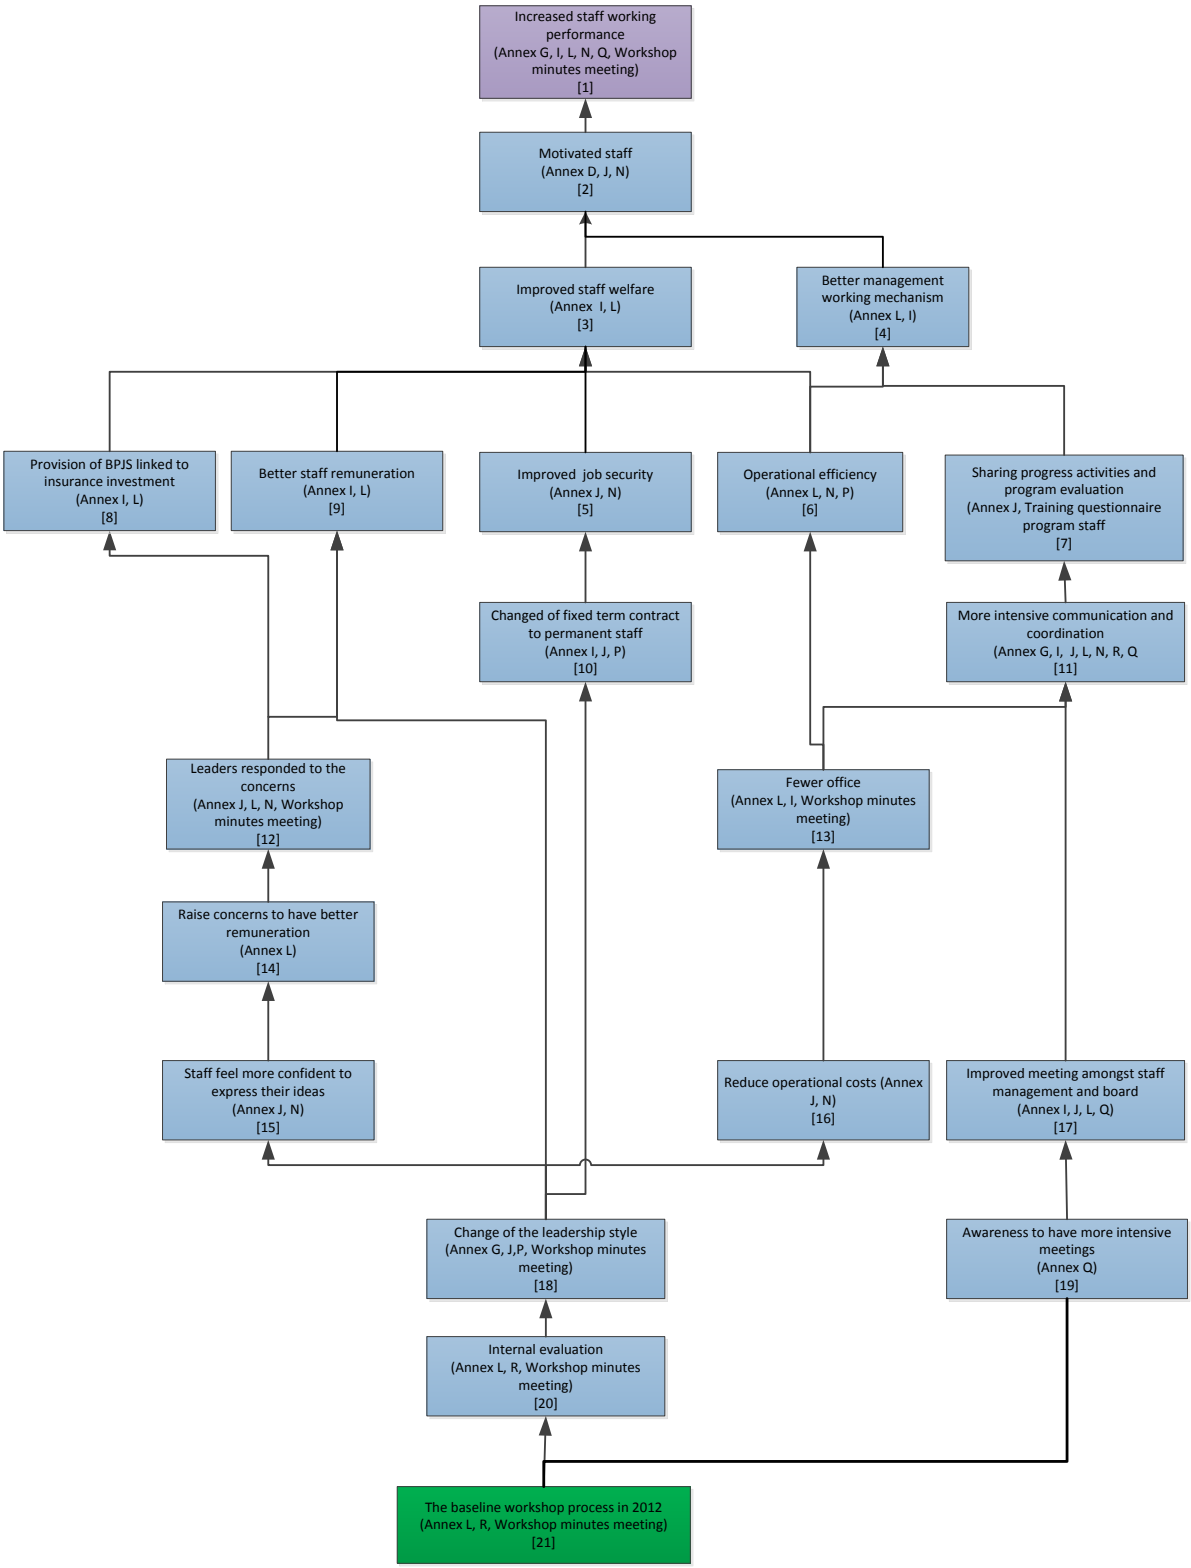
The key change in YPI's organizational capacity since the baseline is an improvement in service quality [1]. Three underlying factors caused this improvement:

1. An increase in staff working performance [2]
2. An improved network maintenance s [3]
3. Strengthened organization independency [4]

Each of these factors is explained in detail below.

First of all, the staff's working performance increased for six different reasons:

1. Increased frequency of controlling beneficiaries for YPI program improvement [11]
    a. YPI beneficiaries were frequented and monitored more intensely which lead to overall program improvement. This was enabled by a greater number of staff members with Monitoring and Evaluations skills from other projects [18]. Staff capacity in general increased through training, which enabled the sharing of Monitoring and evaluation skills [23] and application across other programs. The increased focus on developing staff skills came from a greater need to professionalize all aspects in the organization to maintain credibility in the field [27] and to adhere to donor requirements [35].
2. Staff has opportunities to attend training, comparative studies and courses [12]
    a. Generally staffs that do not have enough skills will be trained or given opportunity to attend seminars/course locally and abroad. The availability of external funding and also leaders initiative to send staff to attend trainings, course was the primary reason for staff to to attend training and courses [19].The leader is selective however in choosing who can follow courses, only those people that are willing and able are chosenIncreased staff motivation in turn came about from increased incentives from the leadership [28] and more openness between staff and board/management [24]. The latter was a logical consequence from the close relationship between the staff's executive board and the founder of the organization [29] which developed soon after the change in leadership style [36].
3. Ideas from staff are accepted [13]
    a. Similarly to the previous line of developments, ideas from staff became more accepted and encouraged due to the openness between staff and board [24].
4. Response to problems in the field [14]
    a. The organization was able to respond to more problems and issues in the field by generally becoming more flexible and responsive [30]. This can largely be attributed to the change of leadership style which caused a much flatter organizational structure [36]
5. Appropriate action for offences because of a clear working description [15]
    a. Much like the previous factor, staff members were not only able to respond faster to problems, but also able to act more effectively by taking appropriate action for offences [15]. This came about from clearer and more detailed job descriptions of work activities[31] on the one hand, and a simplified organizational structure on the other. The revision of job descriptions was performed to make jobs easier and responsibilities clearer [33] and generally provide more guidelines for the organization's work [34]. The development of Standard Operating Procedures (SOP's) lay at the foundation of all these formalization and specification actions [37]. The simplication of the organizational structure on the other hand happened for efficiency reasons [32], which went hand in hand with the change of leadership style [36].
6. Increased job security [5]
    a. Increased job security also played an important role in the increased staff working performance, which greatly impacted staff morale [5]. Since the baseline MFS2 5C evaluation, a salary standard was introduced [8] as well as an improvement in employment status (no more contract work) [9]. Both developments could be realized from cost-saving resulting from the simplification of the organizational structure [25].



The second factor that resulted in improved service quality of YPI was the improvement of YPI's network [3]. This resulted from an optimized use of social media as a communication platform for

stakeholders [6] on the one hand, and due to expanding networks to other actors and beneficiaries [10] on the other. More actors could now be served more effectively. Both these developments came about from contacting and including the new partners in the YPI programs [20], which in turn developed through the active networking and building of relationships with related organizations [26]. The latter resulted from the conscious decision of YPI to strengthen their networking activities.

The third and final factor affected YPI's improved service quality is the strengthened organization's independence from other organizations and stakeholders [4]. YPI achieved this by founding limited independent corporate entities to provide services such as training, facilitation, health services and accommodation. For example, YPI  have done various fundraising activities such as giving trainings, organizing music events, acting as facilitator and developing a clinic. For example, one of YPIs field offices has already established a self-sustained training center successfully. The income generated from this initiative covers the operational expenses of the camp itself. This has not been practiced for the whole organization yet.However some plan has been initiated to make it in a larger scale [7]. The former was achieved by YPI's proactive stance in finding new funds and partners in their network [17] after a decrease in donor support became evident soon after the baseline [21].

# Appendix 5 Results - attribution of changes in organisational capacity - detailed causal maps

**Narrative C1.1 More motivated staff**

During the endline workshop at YPI, a discussion was held around what staff perceived as the key changes in in the organisation since the baseline. This then led to a discussion on what were the key organisational capacity changes and why these changes have taken place according to staff present at the endline workshop. The discussion resulted in a 'general causal map' which is described below. The general causal map provides a comprehensive picture of organisational capacity changes that took place since the baseline, based on the perspective of SPO staff present at the endline workshop. Numbers in the narrative correspond to the numbers in the visual.

The identified organisational change under the capability to act and commit was ''more motivated staff [2] (Annex D, J, N), which is expected to contribute to increased work performance of staff to manage program activities [1] (Annex G, I, L, N, Q, workshop minutes meeting). The main underlying reason

for this change is the MFS II organisational capacity development (5c) baseline process [21] (Annex L, R, workshop minutes meeting) which has inspired staffs, management and board management to improve some organizational aspects (Annex J), in particular, leadership [18] (Annex G, I, L, P, R, workshop minutes meeting) for example more responsive, decisive and open feedback. Staff has become more motivated due to improved staff welfare [3] (Annex I, L) and a better management working mechanism [4] (Annex I, J, L). Below you can find an explanation of how these changes have come about.

There were four main reasons for **improved staff welfare** [3] (Annex I, L): provision of BJS linked to investment [8] (Annex I, L); better staff remuneration [9] (Annex I, L); increased/improved job security [5] (Annex J, N); and operational efficiency [6] (Annex L, N, P).

Provision of BJS and insurance was linked to investment [8] (Annex I, L) which led to improved staff welfare by ensuring their insurance of health [3].

There has been better staff remuneration which was increased since December 2013 [9] (Annex I, L). The management acknowledged that the YPI remuneration is relatively low compared to other local organizations, but it is substituted by the provision of BPJS[33] and insurance linked to the investment [8] (Annex I,L). The investment insurance scheme is given to the staff with at least two-year service period. This improved staff remuneration is the result the leader's response to employee concerns, which were raised by staff [14] (Annex L). Staff would not have been able to raise such concerns without the new leader's ability to allow for such feedback [15] (Annex G, I, J, L, R). The main reason for this was that there was a change of leadership style. Previously the leader (the Director) was less responsive to staff concerns, and now the Director has better understanding to staff concerns [18] (Annex G, I, L, P, R, workshop minutes meeting).

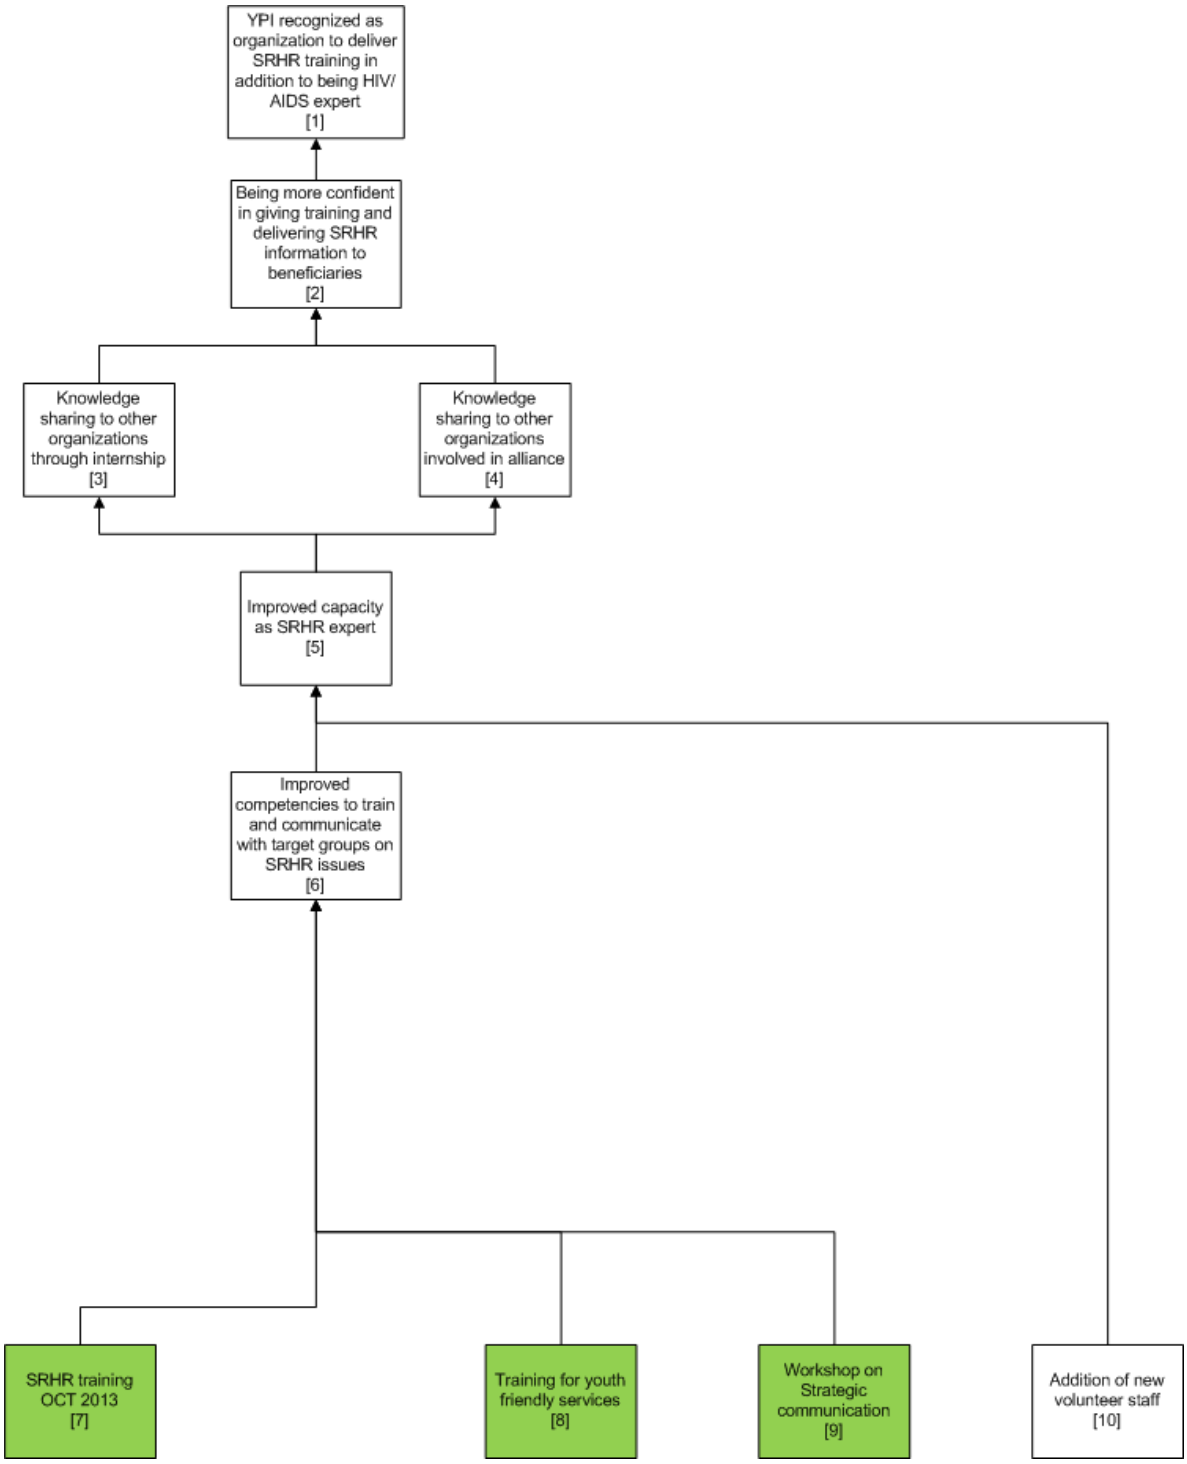
The third reason for improved staff welfare was improved job security [5] (Annex J, I, L, N). Staff perceived increased job security [5] (Annex J, I, L, N) due to a change from fixed term contracts to permanent staff employment [10] (Annex I, J, P). This too was one of the changes brought about by the change of leadership [18] (Annex G, I, L, P, R, workshop minutes meeting).

The fourth reason for improved staff welfare was improved operational efficiency [6] (Annex L, N, P). This was related to a reduction in the number of offices [13] (Annex L, I, R, Q, workshop minutes meeting), which had to happen to reduce operational costs [16] (Annex J, N). These reductions came straight from the process of internal evaluation [20] (Annex L, R, minutes endline workshop). In the internal evaluation there was discussion related to how to make the organization more efficient by reducing the number of offices (from 3 to 2) and using the saved money to increase staff welfare.

The second reason for improved staff motivation was having **a better management working mechanism** [4] (Annex I, J, L). This came about as a result of the active sharing of progress on activities and program evaluation results [7] (Annex J, training questionnaire_staff, training questionnaire_program manager, training questionnaire_secretary of executive board), which resulted from an increased staff habit to communicate and coordinate more intensively [11] (Annex G, I, J, L, N, R, Q). This habit resulted somewhat automatically from the fact that there was a reduction in the number of offices [13] (Annex L, I, R, Q workshop minutes meeting) allowing staff to communicate more easily. The reduction in the number of offices also affected to the operational efficiency [6] (Annex L,N,P) that led to better management working mechanism [4] (Annex L,I). Having fewer offices, reduced operational cost has enabled the management to manage the working mechanism better. In addition to this, the quality of meetings and relationships between staff management and the board also increased [17] (Annex I, L, Q, R). The latter resulted from an increased awareness to communicate more closely [19] (Annex Q), which was one of the results from the process of baseline workshop process conducted by MFS II in 2012 [21] (Annex L, R, workshop minutes meeting).

During the 5C baseline workshop in 2012 [21] (Annex L, R, workshop minutes meeting), the development of the *historical timeline* and the *theory of change*, made staff become more aware of the importance of having more intensive meeting amongst themselves, with management and with the executive board (source: CFA; additional sheet). The intensified meetings have increased staff's common understanding on the organization's current situation. It is also used as an internal forum for

[33] BJPS is the Administrator for the Social Security System



evaluation and at the same time as a means to strengthen the team work [20] (Annex L, R, workshop minutes meeting). YPI staff also said that they used to conduct regular meetings once in three months, but during the 5c baseline assessment, they became more aware of the importance of having more regular meetings. Intensive feedback and input through the internal evaluation has resulted to the change of leader's attitude. The leader is becoming more responsive, decisive and open to feedback [18] (Annex G, I, L, P, R, workshop minutes meeting).

The more intensive meetings also included an increased intensity of the board to have intensive interaction with staff [17] (Annex, I, L, Q, R). Through this, the board has better understanding on the updates of the organization. Before the baseline in 2012, meetings amongst management were not intensive and this was realized during the 5c baseline assessment in 2012 [19] (Annex L, R, workshop minutes meeting).

On the whole, the baseline 5c assessment in 2012 has had quite a big impact on the organisation in terms of a changed leadership style and ultimately motivated staff.

**Narrative C1.2 More recognized capacity to deliver SRHR training**

Below you will find a description of the 'More recognized capacity to deliver SRHR training' and how this has come about.

YPI has been recognized and acknowledged by its peers in providing trainings on SRHR in addition to being already considered as an HIV-AIDS expert in Indonesia [1] (Annex A, B, C). The many invitations that YPI has received in which the organization was requested to act as a facilitator, resource person or consultant in various forums at the local, regional as well as national level, serves as proof for this. YPI's staff has become more confident in giving trainings and delivering SRHR information to beneficiaries [2] (Annex A,X) as a result of knowledge sharing to other organizations through internships [3] (Annex C,X), as well as knowledge sharing to other organizations involved in the alliance [4] (Annex A,X).

On the one hand knowledge was shared through the internship positions that YPI had created [3] (Annex C,X). In order to develop the issues of SRHR and HIV-AIDS amongst the youths, YPI initiated a *youth forum* within DKI Jakarta. The idea was to bring about one forum that comes from, was run by, and made for, youths who were working with these two issues as a basis. YPI performed the role of initiator and facilitator. This forum was the place where YPI staffs' learning process was disseminated to the members of the youth forum.

On the other hand, knowledge was shared through organizations involved in the alliance [4] (Annex X). YPI is involved in as a member, official or initiator in several alliances related to SRHR issues. Among the most important ones is the Independent Youth Alliance (ARI). Each alliance possesses communication mechanism both in the form of direct meetings and electronic media (social media). In general, these alliances were established as a place for various organizations in sharing their problems, insights, knowledge, information and agenda-setting. It is from and through these alliance forums that YPI's staff improved their capacity on SRHR training and communication. They often share what they have learnt from the forums they participated in, as well as being asked to join as committee members or facilitators of activities initiated by the alliance.

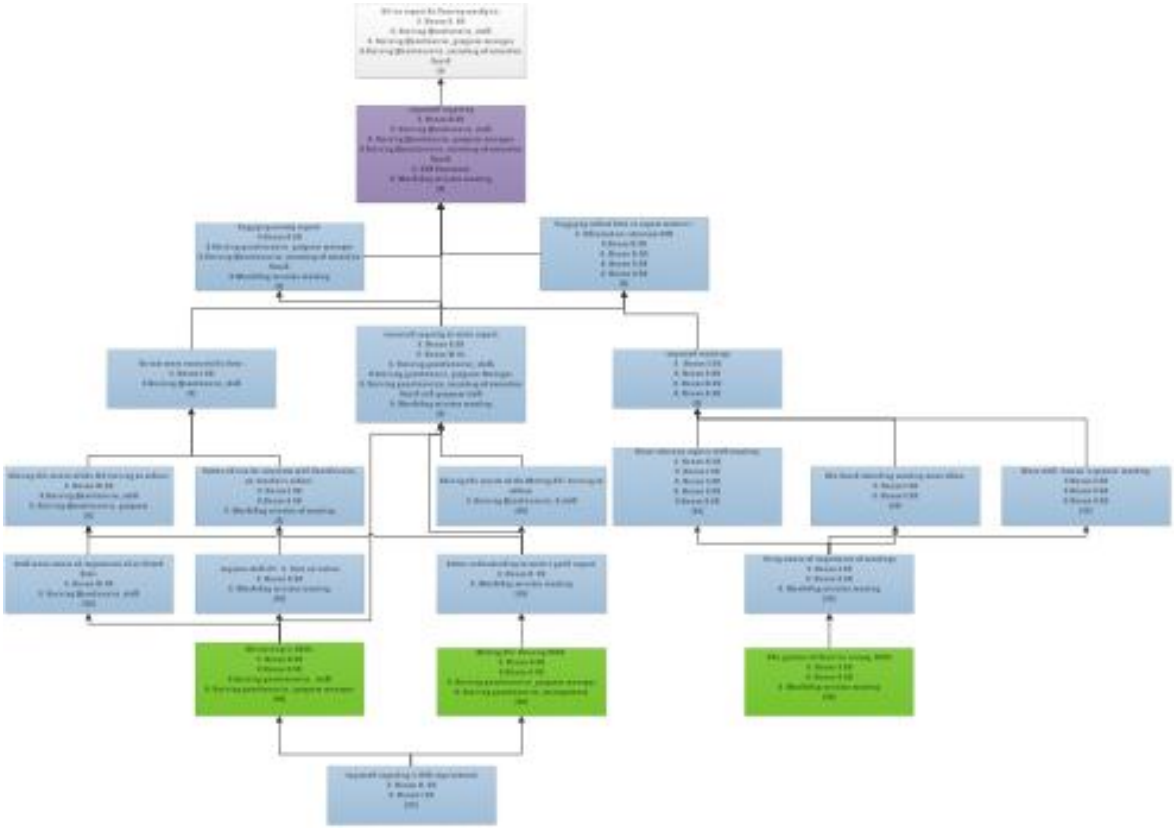
The sharing of knowledge and participation in these forums was enabled by the improved capacity as SRHR experts of the organization. During 2013, YPI increasingly participated in SRHR initiatives and venues next to practicing their existing expertise on HIV-AIDS, improving the capacity of the organizations SRHR expertise [5] (Annex A, X). This was enabled by the improved competencies to train and communicate with target groups on SRHR issues [6] (Annex A, B) on the one hand, but also through the addition of new staff members and volunteers who were increasingly involved in the SRHR programs and contributed to the capacity growth of the organization in the field of SRHR [10] (Annex A, X).

Improved competencies to train and communicate with target groups on SRHR issues can be attributed to three MFS II funded capacity interventions. In each training there was an unwritten agreement obliging them to share what they have learnt to others internally (Annex X).

**SRHR Training [7] (Annex A, B, X**

This training was held by RutgersWPF, on October 2013. YPI received an invitation for 3 participants. Who all attended. In the training emphasis was put on holistic understanding on everything related to SRHR. All partners who had implemented SRHR modules presented and shared their work which enabled them to learn from each other.

**Training for Youth Friendly Services [8] (Annex A,B,X)**



This training was held by PKBI in Cibubur on November 2013, and funded by MFS II and the ASK program. One YPI staff member attended the training, who was an active volunteer in YPI, and also a youth forum member. Targeted training to promote new means of communication to modern youth was given. The use of social media was emphasized.

**Workshop on Strategic Communication [9] (Annex A,B,X)**

This training was held in Bogor on September 2013 by One Vision Alliance. On YPI staff member attended the training. The training was focused on the development of a communication strategy, and how to strengthen the organization's standpoint to give communication more impact.

**Narrative C3.1 Improved reporting**

The key organizational change in the capability to adapt and self renew was initially identified as 'improved monitoring and evaluation' but during the process was refined to 'improved reporting' since the focus was more on this part of monitoring and evaluation [2] (Annex A; training questionnaire_staff; training questionnaire program manager; training questionnaire secretary of the executive board; workshop minutes meeting); CFA Document). The improved reports help to develop work plans [1] (Annex P; training questionaire_staff; training questionaire_program manager; training questionnaire secretary of executive board).

Improved reporting has been influenced by three factors: getting more varied reports (report with more form of data such as more visual or pictures and photography) [3] (Annex C; workshop minutes meeting; training questionnaire secretary of executive board), an improved capacity to write reports [6] (Annex B; Annex M; training questionnaire program manager; training questionnaire staff; training questionnaire secretary of executive board) and getting more robust data for report writing [4] (Observation interview CFA; Annex G; Annex N; Annex I; Annex P; Annex R). Reports are getting more varied because they have lots of data and know how to present the data in their reports also the reporting format has become more complicated [3] (Annex A; C; workshop minutes meeting; training questionnaire secretary of executive board; workshop minutes of meeting).

Staff have improved their capacity to write reports [6] (Annex B; Annex M; training questionnaire program manager; training questionnaire staff, training questionnaire secretary of executive board; workshop minutes meeting), on the one hand because of the M&E training in 2012 [18] (Annex C; Annex B; training questionnaire program manager, training questionnaire staff), which came as a requirement by the CFA [21] (Annex D; Annex J). The second reason for improved reporting capacity was the sharing among staff of results of the writing skills training. One of the participants at workshop in YPI while facilitating sheet of perspective SPO said that they shared the training experience and knowledge to other colleagues) [10] (Training questionnaire_3 staffs). One of the managers indicated during an interview that staff who is responsible for the teenagers group, has better understanding in report writing (Annex C). One of the training participants admitted that before the training, she needed more guidance from the leader in report writing, while after the training she feels more independent and needs less guidance from the leader (training questionnaire program manager). The writing skills training itself was supported by RWPF in 2013 [19] (Annex C; Annex B; training questionnaire management; training questionnaire program manager), and led to better understanding of how to write a good reports [19] (Annex C; Annex B; training questionnaire management; training questionnaire program manager). Ultimately it was the requirement from the CFA for improved reporting which created the necessity to have the trainings on M&E and writing skills [21] (Annex D; Annex J).

The third reason for improved reporting [2] (training questionnaire staff; training questionnaire program manager; training questionnaire secretary of the executive board); CFA Document) is that more robust data are being supplied as material for the reports [4] (observation interview CFA; training questionnaire management; Annex G; Annex N; ; Annex R; workshop minutes of meeting). There are two reasons for getting more robust data: on the one hand more accountable data is being collected [5] (Annex J; Training questionnaire staff) and on the other hand meetings have improved [7] (Annex L; Annex P, Annex O, Annex R).

**More accountable data is being collected** [5] (Annex J; training questionnaire staff) by staff due to an increase in the competences to conduct interviews in the field, such as beneficiaries and teachers [9] (Annex M; Training questionnaire _staff), The competencies to has come as a result of improved awareness on the importance of validated data [14] (Annex M, Training questionnaire staff), not only by staff forward attended a training on monitoring and evaluation, but also staff who learned this from the people trained [8] (Annex M; training questionnaire program manager; training questionnaire program staff). This is mainly due to a training by RWPF on monitoring and evaluation, which was conducted in 2011 [18] (Annex C; Annex B; training questionnaire program manager; training questionnaire staff), and which was attended by the project officer, the program manager and the secretary of the executive board.

Other staff, who did not join the training also increased their awareness on the importance of data validation, since M&E training participants shared their training experience in organizational meetings [8] (Annex M; training questionnaire program manager; training questionnaire program staff). The need to share became clear to staff attending the training as their awareness of the importance of validated data collection increased [14] (Annex M, training questionnaire staff). Staff has begun to discuss with their colleagues about data collected in monthly discussions. The requirement from the CFA for improved reporting created the necessity to have the trainings on M&E and writing skills [21] (Annex D; Annex J).

**The second reason for having more robust data is that meetings have been improved** [7] (Annex L; Annex N; Annex P; Annex O; Annex R) for a variety of reasons. Firstly, the staff meetings are more intensive and regular, as stated by staff and executive board during the interview [11] (Annex D; Annex J; Annex L, Annex P; Annex R). YPI staff also said that they used to conduct regular meetings once in three months, but during the 5c baseline, they realized the importance of having more regular meetings [20] (CFA, Annex M, Annex R) and are now conducting monthly meetings as a result of baseline survey [11] (Annex D; Annex L; Annex L, Annex P).

Secondly, the executive board visits the YPI office more regularly [12] (Annex J; Annex L;). It is stated by the founder, that they initiate the meeting (Annex L). This statement is supported by one of the management, that the executive board is asking to conduct meetings to get information about the progress of activities (Annex L; Informal discussion with management) and is supported by admin staff [12] (Annex L) and by field staff (Annex J).

Thirdly, more staff are involved in regular meetings [13] (Annex L; Annex P; Annex N). In the last two years, YPI reduced the staff, which means that YPI doesn't have project staff anymore (Annex J; Annex L). Staff in YPI are permanent staff, who have rights and obligations based on YPI regulations. The smaller number of YPI staff, makes them being more involved in regular meetings.

During the 5C baseline workshop, and in particular the discussions on the historical time line and the theory of change, and during discussions with management [20] (Annex L, Annex R; Workshop minutes meeting), staff became aware of the importance of having intensive meetings among staff, management and the executive board [17] (Annex L, Annex R)

Report CDI-15-050

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

# Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation YRBI and the Co-Financing Agency ICCO for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to YRBI, ICCO, the synthesis team, IOB and NWO/Wotro.

The Indonesia 5C evaluation team

# 1 Introduction & summary

## 1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (Medefinancieringsstelsel, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around four **key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: YRBI in Indonesia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1.Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps describe the identified key organisational capacity changes that are possibly related to MFS II

interventions in these two capabilities, and how these changes have come about. More detailed information can be found in appendix 5.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR: Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

## 1.2 Brief summary of analysis and findings

Since the baseline, two years ago, YRBI has seen most changes under the capability to act and commit. Overall a slight deterioration took place as compared to the baseline, although some positive developments were found as well. Changes in the staff composition, including the leadership position, created a positive change in responsive leadership and internal communication, but a negative change in staff turnover, strategic guidance and the articulation of strategies. No new funding sources have been found after the ICCO contract ended which left the organization unable to act or perform. In terms of the capability to adapt and self-renew, a very slight deterioration took place. This could be attributed largely to the deterioration in terms of critical reflection. Less meetings, and opportunities for feedback from colleagues to management were the main reasons for this. The capability to deliver on development objectives has effectively remained unchanged. This was because although operational plans have become clearer, the efficiency of monitoring has slightly deteriorated. The capability to relate has very slightly improved. YRBI has expanded its network to several new networks and groups, but does not have the resources anymore to continue to engage with its target groups. Internal relations within the organization have improved. No changes occurred in terms of the capability to achieve coherence since the baseline in 2012.

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team. During the endline workshop some key organisational capacity changes were brought up by YRBI's staff:

1. staff capacity on *mukim* and *gampong* sovereignty issues is more recognized
2. an improved and more extensive network
3. reduced paid workforce and program funds

Two of these changes were selected for process tracing as they were tied to MFS II funded capacity development interventions, namely the 'poor financial situation of the organization' (the third change mentioned above), as well as 'YRBI becoming the leading organization in mukim and gampong sovereignty issues in Aceh and Indonesia' (related to the first change mentioned above).

YRBI staff indicated that, according to them, staff capacity is more recognized due to more invitations from the community to share staff knowledge and skills on mukim and gampong issues. The increase of staff capacity can be attributed to internal knowledge sharing and learning from various staff capacity building activities by ICCO through MFS II funded capacity development interventions. This increase of staff capacity has also led to a more prominent recognition of YRBI in these areas. According to YRBI staff, YRBI has become the leading organization in mukim and gampong sovereignty issues in Aceh and Indonesia. MFS II initiatives allowed YRBI to develop new empowement programs for the poor and programs focussed on participatory mapping of communities.

YRBI's network improved and became more extensive. The latter can be attributed to the optimal use of the organization's facilities for events and trainings, the initiation of sovereignty institutions, as well as mukim and gampong issues becoming more widespread and therefore attracting greater public attention. No relationship has been indicated with MFS II funded capacity development interventions. Most of the changes are due to the organisation's own initiatives.

The reduction in paid work force and program funds was a negative development, due to a poor financial situation that led to the closure of programs, staff leaving the organisation and staff not being paid. This poor financial situation can be partly attributed to a change of ICCO policy following the renewal of the MoU between ICCO and the Indonesian government, in which political areas and topics complicated the continuation of projects in the area. Furthermore, the organisation itself did not develop successful proposals since not many proposals were developed, even though staff at the capacity to write proposals, and the new leader didn't have adequate fundraising experience. Whilst there was no link indicated with MFS II funded capacity development interventions, the fact that the main funder ICCO (MFS II) withdrew from funding the organisation has had an important effect on the organisation's financial situation.

In terms of process tracing the following organisational capacity changes were focused on: 'poor financial situation' and 'Becoming the leading organization in *mukim* and *gampong* sovereignty issues in Aceh and Indonesia'.

The poor financial situation of YRBI resulted from a lack of obtaining new funds, which in turn resulted from the expiration of the ICCO contract, no follow up on fundraising activities occurred, and rejection of proposals for funding (see 4.3.1) took place, even though the organisation has increased its capacity to provide financial reports based on donor standards. This developed competence cannot be related to any MFS II supported capacity development interventions. The expiration of the YRBI and ICCO contract was due to a change of ICCO policy. In this policy ICCO stated that they couldn't further support activities with "mukim and gampong" issues, as they did not receive permission to work in these areas in Aceh any longer after the renewal of the MoU between ICCO and the Government of Indonesia. No follow up for fundraising occurred, despite increased competencies in resource mobilization as the result of the Resource Mobilization training in 2013 by ICCO. The competencies to raise public funds as generated in the ICCO intervention to mobilise resources training in February 2013, were not utilized for YRBI's own financial situation. Instead YRBI elected to share these training outcomes amongst its beneficiary communities, some of which successfully applied this to raise public funds through cooperation with private parties.

No evidence for a relation could be found between the poor financial situation of YRBI and the improved transparency and accountability in financial reporting which resulted from the Financial Management training. Despite the positive outcomes in reaching the CFA's objectives in terms of utilizing the financial software and becoming a more transparent and accountable reporting organization, these developments did not impact the financial situation of YRBI. Instead the capacity built up in this area is now unused, as YRBI does not have any ICCO programs to carry out anymore.

YRBI has become more visible as a leading organisation in Mukim and Gampong sovereignity issues in Aceh in Indonesia. This was due to YRBI's staff capacity on Gampong and Mukim issues becoming more recognized amongst its stakeholders, due to more invitations from the community to share staff knowledge and skills.

Village maps were produced and utilized by the people as a result of the application of the training skills to some of the villages independently. This can be attributed to the increased staff ability to develop maps independently, following internal knowledge sharing gained from trainings. The knowledge shared in this case can be contributed to the participatory mapping internship (GIS) that took place in 2014 and was MFS II funded.

The 'Making Markets Work for the Poor' Training (MFS II), which took place in the course of 2014 parallel to the endline evaluation, resulted in the successful creation of a economic development project for beneficiary communities on the topic of honey bee exploitation and commercialisation. An increased amount of beneficiary groups has started getting involved in this project, again leading to greater trust amongst beneficiary communities.

Encouraging the community to use the results of training as a strategy to raise public and corporate funds resulted from the sharing of training knowledge to beneficiaries. This can be attributed to the gained staff skill to do fundraising from public or corporate CSR funds. This was due the internal knowledge sharing of the MFS II funded resource mobilization training that took place in 2013 as well.

On the whole, YRBI has grown into a leading organisation in Mukim and Gampong sovereignty issues in Aceh and Indonesia, and this is mainly due to positive effects at community level of the projects implemented by staff whose competencies have been enhanced in the MFS II trainings on participatory mapping, 'Making Markets Work for the Poor' and resource mobilisation. the whole, the changes in the key organisational capacity change can be attributed to a large extent to MFS II supported capacity development interventions.

# 2 General Information about the SPO – Name SPO

## 2.1 General information about the Southern Partner Organisation (SPO)

## 2.2 The socio-economic, cultural and political context in which the partner operates

**The socio-economic, cultural and political context in which the partner operates**
The region of Aceh, historically divided into three hierarchy, they are kesultanan, (state), sago/negeri (province), Mukim (district) and Gampong (Village). Mukim is Traditional Institution, which grew up and rooted in social order of Aceh society which has a great role in management and spatial control and also their parts of life. Every Mukim has its clear boundaries.[1]

The project addresses issues of lack of capacities of those traditional institutions, gampong and mukim , in natural resources and spatial management. It aims to empower and enhance capacities of both gampong and mukim to deal with increasing problems related with land tenure, natural hazard, natural resources and spatial management in Aceh. The project is important, particularly, in the context of post-tsunami and post-conflict of Aceh, where society was quite significantly divided into conflicting groups and its environment was severely devastated due to the disaster. While the problems of post-conflict and post-tsunami are particular in Aceh, the weakness of traditional institutions was widespread throughout the archipelago.

The issues of deficiency of traditional institutions can be explained mainly as the consequence of two major developments that happened in modern history of Indonesia. Firstly, the modernization process that took place in the archipelago since several decades ago especially following colonial expansion and more particularly in the aftermath of Indonesia's independence in 1945. Secondly, strategic policy taken by the "new order" regime to implement the Law number 5/1979 on Village Governance which was part of the centralistic approach of President Soeharto.

While in the past gampong and mukim played an important role in social and economic activities of Aceh people, they have been weakened significantly as a consequence of the two developments. In the old days of Aceh, their role include government administrative roles, customary (adat) and hukom (law)[2]. The division of authority between gampong and mukim (association of gampong) is that

[1] YRBI Program Report The Empowerment of the Mukim and Gampong Capacity in Spatial Management Phase II Period: November 2010 until October 2011
[2] Source: correspondence with YRBI director Sanusi M. Syarif (2010: 67).

mukim deals with issues which are not resolved at gampong level and becomes the authorized reference for religious affairs. Mukim also deals with external affairs, while gampong addresses internal affairs. However, following the implementation of Law 5/1979 mukim had no longer central role and authority since the law only recognize the authority of gampong which is seen as a village, the smallest administration unit of government—assuming as part of homogenous pattern of village administration throughout the archipelago. Without such legal recognition and financial resources mukim played no significant role in Aceh society during the period. At the same time the nature of gampong which was characterized by collegial type of leadership (altogether with teungku meunasah and tuha peut) shifted to be a centralistic kind of leadership. In short, the head of village became the sole authority at village level[3].

Following the collapse of the New Order Regime in 1998 and in the aftermath of the tsunami attack in 2004, there have been new streams and movements to revive and to revitalize traditional institutions and laws in Aceh. There were, actually, efforts to give a 'special treatment' to Aceh by providing 'special autonomy' through UU No 18/2001 and UU No.11/2006 on Aceh governance. Yet the implementation of these laws was not followed by strong and significant efforts to re-strengthen Mukim institution. Both the national and local government of Aceh gave more attentions for doing physical reconstruction and rehabilitation programs of the post-tsunami rather than improving capacity of gampong and mukim to involve in development process. There are also too little efforts and resources available to enhance capacity of 6.408 gampong and 755 mukims throughout Aceh.

Following massive and intensive rehabilitation and reconstruction programs, land tenure and environment problems have become new crucial issues in Aceh. Besides hundreds of thousands people dead and colossal destruction in Aceh, the tsunami has also brought about another serious problem: the massive loss of land tenure documents. In some areas it has led to conflicting issues regarding boundaries between gampongs or between mukims. It became deteriorated in some areas particularly when new projects for natural resources exploitation took place. In several cases, both gampongs and mukims have not been involved in producing the license for natural resources exploitation which might end up in conflict between villagers and companies as well as among the villagers.

With these emerging problems in the backdrop, YRBI seeks to empower traditional institutions of *gampong* and *mukim* in Aceh to play more important roles in resolving conflict between groups as well as in better managing natural resources for a more prosperous and sustainable society.

In the 2012-2013 program period, the location of fieldwork conducted in several villages federation (mukim) at Aceh Besar Regency. That location are Mukim Siem, Mukim Lambaro Angan, Mukim Lamteuba and Mukim Lampanah. While in Aceh Jaya-South Aceh, focus in Mukim Pucok Panga, Mukim Sarah Raya, Mukim Panga Pasie and Gampong Jambo Papeun. Besides also the location of shared learning through discussion, mapping and site visits, followed by mukim's at Aceh Jaya Regency (Mukim Sarah Raya, Mukim Panga Pasie, and Mukim Pasie Teube) and South Aceh Regency (Gampong Jambo Papeun).[4]

The context between the project locations Siem and Lamteuba is different. Siem is sub-urban area where most population are working in the city as government officers and or employees, whereas Lamteuba is located in rural areas where most population are working as farmers or agricultural-related workers. This will explain why these two Mukim have a different approach in dealing with conflict and in their capacity to document their information (map and other important data/information). When the community is not able to keep and take care of the information, usually YRBI will help them keeping such data including the map.

[4] Final-Report- 2014 "The Empowerment of the *Mukim* and the Gampong Capacity in Spatial Management Program Phase II"

## 2.3 Contracting details

When did cooperation with this partner start: 2005.

What is the MFS II contracting period: 1-11-2012 to 31-10-2013

Did cooperation with this partner end: Yes

If yes, when did it finish: 2013

What is the reason for ending the cooperation with this partner: Contract expired

Is there expected cooperation with this partner after 31st of December 2015: No.

## 2.4 Background to the Southern Partner Organisation

**History**
In 1995 YRBI was established by 4 founders concerned in empowering indigenous institutions, agriculture and environment[5]. In 1998, YRBI still had no donors and the organization consisted of a staff of six people and ten volunteers. As YRBI was dealing with the legal aspects of palm oil extraction, it had to function undercover[6]. The main issues YRBI was engaged with at this point were: democracy and human rights advocacy, identifying conflict origins and (eventually) reducing those, solving local conflicts using traditional wisdom and finally the engagement with issues concerning the sustainable use of natural resources[7].

In 1999 the Program of Panglima Laut was funded by local fishermen and in 2000 a YRBI volunteer was abducted by Indonesia's security force (Brimob) during the Aceh conflict [8]. In 2001 YRBI had its Standard Operational Procedures elaborated and the YRBI's office was moved to Banda Aceh. From 2001 to 2004 YRBI had a staff of 11 people and was funded by DAI-OTI-USAID in its program on civil society mapping, democracy and human rights[9]. From 2005 to 2008 the organization experienced little to no expansion due to limited resources[10].

From 2006 to the present YRBI has broadened its network of collaborating partners. As such, the organization has worked in joint activities with WALHI, SAMDANA and Pusaka Foundation, in the Forest People Program. In the last year YRBI started to focus also on climate change and it had a poor achievement in raising public funding[11].

**Vision**
YRBI envisions a community that *"will be able to manage natural resources independently and develop the potential of the region to achieve the prosperous life in a fair way"*[12].

**Mission**
**The Missions** [13]:
- Strengthen the management of natural resource and the area
- Strengthening of civil based economy
- Strengthening of local values
- Strengthening of public policy with community justification based
- Strengthen the solidarity among social community

**Strategies**

[12] YRBI (2010) Profil_English version
[13] Proposal YRBI-ICCO, 2010-2013, "The Empowerment of the *Mukim* and the Gampong Capacity in Spatial Management Program Phase II"

There are specific strategies developed for the achievement of each of the outputs. The aimed outputs and the respective strategies are described below.

**Output 1**

Increasing Mukim and gampong capacity in Aceh Besar, Aceh Jaya dan Aceh Selatan on layout, environmental effect analyzing and disasters management sectors. The activities include:

A. Workshop Program
   This activity is basic through all programs. Through the workshop, YBRI expects to collect valuable inputs from the participants in designing detail program and field program development.
B. Participatory Mukim Appraisal
   This investigation is run by using the PRA (Participatory Rural Appraisal) approach. The result of this activity offers basic information about the social, economic and traditional contexts of the Mukim environment. It is done in every focus location.
C. Periodic meeting, once in every three months
   A periodic meeting is carried out in focus locations and it serves as a communication forum point of Mukim.
D. Re-planting and agro forestry workshop
   The objective of this activity is that of offering concepts and practical guidance for the implementation of field assistance and re-planting activities.

**Output 2**

There are gampong/Mukim regulations about spatial of Natural Resources management with community based and continuity management design. The activities include:

A. Community Participatory Mapping
   The activity comprises producing sketches of the process of Mukim areas, identifying Mukim boundaries and drawing maps. This mapping activity is done in two Mukim areas, they are: Mukim Lam Teuba and Mukim Trieng Meuduro/ Gampong Panton Luas. The other goals of community mapping are: to identify water sources, and to re-arrange community forest protection (Climate Change related activity).
B. Spatial Planning and Mukim development
   This activity includes: identifying the potential of natural resources in Mukim areas, Mukim social resources, outlining an order of priorities, stipulating agreements in process development and defining Mukim spatial management. Since it is a follow-up activity after the mapping process it will also be implemented in two Mukim areas (Lam Teuba and Trieng Meuduro gampong Panton Luas). Through these activities, the communities could improve their struggle for better living conditions.
C. Revitalization Workshop of Tuha Peut
   This program aims at introducing concepts and guidance outlines which can be implemented in the process of field assistance for Tuha Peut institution. This workshop is done by every Tuha Peut from Mukim and gampong in target group area.
D. Training for Tuha Peut to make Rule of Gampong.
   This program is focused in guiding villages' leaders and Tuha Peut participants in arranging and stipulating gampong regulation by combining traditional and formal approaches.
E. Training of land tenure and customary right (the adat Aceh) for youth.
   This activity is aimed at identifying the Mukim land tenure and customary rights.

**Output 3**

Registration and documentation of local wisdom about Natural Resources management. The activities designed for reaching this objective include:

A. Documentation of local regulations and other connected regulations.
   The objective of this activity is that of helping the target society in documenting local wisdom and the society's customs.
B. Social research for Mukim Catle land (padang rumput) management.
   It is expected that this activity can contribute to the practitioners and local community in understanding cattle and land management issues in Aceh.
C. Social research for Mukim traditional market management.
   It is expected that this activity can contribute to the practitioners and local community in understanding the reality of the Mukim traditional market management in Aceh.
D. Bulletin Peureude and Info sheet publication "Suara Mukim" once for three months.
   These media publish the cases which are related to Mukim and field findings during the time of carrying out the programs.
E. Assistance
   This activity is run in focus area. The assistance is offered in areas of institution management and field process, which concerns the preservation of local customs. Besides that, this activity also proposes the strengthening of community organization.

**Output 4**

Increasing the amount of re-plantations in order to counter-weight the impact of climate change in program location. The activities comprise:

A. Identification of the river area and the sources of water
   It is expected that this activity can contribute for the local community's to understanding of the importance and actual situation of local river and other sources of water (Climate Change related activity).
B. Making billboard for water sources
   This activity produces billboards about preservation for water sources (Climate Change related activity). Distribution seed for farmer (Climate Change related activity)[14].

[14] YRBI(2010)Final Proposal 2010-2013

# 3 Methodological approach and reflection

## 3.1 Overall methodological approach

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

## 3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012[15].

[15] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

## 3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: **To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?** and the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

### 3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PT.PPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

### 3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop

have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

### 3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during

the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to

generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# 4 Results

## 4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of YRBI that have taken place since 2011 are described. The information is based on the information provided by ICCO.

Table 1
*Information about MFS II supported capacity development interventions since baseline*

| Title of the MFS II supported capacity development intervention | Objectives | Activities | Timing and duration | Budget |
|---|---|---|---|---|
| Participatory Mapping Internship (GIS) | Develop staff competence in GIS application and development | Series of activities | October 2013 – January 2014 | n/a |
| Making Markets work for the Poor (MFP) Training | Develop economic empowerment programs | Series of training workshops, onsite coaching, business model and plan development workshops | March 2014-ongoing | 90,252 Euro |
| Resource Mobilization Training | Develop innovative strategies to become a sustainable organization | Training with other ICCO Alliance partners | February 2013 | n/a |
| Financial System Management training | Ensure that partners meet the minimal standard of financial reporting | Finance software training and standard guidelines for the system | March 2013 | 1200 Euro |

## 4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

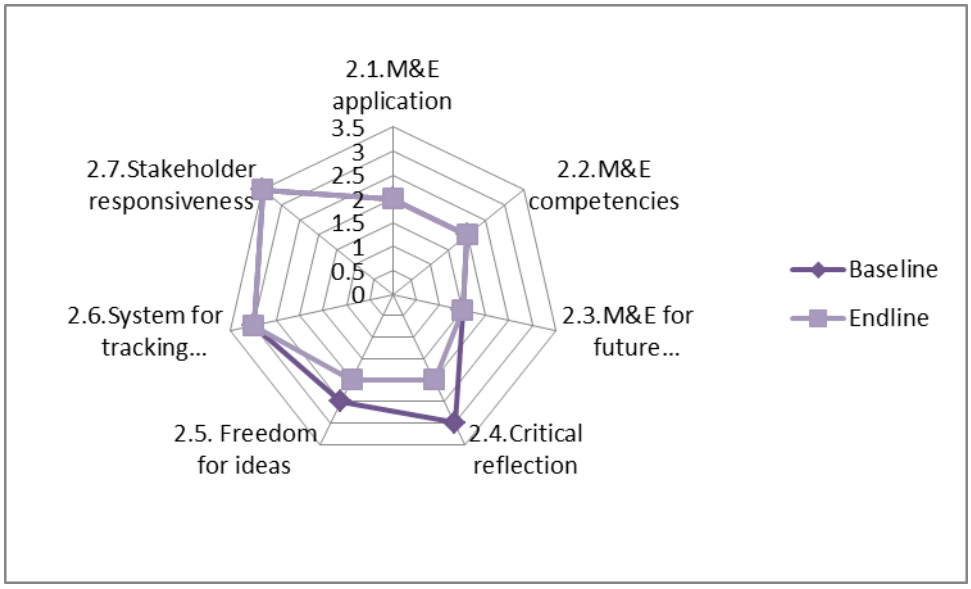
Below you can find a description of the changes in each of the five core capabilities. This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also annex 3.

### 4.2.1 Changes in the five core capabilities

**Capability to act and commit**

After a handing over the director's position to a younger staff member, YRBI has become a more open organization for its staff members. Communication with management, feedback and the ability to participate in decision making were enabled by the new director in charge. Staff is encouraged to create their own strategies, methods and approaches in work. Despite that, decision making still appears to be a slow process particularly in relation to "inherited" problems such as financial problems that have yet to be solved. On the whole strategic guidance needs to be further developed.

In term of organization structure, it is thinner due to the project activities and staffs reduction. This reduction has also caused M&E to no longer be conducted. They only hold informal forum to to discuss contemporary issues that develop at local, regional, and national which is called "Diskusi Lorong".



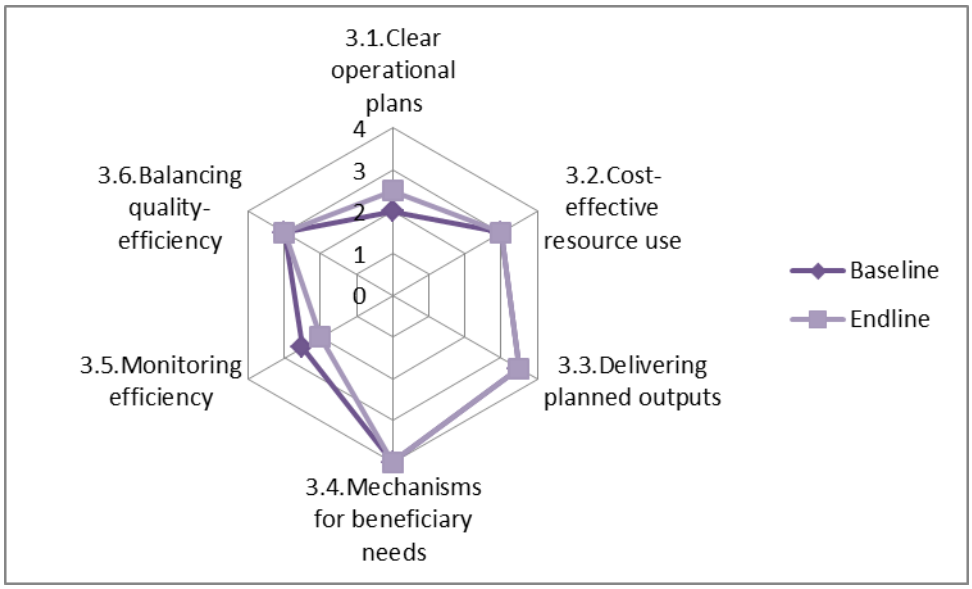
Overall, daily operations are in line with strategic planning, although the number of activities carried out has gone down significantly after the ICCO funded program was finalized. This is also affected staff turnover since staff had to leave the organisation due to closing the ICCO funded project. The number of staffs reduced from 14 to 8. No new major funds have been acquired since, although the organization is actively seeking out new opportunities and has applied to several potential donors. Staff skills have slightly improved over the observed period as a result of increased work experience and donor (ICCO) supported trainings in Participatory Mapping Internship [GIS], Making Market for the Poor Training (MFP), Resource Mobilization Training, and Financial Management Training between 2012-2014. Nonetheless further improvements are needed in terms of English language proficiency to improve the quality of proposals and negotiations.

The previous structure is actually still relevant with the organization needs but the project activities and staffs reduction caused the structure to be thinner.

Since YRBI closed their projects, M&E was no longer conducted. They only held informal forums to discuss contemporary issues that develop at local, regional, and national which is called "Diskusi Lorong".

Score: 2.7 to 2.4 (very slight deterioration)

**Capability to adapt and self-renew**



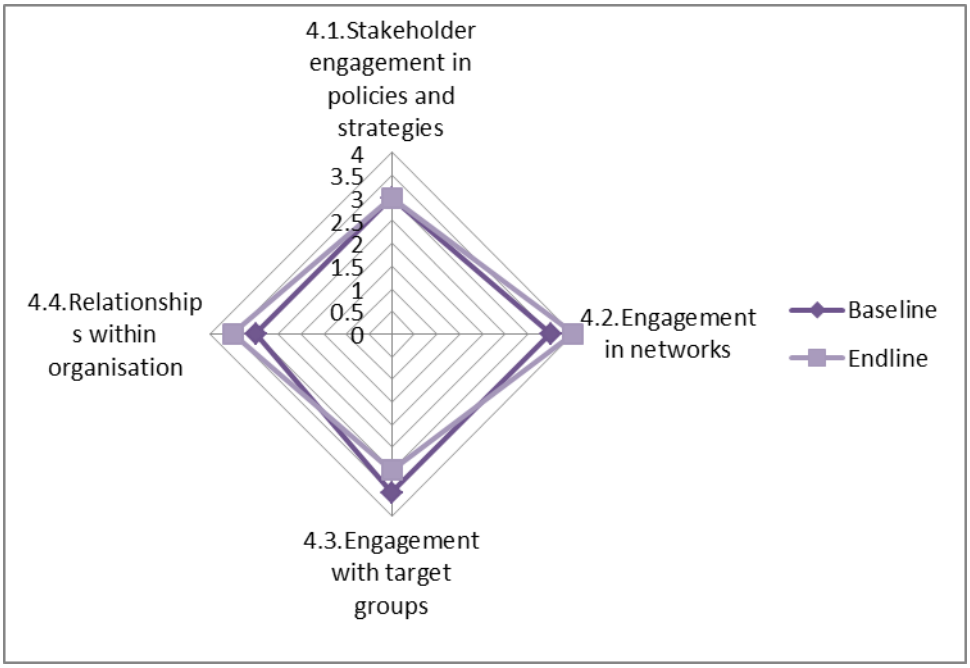
On the whole, there is a very slight deterioration in the capability to adapt and self-renew for YRBI. Although staff has indicated numerous times that they see the benefit and need to develop their monitoring and evaluation, it has not been prioritized until now. M&E resides with the Director as there is no trained staff assigned with this particular role. Limited but irregular M&E is done at the project level through infrequent meetings where staff is free to address outstanding issues. M&E is done in the form of discussions based on project agreements (activities, outputs and outcomes), so this is initially done for reporting back to donors. They are learning from it though, identifying obstacles and constraints and reducing the risk of failure by finding solutions.

Staff meetings in general have reduced in frequency, duration and intensity, providing fewer scheduled moments for feedback and discussion. Nonetheless office and organizational culture can be considered open and free and enables informal communication. With regards to keeping track of external developments YRBI continues to track media and its network at the local and national level, and picks up on current issues from there, but there is no formal system in place to do this tracking of the environment.

Communication and engagement with stakeholders and beneficiaries is done directly in the field and includes all level of staff, including the director. Active participation of the community allows YRBI to convey their expectations and this yields better results as well as a sense of ownership of the products amongst the beneficiaries. It also prevents wasting time and resources on unwanted activities.

Score: 2.5 to 2.3 ( very slight deterioration)

**Capability to deliver on development objectives**

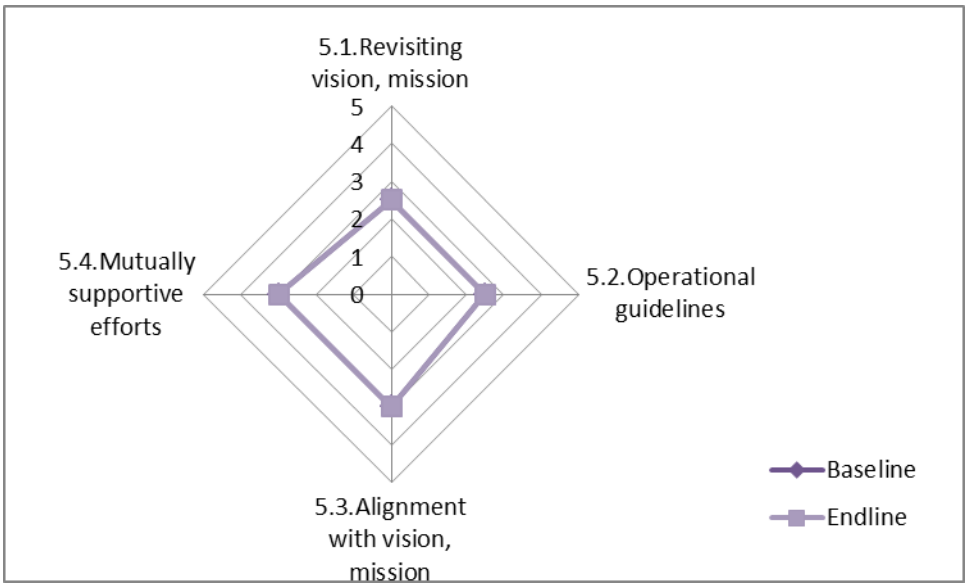


There is an overall strategic plan in YRBI and day-to-day activities are based on the strategic plan. The ability to implement programs has increased since more staff understands the programs. Delegation is done effectively from the new director to the coordinators, but more difficult from coordinators to the staff, sparking the need for better job delegation and management practices. YRBI works closely together with its beneficiaries in a participatory approach, through which they are able to consistently deliver on donor-agreed outputs and and deliver quality results. The approach however is intensive and sometimes causes delays and affects efficiency.

Overall meetings to discuss program progress including linking inputs and outputs from projects are held, but there is no formal system in place to assess efficiency by linking inputs to outputs. This is in line with having a week monitoring and evaluation system in place. YRBI has a clear vision and is a focused organization. They cannot depend on funding anymore because the ICCO contract ended (only funder) and was not renewed and together with the community they work together hand in hand with the in sourcing funds. The terms of reference for the project have changed from a donor-driven process into community needs-driven process and on the whole, engagement with the beneficiaries is good.

All in all the capability to deliver on development objectives has remained unchanged, and there is room for improvement.

Score: from 3 to 3 (no change)



**Capability to relate**

Overall this capability has not changed. YRBI has a good network with local government institutions and NGOs which help them in their advocacy work. Stakeholders are involved and there is ongoing communication with these stakeholders and policy makers, but it is not clear to what extend the stakeholders also contributed to informing policies and strategies of YRBI. . Currently, there is an extension in YRBI's network with the addition of more NGOs. YRBIs network is at the local and national level, mainly with organizations working on similar issues in indigenous rights and the natural environment, or with organizations that outsource part of their projects to YRBI (subcontracting). Due to their participatory approach there are regular field visits, however the frequency of these visits has reduced due to budget constraints after closing projects which affected having less field officers available. There is a sense of family among the staff members, but also a respect for seniority that prevents junior staff from arguing with senior staff, even though there is an open atmosphere in which one can freely discuss any issue and give their input before a decision is made. With the change of leadership, the above situation sometimes still occur, but the new (young) director applies more egalitarian leadership style, which makes the junior-senior relationship smoother than before.

Score: from 3.2 to 3.4 (very slight improvement)

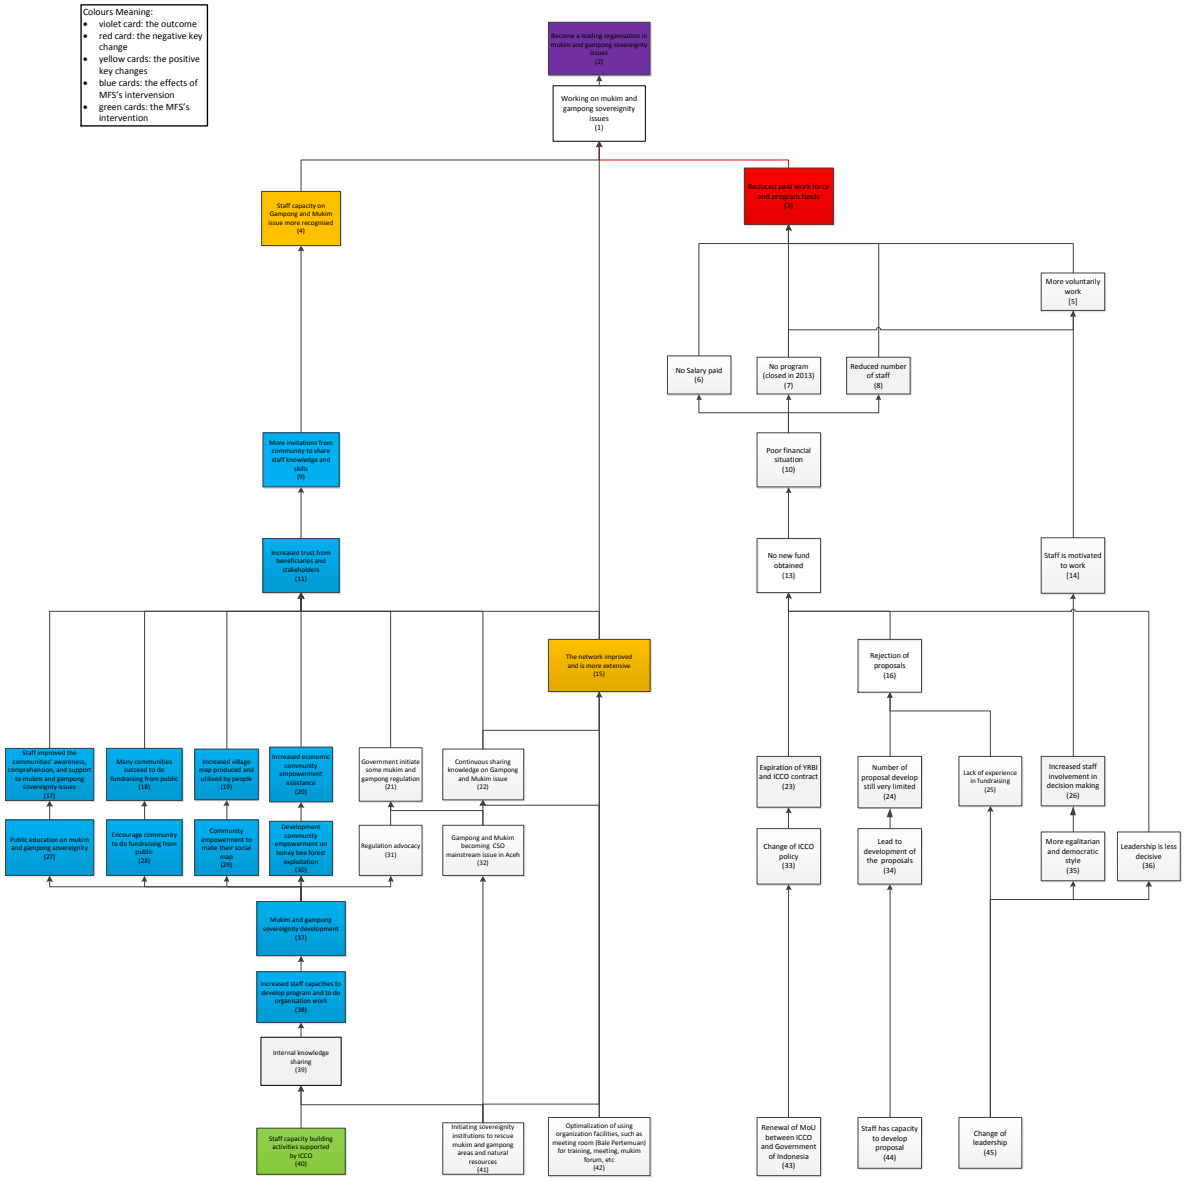
**Capability to achieve coherence**

There are no changes in the capability to achieve coherence. Overall the same approaches towards strategy, the application of vision and mission to daily operations and the alignment of all these factors have remained the same. Standard operating procedures are in still place for finance, but not for HRM.

Score: from 2.7 to 2.7 (no change)

### 4.2.2 General changes in the organisational capacity of the SPO

**Narrative of General Causal Map of Yayasan Rumpun Bambu Indonesia (YRBI)**
YRBI is an organization established in 1995 which works in the fields of indigenous community empowerment, agricultural development, and environmental conservation. Since 2006, YRBI has dealt with climate change issues until 2011 when they chose traditional community development as their main issue. Collaboration between YRBI and the Netherlands began in 2005 after the tsunami. The contract between MFS II and YRBI started on 1 November 2012 and ended on 31 October 2013 without being renewed.



The evaluation team carried out an end line assessment at YRBI from 14 to 16 July 2014. During this workshop, the team made a recap of key features of the organisation in the baseline in 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline.

Some positive and negative changes have taken place in the organization since the baseline, and both of these have affected the organization in terms of being able to work or *on mukim* and *gampong* sovereignty issues [1] , and thereby becoming a leading organization on these issues [2]. *Mukim* and *gampong* are legal administrative community units[16] in Indonesia. YRBI wants to become a leading organization in terms of the issues in dealing with *mukim* and *gampong* sovereignty [2]. The extent to which the organisation has been able to work or on *mukim* and *gampong* sovereignty issues [1], can be attributed to three key organisational capacity changes:

4. staff capacity on *mukim* and *gampong* sovereignty issues is more recognised [4];
5. an improved and more extensive network [15];
6. reduced paid workforce and program funds [3], which is a negative development ;

[16] It has boundaries and authority to control and manage the interests of local communities based on the origin and the local customs which are recognized in the Indonesian Government system. In a nutshell is zoning based on local custom. In the structure, gampong is under mukim. Mukim formed by at least four gampong. Each mukm is led by a Uleebalang or a Mukim. This system is applied since the era of the Aceh Sultanate.

Each of these key organisational capacity changes and how they have come about is further explained below. Numbers in the narrative corresponds to numbers in the visual.

**Staff capacity on *mukim* and *gampong* sovereignty issues is more recognised [4]**

An increase in staff capacity has become more visible to stakeholders, partners and beneficiaries [4] as staff members carried out their duties. More invitations from the community for staff to share their knowledge and skills [9] made the public realize the increase in their knowledge and capacity.

The greater number of invitations from the community to share knowledge and skills is due to an increased trust from beneficiaries and stakeholders in YRBI's competencies [11]. This was due to a range of different issues:

- Staff improved the communities' awareness, comprehension and support to *mukim* and *gampong* sovereignty issues [17], Which was due to public education on these issues [27].
- Many communities succeed to raise funds from the public [18] after encouragement and assistance from YRBI [28]
- An increased number of village maps has been created and utilized by the people [19] after YRBI empowered the community with the skills to create their own social maps [29]
- Increased community economic development assistance [20] through honey bee forest exploitation [30].
- Government created a *mukim* and *gampong* regulation [21] after active and regular advocacy and lobbying of YRBI [31].
- Continuous sharing of knowledge on *mukim* and *gampong* issues [22] because these issues have become more mainstream in Aceh [32].

Each of these factors resulted from the overall development of the *Mukim* and *Gampong* sovereignity over the last two years [37], following the increased efforts and staff capacities to deliver work and carry out program activities [38]. This was due to more internal knowledge sharing [39]. It is custom for YRBI staff who have returned from an external event, whether it is a discussion, seminar, or training, to share the knowledge they received to the other staff members in a forum. This forum is called "*Diskusi Lorong"* [39]. It is held at least twice in one month. Aside from being a forum to share knowledge, *Diskusi Lorong* also benefits as a forum to discuss program development and contemporary issues that develop at local, regional, and national level.

Amongst the knowledge shared were several staff capacity building activities as supported by ICCO [40] and the establishment and initiation of *mukim* and *gampong* coalition for sovereignty natural resources governance. Capacity building activities for YRBI were supported by ICCO between 2012-2013[40], Which included: 1) Participatory Mapping Internship (GIS); 2) Making Market for The Poor Training; 3) Resource Mobilization Training.

The other issue that affected increased trust from beneficiaries and stakeholders [15] is an improved and more extensive network [15]. Since this also directly affected the organisation's capacity to address *mukim* and *gampong* sovereignty issues, it is further elaborated upon below,

**The network improved and is more extensive [15]**
YRBI's network has grown over the last two years [15]. The continuous sharing of knowledge and developments on *mukim* and *gampong* issues in the public, amongst stakeholders and community played a large role in this [22]. On the other hand, YRBI is now able to host meetings, trainings and *mukim* forums in themeeting room *(Bale Pertemuan)* in the new building , which has allowed more beneficiaries and stakeholders to get in touch with YRBI [42]. In fact, the *Bale Pertemuan* has now become a regular meeting point for civil society activists. Improved facilities have also contributed to being able to continuously share knowledge on *mukim gampong* and sovereignty issues [22]. This sharing is also due to *gampong* and *mukim* becoming a CSO mainstream issue in Aceh [32], which in turn is due to initiating sovereignty institutions to rescue *mukim* and *gampong* areas and natural resources [41].

**Reduced paid workforce and program funds [3]**
This is a negative change that occurred in YRBI since the baseline in 2012. There are a variety of reasons for this negative change:

- No salary being paid to staff members [6]
- No more program activities after 2013 [7]
- Reduction in the number of staff members [8]
- More voluntary work [5]
- Less decisive leadership [36].

Each of these factors was the result of the poor financial situation of YRBI [10] after no new funds could be obtained [13] after the contract with ICCO expired in 2013 [23]. A change in ICCO policy was the primary reason for this occurring [33] after specific new changes were included in the renewal of the MoU between ICCO and the government of Indonesia [43]. Prior to this, ICCO was more focused on local economic empowerment. Although YRBI has had the opportunity to submit new proposals in line with ICCO's policy, they chose to stick with the empowerment of *mukim* and *gampong* institutions, and as a result, the contract with ICCO ended.

No additional funds were acquired in the meantime either as proposals written by YRBI were rejected [16]. This was partly due to the limited number of proposals being developed, decreasing the chances of getting new funds significantly [24]. Proposals. riting and development was possible [34] because some senior staff already possessed the capacity and experiences to do so [44]. Nonetheless, a lack of experience in fundraising of the new director of YRBI [25] reduced YRBI's chances for success acquisition, and this new leadership came on board after a leadership change in the mid of 2013 [45]. The previous director, staff recalled, had better networking and fundraising skills.

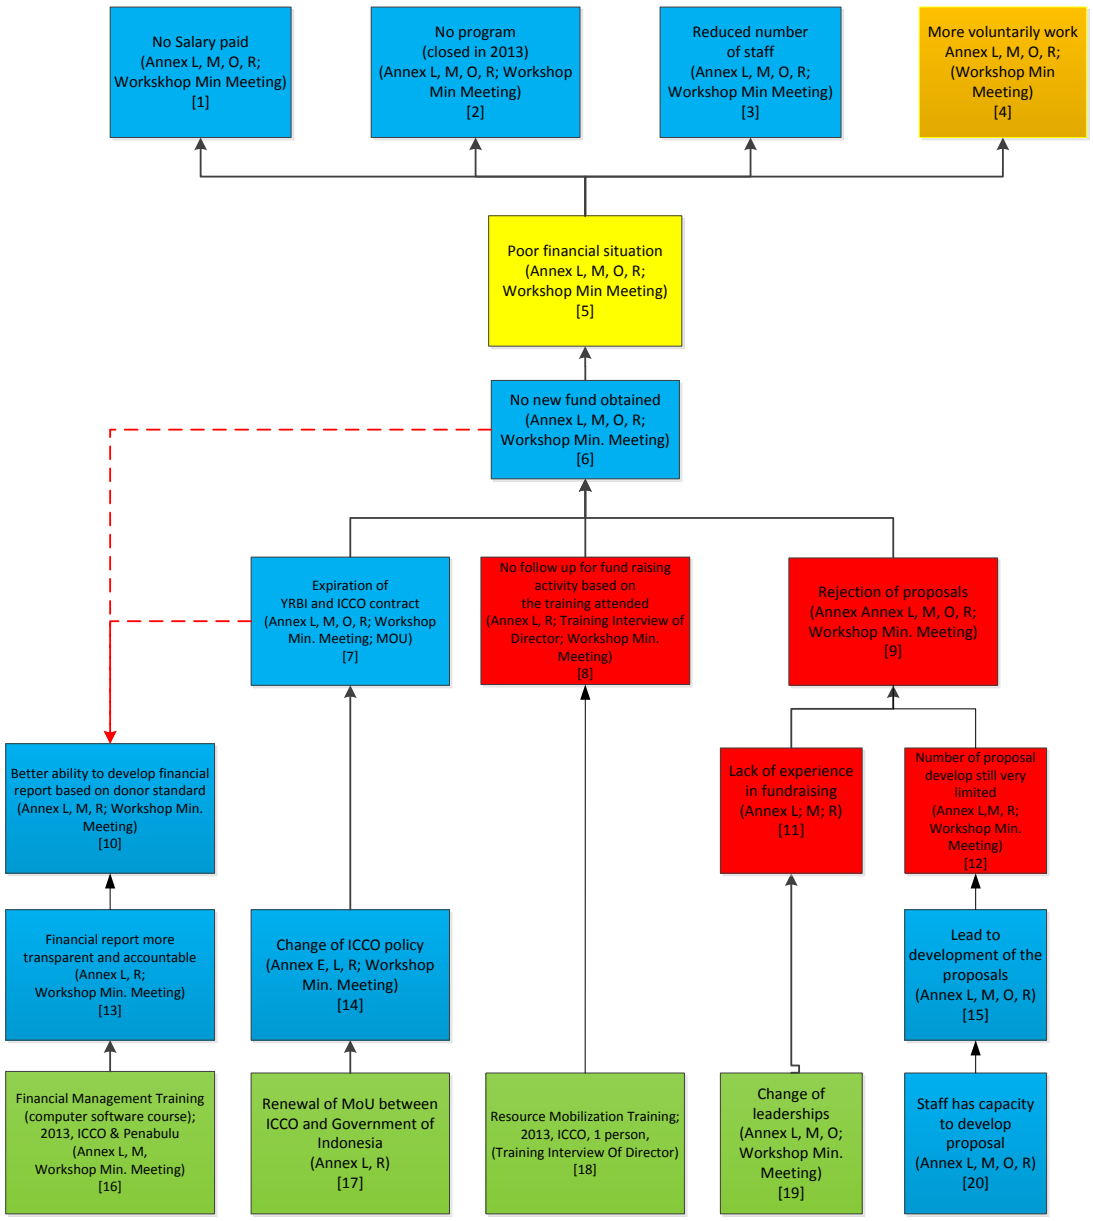
Finally, the poor financial condition of the organization resulted in more voluntary work being done since 2013 [8]. This was the only way for YRBI to keep the organization at work with limited resources and capital. Volunteers, and staff working for free on a voluntary basis, were attracted to do so by

their motivation to work and contribute to the organization and its mission [14]. The increase in motivation could also be attributed to the fact that they were now more involved in decision making [26] which was enabled by the freedom and more democratic leadership style of the new director [35]. Unfortunately this increase in staff autonomy and empowerment by the new director also led to a less decisive leadership management [36], which some staff members indicated harmed the organization in need for change and funds.

## 4.3 Attributing changes in organisational capacity development - evaluation question 2 and 4

Note: for each country about 50% of the SPOs has been chosen to be involved in process tracing, which is the main approach chosen to address evaluation question 2. For more information please also see chapter 3 on methodological approach. For each of these SPOs the focus has been on the capability to act and commit and the capability to adapt and self-renew, since these were the most commonly addressed capabilities when planning MFS II supported capacity development interventions for the SPO.

For each of the MFS II supported capacity development interventions -under these two capabilities- an outcome area has been identified, describing a particular change in terms of organisational capacity of the SPO. Process tracing has been carried out for each outcome area. In the capability to act and commit the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'poor financial situation'.



In the capability to adapt and self-renew the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'Becoming the leading organization in mukim and gampong sovereignty issues in Aceh and Indonesia'

Table 2
*Information on selected capabilities, outcome areas and MFS II supported capacity development interventions since the baseline*

| Capability | Outcome area | MFS II supported capacity development intervention(2) |
|---|---|---|
| Capability to act and commit | Poor financial situation | Financial System Management Training (March 2013)<br>Resource Mobilization Training (February 2013) |
| Capability to adapt and self-renew | Becoming the leading organization in mukim and gampong sovereignty issues in Aceh and Indonesia | Participatory Mapping Internship (GIS) (series of activities), October 2013 – January 2014<br>Making Markets work for the Poor (MFP) Training series, March 2014-ongoing<br>Resource Mobilization Training, February 2013 |

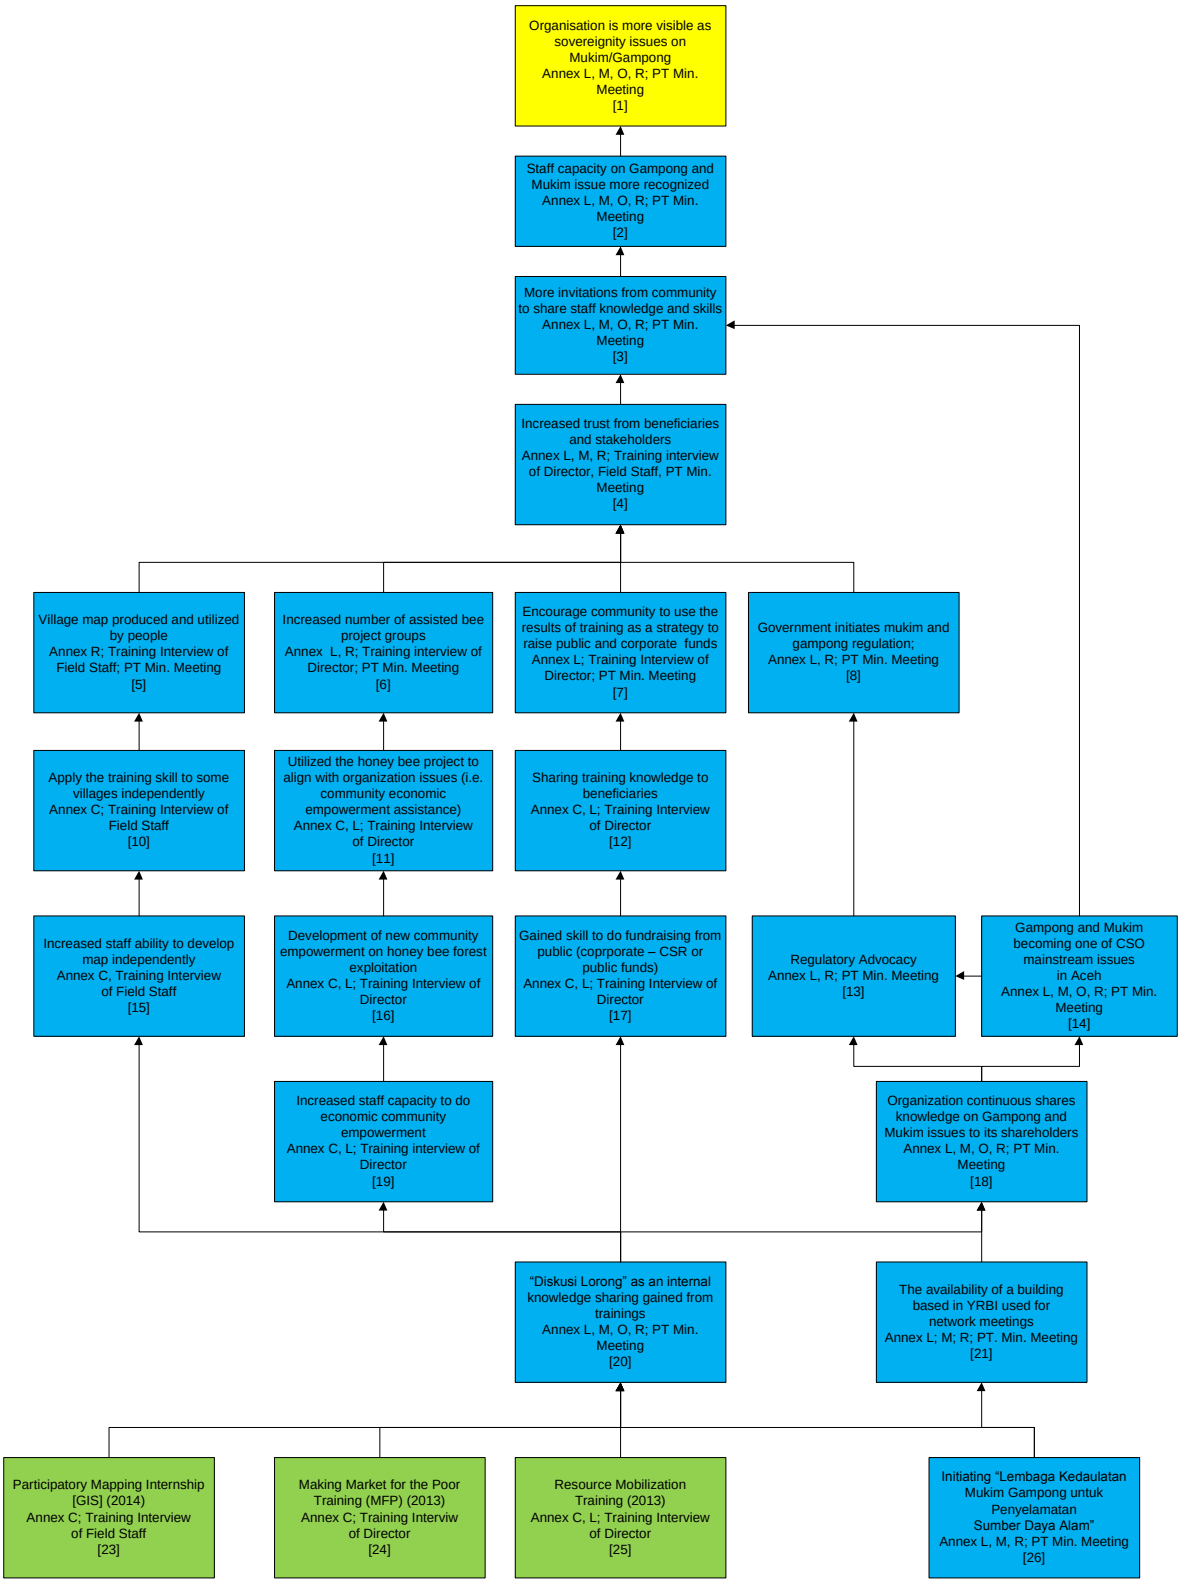
The next sections will describe the results of process tracing for each of the outcome areas, and will describe to what extent these outcome areas have taken place as a result of MFS II supported capacity development interventions and/or other related factors and actors.

### 4.3.1 Poor financial situation

The key capacity change that was focused on during the process tracing workshop was identified as 'poor financial situation' [5] (Annex L, M, O, R; Workshop Minutes Meeting). Staff of YRBI indicated that this has led to salary not being paid since the beginning of 2014 [1] (Annex L, M, O, Workshop Min. Meeting); the ending of all program activities in 2013 [2] (Annex L, M, O, R; Workshop Min. Meeting); a considerable reduction in the number of staff [3] (Annex L, M, O, R; Workshop Min. Meeting); encourage staff working more on a voluntary basis [4] (Annex L, M, O, R; Workshop Min. Meeting).

The poor financial situation of YRBI [5] (Annex L, M, O, R; Workshop Min. Meeting) is due to fact that since the MFS II contract ended, in 2013, no new funds have been obtained [6] (Annex L, M, O, R; Workshop Min. Meeting). The reason for this was threefold. *First,* the YRBI and ICCO contract expired [7] (Annex L, M, O, R; Workshop Min. Meeting). *Secondly,* no follow up for fund raising activity based in the training attended [8] (Annex L, R; Training interview of Director; Workshop Min. Meeting). *Thirdly*, the rejection of proposals for program activities and funding [9] (Annex L, M, O, R; Workshop Min. Meeting). Each of these three reasons is explained in more detail below.

1. The ICCO contract expired on 31 Oktober 2013 and was not renewed due to political and administrative issues. This was due to an internal ICCO policy change [14] (Annex E, L, R; Workshop Min. Meeting), which directly resulted from the renewal of an MoU between ICCO and



the Government of Indonesia [17] (Annex L, R). The policy stated that ICCO couldn't further support activities with "mukim and gampong"[17] (zoning based on local custom) issues.
ICCO funded Financial Management Training [16] (Annex L, M, Workshop Min. Meeting) resulted in ability to develop report based on donor standard [13] (Annex L, M, R; Workshop Min. Meeting). The financial reports are now more transparent and accountable [13] (Annex L, R; Workshop Min. Meeting). This training has no further follow up since YRBI didn't need to develop reports as they didn't have programs anymore after the contract from ICCO has been ended.

2. There was no active follow up on fund raising activities [8] (Annex L, R; Tranining Interview of Director; Workshop Min. Meeting) as taught in the Resource mobilization Training supported by ICCO In 2013 [18] (Training Interview of Director), but the knowledge from the training had been shared and disseminated to the community to empower them to raise fund in a variety of ways. Despite no concrete fund raising activities being carried out after the resource mobilization training took place, the training did result in positive changes elsewhere. A number of beneficiary communities succeeded in raising public funds through cooperation with private sectors/companies or directly from the community with help of YRBI and the newly acquired capabilities in the training. They did this by creating proposals for cooperation or donations, selling merchandise, etc. Unfortunately these capabilities to raise public funds were not utilized for YRBI's own sake.
3. The final reason for the lack of securing new funds was the rejection of submitted proposals [9] (Annex L, M, O, R; Workshop Min. Meeting). During the field interviews, various people have noted that the new director was unable to maintain the level of fundraising and had a significant lack of experience in it and also in networking [11] (annex L, M, R). The change of leadership happened in 2013 [19] (annex L, M, O; Workshop Min. Meeting).

The other reason for rejection was that the number of proposals developed was actually very low [12] (Annex L, M, R; Workshop Min. Meeting). This despite the fact that some of the submitted proposals were developed by YRBI staff themselves [15] (Annex L, M, O, R), as they have capacity to do them [21] (annex L, M, O, R).

[17] Mukim and gampong is a legal community unit. It has boundaries and authority to control and manage the interests of local communities based on the origin and the local customs which are recognized in the Indonesian Government system. In a nutshell is zoning based on local custom. In the structure, gampong is under mukim. Mukim formed by at least four gampong. Each mukim is led by a Uleebalang or a Mukim. This system is applied since the era of the Aceh Sultanate.

### 4.3.2 Becoming the leading organization in mukim and gampong sovereignty issues in Aceh and Indonesia

This process tracing map differs slightly from the other maps presented in this report in that it addresses not only competencies and organizational capacity, but also some implementation activities and targets. The two are inherently intertwined within YRBI and hard to separate when explained for this particular capacity. It should therefore be considered a "mixed" causal map.

Following is the narration for the YRBI causal map between 2012-2014. Within the two year time period since the MFS II baseline evaluation in 2012, a key organizational capacity change at YRBI was that it has become the leading organization in mukim and gampong18 sovereignty issues in Aceh and Indonesia [1] (Annex L, M, O, R; Process Tracing Minutes Meeting). During the process tracing workshops and interviews it was made clear that this outcome is the direct result of an increased recognition in staff capacity on Gampong and Mukim issues [2] (Annex L, M, O, R; Process Tracing Minutes Meeting). This increased recognition can be explained through two factors:

1. More invitations from community to share staff knowledge and skills [3] (Annex L, M, O, R; Process Tracing Minutes Meeting)
2. *Gampong* and *Mukim* becoming one of CSO mainstream issues [14] (Annex L, M, O, R; Process Tracing Minutes Meeting)

Each of these changes is described below. First off the increase in invitations for staff to share their knowledge and skills [3] (Annex L, M, O, R; Process Tracing Minutes Meeting) resulted from an increase in trust in YRBI from beneficiaries and stakeholders [4] (Annex L, M, R; Training Interview of Director, Field Staff; Process Tracing Minutes Meeting). Four factors contributed to this increase in trust, which will be discussed in detail below:

1. Village maps being produced and utilized by people [5] (Annex R, Training Interview of Field Staff; Process Tracing Minutes Meeting).
2. An increased number of assisted bee project groups [6] (Annex L, R; Training Interview of Director; Process Tracing Minutes Meeting)
3. Encouragement of the community to use the results of training as a strategy to raise public and corporate funds [7] (Annex L, Training Interview of Director; Process Tracing Minutes Meeting)
4. A government initiation to create new regulations related to *mukim* and *gampong* [8] (Annex L; Process Tracing Minutes Meeting)

*First,* the village maps being produced by communities came forth from the transfer of staff knowledge to villagers [5] (Annex R; Training Interview of Field Staff; Process Tracing Minutes Meeting). This program continues to this day and at least three social maps have successfully been completed, and were funded by the villagers themselves [10] (Annex C; Training Interview of Field Staff). This knowledge resulted from an increase in staff's ability to develop maps independently. Field Staff applied his knowledge by independently conducting social mapping in a number of villages [15] (Annex C; Training Interview of Field Staff). This was purely from Field Staff initiative, and YRBI functioned as a facilitator. He was one of the YRBI staff members who participated in the Participatory Mapping Internship (GIS) in Bogor, 2013 [23] (Training Interview Field Staff). He shared his knowledge with his colleagues in YRBI after his return from there [20] (annex L, M, O, R; Process Tracing Minutes Meeting).

*Secondly,* an increased number of assisted bee project groups arose [6] (Annex L, R; Training Interview of Director; Process Tracing Minutes Meeting) after the honey bee project was aligned with organization issues wich is economic community empowerment [11] (Annex C, L; Training Interview of Director). There was development of new community empowerment on honey bee forest exploitation [16] (Annex C, L; Training Interview of Director). The number of communities increased from two to six benefiting communities. Actually honey exploitation is not a new activity. It was stagnant but has developed since one of YRBI staff participated and shared the knowledge about economic community empowerment with his colleagues. Together with his colleagues, then benefiting communities after their own skill raised [19] (annex L, M, O, R; Process Tracing Minutes Meeting). At the bottom of all this was the Making Market for the Poor Training (MFP) [24] (Annex C; Training Interview of Director). This activity was held in 2013 in the form of training by Penabulu supported by ICCO. The YRBI staff who participated in this training was–The YRBI Director. This training made

[18] Mukim and gampong is a legal community unit. It has boundaries and authority to control and manage the interests of local communities based on the origin and the local customs which are recognized in the Indonesian Government system. In a nutshell is zoning based on local custom. In the structure, gampong is under mukim. Mukim formed by at least four gampong. Each mukim is led by a Uleebalang or a Mukim. This system is applied since the era of the Aceh Sultanate.

efforts in providing participants with the competencies necessary to market their products. Oftentimes, the obstacle in the development of small to medium-sized industries is marketing products. Through this training, the products can be marketed well and in time so as to increase the economy of the community.

*Thirdly,* communities were encouraged to use the results of training as a strategy to raise public and corporate funds [7] (Annex L; Training Interview of Director; Process Tracing Minutes Meeting). YRBI makes an active effort in order for the beneficiary communities to be able to not only raise resources, but also be able to identify and be firm towards companies involved in cases of corruption, environment, human rights, etc. A number of beneficiary communities succeeded in raising public funds through cooperation with private sectors/companies or directly from the community. They did this by creating proposals for cooperation or donations, selling merchandise, etc. However, YRBI asserted the beneficiary communities to pay attention to the background of those they would like to cooperate with, especially the private companies. That knowledge was shared by YRBI's staff to all beneficiaries [12] (Annex L; Training Interview of Director), and this knowledge was the result of skills gained to do fundraising from the public and the private sector [17] (Annex L; Training Interview of Director). At the basis of this increased capacity was the Resource Mobilization Training [25] (Annex C, L; Training Interview of Director). This activity was held in 2013 in the form of a training held by Penabulu with the support of ICCO. The YRBI staff sent to participate in the training was The YRBI Director. This training was on how beneficiary communities or the organization can raise public funds, therefore making this beneficial for the beneficiary communities and YRBI. The output was his improved competencies in raising public funds [17] (Annex C, L; Training Interview of Director). Unfortunately, the increased fundraising capacity was not successfully applied to the own organization.

In all three cases of ICCO supported trainings and activities, YRBI organized meetings to share the outcomes amongst the staff who didn't attend. *"Diskusi Lorong"* [20], as it is called, was actually YRBI's internal forum to discuss or share technical details dealing with program implementation and the performance of the organization or the subjects of the capacity building. The staffs who have recently attended trainings are often asked to share their knowledge with others through this forum. In addition, this forum is also used for updating the latest social issues developing in Aceh. Although this forum is informal, the staffs consider it very productive. Their capacities have significantly increased through this forum.

*The fourth* and last factor contributing to the increase in trust among beneficiaries and stakeholders was a shift in government regulation regarding *mukim* and *gampong* [8] (Annex L, R; Process Tracing Minutes Meeting). This was the result of regulatory advocacy from YRBI on the one hand [13] (Annex l, R; Process Tracing Minutes Meeting) and the increasing spotlight on the CSO mainstream issues of *mukim* and *gampong* on the other hand [14] (annex L, M, O, R; Process Tracing Minutes Meeting). Both will be explained below.

*Firstly,* due to the government permitted exploitation of natural resources by companies, YRBI was motivated to increase public awareness, in this case the *mukim* and *gampong*, that they are the ones who truly have the sovereignty for natural resources. The government must include them in managing the natural resources. If companies want to exploit the natural resources, it must be permitted by *mukim* and *gampong*. YRBI trained and accompanied the community in managing the natural resources. They paid attention to a number of values, such as: environmentally friendly based on custom. In addition, YRBI also advocate so that issue was accommodated by the government as a regulation [13] (Annex L, R; Process Tracing Minutes Meeting).

*Secondly,* by starting with issues on managing natural resources, the *mukim* and government sovereignty became a mainstream issue for NGOs in the Aceh province [14] (annex L, M, O, R; Process Tracing Minutes Meeting). This forum succeeded in making *mukim* and *gampong* sovereignty a joined issue. Women NGOs, human rights NGOs, environmental NGOs, economic empowerment NGOs, etc, have made *mukim* and *gampong* the basis of their actions, and custom as the spirit. Productive communication, interaction and sharing between NGOs, or stakeholders, specifically dealing with *mukim* and *gampong* was done in this forum [18] (Annex L, M, O, R; Process Tracing Minutes Meeting). For YRBI itself, this forum made use of YRBI's infrastructure to optimize the work of the network [21] (Annex L, M, R; Process Tracing Minutes Meeting). The development of YRBI's organization infrastructure resulted as part of an independent effort to become more sovereign [26]

(Annex L, M, R; Process Tracing Minutes Meeting) in the initiation of “Mukim Sovereignty Organizations for the Sovereignty of Natural Resources".

# 5 Discussion and conclusion

## 5.1 Methodological issues

**General: Applied to all or most SPOs**

With regard to the methodology, Indonesia has made some data collection adjustment based on the context. The first adjustment was related to the type of instrument used. To assess the organizational capacity, the study has provided self-assessment, observation and interview sheets. These all were used during the baseline with all SPOs. During the end line the team used self-assessment, interview and observation sheets. However the evaluator applied interview sheets as self-assessment—where participants were asked to fill these sheets by themselves. For the participants who did not attend the workshop, the interviews were done separately using the interview sheet and the results from the interview were included in the subgroup interview sheet that was already filled by the staff member. Were combined into the relevant sub categories in the interview sheet. Interview sheets were also applied for interviews with the CFAs, partners and consultants.

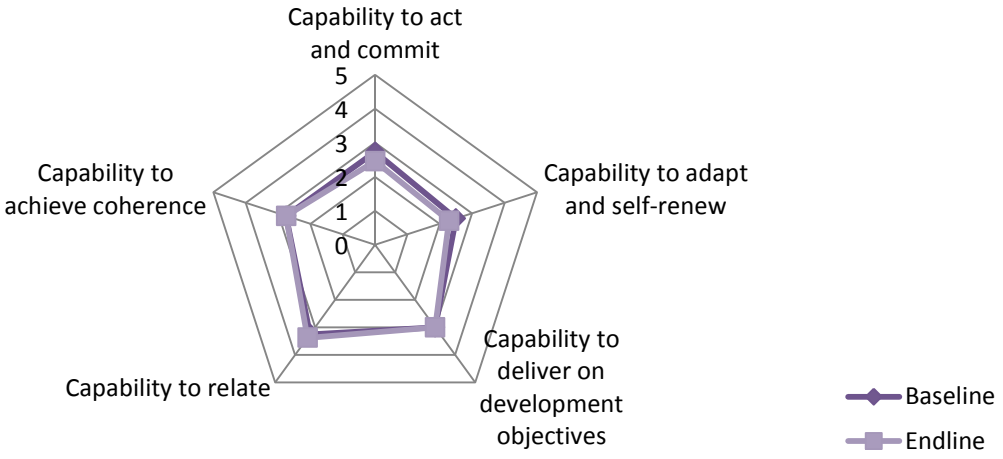
The baseline study showed that having two similar instruments (self assessments, and interview sheets) did not have any effect in relation to obtaining adequate and quality data.

Another adjustment to the methodology was the language. The team has translated all instruments in to Bahasa Indonesia to be able better understood by the SPO's. This also applied to the initial findings (translated back into Indonesia) for three SPOs that are YRBI, ASB and PT.PPMA.

To have some clarification post visit to all SPOs, the evaluator used email and phone interviews.

**YRBI**

The evaluator began the endline process by sending all the interview sheets prior to the field visit to the SPO. However none of them was returned back. This was due to the staff workload and the little time available for responding to the request to fill in these sheets. YRBI is one of the SPO's that was selected for process tracing. The evaluator visited the SPO twice.



The first visit was divided into two sessions. The first session was to develop the general causal map, based on key organisational capacity changes since the baseline, and to facilitate the interview. The second visit focused on verifying the general causal map and furthermore interviews with the former director and organizational partners [Director of the Aceh Human Rights Coalition and Imam Mukim (Local Leader)] were carried out.

Furthermore, process tracing was carried out during the second the field visit to the SPO. In relation to this process tracing, three staffs filled the training questionnaire related to MFS II funded training events since the baseline in 2012.One staff attended two different trainings in 2013 (Resource Mobilisation) and 2014 (Marketing for the Poor), while another staff attended one internship during 2013-2014 on PIWA—Custom Territory Land Mapping. It was not possible to engage YRBI staff that participated in the baseline study because they no longer worked in the organization due to the financial crisis of the organisation. In the baseline, 6 permanent staff and 8 program staff (non-permanent staff) participated. While in the end line, only 8 staff remained and participated in the study. They were, 1 management staff (director), 2 program staff, 2 admin and HRM staff, and 3 field staff..

## 5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Changes in the five capabilities for YRBI have been both negative and positive, but largely unchanged. The greatest change took place under the capability to act and commit but was negative. The changes in each of the capabilities are further explained, by referring to the specific indicators that changed.

Over the last two years most changes for YRBI took place in the indicators under the capability to act and commit. Overall a slight deterioration took place as compared to the baseline, although some positive developments were found as well. Responsive leadership slightly improved as the director's position was handed over to a younger staff member, which made day to day interaction with colleagues easier. Strategic guidance however deteriorated as a result of a lack of detailed instructions on daily work activities by the new director. Staff turnover deteriorated as well, due to a lack of influx of new staff and existing staff members leaving due to a lack of funding of the organization. Organizational structure deteriorated related to this leaving of staff members. Critical functions of the organizations can no longer be fulfilled. Articulated strategies slightly deteriorated as after the closing of program activities there is no further need for developing analyses and performing M&E. Nonetheless, staff skills slightly improved due to various training offerings from ICCO in 2012-2014. In line with this, training opportunities for staff members improved slightly. A deterioration in terms of funding sources is evident in case of YRBI. After the contract with ICCO ended, no new funding sources have been found, leaving the organization unable to perform or act.

In terms of the capability to adapt and self-renew, a very slight deterioration took place. In terms of critical reflection the situation has deteriorated. Regular staff meetings are no longer held, and some staff members have indicated that it is difficult to provide and receive critical feedback from colleagues or management. Similarly, the freedom for ideas has slightly deteriorated, recently the regularity and duration of meetings has been reduced due to the limited amount of work activities.

The capability to deliver on development objectives has effectively remained unchanged although two particular indicators have changed. First, a slight improvement was found in clear operational plans. As all the information is now open on the table in terms of work plans and budget, it is very clear what can and cannot be done in terms of work. Secondly, a slight deterioration took place in terms of monitoring efficiency. Structural practices are missing and even deteriorating.

The capability to relate has very slightly improved. This resulted from a slight improvement in the engagement in networks. YRBI has expanded its network to several new networks and groups. In contrast to this is the slight deterioration, which occurred in terms of engagement with target groups. Although in practice the network is still strong and partners still support YRBI, the organisation does

not have the resources anymore to continue to engage with its target groups, which can lead to a slow erosion of relationships over time. Despite all this, relationships within the organization have slightly improved. Staff members have described internal relations as a "sense of family" and staff get along well with the new director.

No changes occurred in terms of the capability to achieve coherence since the baseline in 2012.

**General organisational capacity changes related to MFS II Interventions**

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. Please note that this information is based only on the information provided by YRBI staff during the endline workshop, but no validation of this information has been done like with the process tracing causal maps. For details in relation to attribution, we refer to the next section (5.3).

During the endline workshop some key organisational capacity changes were brought up by YRBI staff, these have been captured in the general causal map in 4.2.2:

1. staff capacity on *mukim* and *gampong* sovereignty issues is more recognized
2. an improved and more extensive network
3. reduced paid workforce and program funds

All of these are expected to contribute to YRBI becoming the leading organization in mukim and gampong sovereignty issues. YRBI staff experienced these as the most important capacity changes in the organisation since the baseline.

Staff capacity is more recognized due to more invitations from the community to share staff knowledge and skills on mukim and gampong issues. This can be attributed to the increased trust from beneficiaries and stakeholders, which is due several developments; improved community awareness due to public education on the issue; successful fundraising of communities with YRBI's support and encouragement; more village maps produced with help from YRBI; increased economic community empowerment assistance through the honey bee exploitation program; and the government initiating specific mukim and gampung regulation after active advocacy. All of these factors can be attributed to mukim and gampong sovereignty becoming more developed as a result of increased staff capacities to develop the program. This was enabled through internal knowledge sharing, resulting from various staff capacity building activities by ICCO through MFS II funded capacity development interventions. Another factor affecting the trust of stakeholders was the continuous sharing of knowledge after mukim and gampong became a mainstream issue in Aceh following the initiation of sovereignty institutions to rescue these areas and their natural resources.

YRBI's network improved and became more extensive. The latter can be attributed to the optimal use of the organization's facilities for events and trainings, the initiation of sovereignty institutions, as well as the greater public attention resulting from the mainstream issue status.

There was also a negative change in the organisation: a reduction in paid work force and program funds. This resulted from no salary being paid, program activities being shut down, a reduction in the number of staff, and staff took up work on a voluntary basis as a result of this.. Each of these changes can be attributed to the poor financial situation of YRBI since no new funds were obtained after the expiration of the ICCO contract. This can be attributed to a change of ICCO policy following the renewal of the MoU between ICCO and the Indonesian government, in which political areas and topics complicated the continuation of projects in the area. No new funds were obtained as well due to the rejection of proposals and indecisive leadership. Proposals being rejected can be attributed to the limited number of proposals developed despite staff having the competencies to do so, as well as the lack of experience in fundraising of the new leader in charge. Finally more voluntary work was commissioned as staff remained motivated to work due to greater involvement in decision making and a more egalitarian and democratic leadership style of the new director. Whilst there was no link indicated with MFS II funded capacity development interventions, the fact that the main funder ICCO (MFS II) withdrew from funding the organisation has had an important effect on the organisation's financial situation. The organisation has not been able to restore the situation which has seriously affected its ability to implement programs.

In conclusion, and based on information provided during the endline workshop, only two branches of the general causal map can be partly attributed to MFS II funded interventions: the improved network of the organization, and staff capacity becoming more recognized in terms of mukim and gampong sovereignty issues. The network improvements can only be partially related, as other developments play a strong role as well. However, it must be noted that the information provided has not been verified through other sources of information. For this please refer to section 5.3 where process tracing has been applied to more carefully address this attribution question.

## 5.3 Attributing changes in organisational capacity development to MFS II

This section aims to provide an answer to the second and fourth evaluation questions:

2. *To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*
4. *What factors explain the findings drawn from the questions above?*

To address the question of attribution it was agreed that for all the countries in the 5C study, the focus would be on the capability to act and commit and the capability to adapt and self-renew, with a focus on MFS II supported organisational capacity development interventions that were possibly related to these capabilities. 'Process tracing' was used to get more detailed information about the changes in these capabilities that were possibly related to the specific MFS II capacity development interventions. The organisational capacity changes that were focused on were:

- Poor financial situation
- Becoming the leading organization in *mukim* and *gampong* sovereignty issues in Aceh and Indonesia

The first organisational capacity change falls under the capability to act and commit. The second organisational capacity change falls under the capability to adapt and self-renew. The second organisational capacity is closely intertwined with some implementation activities and targets of YRBI. The organisational capacity change areas that were chosen are based on document review as well as discussions with the SPO and CFA. Each of these organisational capacity changes is further discussed below.

The following issues are discussed for the MFS II funded activities that are related to the above mentioned organisational capacity changes:

a. Design: the extent to which the MFS II supported capacity development intervention was well-designed. (Key criteria: relevance to the SPO; SMART objectives)
b. Implementation: the extent to which the MFS II supported capacity development was implemented as designed (key criteria: design, according to plans during the baseline);
c. Reaching objectives: the extent to which the MFS II capacity development intervention reached all its objectives (key criteria: immediate and long-term objectives, as formulated during the baseline);
d. the extent to which the observed results are attributable to the identified MFS II supported capacity development intervention (reference made to detailed causal map, based on 'process tracing').

Please note that whilst (d) addresses the evaluation question related to attribution (evaluation question 2), the other three issues (a, b and c) have been added by the synthesis team as additional reporting requirements. This was done when fieldwork for the endline process had already started, and is also not the focus on this 5c evaluation. With the minimum information available the evaluation team tried to address these first 3 questions.

**Poor financial situation**

The following MFS II capacity development interventions supported by ICCO were linked to the key organisational capacity change "poor financial situation":

1. Financial System Management Training (March 2013)

2. Resource Mobilisation Training, February 2013

*Financial System Management Training*

**Design**
This intervention was not specifically planned during the baseline. It is included here as well as in the detailed causal maps and narratives because the effects of this training were observed during the endline and it came up during document review, workshop, and interviews. The immediate objective of this training was to have YRBI apply the financial software in place to use a standard financial system which is conform donor standards. The long term objective was to create a strong financial management system with accountable financial reporting.

The training has been provided by ICCO to all ICCO partners to ensure that they meet the minimal standard of financial reporting, and therefore very relevant to the SPO. The training is however also relevant to YRBI's capacity building for staff. In the Theory of Change developed in the baseline in 2012, finance was identified as a technical competence that required strengthening. Prior to the baseline, several related interventions to finance and financial administration were already carried out. It was also indicated that such interventions may be ongoing activities, although at the time of the baseline, it was not exactly specified when and how this would occur.

The expected effects were partially formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). Then again, the evaluation team did not ask the CFA for SMART objectives but rather asked about the expected immediate and long term effects of the interventions.

**Implementation**
The intervention was not specifically planned for during the baseline. One staff member (the financial manager) attended the training in 2013 at a partner organization in Jakarta as a one day workshop, although an exact date and further information about the session are unknown to the evaluation team. As far as the evaluation team knows, it was implemented as designed, however, details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

**Reaching objectives**
Not having objectives that were defined as very SMART objectives makes it difficult to assess this issue in detail. However, ICCO has stated that YRBI now successfully applies the financial software system, which was the intended immediate objective as stated by the ICCO account manager in the self-assessment and interview and in that respect the immediate objective has been reached. Similarly, both the CFA and SPO have stated that financial reports are now more transparent and accountable, which meets the long-term objective.

*Resource Mobilisation Training, February 2013*

**Design**
This intervention was planned during the baseline and laid out in the theory of change. ICCO stated here that next to past capacity development interventions, for the period of 2012-2015, the plan was to also pay attention to resource mobilization (with a focus on financial sustainability). A previous three day workshop in Jakarta on resource mobilisation and financial sustainability had already been given to the YRBI leader prior to the baseline evaluation in 2012. The resource mobilisation training in 2013 was a follow up on this earlier training.

The immediate expected effect of the intervention was that YRBI would have the capacity to mobilise available resources in their organisation and to create innovative approaches to generating income. The long term expected effects were for YRBI to be able to develop innovative strategies to become a sustainable organisation, and to develop fundraising strategies using their own resources.

Resource mobilisation is very relevant to YRBI now that ICCO has stopped its funding to the organisation. The contract between ICCO and YRBI expired on 31 October 2013 and was not renewed due to political and administrative issues. Having funded 100% of YRBI's activities in the past, ICCO wanted to ensure that YRBI could transition well to this new situation and become a sustainable organisation. After the contract with ICCO has ended, YRBI is required to find its own funding from new sources and sustain its activities by other means.

The above mentioned expected effects were not formulated in a very SMART way (specific, measurable, achievable, relevant and time-bound). Then again, the evaluation team did not ask the CFA for SMART objectives specifically during the baseline, but rather asked about the expected immediate and long term effects of the interventions.

**Implementation**

This intervention took place in the form of a training in February 2013, and was attended by YRBI's director. About 25 other ICCO partners attended the event as well which was held in Depok, Jakarta. As far as the evaluation team knows, it was implemented as designed, however, details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

**Reaching objectives**

Not having objectives that were defined as very SMART objectives makes it difficult to assess this issue in specific, however the causal map on the poor financial situation of YRBI, makes it clear that neither the immediate (ability to mobilise resources and create innovative approaches to generate income) nor the long term objectives (develop innovative sustainable strategies and develop fundraising strategies) have been realised as of yet.

YRBI was unable to apply the lessons learned in the training to itself. No concrete fund raising activities were carried out after the resource mobilisation training took place. Instead, YRBI used the knowledge to train its beneficiary communities in order to empower them to raise funds in a variety of ways. This yielded some positive results in that a number of beneficiary communities succeeded in raising public funds through cooperation with private parties. The lack of new funds has led to a poor financial situation for YRBI in which both the number of program activities, as well as the number of staff has been greatly reduced.

**Attribution of observed results to MFS II capacity development interventions**

The poor financial situation of YRBI resulted from a lack of obtaining new funds, which in turn resulted from the expiration of the ICCO contract, no follow up on fundraising activities occurred, and rejection of proposals for funding (see 4.3.1) took place, even though the organisation has increased its capacity to provide financial reports based on donor standards.

The expiration of the YRBI and ICCO contract was due to a change of ICCO policy. In this policy ICCO stated that they couldn't further support activities with "mukim and gampong" issues, as they did not receive permission to work in these areas in Aceh any longer after the renewal of the MoU between ICCO and the Government of Indonesia.

No follow up for fundraising occurred, despite increased competencies in resource mobilization as the result of the Resource Mobilization training in 2013 by ICCO. The competencies to raise public funds as generated in the ICCO intervention to mobilise resources training in February 2013, were not utilized for YRBI's own financial situation. Instead YRBI elected to share these training outcomes amongst its beneficiary communities, some of which successfully applied this to raise public funds through cooperation with private parties.

The rejection of proposals was do a lack of experience in fundraising on the one hand and a limited number of proposals being developed on the other. The role of fundraising remained an important function of the director, but the new director did not have the experience or networking skills to continue the level of initiatives of the previous director. A limited number of proposals was developed as well, making the chance of success slim. This despite the fact that proposal development was now a developed competence by the staff members. This developed competence cannot be related to any MFS II supported capacity development interventions.

No evidence for a relation could be found between the poor financial situation of YRBI and the improved transparency and accountability in financial reporting which resulted from the Financial Management training. Despite the positive outcomes in reaching the CFA's objectives in terms of utilizing the financial software and becoming a more transparent and accountable reporting organization, these developments did not impact the financial situation of YRBI. Instead the capacity built up in this area is now unused, as YRBI does not have any ICCO programs to carry out anymore.

In conclusion, two MFS II capacity development interventions were identified related to this organizational capacity outcome area, but their impact on the poor financial situation of YRBI remains

limited. Whilst better, more transparent and accountable financial reporting can be attributed to the MFS II funded financial management training, this could not improve the financial situation of the organization. On the other hand the improved competence in resource mobilization can be attributed to the MFS II funded resource mobilization training, but due to lack of follow up and application to YRBI itself, no new funds could be acquired and the financial situation remains poor.

**Becoming the leading organisation in mukim and gampong sovereignity issues in Aceh and Indonesia**

The following MFS II capacity development interventions supported by ICCO are linked to the key organisational capacity change "Becoming the leading organisation in mukim and gampong sovereignity issues in Aceh and Indonesia" (please also see section 4.3 of this report):

1. Participatory Mapping Internship (GIS) (series of activities), October 2013 – January 2014
2. Making Markets work for the Poor (MFP) Training series, March 2014-ongoing
3. Resource Mobilization Training, February 2013

*Participatory Mapping Internship (GIS) – Series of activities between October 2013 and January 2014*

**Design**

This intervention was not planned during the baseline. The participatory mapping internship was a training course for one staff member to develop his competence in GIS application and development, one of the core activities of YRBI. No specific immediate and long term objectives were formulated.

The intervention has been mentioned during the interviews, and self-assessments as very relevant to the SPO as Participatory Mapping is one of YRBI's core activities.

**Implementation**

The intervention was not planned for during the baseline and took place in 6 different sessions of approximately a 3-7 days per session in between October 2013 and February 2014 in Bogor at the School of spatial planning. As far as the evaluation team knows, it was implemented as designed, however, details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

**Reaching objectives**

Since no objectives haven't been formulated , it is not possible to assess to what extent these objectives have been reached. However, it can be stated that the training was perceived positively by the attendee as noted in the interviews, and its contents were disseminated amongst YRBI colleagues and beneficiaries. This has led to various independent efforts with communities to implement the knowledge in practice (see for more information section 4.3.1).

*Making Markets Work for the Poor (MFP) Training series, March 2014-ongoing*

**Design**

This intervention was not planned for during the baseline evaluation. The intervention is an initiative of ICCO to train its 14 partners in their capacity for economic program development in a series of activities between March 2014 until December 2014.

The training was deemed relevant for YRBI by both the SPO as the CFA. YRBI's position close to its beneficiary communities, as well as their in-depth knowledge about the territory and its natural resources, makes the organization well suited for the development and implementation of economic development plans. YRBI's beneficiaries would greatly benefit from developing the economic capacity to exploit local natural resources.

The immediate objective as stated by ICCO was the recognition of a potential economic development program. For the long term , objective, ICCO stated that YRBI should have an economic development program for the community based on the Making Markets Work for the Poor approach as taught in the training.

The expected effects were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). Then again, the evaluation team did not ask the CFA for SMART objectives specifically , but rather asked about the expected immediate and long term effects of the interventions.

**Implementation**

Implementation of the activity took place parallel to the endline evaluation and started in March 2014 with an introduction workshop at PENABULU training center in Jakarta, which was attended by the YPRI director with 24 other ICCO partners. Further activities were planned in the form of on-site coaching (April-July 2014) and business model and plan development workshops in October – December 2014. As far as the evaluation team knows, the intervention was implemented as designed, however, details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

**Reaching objectives**

The implementation of this intervention took place simultaneously to the endline evaluation which makes it difficult to fully assess the outcome of the efforts. Furthermore, since the objectives haven't been formulated as SMART objectives, it is difficult to assess to what extent these objectives have been reached.

Though not the focus of this evaluation, we can provide an indication of the extent to which the objectives as formulated during the baseline and endline, have been achieved.The CFA has stated that after the first workshop took place YRBI had already met the immediate objective of identifying a potential commodity for further development in to a community economic program. Over the past year, this has expanded into a an active community empowerment project to develop honey bee forest exploitation, which comes close to the long term objective of the CFA for YRBI to develop its own community economic development program.

*Resource Mobilisation Training, February 2013*

**Design**

This intervention was planned during the baseline and laid out in the theory of change. ICCO stated here that next to past interventions, for the period of 2012-2015, the plan was to also pay attention to resource mobilization (with a focus on financial sustainability). A previous three day workshop in Jakarta on resource mobilisation and financial sustainability had already been given to the YRBI leader prior to the baseline evaluation in 2012. The resource mobilisation training in 2013 was a follow up on this earlier training.

The immediate expected effect of this intervention was that YRBI would have the capacity to mobilise available resources in their organisation and to create innovative approaches to generating income. The long term expected effects were for YRBI to be able to develop innovative strategies to become a sustainable organisation, and to develop fundraising strategies using their own resources.

Resource mobilisation is very relevant to YRBI now that ICCO has stopped its funding to the organisation. The contract between ICCO and YRBI expired on 31 October 2013 and was not renewed due to political and administrative issues. Having funded 100% of YRBI's activities in the past, ICCO wanted to ensure that YRBI could transition well to this new situation and become a sustainable organisation. After the contract with ICCO has ended, YRBI is required to find its own funding from new sources and sustain its activities by other means. In addition, YRBI's beneficiary communities are constantly looking for additional support as well which YRBI's encourages. Developing and enabling communities with skills on how to fundraise is therefore also very relevant for YRBI.

The above mentioned expected effects were not formulated in a very SMART way (specific, measurable, achievable, relevant and time-bound). Then again, the evaluation team did not ask the CFA for SMART objectives specifically during the baseline, but rather asked about the expected immediate and long term effects of the interventions.

**Implementation**

This intervention took place in the form of a training in February 2013, and was attended by YRBI's director. About 25 other ICCO partners attended the event as well which was held in Depok, Jakarta.

As far as the evaluation team knows, it was implemented as designed, however, details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

**Reaching objectives**

Not having objectives that were defined as very SMART objectives makes it difficult to assess this issue in specific. The training was used successfully to share knowledge with YRBI's beneficiary communities, and to encourage them to use the material in practice. For some of the communities this worked out in favour, as they managed to gain access to new funds from private parties. In this sense, the intervention was successful for YRBI, although it was not primarily intended as such by the CFA. ICCO primarily wanted YRBI to develop its own fundraising capacity.

**Attribution of observed results to MFS II capacity development interventions**

YRBI has become more visible as a leading organisation in Mukim and Gampong sovereignity issues in Aceh in Indonesia. This was due to YRBI's staff capacity on Gampong and Mukim issues becoming more recognized amongst its stakeholders, due to more invitations from the community to share staff knowledge and skills.

Local communities started inviting YRBI more due to an increase of trust in the organisation, as well as as Gampong and Mukim issues becoming more mainstream. The increase of trust occurred because of the implementation of successful program activities that greatly involved and empowered the beneficiary communities. This included a village mapping initiative that was produced and utilized by the community itself (specifics unknown to evaluation team), an increase in the number of assisted bee project groups in the community economic development initiative, and fundraising training to community and successful encouragement of the community to seek public and private funds. Another reason for increased trust by communities and stakeholders is the fact that the government has initiated mukim and gampong regulations, as well as Gampong and Mukim becoming one of the CSO mainstream issues in Aceh.

Village maps were produced and utilized by the people as a result of the application of the training skills to some of the villages independently. This can be attributed to the increased staff ability to develop maps independently, following internal knowledge sharing gained from trainings. The knowledge shared in this case can be contributed to the participatory mapping internship (GIS) that took place in 2014 and was MFS II funded.

The increased number of assisted bee project groups was due to the utilization of the honey bee project to align with organizational issues, which resulted from the development of new community empowerment of honey bee forest exploitation. This can be attributed to increased staff capacity to do economic community empowerment, which resulted from internal knowledge sharing after the Making Markets work for the Poor Training in 2013 (MFS II funded).

Encouraging the community to use the results of training as a strategy to raise public and corporate funds resulted from the sharing of training knowledge to beneficiaries. This can be attributed to the gained staff skill to do fundraising from public or corporate CSR funds. This was due the internal knowledge sharing of the resource mobilization training that took place in 2013 as well.

Government initiating mukim and gampong regulation resulted from regulatory advocacy taking place which can be attributed to the organization continuously sharing knowledge on mukim and gampong issues to its shareholders, as well as this topic becoming a CSO mainstream issue. Sharing with stakeholders can be attributed to the internal knowledge sharing of trainings on the one hand, and on the availability of a building based in YRBI used for network meetings on the other. This can be attributed to the "Mukim Sovereignty Organizations for the sovereignty of natural resources" initiative which YRBI undertook.

First, the participatory mapping internship (MFS II) held between October 2013 and January 2014 led to the sharing of training outcomes amongst all YRBI staff through a special knowledge sharing medium in the organization named "diskusi lorong". This resulted in the increase in staff capacity in this field, which translated in active application in the field in close cooperation with beneficiary communities, who were taught in the process. Not only did this build trust, it also empowered these communities which lead to a more visible and leading stature of YRBI.

Secondly, the 'Making Markets Work for the Poor' Training (MFS II), which took place in the course of 2014 parallel to the endline evaluation, resulted in the successful creation of a economic development project for beneficiary communities on the topic of honey bee exploitation and commercialisation. An increased amount of beneficiary groups has started getting involved in this project, again leading to greater trust amongst beneficiary communities.

Thirdly, the resource mobilisation training held in 2013 in Jakarta and attended by YRBI's director resulted in sharing fundraising strategies with beneficiary communities Communities were encouraged to use the results of training as a strategy to raise public and corporate funds. YRBI has made an active effort in order for the beneficiary communities to be able to not only raise resources, but also be able to identify and be firm towards companies involved in cases of corruption, environment, human rights. A number of beneficiary communities succeeded in raising public funds through cooperation with private sectors/companies or directly from the community

On the whole, YRBI has grown into a leading organisation in Mukim and Gampong sovereignty issues in Aceh and Indonesia, and this is mainly due to positive effects at community level of the projects implemented by staff whose competencies have been enhanced in the MFS II trainings on participatory mapping, 'Making Markets Work for the Poor' and resource mobilisation. the whole, the changes in the key organisational capacity change can be attributed to a large extent to MFS II supported capacity development interventions..

# Appendix 1 Methodological approach & reflection

## Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

## Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline

has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.19 Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

19 The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team

15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
   - -2 = Considerable deterioration
   - -1 = A slight deterioration
   - 0 = No change occurred, the situation is the same as in 2012
   - +1 = Slight improvement
   - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*

3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
   - Intervention, actor or factor at the level of or by **SPO**: ..... .
   - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
   - Intervention, actor or factor at the level of or by the **other funders**: ..... .
   - **Other** interventions, actors or factors: ..... .

Step 2. **Review** the descriptions per indicator – in-country team & CDI team

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;
- Business plans;
- Project/ programme planning documents;

- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5. **Prepare and organise the field visit** to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6. **Interview the CFA** – CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

*Step 7. **Run the endline workshop** with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

**Purpose of the fieldwork:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

**Brainstorm on key organisational capacity changes and influencing factors:** a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative.This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

**Self-assessments:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8.* ***Interview SPO staff*** *– in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9.* ***Fill-in observation sheets*** *– in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

*Step 10.* ***Interview externals*** *– in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11.* ***Upload and auto-code all the formats*** *collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the* ***overview of information*** *per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13.* ***Analyse the data and develop a draft description*** *of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14.* ***Analyse the data and finalize the description*** *of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15.* ***Analyse the information*** *in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

## Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

- Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.
- Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.
- Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the

purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

*The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia*

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

*SPOs selected for process tracing – Ethiopia*

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| AMREF | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| CARE | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| ECFA | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| FSCE | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| HOA-REC | Sustainable Energy project (ICCO Alliance): 2014 Innovative WASH (WASH Alliance): Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| HUNDEE | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| NVEA | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |
| OSRA | C4C Alliance project (farmers marketing): December 2014 ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| TTCA | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

*The extent to which the Dutch NGO explicitly targets the following capabilities – India*[20]

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

*SPOs selected for process tracing – India*

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BVHA | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| COUNT | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| DRISTI | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| FFID | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |

[20] RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Jana Vikas | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| NEDSF | | | | | | | No – delayed baseline |
| RGVN | | | | | | | No - delayed baseline |
| Samarthak Samiti (SDS) | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| Shivi Development Society (SDS) | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| Smile | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| VTRC | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

*The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia*

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | PT. PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, PT.PPMA, YPI, YRBI.

Table 6

*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| ASB | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| Dayakologi | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| ECPAT | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| GSS | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| Lembaga Kita | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| PT.PPMA | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| Rifka Annisa | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| WIIP | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Yayasan Kelola | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| YPI | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| YRBI | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| Yadupa | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

*The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia*

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

*SPOs selected for process tracing – Liberia*

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BSC | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| DEN-L | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| NAWOCOL | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| REFOUND | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| RHRAP | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

- A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
- A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
- **Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
- **Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for coding documents received from SPO and CFA in NVivo on the following:

- 5C Indicators: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the capacity development interventions implemented by the CFA (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
  - In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
  - During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;
  - During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
  - During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.

The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

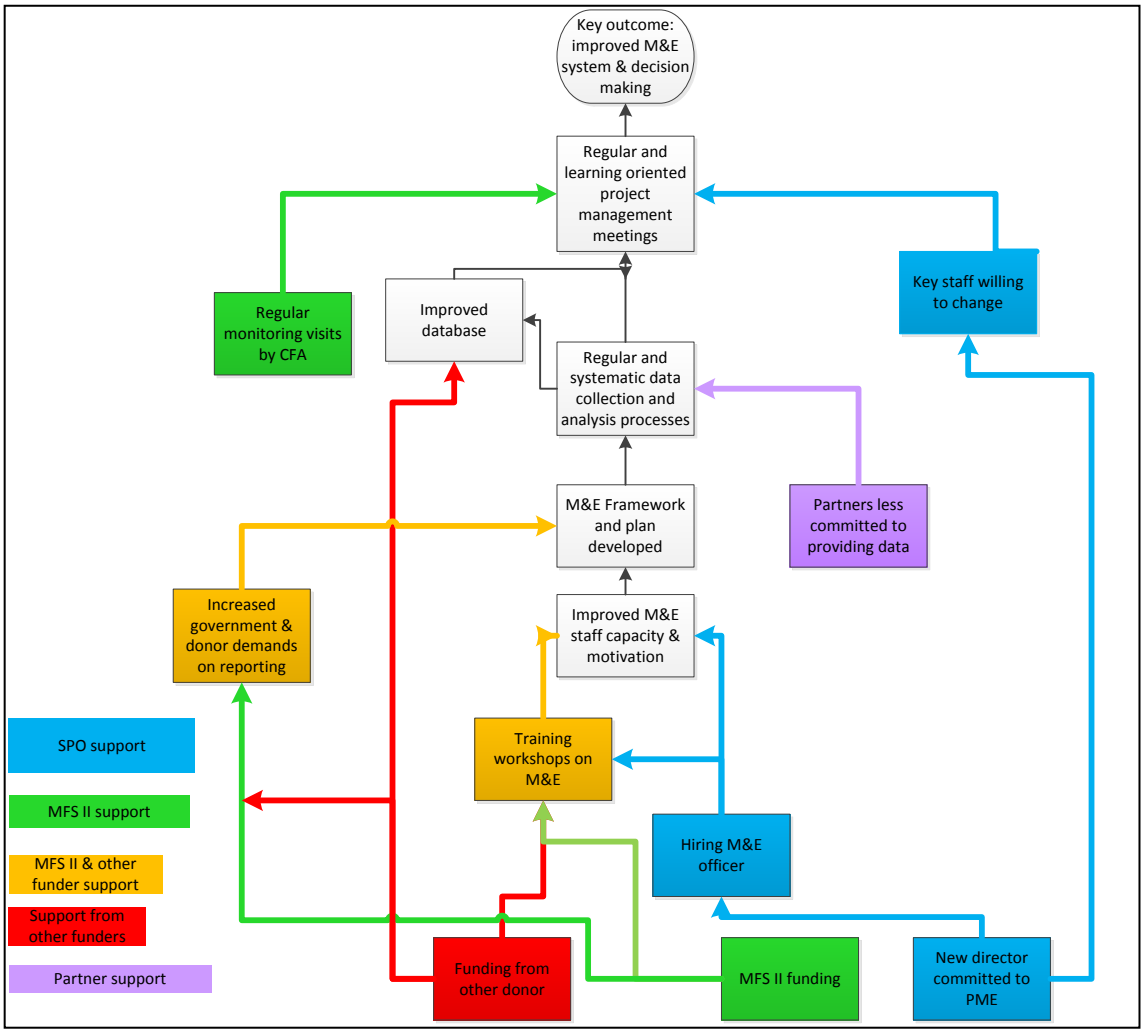

***Figure 1*** *An imaginary example of a model of change*

*Step 5. Identify **types of evidence** needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, *"What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?"*. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

- **Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.
- **Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
- **Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.
- **Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

*Format for identifying types of evidence for different causal relationships in the model of change (example included)*

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| Describe relationship between the subcomponents of the model of change | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions.<br>Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y?<br>Can we find this information by means of :<br>Pattern evidence;<br>Sequence evidence;<br>Trace evidence;<br>Account evidence? | Describe where you can find this information |
| Example:<br>Training workshops on M&E provided by MFS II funding and other sources of funding | Example:<br>What type of training workshops on M&E took place?<br>Who was trained?<br>When did the training take place?<br>Who funded the training?<br>Was the funding of training provided before the training took place?<br>How much money was available for the training? | Example:<br>Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br><br>Sequence evidence on timing of funding and timing of training<br><br>Content evidence: what the training was about | Example:<br>Training report<br>SPO Progress reports<br>interviews with the CFA and SPO staff<br>Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be

addressed by the in country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality** of data and **analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes* subcomponent Y and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

| *Example format for the adapted evidence analysis database (example included)* **Description of causal relation** | **Confirming/ rejecting a causal relation (yes/no)** | **Type of information providing the background to the confirmation or rejection of the causal relation** | **Strength of evidence: strong/ rather strong/ rather weak/ weak** | **Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected** |
|---|---|---|---|---|
| e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

## Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

## Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has

provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores:** using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is

crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection

has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

- The capability to act and commit;
- The capability to deliver on development objectives;
- The capability to adapt and self-renew;
- The capability to relate (to external stakeholders);
- The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed. A detailed overview of capabilities with outcome domains and indicators is attached in Appendix 3.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Appendix 3 Changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

**Description of Endline Indicator Yayasan Rumpun Bambu Indonesia**
**Capability to act and commit**
1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

*This is about leadership within the organization (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organization.*

The director's position has been handed over to younger staff after the previous leader resigned. With this change came a change in the leadership style as well, which can now be characterized as more democratic, open and encompassing of staff opinion. Decisions are made in a democratic fashion through open discussions between staff and the director. The young new director's age and experience are similar to that of his subordinates. This makes communication and day to day interaction between him and his colleagues much easier and informal. Staff has indicated that they feel less reluctant to approach the new director as opposed to his predecessor. This has also resulted in a new habit for the coordinators who have now been empowered to communicate intensely with the community. Every staff is encouraged to contribute their ideas and energy to the development of YRBI, and to be the baseline involved as a part of YRBI which has increased their sense of responsibility.

Score: from 3 to 3.5 (slight improvement)

1.2.Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

*This is about the extent to which the leader(s) provide strategic directions*

The director also allows the staff to create their own strategy, methods and approach in their work. The lack of detailed instructions on day to day work activities, and instead the greater autonomy in carrying out tasks, is seen as a sign of trust from the new director, and greatly appreciated by the staff. Nonetheless, some staff members indicate that they would still like to receive strategic guidance and detailed instructions in some aspects of their work.

On the other hand there are still many inherited problems that have yet to be solved by the new director. The discussion process to address these issues sometimes appears to take much longer than necessary to come to decisions.

Score: from 3.5 to 2.5 (deterioration)

1.3.Staff turnover: 'Staff turnover is relatively low'

This is about staff turnover.

Compared to the baseline evaluation, there has been no influx of new staff, but rather there has been a reduction of staff due to the deterioration of their financial condition.

In 2013, the contract between YRBI and ICCO ended without being renewed. Afterwards YRBI failed to get new funds therefore their financial condition deteriorated. This condition forced YRBI to close their project activities and reduce their staffs.

Before 2012, YRBI had 6 permanent staffs and 8 program staffs. In 2012, they removed 3 permanent staffs. Then, in February 2013, they removed 3 permanent staffs. So in 2014, they have a total of 8 permanent staffs.

Score: from 3.5 to 2.5 (deterioration)

1.4 .Organisational structure 'Existence of clear organization structure reflecting the objectives of the organization"

*Observable indicator: Staff have copy of org. structure and understand this*

The previous structure is actually still relevant with the organization needs but the project activities and staffs reduction caused the structure to be thinner.

Score: from 3.5 to 2.5 (deterioration)

1.5 Articulated Strategies. Strategies are articulated and based on good situation analysis and adequate M&E

*Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.*

Since YRBI closed their projects, M&E were no longer conducted. They only hold informal forum to discuss contemporary issues that develop at local, regional, and national which is called "Diskusi Lorong".

Score: From 2 to 1.5 (slight deterioration)

1.6.Daily operations: 'Day-to-day operations are in line with strategic plans'

*This is about the extent to which day-to-day operations are aligned with strategic plans.*

Day-to-day operations are currently aligned with the strategic plans in place. However, after the closing of ICCO funded program activities, the number of field activities has significantly decreased due to the limited operational budget, which made it more difficult to achieve target (strategic) results. Other staff members have indicated that the current daily operations are back in line again with the strategic planning and the organisation's vision and mission, which is to assists local mukim and gampong communities.

Score: from 3 to 3 (no change)

1.7.Staff skills: 'Staff have necessary skills to do their work'

*This is about whether staff have the skills necessary to do their work and what skills they might need.*

Several training opportunities have been offered to staff of YRBI in the observed period which were supported by ICCO. There were: Participatory Mapping Internship [GIS] in 2014 for the field staff; 2) Making Market for the Poor Training (MFP) in 2013 for the director; 3) Resource Mobilization Training in 2013 for the director; 3) Financial Management Training (computer software course) in 2013 for Finance Staff. As a result, staff has indicated that their skills have generally improved. As an example, one of the field officers indicated that through the GIS training has enabled him to now use GPS data in mapping programs and was able assist the in-house GIS expert with his work. The GIS expert indicated that through his help, his job could now be done faster and more easily.

Despite general improvements in terms of capacity building and training for the staff, language still appears to be a problem in terms of writing and winning proposals, as well effective negotiation.

Score: from 3 to 3.5 (slight improvement)

1.8.Training opportunities: 'Appropriate training opportunities are offered to staff'

*This is about whether staffs at the SPO are offered appropriate training opportunities*

In general training opportunities are offered in numerous ways for staff, directors and volunteers, either to improve skills or to teach new ones. The decision on who gets to attend which training are discussed openly with everyone involved in the organization. The training opportunities were: Participatory Mapping Internship [GIS] in 2014 for the field staff; 2) Making Market for the Poor Training (MFP) in 2013 for the director; 3) Resource Mobilization Training in 2013 for the director; 3)

Financial Management Training (computer software course) in 2013 for Finance Staff. All of them were supported by ICCO.

Score: from 2.5 to 3 (slight improvement)

1.9.1.Incentives: 'Appropriate incentives are in place to sustain staff motivation'

*This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.*

Since the baseline there have not been anychanges in term of incentive for the staff both before and after the contract between YRBI and ICCO ended in October 2013.- Up to now incentives for staff are numerous and come in the form of training opportunities but also flexible work times and freedom at work. Staff also mentioned that they considered the organizational culture and sense of belonging as an incentive to work for YRBI.

Score: from 3 to 3 (no change)

1.9.2.Funding sources: 'Funding from multiple sources covering different time periods'

*This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.*

After the ending of the ICCO contract no new major funding sources have been found. This has led to some downsizing in staff capacity, and the inability to carry out all organizational activities. The organization has acquired a small project for the end of April 2014 for approximately seven months. But the project value is too low to fund additional staff or activities of YRBI.

YRBI has actively applied to new donors and completed assessment with other parties and potential partners. There are some possibilities for cooperation, but none of the ventures have led to agreements as of yet.

Score: from 1.5 to 0.5 (deterioration)

1.9.3.Funding procedures: 'Clear procedures for exploring new funding opportunities'

*This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.*

There are still no clear and formal proposals for the development of proposals. Although the responsibility for proposal writing lies with the director, staff is invited to provide input and ideas during proposal development. Everyone in the organization is engaged to contribute, although overall proposal writing and negotiation skills still require further development.

Score: from 1.5 to 1.5 (no change)

**Summary capability to act and commit**
After a handing over the director's position to a younger staff member, YRBI has become a more open organization for its staff members. Communication with management, feedback and the ability to participate in decision making were enabled by the new director in charge. Staff is encouraged to create their own strategies, methods and approaches in work. Despite that, decision making still appears to be a slow process particularly in relation to "inherited" problems such as financial problems that have yet to be solved. On the whole strategic guidance needs to be further developed.

In term of organization structure, it is thinner due to the project activities and staffs reduction. This reduction has also caused M&E to no longer be conducted. They only hold informal forum to to discuss contemporary issues that develop at local, regional, and national which is called "Diskusi Lorong".

Overall, daily operations are in line with strategic planning, although the number of activities carried out has gone down significantly after the ICCO funded program was finalized. This is also affected staff turnover since staff had to leave the organisation due to closing the ICCO funded project. The number of staffs reduced from 14 to 8. No new major funds have been acquired since, although the organization is actively seeking out new opportunities and has applied to several potential donors. Staff skills have slightly improved over the observed period as a result of increased work experience and donor (ICCO) supported trainings in Participatory Mapping Internship [GIS], Making Market for the Poor Training (MFP), Resource Mobilization Training, and Financial Management Training between

2012-2014. Nonetheless further improvements are needed in terms of English language proficiency to improve the quality of proposals and negotiations.

The previous structure is actually still relevant with the organization needs but the project activities and staffs reduction caused the structure to be thinner.

Since YRBI closed their projects, M&E were no longer conducted. They only hold informal forum to to discuss contemporary issues that develop at local, regional, and national which is called "Diskusi Lorong".

Score: 2.7 to 2.4 (very slight deterioration)

**Capability to adapt and self-renew**

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

*This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).*

Compared to the baseline, nothing has changed in terms of the application of M&E. There is still no comprehensive and functional M&E system in place and there are no written documents or formal procedures for M&E. M&E was mostly conducted through discussions between staff and coordinators. M&E is applied at the project level, not yet the organizational level. M&E is done in the form of discussions based on project agreements (activities, outputs and outcomes), so this is initially done for reporting back to donors. They are learning from it though, identifying obstacles and constraints and reducing the risk of failure by finding solutions.

Score: from 2 to 2 (no change)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

*This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.*

There is no trained staff on M&E, but people that have had training in program management have a basic understanding of it. The M&E of program implementation is done by the director and the coordinator. Measurement is based on program achievements and its conformity with the goal of the program.

Score: from 2 to 2 (no change)

2.3.M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

*This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.*

During visits from the donor, YRBI talks about the projects to check the results based on the agreements in the contract. From the viewpoint of the donor this is aimed to monitor results, but at the same time also to inspire and show that results can be used for improvements to the strategic plan. YRBI is aware of the potential for using M&E, but a problem is that programs can run into a lack of funds, and cannot continue. In this way they cannot generate lessons learned which can be incorporated into new strategies.

Score: from 1.5 to 1.5 (no change)

2.4.Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

*This is about whether staffs talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staffs are comfortable raising issues that are problematic.*

Regular staff meetings are no longer held, although the open atmosphere in the organization encourages staff to talk freely about the particular challenges that they may be facing. This situation is supported and encouraged by the new director.  Nonetheless some staff has stated that it is difficult to

provide and receive consistent feedback and reflect due to the irregularity of meetings, particularly after a project or program has ended. During the informal meetings final decisions are agreed upon together. Volunteers are not involved in these meetings, although they are free to offer their opinions during regular work activities.

Score: from 3 to 2 (deterioration)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives

*This is about whether staffs feel that ideas they bring for implementation of the program are welcomed and used.*

The staff can present their ideas during regular staff meetings. Although they have and offer many ideas, few of them appear to be followed up upon. Not all ideas can be implemented due to budgetary constraints, but staff has indicated that suitable and good ideas have a good chance of being implemented.

Recently, the regularity and duration of meetings have greatly reduced, as a result of which feedback and ideas could not be presented and considered by staff.

Score: from 2.5 to 2 (slight deterioration)

2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and developments in its operating environment'

*This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.*

Staff members have indicated that there is still no system in place to track the environment, although they agree that it's necessary. YRBI has a good network at the local and national level, and picks up on current issues from there. They also follow the media closely. This information is shared within the organization. Some staff members indicate that YRBI does not use the information on trends for its benefit though. Regular contact with beneficiaries can also provide relevant information. As there is no systematic M&E in place, following trends and developments is also not done systematically.

Score: from 3 to 3 (no change)

2.7.Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and the general public'

*This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.*

There are regular informal meetings with stakeholders, for example indigenous communities, women's groups, village governments, higher level government, other NGOs, and *mukim* forum. The program staff, coordinator and director all meet with them. There is no more distinction between staff, coordinator or director in this regard, as everyone is considered to stay closely involved with stakeholders and beneficiaries.

Active participation of the community allows them to convey their expectations, and yields better results as well as a sense of ownership of the products. It also prevents wasting time and resources on unwanted activities.

Score: from 3.5 to 3.5 (no change)

**Summary capability to adapt and self-renew**

On the whole, there is a very slight deterioration in the capability to adapt and self-renew for YRBI. Although staff has indicated numerous times that they see the benefit and need to develop their monitoring and evaluation, it has not been prioritized until now. M&E resides with the Director as there is no trained staff assigned with this particular role. Limited but irregular M&E is done at the project level through infrequent meetings where staff is free to address outstanding issues. M&E is done in the form of discussions based on project agreements (activities, outputs and outcomes), so this is initially done for reporting back to donors. They are learning from it though, identifying obstacles and constraints and reducing the risk of failure by finding solutions.

Staff meetings in general have reduced in frequency, duration and intensity, providing fewer scheduled moments for feedback and discussion. Nonetheless office and organizational culture can be considered open and free and enables informal communication. With regards to keeping track of external developments YRBI continues to track media and its network at the local and national level, and picks up on current issues from there, but there is no formal system in place to do this tracking of the environment.

Communication and engagement with stakeholders and beneficiaries is done directly in the field and includes all level of staff, including the director. Active participation of the community allows YRBI to convey their expectations and this yields better results as well as a sense of ownership of the products amongst the beneficiaries. It also prevents wasting time and resources on unwanted activities.

Score: 2.5 to 2.3 ( very slight deterioration)

**Capability to deliver on development objectives**

3.1.Clear operational plans: 'Organization has clear operational plans for carrying out projects which all staff fully understand'

*This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.*

There is an overall strategic plan, in place which is well understood by staff. Every staff member now has information on what these work plans and budgets are composed of, and how they are used. Program plans are distributed to all staff in the organization. The ability to implement programs has improved since all staff members as more staff now understands how to run the program.

Delegation from the new director to the coordinator runs smoothly but delegation from the coordinator to staff has to be monitored through more systematic job delegation.

Score: from 2 to 2.5 (slight improvement)

3.2.Cost-effective resource use: 'Operations are based on cost-effective use of its resources'
*This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.*

YRBI works closely with its beneficiaries in a participatory approach, involving them in the implementation of projects. If beneficiaries are unresponsive to efforts made, program activities are reconsidered or even stopped entirely, in an overall effort to reduce waste of resources. This approach is the still same as it was during the baseline evaluation and has been proven as effective.

Score: from 3 to 3 (no change)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

*This is about whether the SPO is able to carry out the operational plans.*

Over the last two years YRBI has remained consistent in delivering donor-agreed outputs as outlined in the contracts. The strong involvement of beneficiaries in projects leads to positive results and in some cases even exceeds expectations. This approach remains however time consuming and can lead to delays. .

Score: from 3.5 to 3.5 (no change)

3.4. Mechanisms for beneficiary needs: 'The organization has mechanisms in place to verify that services meet beneficiary needs'

*This is about how the SPO knows that their services are meeting beneficiary needs*

The participatory approach ensures that the target group decides whether they want to work with YRBI and that they actually need the project's output. If there is no active participation of the beneficiaries, the project is canceled. There are formal and informal discussions with beneficiaries on activities and how they use the end products. No change has occurred in this indicator.

Score: from 4 to 4 (no change)

3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratio's)'

*This is about how the SPO knows they are efficient or not in their work.*

M&E remains a point for development for YRBI. Although meetings are held in which both staff, coordinators and leadership are included to discuss efficiency and processes, these are irregular and non-systematic. The lack of a formal system to measure efficiency remains, and roles are not clearly defined in the organization. Although the overall organizational culture under the new leadership supports an environment of critical reflection, structural practices are missing and even deteriorating. Meetings now occur less frequently and are generally considered to be shorter, allowing for less time to address ideas and feedback on process efficiency.

Score: from 2.5 to 2 (slight deterioration)

3.6. Balancing quality-efficiency: 'The organization aims at balancing efficiency requirements with the quality of its work'

*This is about how the SPO ensures quality work with the resources available*

YRBI has a clear vision and is a much focused organization. They cannot depend on funding anymore because the ICCO contract (only funder) ended without being renewed, and together with the community they work together hand in hand in sourcing budget.

The terms of reference for the project have changed from a donor-driven process to a community needs-driven process. With the community closely involved at all stages of project implementation quality is ensured at all times. Efficiency tradeoffs are made if needed, particularly if a beneficiary does not appear to be engaged or supportive of actions. Overall this indicator remains unchanged from the evaluation two years ago.

Score: from 3 to 3 (no change)

**Summary capability to deliver on development objectives**

There is an overall strategic plan in YRBI and day-to-day activities are based on the strategic plan. The ability to implement programs has increased since more staff understands the programs. Delegation is done effectively from the new director to the coordinators, but more difficult from coordinators to the staff, sparking the need for better job delegation and management practices. YRBI works closely together with its beneficiaries in a participatory approach, through which they are able to consistently deliver on donor-agreed outputs and and deliver quality results. The approach however is intensive and sometimes causes delays and affects efficiency.

Overall meetings to discuss program progress including linking inputs and outputs from projects are held, but there is no formal system in place to assess efficiency by linking inputs to outputs. This is in line with having a week monitoring and evaluation system in place. YRBI has a clear vision and is a focused organization. They cannot depend on funding anymore because the ICCO contract ended (only funder) and was not renewed and together with the community they work together hand in hand with the in sourcing funds. The terms of reference for the project have changed from a donor-driven process into community needs-driven process and on the whole, engagement with the beneficiaries is good.

All in all the capability to deliver on development objectives has remained unchanged, and there is room for improvement.

Score: from 3 to 3 (no change)

**Capability to relate**

4.1. Stakeholder engagement in policies and strategies: 'The organization maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organization'

*This is about whether the SPO engages external groups in developing their policies and strategies, and how.*

YRBI has a good network with local government institutions and NGOs, and this network helps them especially in their advocacy work. They also attend international conferences on forest management, governance and indigenous peoples' rights. Stakeholders are involved in activities, and there is ongoing communication with these stakeholders and also with policy makers. Their network helps YRBI to implement its programs and get results, but it is not clear whether the stakeholders also help shape their policies and strategies.

At present, YRBI has extended its network to other NGO's through close cooperation in the areas of new and old beneficiaries. The working fields of these NGO's differ slightly from YRBI however, which makes the organization wonder how they can benefit from these new connections as of yet.

Score: from 3 to 3 (no change)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'

*This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.*

YRBIs network is at the local and national level, mainly with organizations working on similar issues in indigenous rights and the natural environment, or with organizations that outsource part of their projects to YRBI (subcontracting). Over the years, YRBI has worked on a number of projects together with other organizations like Sedha, Danida, JKPP, ICCO, GEF and Samdhana. Locally they work together with the *Majlis Mukim Aceh Besar* and the *Pemerintah Daerah* (regional governments). Presently the number of NGO's in their network has increased through new cooperations in different fields of work dedicated to the same beneficiaries and locations.

For instance, YRBI has expanded its network to the, *Lembaga Pendukung Kedaulatan Mukim*, which consists of eighteen local organizations with mainstream movement in the advocacy for indigenous people. YRBI also acts as the main actor in an a Working Group, a multi stakeholder forum for climate change, and as a member of Walhi, YRBI has been in the position as a strategic partner in Walhi programs regarding environmental issues. YRBI also contributed to a coalition with NGO-HAM in regards to strengthening the *mukim*.

Score: from 3.5 to 4 (slight improvement)

4.3.Engagement with target groups: 'The organization performs frequent visits to their target groups/ beneficiaries in their living environment'

*This is about how and when the SPO meets with target groups.*

Although nothing has changed in the participatory approach through regular field visits, and relationships with beneficiaries continue to be close, YRBI is now challenged to continue these intensive practices with less field officers and lower budgets. This is mainly the result of the ending of specific program activities. YRBI has responded to this by lowering the frequency and intensity of field visits.

Score: from 3.5 to 3 (slight deterioration)

4.4.Relationships within organization: 'Organizational structure and culture facilitates open internal contacts, communication, and decision-making'
*How does staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?*

There is a sense of family among the staff members, but also a respect for seniority that is rooted in their culture. This prevents junior staff to argue with senior staff, even though there is an open atmosphere in which one can freely discuss any issue and give their input before a decision is made.

With the new changing of leadership, the above situation still sometimes occurs, but since the new director applies more egalitarian leadership style, according to some staffs, the junior-senior

relationship dynamic has become less formal. Junior staff feels more confident to defend their ideas during discussions. This is also enabled by the director who, due to his younger age is able to relate better to the younger staff members.

Score: from 3 to 3.5 (slight improvement)

**Summary capability to relate**
Overall this capability has not changed. YRBI has a good network with local government institutions and NGOs which help them in their advocacy work. Stakeholders are involved and there is ongoing communication with these stakeholders and policy makers, but it is not clear to what extend the stakeholders also contributed to informing policies and strategies of YRBI. . Currently, there is an extension in YRBI's network with the addition of more NGOs. YRBIs network is at the local and national level, mainly with organizations working on similar issues in indigenous rights and the natural environment, or with organizations that outsource part of their projects to YRBI (subcontracting). Due to their participatory approach there are regular field visits, however the frequency of these visits has reduced due to budget constraints after closing projects which affected having less field officers available. There is a sense of family among the staff members, but also a respect for seniority that prevents junior staff from arguing with senior staff, even though there is an open atmosphere in which one can freely discuss any issue and give their input before a decision is made. With the change of leadership, the above situation sometimes still occur, but the new (young) director applies more egalitarian leadership style, which makes the junior-senior relationship smoother than before.

Score: from 3.2 to 3.4 (very slight improvement)

**Capability to achieve coherence**
5.1.Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organization'

*This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.*

The strategic plan is extended to 2020 and also contains the same vision and mission that has been used by the organization for the past years. Although staff is not included in the formulation of high level strategy and revisions of mission and vision, they are well informed about the content and meaning of the strategic plan and how it applies to their work.

Score: from 2.5 to 2.5 (no change)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

*This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.*

There is a standard operational procedure (SOP) on Finance & Organization, but not yet on HRM. This has not changed since the baseline and the draft SOP for HRM has yet to be finalized. Decisions regarding the formulation of these SOPs is done at the managerial level and not discussed with staff prior to finalization.

Score: from 2.5 to 2.5 (no change)

5.3.Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'

*This is about whether the operations and strategies are line with the vision/mission of the SPO.*

YRBI's work on marginalized communities and natural resources is in line with their vision and mission. Both staff, donor and partners have acknowledged this. Prior to the implementation of project and program activities, the vision and mission are reviewed without any changes because it was still considered relevant, as was already the case during the baseline evaluation two years ago. Overall

staff remains well aware of strategic plans and directions, and is able to relate this to their day to day activities and operations.

Score: from 3 to 3 (no change)

5.4.Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

*This is about whether the efforts in one project complement/support efforts in other projects.*

Due to YRBI's limited funds and resources they are forced to be practical in the implementation of projects and program activities. Initiatives are closely discussed with beneficiaries and adapted accordingly, which makes their work to some extent related and mutually supportive. Overall no particular change has occurred in this indicator, other than that now more than ever, the need for practicality and efficiency exists due an even greater limitation in funds and resources.

Score: 3 to 3 (no change)

**Summary capability to achieve coherence**

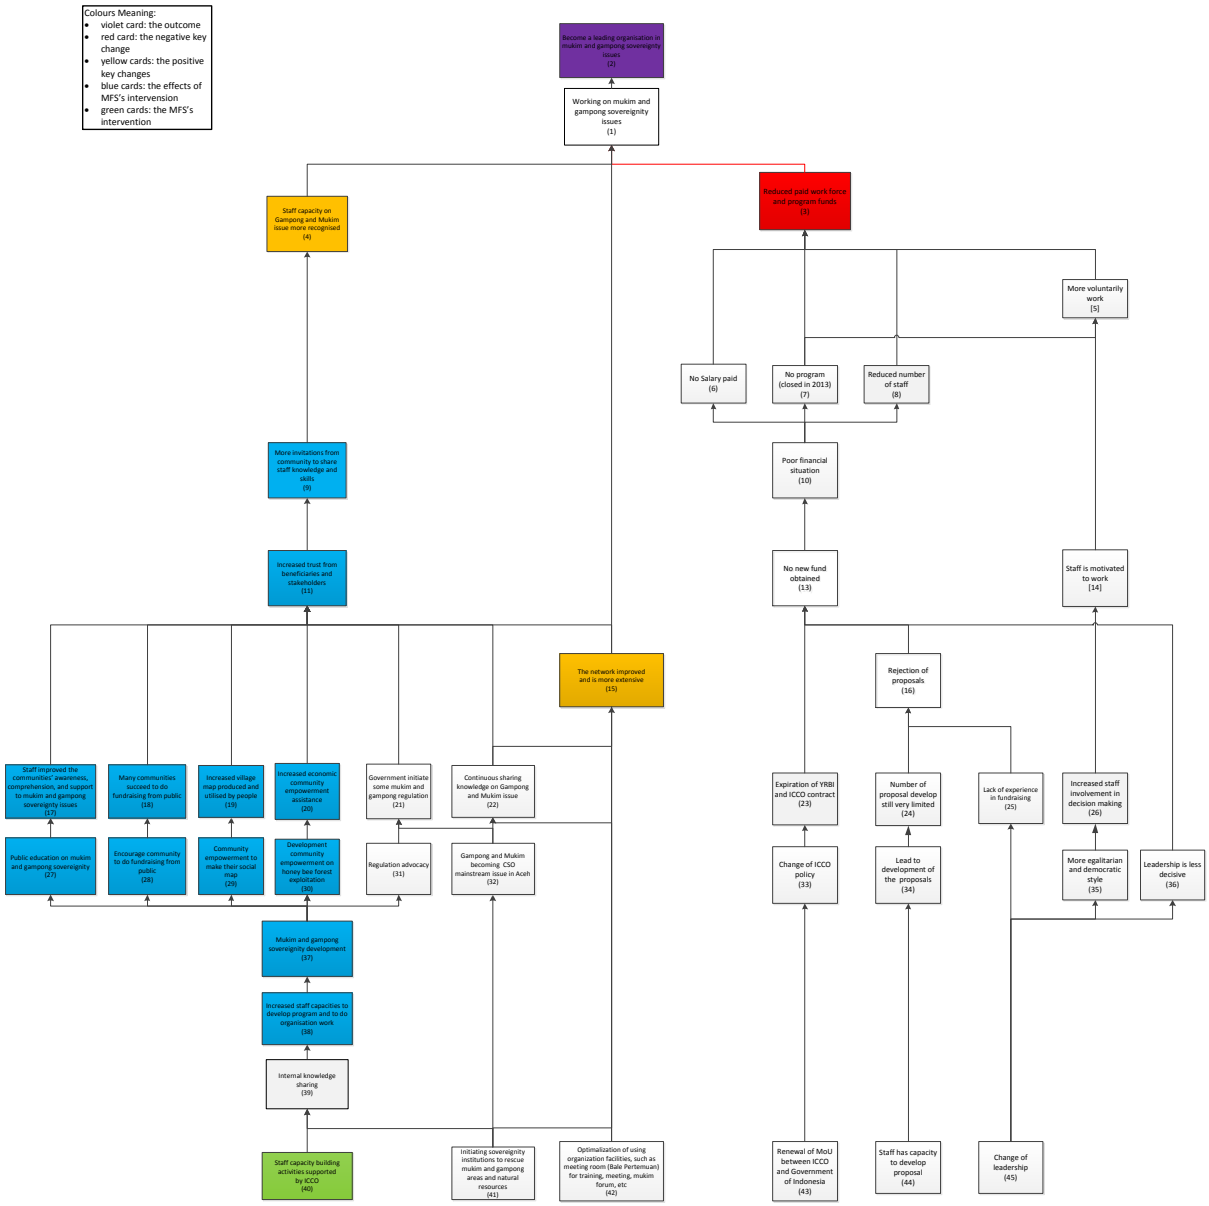
There are no changes in the capability to achieve coherence. Overall the same approaches towards strategy, the application of vision and mission to daily operations and the alignment of all these factors have remained the same.  Standard operating procedures are in still place for finance, but not for HRM.

Score: from 2.7 to 2.7 (no change)

# Appendix 4 Results - key changes in organisational capacity - general causal map

**General Causal Map Yayasan Rumpun Bambu Indonesia (YRBI)**

**Narrative of General Causal Map of Yayasan Rumpun Bambu Indonesia (YRBI)**
YRBI is an organization established in 1995 which works in the fields of indigenous community empowerment, agricultural development, and environmental conservation. Since 2006, YRBI has dealt with climate change issues until 2011 when they chose traditional community development as their main issue. Collaboration between YRBI and the Netherlands began in 2005 after the tsunami. The contract between MFS II and YRBI started on 1 November 2012 and ended on 31 October 2013 without being renewed.



The evaluation team carried out an end line assessment at YRBI from 14 to 16 July 2014. During this workshop, the team made a recap of key features of the organisation in the baseline in 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline.

Some positive and negative changes have taken place in the organization since the baseline, and both of these have affected the organization in terms of being able to work or *on mukim* and *gampong* sovereignty issues [1] , and thereby becoming a leading organization on these issues [2]. *Mukim* and *gampong* are legal administrative community units[21] in Indonesia. YRBI wants to become a leading organization in terms of the issues in dealing with *mukim* and *gampong* sovereignty [2]. The extent to which the organisation has been able to work or on *mukim* and *gampong* sovereignty issues [1], can be attributed to three key organisational capacity changes:

1. staff capacity on *mukim* and *gampong* sovereignty issues is more recognised [4];
2. an improved and more extensive network [15];
3. reduced paid workforce and program funds [3], which is a negative development ;

Each of these key organisational capacity changes and how they have come about is further explained below. Numbers in the narrative corresponds to numbers in the visual.

[21] It has boundaries and authority to control and manage the interests of local communities based on the origin and the local customs which are recognized in the Indonesian Government system. In a nutshell is zoning based on local custom. In the structure, gampong is under mukim. Mukim formed by at least four gampong. Each mukm is led by a Uleebalang or a Mukim. This system is applied since the era of the Aceh Sultanate.

**Staff capacity on *mukim* and *gampong* sovereignty issues is more recognised [4]**

An increase in staff capacity has become more visible to stakeholders, partners and beneficiaries [4] as staff members carried out their duties. More invitations from the community for staff to share their knowledge and skills [9] made the public realize the increase in their knowledge and capacity.

The greater number of invitations from the community to share knowledge and skills is due to an increased trust from beneficiaries and stakeholders in YRBI's competencies [11]. This was due to a range of different issues:

- Staff improved the communities' awareness, comprehension and support to *mukim* and *gampong* sovereignty issues [17], Which was due to public education on these issues [27].
- Many communities succeed to raise funds from the public [18] after encouragement and assistance from YRBI [28]
- An increased number of village maps has been created and utilized by the people [19] after YRBI empowered the community with the skills to create their own social maps [29]
- Increased community economic development assistance [20] through honey bee forest exploitation [30].
- Government created a *mukim* and *gampong* regulation [21] after active and regular advocacy and lobbying of YRBI [31].
- Continuous sharing of knowledge on *mukim* and *gampong* issues [22] because these issues have become more mainstream in Aceh [32].

Each of these factors resulted from the overall development of the *Mukim* and *Gampong* sovereignty over the last two years [37], following the increased efforts and staff capacities to deliver work and carry out program activities [38]. This was due to more internal knowledge sharing [39]. It is custom for YRBI staff who have returned from an external event, whether it is a discussion, seminar, or

training, to share the knowledge they received to the other staff members in a forum. This forum is called "*Diskusi Lorong"* [39]. It is held at least twice in one month. Aside from being a forum to share knowledge, *Diskusi Lorong* also benefits as a forum to discuss program development and contemporary issues that develop at local, regional, and national level.

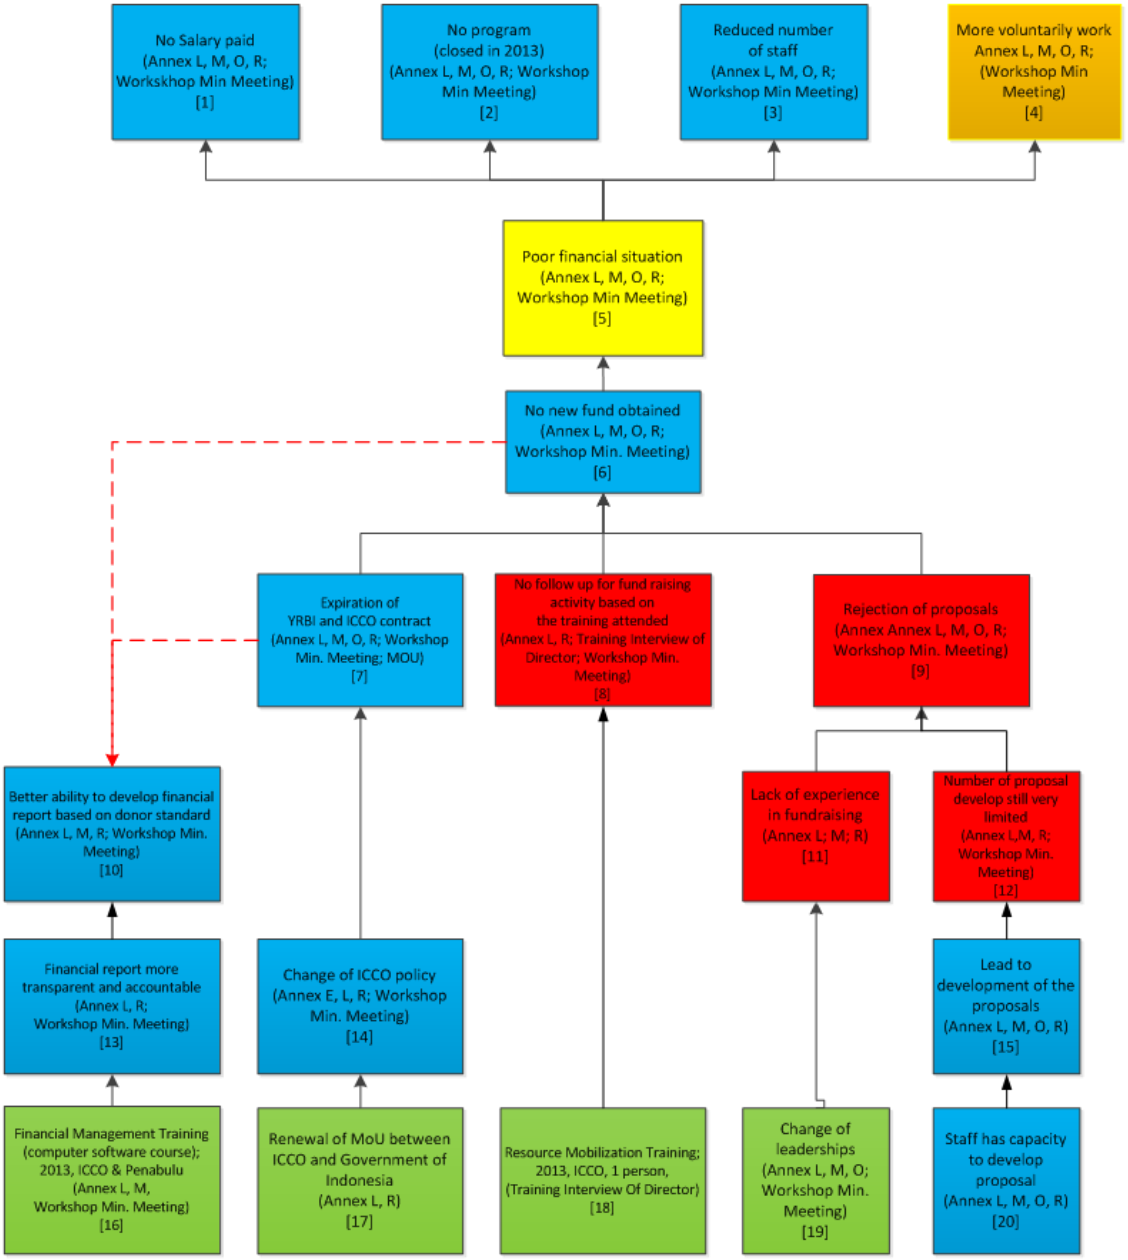
Amongst the knowledge shared were several staff capacity building activities as supported by ICCO [40] and the establishment and initiation of *mukim* and *gampong* coalition for sovereignty natural resources governance. Capacity building activities for YRBI were supported by ICCO between 2012-2013[40], Which included: 1) Participatory Mapping Internship (GIS); 2) Making Market for The Poor Training; 3) Resource Mobilization Training.

The other issue that affected increased trust from beneficiaries and stakeholders [15] is an improved and more extensive network [15]. Since this also directly affected the organisation's capacity to address *mukim* and *gampong* sovereignty issues, it is further elaborated upon below,

**The network improved and is more extensive [15]**
YRBI's network has grown over the last two years [15]. The continuous sharing of knowledge and developments on *mukim* and *gampong* issues in the public, amongst stakeholders and community played a large role in this [22]. On the other hand, YRBI is now able to host meetings, trainings and *mukim* forums in themeeting room *(Bale Pertemuan)* in the new building , which has allowed more beneficiaries and stakeholders to get in touch with YRBI [42]. In fact, the *Bale Pertemuan* has now become a regular meeting point for civil society activists. Improved facilities have also contributed to being able to continuously share knowledge on *mukim gampong* and sovereignty issues [22]. This sharing is also due to *gampong* and *mukim* becoming a CSO mainstream issue in Aceh [32], which in turn is due to initiating sovereignty institutions to rescue *mukim* and *gampong* areas and natural resources [41].

**Reduced paid workforce and program funds [3]**
This is a negative change that occurred in YRBI since the baseline in 2012. There are a variety of reasons for this negative change:

- No salary being paid to staff members [6]
- No more program activities after 2013 [7]
- Reduction in the number of staff members [8]
- More voluntary work [5]
- Less decisive leadership [36].



Each of these factors was the result of the poor financial situation of YRBI [10] after no new funds could be obtained [13] after the contract with ICCO expired in 2013 [23]. A change in ICCO policy was the primary reason for this occurring [33] after specific new changes were included in the renewal of the MoU between ICCO and the government of Indonesia [43]. Prior to this, ICCO was more focused on local economic empowerment. Although YRBI has had the opportunity to submit new proposals in line with ICCO's policy, they chose to stick with the empowerment of *mukim* and *gampong* institutions, and as a result, the contract with ICCO ended.

No additional funds were acquired in the meantime either as proposals written by YRBI were rejected [16]. This was partly due to the limited number of proposals being developed, decreasing the chances of getting new funds significantly [24]. Proposals. riting and development was possible [34] because some senior staff already possessed the capacity and experiences to do so [44]. Nonetheless, a lack of experience in fundraising of the new director of YRBI [25] reduced YRBI's chances for success acquisition, and this new leadership came on board after a leadership change in the mid of 2013 [45]. The previous director, staff recalled, had better networking and fundraising skills.

Finally, the poor financial condition of the organization resulted in more voluntary work being done since 2013 [8]. This was the only way for YRBI to keep the organization at work with limited resources and capital. Volunteers, and staff working for free on a voluntary basis, were attracted to do so by their motivation to work and contribute to the organization and its mission [14]. The increase in motivation could also be attributed to the fact that they were now more involved in decision making [26] which was enabled by the freedom and more democratic leadership style of the new director [35]. Unfortunately this increase in staff autonomy and empowerment by the new director also led to a less decisive leadership management [36], which some staff members indicated harmed the organization in need for change and fun

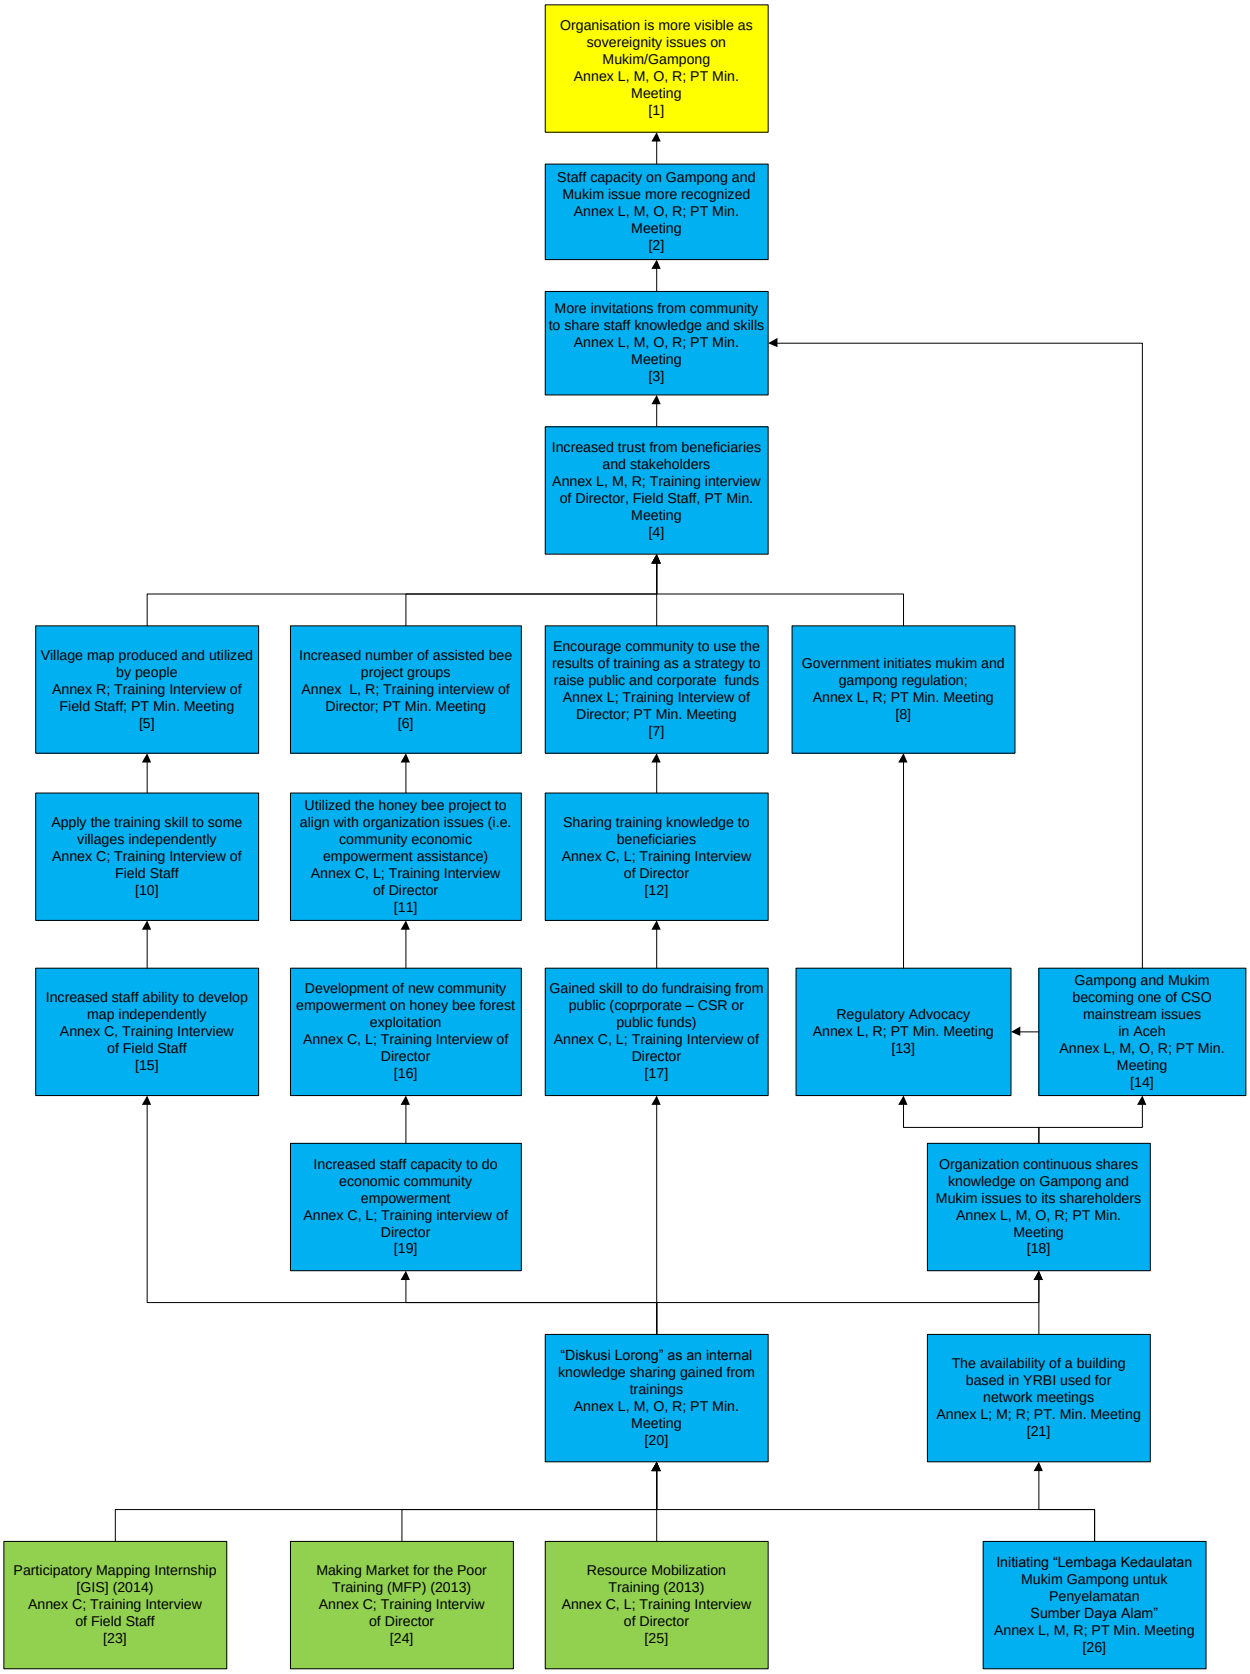
# Appendix 5 Results - attribution of changes in organisational capacity - detailed causal maps

**Narrative of Causal Map C.1 Poorer Financial Situation Yayasan Rumpun Bambu Indonesia (YRBI)**

**Introduction**

The key capacity change that was focused on during the process tracing workshop was identified as 'poor financial situation' [5] (Annex L, M, O, R; Workshop Minutes Meeting). Staff of YRBI indicated that this has led to salary not being paid since the beginning of 2014 [1] (Annex L, M, O, Workshop Min. Meeting); the ending of all program activities in 2013 [2] (Annex L, M, O, R; Workshop Min.

Meeting); a considerable reduction in the number of staff [3] (Annex L, M, O, R; Workshop Min. Meeting); encourage staff working more on a voluntary basis [4] (Annex L, M, O, R; Workshop Min. Meeting).



The poor financial situation of YRBI [5] (Annex L, M, O, R; Workshop Min. Meeting) is due to fact that since the MFS II contract ended, in 2013, no new funds have been obtained [6] (Annex L, M, O, R; Workshop Min. Meeting). The reason for this was threefold. *First,* the YRBI and ICCO contract expired [7] (Annex L, M, O, R; Workshop Min. Meeting). *Secondly,* no follow up for fund raising activity based in the training attended [8] (Annex L, R; Training interview of Director; Workshop Min. Meeting). *Thirdly*, the rejection of proposals for program activities and funding [9] (Annex L, M, O, R; Workshop Min. Meeting). Each of these three reasons is explained in more detail below.

1. The ICCO contract expired on 31 Oktober 2013 and was not renewed due to political and administrative issues. This was due to an internal ICCO policy change [14] (Annex E, L, R; Workshop Min. Meeting), which directly resulted from the renewal of an MoU between ICCO and the Government of Indonesia [17] (Annex L, R). The policy stated that ICCO couldn't further support activities with "mukim and gampong"[22] (zoning based on local custom) issues.
   ICCO funded Financial Management Training [16] (Annex L, M, Workshop Min. Meeting) resulted in ability to develop report based on donor standard [13] (Annex L, M, R; Workshop Min. Meeting). The financial reports are now more transparent and accountable [13] (Annex L, R; Workshop Min. Meeting). This training has no further follow up since YRBI didn't need to develop reports as they didn't have programs anymore after the contract from ICCO has been ended.
2. There was no active follow up on fund raising activities [8] (Annex L, R; Tranining Interview of Director; Workshop Min. Meeting) as taught in the Resource mobilization Training supported by ICCO In 2013 [18] (Training Interview of Director), but the knowledge from the training had been shared and disseminated to the community to empower them to raise fund in a variety of ways. Despite no concrete fund raising activities being carried out after the resource mobilization training took place, the training did result in positive changes elsewhere. A number of beneficiary communities succeeded in raising public funds through cooperation with private sectors/companies or directly from the community with help of YRBI and the newly acquired capabilities in the training. They did this by creating proposals for cooperation or donations, selling merchandise, etc. Unfortunately these capabilities to raise public funds were not utilized for YRBI's own sake.
3. The final reason for the lack of securing new funds was the rejection of submitted proposals [9] (Annex L, M, O, R; Workshop Min. Meeting). During the field interviews, various people have noted that the new director was unable to maintain the level of fundraising and had a significant lack of experience in it and also in networking [11] (annex L, M, R). The change of leadership happened in 2013 [19] (annex L, M, O; Workshop Min. Meeting).

The other reason for rejection was that the number of proposals developed was actually very low [12] (Annex L, M, R; Workshop Min. Meeting). This despite the fact that some of the submitted proposals were developed by YRBI staff themselves [15] (Annex L, M, O, R), as they have capacity to do them [21] (annex L, M, O, R).

[22] Mukim and gampong is a legal community unit. It has boundaries and authority to control and manage the interests of local communities based on the origin and the local customs which are recognized in the Indonesian Government system. In a nutshell is zoning based on local custom. In the structure, gampong is under mukim. Mukim formed by at least four gampong. Each mukim is led by a Uleebalang or a Mukim. This system is applied since the era of the Aceh Sultanate.

**Narrative of Causal Map C3 : Becoming the leading organization in *mukim* and *gampong* sovereignty issues in Aceh and Indonesia**

**Narrative :**

This process tracing map differs slightly from the other maps presented in this report in that it addresses not only competencies and organizational capacity, but also some implementation activities

and targets. The two are inherently intertwined within YRBI and hard to separate when explained for this particular capacity. It should therefore be considered a "mixed" causal map.

Following is the narration for the YRBI causal map between 2012-2014. Within the two year time period since the MFS II baseline evaluation in 2012, a key organizational capacity change at YRBI was that it has become the leading organization in *mukim* and *gampong*[23] sovereignty issues in Aceh and Indonesia [1] (Annex L, M, O, R; Process Tracing Minutes Meeting). During the process tracing workshops and interviews it was made clear that this outcome is the direct result of an increased recognition in staff capacity on *Gampong* and *Mukim* issues [2] (Annex L, M, O, R; Process Tracing Minutes Meeting). This increased recognition can be explained through two factors:

1. More invitations from community to share staff knowledge and skills [3] (Annex L, M, O, R; Process Tracing Minutes Meeting)
2. *Gampong* and *Mukim* becoming one of CSO mainstream issues [14] (Annex L, M, O, R; Process Tracing Minutes Meeting)

Each of these changes is described below. First off the increase in invitations for staff to share their knowledge and skills [3] (Annex L, M, O, R; Process Tracing Minutes Meeting) resulted from an increase in trust in YRBI from beneficiaries and stakeholders [4] (Annex L, M, R; Training Interview of Director, Field Staff; Process Tracing Minutes Meeting). Four factors contributed to this increase in trust, which will be discussed in detail below:

1. Village maps being produced and utilized by people [5] (Annex R, Training Interview of Field Staff; Process Tracing Minutes Meeting).
2. An increased number of assisted bee project groups [6] (Annex L, R; Training Interview of Director; Process Tracing Minutes Meeting)
3. Encouragement of the community to use the results of training as a strategy to raise public and corporate funds [7] (Annex L, Training Interview of Director; Process Tracing Minutes Meeting)
4. A government initiation to create new regulations related to *mukim* and *gampong* [8] (Annex L; Process Tracing Minutes Meeting)

*First,* the village maps being produced by communities came forth from the transfer of staff knowledge to villagers [5] (Annex R; Training Interview of Field Staff; Process Tracing Minutes Meeting). This program continues to this day and at least three social maps have successfully been completed, and were funded by the villagers themselves [10] (Annex C; Training Interview of Field Staff). This knowledge resulted from an increase in staff's ability to develop maps independently. Field Staff applied his knowledge by independently conducting social mapping in a number of villages [15] (Annex C; Training Interview of Field Staff). This was purely from Field Staff initiative, and YRBI functioned as a facilitator. He was one of the YRBI staff members who participated in the Participatory Mapping Internship (GIS) in Bogor, 2013 [23] (Training Interview Field Staff). He shared his knowledge with his colleagues in YRBI after his return from there [20] (annex L, M, O, R; Process Tracing Minutes Meeting).

*Secondly,* an increased number of assisted bee project groups arose [6] (Annex L, R; Training Interview of Director; Process Tracing Minutes Meeting) after the honey bee project was aligned with organization issues wich is economic community empowerment [11] (Annex C, L; Training Interview of Director). There was development of new community empowerment on honey bee forest exploitation [16] (Annex C, L; Training Interview of Director). The number of communities increased from two to six benefiting communities. Actually honey exploitation is not a new activity. It was stagnant but has developed since one of YRBI staff participated and shared the knowledge about economic community empowerment with his colleagues. Together with his colleagues, then benefiting communities after their own skill raised [19] (annex L, M, O, R; Process Tracing Minutes Meeting). At the bottom of all this was the Making Market for the Poor Training (MFP) [24] (Annex C; Training

[23] Mukim and gampong is a legal community unit. It has boundaries and authority to control and manage the interests of local communities based on the origin and the local customs which are recognized in the Indonesian Government system. In a nutshell is zoning based on local custom. In the structure, gampong is under mukim. Mukim formed by at least four gampong. Each mukim is led by a Uleebalang or a Mukim. This system is applied since the era of the Aceh Sultanate.

Interview of Director). This activity was held in 2013 in the form of training by Penabulu supported by ICCO. The YRBI staff who participated in this training was–The YRBI Director. This training made efforts in providing participants with the competencies necessary to market their products. Oftentimes, the obstacle in the development of small to medium-sized industries is marketing products. Through this training, the products can be marketed well and in time so as to increase the economy of the community.

*Thirdly,* communities were encouraged to use the results of training as a strategy to raise public and corporate funds [7] (Annex L; Training Interview of Director; Process Tracing Minutes Meeting). YRBI makes an active effort in order for the beneficiary communities to be able to not only raise resources, but also be able to identify and be firm towards companies involved in cases of corruption, environment, human rights, etc. A number of beneficiary communities succeeded in raising public funds through cooperation with private sectors/companies or directly from the community. They did this by creating proposals for cooperation or donations, selling merchandise, etc. However, YRBI asserted the beneficiary communities to pay attention to the background of those they would like to cooperate with, especially the private companies. That knowledge was shared by YRBI's staff to all beneficiaries [12] (Annex L; Training Interview of Director), and this knowledge was the result of skills gained to do fundraising from the public and the private sector [17] (Annex L; Training Interview of Director). At the basis of this increased capacity was the Resource Mobilization Training [25] (Annex C, L; Training Interview of Director). This activity was held in 2013 in the form of a training held by Penabulu with the support of ICCO. The YRBI staff sent to participate in the training was The YRBI Director. This training was on how beneficiary communities or the organization can raise public funds, therefore making this beneficial for the beneficiary communities and YRBI. The output was his improved competencies in raising public funds [17] (Annex C, L; Training Interview of Director). Unfortunately, the increased fundraising capacity was not successfully applied to the own organization.

In all three cases of ICCO supported trainings and activities, YRBI organized meetings to share the outcomes amongst the staff who didn't attend. *"Diskusi Lorong"* [20], as it is called, was actually YRBI's internal forum to discuss or share technical details dealing with program implementation and the performance of the organization or the subjects of the capacity building. The staffs who have recently attended trainings are often asked to share their knowledge with others through this forum. In addition, this forum is also used for updating the latest social issues developing in Aceh. Although this forum is informal, the staffs consider it very productive. Their capacities have significantly increased through this forum.

*The fourth* and last factor contributing to the increase in trust among beneficiaries and stakeholders was a shift in government regulation regarding *mukim* and *gampong* [8] (Annex L, R; Process Tracing Minutes Meeting). This was the result of regulatory advocacy from YRBI on the one hand [13] (Annex l, R; Process Tracing Minutes Meeting) and the increasing spotlight on the CSO mainstream issues of *mukim* and *gampong* on the other hand [14] (annex L, M, O, R; Process Tracing Minutes Meeting). Both will be explained below.

*Firstly,* due to the government permitted exploitation of natural resources by companies, YRBI was motivated to increase public awareness, in this case the *mukim* and *gampong*, that they are the ones who truly have the sovereignty for natural resources. The government must include them in managing the natural resources. If companies want to exploit the natural resources, it must be permitted by *mukim* and *gampong*. YRBI trained and accompanied the community in managing the natural resources. They paid attention to a number of values, such as: environmentally friendly based on custom. In addition, YRBI also advocate so that issue was accommodated by the government as a regulation [13] (Annex L, R; Process Tracing Minutes Meeting).

*Secondly,* by starting with issues on managing natural resources, the *mukim* and government sovereignty became a mainstream issue for NGOs in the Aceh province [14] (annex L, M, O, R; Process Tracing Minutes Meeting). This forum succeeded in making *mukim* and *gampong* sovereignty a joined issue. Women NGOs, human rights NGOs, environmental NGOs, economic empowerment NGOs, etc, have made *mukim* and *gampong* the basis of their actions, and custom as the spirit. Productive communication, interaction and sharing between NGOs, or stakeholders, specifically dealing with *mukim* and *gampong* was done in this forum [18] (Annex L, M, O, R; Process Tracing Minutes

Meeting). For YRBI itself, this forum made use of YRBI's infrastructure to optimize the work of the network [21] (Annex L, M, R; Process Tracing Minutes Meeting). The development of YRBI's organization infrastructure resulted as part of an independent effort to become more sovereign [26] (Annex L, M, R; Process Tracing Minutes Meeting) in the initiation of "*Mukim* Sovereignty Organizations for the Sovereignty of Natural Resources".

Report CDI-15-051

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Report CDI-15-061

WAGENINGEN UR
For quality of life

Klaver, D.C., Smidt H., Nugroho, K., Prasetya, K. S.,February 2015, *Common Room end line report; MFS II country evaluations, Civil Society component,* Centre for Development Innovation, Wageningen UR (University & Research centre) and SurveyMETER. Report CDI-15-061. Wageningen.

This report describes the findings of the end line assessment of the Indonesian organisation Common Room that is a partner of Hivos.

The evaluation was commissioned by NWO-WOTRO, the Netherlands Organisation for Scientific Research in the Netherlands and is part of the programmatic evaluation of the Co-Financing System - MFS II financed by the Dutch Government, whose overall aim is to strengthen civil society in the South as a building block for structural poverty reduction. Apart from assessing impact on MDGs, the evaluation also assesses the contribution of the Dutch Co-Funding Agencies to strengthen the capacities of their Southern Partners, as well as the contribution of these partners towards building a vibrant civil society arena.

This report assesses Common Room's contribution towards strengthening Civil Society in Indonesia and for this exercise it used the CIVICUS analytical framework. It is a follow-up of a baseline study conducted in 2012. Key questions that are being answered comprise changes in the five CIVICUS dimensions to which Common Room contributed; the nature of its contribution; the relevance of the contribution made and an identification of factors that explain Common Room's role in civil society strengthening.

Keywords: Civil Society, CIVICUS, theory based evaluation, process-tracing

# Acknowledgements

SurveyMeter and CDI are thanking the staff and the leaders of all Southern Partner Organisations that participated in collecting information for the evaluation of the contribution of these partner organisations to creating a vibrant civil society in Indonesia. They also thank the Co-Funding Agencies and the Dutch Consortia they are a member of for making background documents available. We hope that this evaluation can support you in better positioning yourself in the Civil Society Arena of Indonesia.

# 1 Introduction

This report presents the civil society end line findings of Common Room in Indonesia which is a partner of Hivos in Indonesia under the Dutch Consortium People Unlimited. It is a follow-up to the baseline assessment that was carried out in 2012. According to the information provided during the baseline study, Common Room is working on the theme 'governance'.

These findings are part of the overall evaluation of the joint MFS II evaluations to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern Partner Organisations (SPO) and to contribute to the improvement of future development interventions. The civil society evaluation uses the CIVICUS framework and seeks to answer the following questions:

- What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?
- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- What factors explain the findings drawn from the questions above?

The CIVICUS framework that comprises five dimensions (civic engagement, level of organisation, practice of values, perception of impact and contexts influencing agency by civil society in general) has been used to orient the evaluation methodology.

*Changes in the civil society arena of the SPO*
In the 2012 – 2014 period the most important change that took place in the civil society arena of the SPO are related to 'perception of impact', specifically the impact of the emergence of a new sub-culture on the music scene in Bandung. Innovations supported by Common Room have generated greater public interest in, and acceptance of traditional Sundanese customs and the underground metal scene. This was achieved through the introduction of Karinding, a traditional Sundanese instrument, and supporting groups that were capable of offering a unique fusion of musical genres.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with the SPO, and interviews with external resources persons working in civil society organisations that receive support from the SPO; other civil society organisations with whom the SPO is collaborating; public or private sector agents and; external resource persons capable of overlooking the MDG or theme on which the SPO is concentrating.

*Contribution analysis*
Based upon an analysis of the projects and programmes financed by the Dutch CFAs a selection was made of SPOs to be included in an in-depth process tracing trajectory and those to be included for a quick contribution assessment. Common Room was selected for a quick assessment.

The outcome that we looked at is: the Karinding community has become more organized and capable of championing the revival of an interest in a traditional Sundanese instrument and supporting the underground metal scene. Common Room's innovation in combining Karinding – an instrument that lacked popularity, with the metal music genre has led to the development of a sub-culture amongst the youth of Bandung. The innovation has also brought the Karinding community and both affiliated communities, underground metal and Sundanese customary groups, into the public space. The pathway that most likely explains this outcome is a combination of Common Room's intervention, and the popularity of the personnel of the Karinding Attack band, and the emergence of a trend or hype. The contribution of the SPO towards achieving this outcome is in facilitating the musical experimentation, assisting artists in music composition, and providing space for trainings and performances.

*Relevance*
Interviews with staff of Common Room, with external resource person, with the liaison officer of Hivos, as well as contextual information helped to assess the relevance of Common Room's interventions in terms of; its Theory of Change (ToC) for Civil Society (SC) as designed during the baseline study; the context in which Common Room is operating; the CS policies of Hivos.

With regards to the baseline ToC, the interventions and outcomes achieved are to some extent relevant because it shows how the provision of public space contributes to strengthened creative industry, which in turn leads to a healthy society characterized with strong cultural identity and freedom of expression.

With regards to the context in which Common Room is operating, its interventions and outcomes achieved are relevant because public space in Bandung has been dominated by market-driven and hegemonic urban culture.

With regards to the Civil Society policies of Hivos, Common Room's interventions and outcomes are relevant because it is in line with Hivos' strategy to empower civil society and encourage knowledge sharing collaboration between communities and/or individuals. However Hivos observed that Common Room's organisational performance is hampering the organisation to effectively contribute to Hivos' policies, which was a reason for ending the partnership in December 2013.

*Explaining factors*
The information related to factors that explain the above findings was collected at the same time as the data were gathered for the previous questions. The evaluation team looked at internal factors within Common Room, the external context in which it operates and the relations between Common Room and Hivos.

Internal factors within the SPO that explain the findings are the degrading quality of Common Room's new facilities and Common Room's absolute dependency on its director and an inability to recruit more competent personnel.

External factors that explain the findings are the emergence of similar initiatives (alternative public spaces) in Bandung, a supportive government, and the trend of contemporary urban sub-culture.

The following chapter briefly describes the political context, the civil society context and the relevant background with regards to the MDG/theme Common Room is working on. Chapter three provides background information on Common Room, the relation of its MFS II interventions with the CIVICUS framework and specific information on the contract with Hivos. An evaluation methodology has been developed for the evaluation of the Civil Society component which can be found in Appendix 2 of the country report; however, deviations from this methodology, the choices made with regards to the selection of the outcomes for contribution analysis, as well as difficulties encountered during data collection are to be found in Chapter 4. The answers to each of the evaluation questions are being presented in Chapter 5, followed by a discussion on the general project design in relation to CS development; an assessment of what elements of the project design may possibly work in other contexts or be implemented by other organisations in Chapter 6. Conclusions are presented in Chapter 7.

# 2 Context

This paragraph briefly describes the context Common Room is working in. A description of the Civil Society Context assessed according to the CIVICUS framework is provided in appendix 3 of the country report for Civil Society.

## 2.1 Political context

### 2.1.1 Brief historical perspective

Indonesia's rise to being the world's third largest democratic nation has been lauded by many world leaders. The county is often considered to be a model Muslim democracy. As the fourth most populous nation with an estimated 250 million people[1], Indonesia has sustained its democratic commitment since transitioning from an authoritarian leadership to a democracy in 1998. The decentralized administration now consists of 34 provinces and 508 districts and municipalities.

Prior to 1998, Indonesia was under strict authoritarian regime. Suharto, known for his so-called New Order (1966-1998) regime, ushered in radical transformations that would place social and political forces under direct state supervision. The defining characteristics of the Suharto era were a focus on economic growth and controlled consensus and political stability devoid of dissent. A series of tumultuous economic and political transitions in the nineties severely diminished the credibility of ageing President Suharto, who was forced to resign amidst mass street protests.

His departure in 1998 laid bare three decades of social inequalities, state-perpetuated abuses against human rights, and a lack of civilian liberties. The regime change opened the way for a period of *Reformasi* started under the presidency of B. J. Habibie (1998-1999) and continued by Abdurrahman Wahid (1999–2001), Megawati Soekarnoputri (2001–2004), and Susilo Bambang Yudhoyono (2004–2014). Restrictions on citizen participation, press freedom and association were removed. Democratic reforms and decentralization led to direct elections, portioned authority, devolution of authority to regional authorities, formation of new political parties and ended the military's parliamentary influence. The distinct historical periods of the New Order Regime and *Reformasi* (1998-present) have shaped the emergence of civil society. Defining characteristics are summarized in the table below.

Table 1
*Characteristics that have defined the emergence of civil society in Indonesia*

| Characteristics | New Order, authoritarian period (1966 – 1998) | Reformasi (1998 – present) |
|---|---|---|
| **Political system** | Centralized, authoritarian characterized by unipolarity. Golkar as the dominant political party.<br><br>In 1999, there were 27 provinces, 306 districts and around 60,000 villages. | Decentralized, democratic. Fragmentation of power and atomization of patronage relationships. Emergence of numerous political parties. Direct presidential elections since 1999.<br><br>Decentralization altered the political and administrative landscape: 34 provinces, 410 districts, 98 municipalities, 6,944 sub-districts and 81,253.[2] |
| **State-citizen interaction** | Benevolent leader, obedient population. Down to the village level, the state permeated society. | Modern political culture marked by diminishing hierarchy between the state and citizens, |

[1] In 2010 the population was estimated to be around 237 million people (BPS 2010 Population Census). The current figure is an estimate from BKKBN and similar figures are cited in the CIA's World Fact Book and the World Bank.

[2] Rumah Pemilu, "Gambaran Singkat Pemilihan Umum 2014 di Indonesia", 3 July 2014. Available from http://www.rumahpemilu.org/in/read/3351/Gambaran-Singkat-Pemilihan-Umum-2014-di-Indonesia (accessed 25 October 2014)

| | | |
|---|---|---|
| | | allowing for citizens to interact more freely. |
| **Citizen representation and voice** | Strict control of speech, expression and association.<br><br>CSOs and their networks largely "hiding behind the screen", and operating under state surveillance. A period of growth occurred in 1995-98, as resistance was building. | Burgeoning of CSOs, pressure groups and NGOs following the political euphoria after Suharto's fall.<br><br>Indonesian CSOs began to establish new networks internationally. Up until the early 2000s the focus was on state-centrist issues. Later, issues that CSOs were tackling became more diverse, ranging from pluralism, poverty reduction to fulfilment of economic, social and cultural rights. |
| **Media** | No free press, censorship and state-control. Suharto had firm grasp over how to use print & broadcast medias to promote political ideologies. | More vibrant media environment, flourishing of media businesses albeit in control of 12 main conglomerates that are mostly profit-driven and often have political ties. |
| | Limited public and CS use and access to internet until mid-90s. | Twitter nation, widespread social media use. |
| | | Growing realization of the importance of media/free press as the fourth pillar of democracy. |
| **Artistic forms of expression** | Art and literary censorship conducted by the state. Art forms were a means to reinforce political order. | Greater freedom of the arts and cultural sectors. Organisations able to hold art events more freely. Freedom of expression a catchphrase amongst individuals and artistic groups, but challenged by more conservative members of society. |
| **Religious expression and organisation** | Regime repressed religious groups, especially radical forms. | Emergence of religious groups seeking to restore Islamic values and defend Muslim values. |

With political reforms came greater freedom and space for civic engagement. In the *Reformasi* period, there was a remarkable increase in the number of civil society organisations, many of which were Islamic in character. In 2000, the Central Agency on Statistics (BPS) recorded around 70,000 registered organisations, compared to just 10,000 in 1996.[3]New groups sprung up with donors encouraging activists to establish NGOs they could fund. These organisations were eager to distance themselves from state and often took an anti-government stance. Proliferating CSOs and NGOs have taken advantage of decentralization and greater regional autonomy to engage in public affairs. Civil society and government relations have improved, although both sides remain sceptical of the others' intentions.

### 2.1.2 Recent trends in the political context

Indonesia is considered to be a story of democratic success, but it still struggles to realize the benefits of sustained and equitable economic growth. In the political context, the main challenges lie in governing such geographically vast and decentralized country, applying principles of good governance and the enormous task of reforming the country's bureaucracy.

Although, Indonesia's 'big bang' decentralization initiated at the turn of the century narrowed the gap between local government and citizens, it has also localized political power struggles. While the devolution of authorities relieved tensions between the central government and the regions, it has also created opportunities for corrupt and rent-seeking practices, at the local level. As indicated by Transparency International's corruption index scores, perceived corruption in Indonesia remains high.

Table 2

*Transparency International's Global Corruption Barometer survey: Indonesia*

| Year | Corruption perceptions Index Score<br>*(0 perceived as highly corrupt and 100 perceived as clean)* | Rank |
|---|---|---|
| 2011 | 30 | 100/182 |
| 2012 | 32 | 118/174 |
| 2013 | 32 | 114/177 |

Source: Transparency International

In 2013, decentralization was taken a step further with the approval of the Village Law, intended to address weak governance arrangements and empower rural communities to participate politically. The new law could also lead to village elites distorting power relations and misusing government funding if not properly monitored.

Indonesia is still transitioning politically and many challenges lie ahead. According to the 2012 Indonesia Governance Index's Executive Report, "Indonesia is witnessing a paradox in its democracy. On one hand, a successful opening-up of civil liberty has led to the avalanche of democratic demands across the nation, however on the other hand, democratic institutions' are inadequately respond to those demands." Nonetheless, the Indonesian Governance Index, which focuses on measuring provincial governance, does show a general improvement in the performance of the government (political office) bureaucracy, civil society and economic society based on principles of participation, transparency, fairness, accountability, efficiency, and effectiveness between 2008 and 2012. Civil society scores improved the most significantly, while scores for bureaucracy rose slightly.[4]

Table 3

*Indonesia Governance Index: Average provincial scores*

| Arena | 2008 | 2012 |
|---|---|---|
| Government | 4.93 | 5.46 |
| Bureaucracy | 5.53 | 5.58 |
| Civil Society | 4.85 | 6.33 |
| Economic Society | 4.77 | 5.71 |

Source: http://www.kemitraan.or.id/igi

In the past decade, Indonesians have generally enjoyed a freedom to participate in the political process through a direct-election mechanism. However, in September 2014 lawmakers voted in favour of a bill reviving indirect elections of regional heads. The controversial vote provoked public outcry which saw peaceful protests and the public voicing their discontent through social media. In early October, just before the end of his term, president Yudhoyono issued a regulation in lieu of the law, effectively repealing the law until further judicial review.

The recent 2014 elections which marked the end of Yudhoyono's 10-year term, demonstrated that Indonesian voters are increasingly voting for popular figures irrespective of political party alliances. While practices of corruption, vote-buying and poor voter administration remained in the recent election, the public seems to have matured politically, indicated by the enormous interest in televised debates between the leading candidates. The appeal of the newly sworn in President Joko Widodo, popularly known as Jokowi, has come from his hands-on, man-of-the-people approach. As Jokowi begins his five-year term he will need to start addressing a myriad of challenges that include corruption, stagnant economic growth, and human rights concerns, particularly with respect to the rights to freedom of expression, peaceful assembly, and religious intolerance. If left unaddressed, these challenges could seriously undermine Indonesia's stability and democratic reforms.

[4] The IGI uses a scale of 1 (lowest) to 10 (highest). Data is available online through their website. Indonesia Governance Index, Data, "IGI Executive Report". Available from http://www.kemitraan.or.id/igi/index.php/data/publication/factsheet/275-igi-executive-report (accessed 25 October 2014)

## 2.2 Civil Society context issues with regards to the MDG

Several important changes took place during the 2011 and 2014 period. First, the global financial crisis and Indonesia's rise to a middle-income country led to a decrease in international donor funding. Development actors, including CSOs and NGOs, have to compete harder for funding. Some have been more successful than others in diversifying funding by turning to the private sector or private foundations. At the expense of past idealism, local NGOs are now more disposed to receiving funding sources which in the past may have been criticized as supporting neoliberalism.

Regulatory changes also affected the civil society arena positively and negatively. Appendix 6 provides an overview of some of these important policy changes. Amongst the more controversial laws to spark reaction was Law No. 17/2013 on Societal Organisations. In an open letter sent before the bill was enacted, CIVICUS said the law would undermine freedom of association and "prevent CSOs from working on sensitive topics related to good governance and democratic reform in the public interest".[5] FORUM-ASIA deplored the repressive provisions in the law that "leave all groups vulnerable to attacks, undermining the hard-won democratic space that has been forged by civil society since the end of the New Order regime."[6]

Other laws passed that provoked criticism were the State Intelligence Law (October 2011) and the Social Conflict Law (April 2012). NGOs and media see these laws as imposing further restrictions on freedom of speech, potentially leading to the criminalization of human rights defenders and signifying a tightening of state control. Discriminatory content was also an issue in discussions on the Religious Harmony Bill in 2013, for which drafting was initiated in despite not being part of the planned National Legislative Program. Late in 2013, the House of Representatives came under fire again for its weak stance against religious intolerance when it re-endorsed a law that limits state-recognized religions to six.

Land rights and natural resource protection have been a long-standing issue for Indonesia. While Indonesia has adopted and amended laws to improve the rights of smallholders and indigenous communities, many of these regulations have faltered in their implementation. Part of the issue lies in the overlap and lack of clarity of laws adopted that regulate different sectors and local legislation. Another issue is that there is a lack of oversight in the procedures such as granting permits and licensing. These problems, which are commonly found across development sectors, are compounded by a lack of information among local communities on what the laws regulate and their rights vis-à-vis them.

# 3 Description of Common Room and its contribution to civil society/policy changes

## 3.1 Background Common Room

Common Room began under the auspices of the Bandung Centre for New Media Arts (BCfNMA), an organisation founded in 2001 by artists RE Hartanto and Gustaff H. Iskandar; architect T. Ismail Reza, and graphic designer Reina Wulansari. At the time, BCfNMA was meant to serve as a vehicle for the development of multidisciplinary arts and education in Indonesia. In 2003, BCfNMA began collaborating with Tobucil, a small bookstore, in setting up a shared space for literacy activities and the promotion of creative potential. It was from this collaborative initiative that Common Room was born. Tobucil decided to continue to expand its activities independently, while BCfNMA was merged into Common Room, taking on a new organisational structure. In 2006, Common Room Networks Foundation registered as a non-profit organisation.

Common Room aimed to develop a civil society through arts, culture and the use of technology (ICT/media). It wants civil society participation to be inclusive, and it desires to provide the means for communities and individuals from different backgrounds to communicate their creative ideas to one another, thereby enhancing societal harmony. Common Room functions as an open platform for various activities related to art, culture and use of ICT/media. Common Room has facilitated numerous exhibitions, screenings, workshops, lectures, discussions, small music concerts, cultural festivals, etc. with the purpose of developing public knowledge and creativity. It has become a place that facilitates dialogue and multidisciplinary cooperation intended to connect individuals, communities and various organisations with diverse economic, social and political interests.

## 3.2 MFS II interventions related to Civil Society

Since its establishment, Common Room has endeavoured to be more than just a physical space; striving to be a melting pot of activities, ideas and creative discourse. In its early engagement with Hivos, the creation of a platform for expression and engagement through arts, culture and the use of technology in Bandung was regarded as a milestone achievement. The 2012-2013 period focused on sustaining spaces for citizen engagement and interaction, with a focus on a pluralistic society. Interventions were to focus on:

1. Expression and appreciation through a range of events such as film screenings, art grants, festivals, discussions, lectures, concerts, exhibitions, etc.
2. Training and education for individual artists in art, culture, and ICT.
3. Producing publications that included thematic books, web articles, anthology, and reports.
4. Working with the Ministry of Tourism and Creative Economy to support the development of cultural centres through policy development and campaigns for creative economy, social, economic and cultural rights. [7]

Common Room intended to contribute to civil society by enhancing civic engagement, strengthening intermediary artists' organisations, and influencing policy. First, Common Room attempted to create a more pluralistic society, playing an intermediary role by encouraging interaction amongst artists and between artists and citizens through events with democratic, human rights or gender themes.

[7] "Kerschet Common Room 1005103", Hivos, 2012

Secondly, Common Room supported artist groups and collectives to engage with citizens and the public, whilst developing financial means to support the activities of creative communities. Thirdly the organisation aimed at getting involved in advocacy by assisting the Ministry of Tourism and Creative Economy in developing local cultural centres.

## 3.3 Basic information

Table 4

*Basic information Common Room*

| | | Details |
|---|---|---|
| Name of SPO | : | Common Room |
| Consortium | : | People Unlimited |
| CFA | : | Hivos |
| Start date of cooperation | : | MFS II: 31 May 2012<br>Earlier cooperation started in 2009 |
| MDG/Theme | : | Governance |
| MFS II Project Name | : | Open Platform for Expression and Citizen Engagement in Bandung and West Java, Indonesia (Project ID: 1005103) |
| Contract period | : | May 31, 2012 - December 30, 2013<br><br>Earlier contract (ID 189I01/Osiris No. 1001474) for period October 1, 2009 – September 30, 2011 € 47,900 |
| Total budget FPU | : | € 35,000 |
| Other donors if applicable | : | Dinas KUKM Bandung City, ASEF, Ministry for Tourism & Creative Economy |

Sources: Project documents

[8] Costs that relate to civil society development or policy influence are those costs that possibly contribute to the development of the CIVICUS dimensions, excluding coordination and office costs; staff costs and financial reserves.

# 4 Data collection and analytical approach

## 4.1 Adjustments made in the methodology of the evaluation

The evaluation team tried to follow the operational guidelines to a great extent, but was unable to have a workshop with all of Common Room's sub-groups. Common Room currently consists of just three personnel (a director and two staff). None of the board members were able to participate in the workshop. Nevertheless, the workshop participants were highly committed to the workshop. They were also very helpful in arranging the meetings with external resource persons.

The evaluation team was unable to obtain averages or scores for each subgroup as participants found the guiding questions difficult to discern, and their responses once the questions were explained tended to be biased. The in-country team has assigned the scores in Appendix 4based on an analysis of the available evidence.

## 4.2 Difficulties encountered during data collection

During data collection, the team experienced the following difficulties:

- Workshop participants did not really understand, or were unfamiliar with the CS indicators or the CIVICUS framework. They found it difficult to relate Common Room's situation with these indicators, although all of them participated in the baseline process. This lessened the effectiveness of the workshop.
- Common Room's logical framework and reports were largely activity and output oriented. Thus it was difficult to obtain required information on higher-level outcome and impact level results. This also affected the quick process-tracing that was done for Common Room.
- The current Hivos Programme Officer for the Expression and Engagement Programme was unfamiliar with the details of the SPO portfolio because she began working on the programme in 2013.

## 4.3 Identification of two outcomes for process tracing

Given the limitations in the data and information available, only one outcome was selected for quick process tracing. The outcome, 'Karinding community has become more organized and capable of championing the revival of an interest in Karinding and supporting the underground metal scene', was selected to be measured for effectiveness.

The selection was made with the following considerations:

- Given the lack of data and challenges in collecting available information, it still seemed sensible to focus on finding evidence to confirm the outcome's achievement.
- The outcome is in line with Common Room's Theory of Change (ToC). The ToC developed in 2012 had two preconditions, namely the 'provision of public space', and 'strengthening the creative industry' that aligned with the outcome.
- This outcome is in line with the MFS-II end line evaluation orientation for Indonesia to focus on strengthening the relations with other organisations in civil society to undertake joint activities.

The outcome is also in line with the interests of the CFA, Hivos, particularly with regards to expression and engagement.

# 5 Results

## 5.1 Results obtained in relation to intervention logic

Table 5

*Overview of results achieved in relation to project plan Common Room*

| Programme area | Contract deliverables (2012-2013) | Level of achievement |
|---|---|---|
| 1. Expression & Appreciation | The events go as planned with more audiences than the previous years (Baseline: 2010: 1,308; 2011: 3,556). | Regularly facilitated exhibitions, music concerts and cultural & arts festivals.<br>Not achieved, because audience decreased<br>- 2012: 2,020<br>- 2013: 2,052<br>- 1st half 2014: 1,275 |
| | The increase of events with democracy, women issues and human rights themes (baseline: 2010: 2%; 2011: 1%) | Partially achieved:<br>2012: 1%, 2013: 32%<br>In 2013 with the following themes: Public Policy, Anti-Violence, Anti-Corruption, Social Political, Religious Harmony |
| | The strategy to expand the involvement of women participants (baseline: 2010: 30%; 2011: 23%) | Partially achieved: initial improvement in women's participation followed by decline:<br>- 2012: 36%<br>- 2013: 30%<br>- 1st half 2014: 28% |
| 2. Education & Training | No target identified in contract | Routine classroom trainings, which included classes in: psychology, dance, Karinding, computer, etc. |
| 3. Publication | The publishing of planned media: 3 journals and books and weekly updated website | Partially achieved:<br>In addition publications on their website and social media, Common Room published two books: one book archiving the Nu-Substance programme from 2007 to 2012 and "Reasoning" (a collection of writings produced in collaboration with the Moedomo Learning Initiative / MLI) with diverse themes focusing on science and education. |
| 4. Policy advocacy | The assistance of local cultural bodies running in at least 3 cities which one out of it resides in outside Java Island. | Partially achieved: Common Room supported Ministry of Tourism & Creative Economy in monitoring and evaluating activities of cultural centres in 9 provinces outside Java Island.<br>Cooperation with West Java provincial Development Planning Agency (Bappeda, specifically Pusdalitbang) in developing an academic paper entitled, 'utilization of natural resources and local culture for the development of ecotourism destinations and creative economy'. The collaboration resulted in the production of two policy recommendations documents that became reference material for the regional Medium-Term Development Plan (RPJMD) in 2013. |
| | The synergy with another Hivos partner(s) in this assistance of local cultural bodies. | No evidence in Common Room reports. In ELSAM reports collaboration mentioned with regards to Common Room joining the Declaration of Internet Freedom together with 14 other organisations. |

| 6. Community development | No target identified in contract | Unclear which activities specifically focused on improving dialogue between civil society elements |
| 7. Research & development | No target identified in contract | Research in the area of youth and creative economy.<br>New media forms explored and 20 works developed presented to the public. |
| 8. Fundraising | No target identified in contract | Not achieved: Common Room expected to mobilize funds from local government and private sector for events, but this fell short of expectations. |
| 9. Internal organisational | Institutional documents which guarantee the good organisational governance exist:<br>1. The Vision and Mission of the organisation.<br>2. Improved organisational structure.<br>3. Standard Operational Procedure on finance, organisational rules, recruitment and human resources relation, administration, library and media archiving. | Insufficient documentation/evidence available. |

It is difficult to conclude the extent to which planned results in the SPO's intervention logic were achieved. This is due to several reasons. First, the logical framework is activity-oriented. There are no clear linkages between the activities and the intended orientation and deliverables of the 2012-2013 programme. Information provided in the reports by Common Room is inconsistent and does not report clearly against contract deliverables. The contract documents for the Hivos and Common Room engagement over the 2012-2013 period also include a specific focus on building the SPO's internal organisational capacity. Yet very little seems to have been achieved in this area. Overall there is a lack of direction to the activities implemented, whilst the reported activities are difficult to match to a concise project plan.

## 5.2 Changes in civil society in the 2012-2014 period

### 5.2.1 Civic engagement

Civic engagement describes the formal and informal activities and participation undertaken by individuals to advance shared interests at different levels. Participation within civil society is multi-faceted and encompasses socially-based and politically-based forms of engagement.

Since the baseline, Common Room has effectively used its space to bring together Bandung's creative community through a number of events, classes, discussions, workshops and other activities. Between 2012 and mid-2014, some 383 activities were organised on a wide range of themes. These themes included contemporary arts, public policy, anti-violence, anti-corruption, science, history, religion, ICT and media, and others. The majority of the activities were held at the local level and have attracted a more diverse audience and participants with different backgrounds and interests. Participants included foreign artists, photographers, high-school students, academia, forums, government, media, and small businesses. However, female participation averaged at around 30 percent, with no significant increase since the baseline.

Unfortunately, there has been a decline in the number of participants since 2011. In 2011 Common Room attracted 3,556 participants, which fell to 2,052 in 2013. This decline can be attributed to a decline in funding as well as Common Room's move to a new, less central location in 2012. While the number of individual artists utilizing Common Room's facilities dropped, the SPO has managed to work with more diverse groups and organisations, although these are less closely related to artistic expression and engagement. It has become less clear which groups Common Room aims to target through its interventions, with the exception of an alternative music genre.

Despite challenges, Common Room has managed to maintain its support to marginal forms of art such as Karinding and the underground metal scene, which has given rise to an alternative, counter-culture amongst youth in Bandung. Common Room has provided space for Karinding groups to emerge, plan, organize and develop. These groups have experimented with the fusion of metal and customary music genres, gaining not just popularity, but acceptance and support from the government.

With regards to Common Room's political engagement, the SPO's director has close personal relations with the local government. As such, Common Room has been able to gain more political support, financial backing from the government, and has to an extent influenced policies and practices in the areas of creative industry and arts and culture.

### 5.2.2 Level of organisation

This dimension assesses the organisational development, complexity and sophistication of civil society, by looking at the relationships among the actors within the civil society arena.

Since the baseline, Common Room's relations with other actors in the civil society arena have shifted. The SPO now has closer relations with education and youth-oriented CSOs and with fewer creative arts organisations. In addition, Common Room now engages in a local disaster risk reduction forum supported by International Organisation for Migration (IOM). According to Common Room's management team this shift is due to Common Room's relocation in 2012, and the lack of space for exhibitions.

Common Room remains close to Karinding groups and the underground metal scene, but has less intense relations with the Bandung Creative City Forum, Rumah Cemara and WALHI. Rather, regular informal and formal meetings now take place with the likes of the disaster risk reduction forum, Moedomo Learning Initiative, and the Indonesia Art Coalition. Karinding groups continue to experiment and practice music at Common Room's location on a regular basis.

Karinding has become a less marginalized art form. Karinding Attack, a band formed in 2009, and continuously supported by Common Room, has championed the popularity of the traditional music instrument, the Karinding. Their unique mix of underground metal and customary practices has challenged public perceptions of both musical genres. With Common Room's artistic and promotional support, and due to the popularity of Karinding Attack, a new contemporary sub-culture, which is modern yet seeks to connect to Sundanese cultural roots, has emerged. In turn, this has also reduced negative stigmas often associated with underground metal bands and garnered public interest and demand for this new form of musical expression.

As an organisation, Common Room is struggling with an unsteady financial resource base. Although Common Room has managed to gain financial support from the local government in 2011, 2012 and 2013, it has still depended heavily on Hivos funding. Annual expenditures have often exceeded annual incomes, and institutional costs were 50 percent in 2012 and 38 percent in 2013. Lower institutional expenses are most likely related to the slim staffing structure. At present, Common Room has just three staff.

### 5.2.3 Practice of Values

Practice of Values refers to the internal practice of values within the civil society arena. Important values that CIVICUS looks at such as transparency, democratic decision-making, taking into account diversity that are deemed crucial to gauge not only progressiveness but also the extent to which civil society's practices are coherent with their ideals.

With regards to Common's Rooms internal practices, there are no significant changes since the baseline in downward accountability. Common Room's board receives reports on an annual basis and only holds meetings when necessary. The board has expanded to include a representative of a Karinding group, one of Common Room's target groups. Although the executive claimed to have improved reporting practices and organisational policies, the size of Common Rooms staffing structure means that this does not have an extensive impact. Programmatic decisions and direction are determined solely by the current director, and Common Room is very much a 'one-man show'.

Common Room admits that they face internal challenges that reflect on its performance as an organisation. The SPO relates this mainly to the difficulties to obtain human resources cable of designing and developing activities based on the organisation's vision and mission.[9]

Common Room has allocated funds for external organisation audits in 2011, 2012 and 2013. The evaluation team only received the financial audit for 2011. None of the audit reports are publically available.

### 5.2.4 Perception of Impact

Perception of Impact assesses the perceived impact of civil society actors on politics and society as a whole as the consequences of collective action. In this, the perceptions of both civil society actors (internal) as well as actors outside civil society are taken into account. Specific sub-dimensions for this

[9] Email communication with Gustaff H. Iskandar, 29 January 2015

evaluation are the extent to which the SPO has contributed to engaging more people in social or political activities, strengthening CSOs and their networks, and has influenced public and private sector policies.

*Civil society arena*
Common Room's impact upon the civil society arena shows both slightly positive and slightly negative trends.

Generally speaking Common Room's most important positive impact has been its facilitation in the emergence of a new sub culture, which has become a new hype among urban youth in Bandung. This new culture merges a traditional instrument in the Sundanese customary community, the karinding, in the underground metal scene, another marginal subculture. Increasingly a trend is being observed among youth in Bandung to bring their karinding instruments with them, wearing traditional headbands as a means to show their identity and to socialise with individuals with the same interests. Underground metal groups, in the past labelled as antisocial and westernised, that now use the karinding observe how their position in society is improving. Apart from these, spells and mantras and burning incenses, often considered as a violation of Islamic rule, have become an integral part of karinding group performances. The popular karinding now also creates a market for those who make this instrument. Common Room has promoted this instrument since 2008.

Common Room's move to a less central location in 2012 with fewer facilities for artists (individuals and groups) meant in practice a decline in the number of activities organised in the new locality as well as less participants. At the same time the utilization of its facilities have not much decreased, but the diversity of artists making use of these facilities has gone down, with mostly karinding performance groups rehearsing, whereas other non – artist groups like the disaster risk reduction forum of Bandung frequently use these facilities.

*Public sector relations and policy-practice influence*
Since the baseline assessment Common Room has intensified its engagement with the public sector and continued to lobby the government on other issues than in 2012.

With regards to public sector relations, Common Room has engaged in a number of lobby activities in the areas of arts promotion, creative economy and risk reduction through forums and coalitions. Common Room's focus has been on developing policies and programmes related to creative economy. The SPO worked with the Ministry of Tourism and Creative Economy as well as the West Java Creative Economic Development Committee in this area.

It is unclear what tangible results these new forms of engagement have produced. What has been more successful has been the long-term campaign efforts by the Concerned Citizen Forum for Babakan Siliwangi, of which Common Room has been a part of, to convince the local government to revoke a building permit ranted to a private company that was planning to alter the function of a community forest area into a commercial area.

Common Room has also achieved some level of success in gaining government financial support and working alongside the government to develop policy inputs. In 2012, the SPO received funding support from the city government, and collaborated with the Provincial Development Planning Agency as well as the Ministry of Tourism and Creative Economy. Common Room produced recommendations on ecotourism and creative economy, and on the revitalization of cultural centres. The documents were said to have been used as reference materials by the government in formulating mid-term development plans. But for Common Room itself the collaboration was not satisfying since it was a challenge to receive payments for the technical services it provided to the government and because their inputs were not taken up sufficiently. Common Room remains critical of the effectiveness of government programs.

*Private sector relations and policy – practice influencing*
With regards to the private sector, Common Room has not engaged companies and other actors in strengthening the development of a creative industry. Although the SPO did collaborate with small businesses and media, event organizers this was limited to specific events such as the Nu-Substance festival and through the utilization of Common Room's facilities.

### 5.2.5 Civil Society Environment

The social, political and economic environment in which civil society operates affects its room for manoeuvre. The civil society context has been described in Chapter 3.

The civil society environment has not affected Common Room to a large extent. Rather Common Room's forced relocation has had a larger impact on its ability to influence and manoeuvre due to the less strategic location. This also illustrates Common Room overreliance on its facilities to relate to other civil society actors and artistic groups. Although Common Room has now opened up to collaborate with other actors, the choice of new partnerships seems to be less strategic to the organisation's vision and more driven by opportunistic motives for resource mobilization.

Common Room has put in place a more enabling environment for Karinding groups, who have become better acknowledged and now enjoy more government and public support. Young musicians and artists are now attracted to a sub-culture that promotes a customary-infused identity that is pluralistic in nature. Common Room is also likely to benefit from the personal relations that its director has with the current mayor of Bandung. But these favourable conditions may change if local elections usher in a new administration which is less open to creativity and artists' groups.

## 5.3 To what degree are the changes attributable to the Southern partners?

Common Room was not selected for in-depth process-tracing. The evaluation team was able to identify one outcome achieved in the 2012-2014 period for quick process-tracing. This outcome is that the Karinding community has become more organized and capable of championing the revival of an interest in Karinding, a traditional Sundanese musical instrument, through a unique combination with the heavy metal music genre. Karinding Attack, a music group established in 2009, is recognized as an 'ambassador' of a progressive Sundanese cultural movement amongst the youth.

***Figure 1*** *Karinding is a traditional Sundanese wind instrument from West Java. It typically measures at 20 cm long and is commonly made from the bark of palm or bamboo trees. (Photo from: http://traditionalmusicinstrument.blogspot.com)*

Common Room has helped the band Karinding Attack become popular. The band has become the champion of the unique blend of underground metal and Sundanese customary music. The underground metal community has grown to be more accepted and are enjoying a better position to exist in Bandung's urban scene. They have also received more support from the government, with an increasing demand for performances and trainings on how to play Karinding. Karinding has attracted urban youth interest in exploring Sundanese customs. This in turn has meant that Sundanese customary identity has become more acknowledged and has been afforded a space in society. Karinding groups, like Karinding Attack, are more able to express their identity and practices freely through burning incense, using mantras and wearing traditional clothing. In the past this was perceived to be peculiar by mainstream urban society. This outcome has also been confirmed by prominent cultural figures of Bandung.

There are three pathways that could explain this outcome. The first attributes the outcome as a result of the popularity of Karinding Attack's personnel among youth. The second attributes the outcome as a manifestation of a 'hype' (contemporary sub-culture), which has driven youth to seek new and unique forms of identity. The third pathway attributes the revival of Karinding to Common Room's support to Karinding Attack.

*Information that confirms or rejects the pathways:*

1. Pathway 1: Karinding Attack's personnel drive the popularity of Karinding

Karinding Attack was formed when Common Room began innovating the combination of Karinding (an unpopular instrument at the time) with other musical instruments and genres. The personnel of Karinding Attack are popular figures amongst the youth and known for their contribution to the underground metal group Ujungberung Rebels. It is possible that the revival and popularity of Karinding is due to the fame of the Karinding Attack personnel.

Information that *confirms* pathway 1:

Man Jasad and Kimung, two of the Karinding Attack's personnel, were already popular before Karinding Attack was formed. Man Jasad was a prominent figure among metal heads in Bandung as he was the vocalist of Jasad Band; while Kimung was a member of Burgerkill, a very famous band in the underground metal community in Indonesia.

Information that *rejects* pathway 1:

Man Jasad, does not deny that his popularity has been behind Karinding Attack's overall popularity. However, in his opinion, without Common Room's intervention they would never have existed, or gained the same level of popularity.

2. Pathway 2: A contemporary sub-culture hype drives Karinding's popularity

The urban youth are continuously seeking new forms of expression and unique identities, which often leads to new hypes. This could also become an explaining factor behind the rise of the Karinding trend.

Information that *confirms* pathway 2:

Bandung is popular as a barometer of lifestyle in Indonesia. Many new music groups and fashion trends have emerged from the city. Since the early 2000s, Bandung has boasted thriving underground music scene that includes punk, metal, hard-core and other alternative genres[10]. Underground metal 'activists' reported that at the time of Karinding Attack's formation (2008-2009), there was actually a downward trend in the metal underground scene. This drove many of its artists to seek out new forms of innovation.

[10] Martin-Iverson, S. 2007. *Community and Critique: Political performance in the Bandung DIY hardcore scene*. Music on the Edge – 2007 IASPM/ANZ Proceedings. Available from https://www.academia.edu/4689328/Community_and_Critique_Political_performance_in_the_Bandung_DIY_hardcore_scene (accessed 13 December 2014)

***Figure 2*** *Karinding Attack is a musical group that combines traditional instruments and heavy metal. (Photo by KOMPAS/RonyAriyanto Nugroho)*

Before Karinding Attack was formed, there was already a growing hype around Sundanese customary identity. Common Room's introduction of Karinding was actually a response to this hype. Outside the Karinding community, other forms of Sundanese cultural expression have also grown. Some examples of this include Rabu Nyunda, a city government initiative which stipulates that all students should wear Sundanese attributes and speak Sundanese on Wednesday; increased popularity of the Suku Baduy village, an isolated customary community, as a tourist destination and; trekking and hiking expeditions to Gunung Padang, famous for its remnants of an ancient mystical pyramid. The government and creative industries have sought to harness a 'creative city' development framework[11].

Information that *rejects* this pathway: none

3. Pathway 3: Common Room assisted Karinding Attack to become popular, in turn reviving an interest in Karinding

Information that *confirms* pathway 3:
Karinding Attack confirmed that Common Room helped them artistically and provided them a space for training and performing. Man Jasad, the lead singer of Karinding Attack, confirmed that without Common Room's intervention, Karinding Attack would not be where they are today with regards to their existence and popularity. Common Room helped to develop Karinding classes and teaching material, which allowed more people to be exposed to and learn Karinding, resulting in the emergences of more Karinding bands/groups.

Information that *rejects* pathway 3: none

[11] Prasetyo, F. A., Martin-Iverson, S. 2013. *Art, activism and the 'Creative Kampung': A case study from Dago Pojok, Bandung, Indonesia*. Paper presented at Planning In The ERA Of Uncertainty, International Conference March 4-5, 2013. Available from https://www.academia.edu/5014085/Art_activism_and_the_Creative_Kampung_A_case_study_from_Dago_Pojok_Bandung_Indonesia (accessed 13 December 2014)

*Conclusion:*
Based on the available data and information, we conclude that Pathway 1 is a *necessary* explanation for the outcome, but it needs Pathway 3 to be *sufficient*; and vice versa. This means that they are part of a causal package that are together sufficient to explain the outcome. Pathway 2 is a *sufficient* but not *necessary* explanation for the outcome, as both Pathway 1 and 2 may also explain the outcome. Common Room played an important role in helping underground metal artists experiment with Karinding. In the art sphere, institutions like Common Room offered a meeting space for various groups to redefine artistic expression[12]. Groups like Karinding Attack benefitted from the space offered by Common Room to practice and innovate, and also profited from the numerous festivals and events organized through the institute to gain a wider audience and fan base.

## 5.4 What is the relevance of these changes?

### 5.4.1 Relevance of the changes in relation to the Theory of Change of 2012

As mentioned in Chapter 4, the selection of the outcome identified for analysis is relevant to the 2012 Theory of Change. Common Room sees itself as a platform and bridge to bring together communities and individuals from different backgrounds. Broadly speaking, the interventions of Common Room are around offering education and training, policy advocacy, developing spaces for expression and the production and distribution of knowledge. However, the evaluation team has found that the preconditions that Common Room sought to achieve in 2012, have not been fully realized. Common Room itself attributes the limitations in achieving intended results to its lack of organisational capacity. As such, the relevance of changes to the ToC is limited.

First, internally Common Room's ability to network, mobilize human resources and sustain its interventions remains rather limited. Although they have made a name for themselves amongst the Karinding and underground metal scene, as well as gaining government recognition, Common Room organisationally remains rather weak. Second, the public space they offer is less accessible and less utilized by marginalized or non-mainstream artists compared to 2012.

Common Room intended to promote the use of ICT/media in their interventions. Other than developing some forms of explorative media and hosting workshops on ICT, the use of media and technology has not become a defining feature of Common Room's work although it did seem to be part in parcel of its ambitions in 2012.

The changes that are relevant to the ToC relate to the forms of cultural identity that Common Room has successfully promoted. Sundanese traditions have been reintroduced into modern forms of musical expression and there seems to be a tolerance amongst the public for the mystical, mantra-like performances of Karinding bands. There is also more tolerance and acceptance of metal bands, who were often stigmatised in the past. As such, former 'outcasts' so to speak have been able to innovate through the support provided by Common Room and the preservation of cultural identity has indeed contributed to positive associations with this new sub-culture.

### 5.4.2 Relevance of the changes in relation to the context in which the SPO is operating

Bandung as a city is still known for its creative industry, but much of this creativity has been commercialized. In urban centres like Bandung, artists have found it a challenge to survive without compromising idealism and creative values. The creative economy discourse has been present in

[12] Ciric, Biljana. *Towards a New Institutionalism in Southeast Asia: Case of Contemporary Art* (forthcoming). Available from https://www.academia.edu/7825317/Towards_a_New_Institutionalism_in_Southeast_Asia_Case_of_Contemporary_Art (accessed 13 December 2014)

Bandung since the late 2000s and originated from initiatives of creative networks[13]. The local government responded to pressures from alliances like Bandung Creative City Forum (BCCF) in formulating policies that promote creative industries. Although there is government support, arguably citizen-driven initiatives for dialogue and the exchange of knowledge and ideas are still as important to drive diversity and as elements of public spaces.

Common Room has continued to provide space for creative alternatives, especially in the music scene. Without the SPO's support, groups like Karinding Attack may not have been as influential in the youth sub-culture as they are today. Common Room was amongst the first to facilitate the fusion of traditional instruments with the metal genre.

Common Room, like many other cultural and artistic spaces, has supported the emergence of alternative cultural movements. As such, they have contributed to a more diverse civil society through the dynamic sphere of art and culture. The underground music scene "provides young Indonesians with a set of alternative identities and lifestyles, providing a route to escape from, challenge, or at least negotiate the dominant frameworks of nationally, ethnicity and class"[14].

### 5.4.3 Relevance of the changes in relation to the policies of the MFS II alliance and the CFA

The support provided to Common Room falls under Hivos' Expression and Engagement programme. This programme aims to generate social debate and cultural dialogue in order for a dynamic culture and new perspectives to emerge. Hivos considers space for socially engaged art and culture to be limited in developing countries and sees art and cultural expression as a means to generate critical reflection, pluralism and diversity.[15] "For Hivos, culture, media and other forms of communication are important means to promote citizenship" and a means to challenge dominant ideas.[16]

According to Hivos documents, Common Room was supported because its creative ideas were in line with Hivos' focus. Common Room was viewed to be working on "empowering civil society through encouraging knowledge sharing and collaboration between communities and/or individuals". The SPO was considered strategic for its support to communication and interaction, whilst maintaining principles of a democratic and pluralistic society.[17]

According to the current Expression and Engagement programme officer of Hivos' Regional Office for Southeast Asia who took over the management of the portfolio when Common Room support was coming to an end, the SPO did indeed provide a platform for alternative forms of artistic and cultural expression. However, Hivos found the interventions of the SPO to be less strategic. It was acknowledged that Common Room's director had many good linkages with the local government in Bandung and that sufficient support could be drawn from the government. However, the organisation seemed to have lacked a strategic vision on how generate greater influence. Moreover, the issues the organisation faces internally, specifically the inability to generate new emerging leaders or staff, have led to Hivos' decision to discontinue support to Common Room especially given that Hivos funds were also intended to improve Common Room's organisational performance.[18]

## 5.5 Explaining factors

### 5.5.1 Internal factors

In 2012, Hivos assessed the capacity of Common Room using the five capacities framework. The assessment scored the core capacities of Common Room, with most areas receiving respectable scores of 7 or 8 (9 being the maximum). The following table presents an overview of the scores:

Table 6

*Hivos assessment of Common Room against the 5C framework.*

| Capacity | Description | Score |
|---|---|---|
| | 5 Cs | |
| 1 | The capability to act and commit | Mean score of 6.67 |
| 1.1 | The organisation has a clear purpose and acts on decisions collectively. The leadership is accepted by staff, inspiring, action-oriented and reliable. | 7 |
| 1.2 | The organisation is capable to mobilise sufficient financial resources, and (where relevant) non material resources from members/ supporters. | 6 |
| 1.3 | The organisation is internally transparent and accountable. (Relations between staff, direction and board; quality of decision-making process | 7 |
| 2 | The capability to perform | Mean score of 6.75 |
| 2.1 | The number, composition and expertise of staff is adequate in view of the organisation's objectives and programmes. (Indicate when there is high staff turnover) | 7 |
| 2.2 | The organisation has a coherent and realistic strategic plan. (Context and problem analysis; Theory of Change; quality of formulation of objectives, intended results and indicators; explanation of strategic choices) | 7 |
| 2.3 | The quality of financial and administrative management is adequate. (Budget, funding plan, financial management, financial report) | 6 |
| 2.4 | The organisation has an appropriate monitoring and evaluation process (documentation & data collection, involvement of stakeholders, quality of analysis and learning) and uses it for accountability and learning purposes. | 7 |
| 3 | The capability to relate | Mean score of 7 |
| 3.1 | The organisation maintains relevant institutional relationships with external stakeholders and is seen as credible and legitimate. (Indicate main strategic relationships and collaboration with other actors) | 7 |
| 3.2 | The organisation is accountable to and communicates effectively with its primary constituents/ beneficiaries. (Describe downward or horizontal accountability process; specify for women) | 7 |
| 4 | The capability to adapt and self-renew | Mean score of 7 |
| 4.1 | The organisation (management) responds adequately to trends and changes in the context and uses up-to-date strategies and knowledge. | 7 |
| 4.2 | The organisation (management) encourages and supports internal learning and reflection processes. (Conditions, incentives) | 7 |
| 5 | Capability to maintain consistency | Mean score of 6 |
| 5.1 | The organisation is capable to maintain consistency between ambition, vision, strategy and operations. The management is able to deal strategically with external pressure and conflicting demands. | 6 |
| | Gender | |
| Quality 1 | To what extent has the organisation formulated objectives with regard to the position of women and issues of gender equality? | 7 |
| Quality 2 | To what extent does the organisation have internal gender expertise? | 4 |
| Quality 3 | To what extent does the organisation maintain relations with key GW&D actors in its context, e.g. women's movement, women's organisations, gender experts? | 5 |

Source: Hivos Partner Capacity Assessment Form 2012

In the 2012 partner capacity assessment, Common Room scored lowest in its capabilities to act and commit and to maintain consistency. The assessment pointed to a number of internal capacity issues that required strengthening in the areas of organisation, management and administration. It also noted that Common Room had high ambitions, but required staffing and funds to support these. In the end line evaluation, we found that little progress has been made in improving the areas found to be weak in 2012. In fact the expected achievements that were put forth in the baseline report with regards to the quality of Common Room's organisation have not been reached. With regards to networking Common Room expected to have 8 personnel, and it now only has 3. Common Room also expected to be less dependent on Hivos for funds and expected to have set up a running business unit. Neither of these have been achieved either.
