Table 29 shows that 4 respondents already started the litigation procedure before the baseline and 3 of them were assisted by LRC-KJHAM. At the midline, 2 of these cases were still on-going and 6 other respondents were involved in a lawsuit regarding divorce. LRC-KJHAM assisted in 7 of the 8 cases, however, 3 respondents also relied on other source of assistance such as a lawyer. At the endline, 2 previous cases were still on-going and 4 respondents started the litigation procedure. LRC-KJHAM was not involved in the on-going cases, and only assisted in 2 of the new cases.

Overall, 15 of 20 respondents were involved in lawsuit regarding divorce until the endline with LRC-KJHAM assisting in 10 of these cases. However, not all of these have been finalized as only 7 respondents had divorced status and 3 remarried at the endline. For example, one case stopped in despair as stated by one respondent "*My lawyer died and he had all of my documents and I don't have*

*their copies. I was so upset and I was too desperate to start my case all over again.*" Another respondent said that "*Because of missing my children, I called off the process of divorce."*

**LRC-KJHAM**

The roles of LRC-KJHAM is very important for the women victims to provide assistance, especially during the litigation process. As discussed above, LRC-KJHAM assisted in 10 of 15 litigation cases but it also provided support to respondents who did not want to divorce. Most respondents visited LRC-KJHAM 2-4 times (12) or more (5), and only 3 respondents visited only once, which shows the usefulness of LRC-KJHAM for the respondents who returned.

However, not all respondents were assisted by LRC-KJHAM in their litigation procedure. 5 women got assisted by other institutions/law firms or choose to file a divorce without any help, and 3 respondents being assisted by LRC-KJHAM also relied on other sources. In general, women who can afford to pay for law firm services usually go to these institutions since these institutions are quicker. As one respondent stated "*I came to LRC-KJHAM and I was welcomed nicely. I was asked to tell my problem, fill my data. After that, I didn't come again because it took my time so long."*

Generally, women who ask for help from LRC-KJHAM really need help so their problem can be solved. Economic factor is seen to be a major obstacle for them as they do not have the money for consultations and representing them in court. They are only able to provide for their and their children's living costs. LRC-KJHAM offers to help them for free until the case is closed. But the women have to be patient due to more interviews to collect information and the limited capacities of LRC-KJHAM. One respondent said that "*We need to be patient if we ask for a help in LRC-KJHAM. Survivor partners [paralegals] are really helpful, so I can be ready solving my problem*." According to the respondents, the staff of LRC-KJHAM is patient and friendly and they really defended domestic violence victims. Participants also got counselling service and they were taught how to make incident chronology, how to prepare a letter for the court, and the steps of the lawsuit. The knowledge and moral support received from the survivors working at LRC-KJHAM provided strength for the respondents in solving their problems at court or in the household. As one respondent said *"The guidance done by KJHAM is only out of the court, I have never been in business with a judge, I am afraid I say the wrong answers"*.

All women were also offered to join one of the support groups of LRC-KJHAM. 5 of 20 respondents remained members of the support group during the evaluation period. They stated that they felt more empowered as they got the courage to stand up for themselves. As one respondent stated "*By meeting up with other members regularly, we can share our experiences. It can make us self-confident and brave. I realize that there are women who have heavier burden compared to mine.*"

However, many respondents said that they found it an obstacle to go to LRC-KJHAM and participating in the support group because LRC-KJHAM is too far for them and they do not have the time to go due to their work. Besides, the activities of the support group are organised during the working hours, which makes it difficult for the women to attend as almost all of them have working duties. For example, one respondent said that "*I really want to gather and add my experience, but I don't have time. I have to meet my company selling target."* Another respondent who remarried said that "*My husband doesn't*

*permit me to join the support group. Actually, I still have a will to come so that I can meet other members."*

### *Other life events*

Table 26 summarizes the type of positive and negative life events that happened to the respondents since the baseline interview. The table shows that many positive and also negative events happened to the respondents during the evaluation period. The most positive changes are related to their jobs, with 7 and 11 respondents reporting positive changes in 2013 and 2014, respectively, while 2 and 3 respondents experienced negative changes in their employment conditions. Nonetheless, several respondents experienced negative economic shocks, especially between 2013 and 2014.

Regarding family life, 9 respondents reported positive changes in 2013, and 10 in 2014. These respondents mentioned that they became more peaceful, had more time to spend with children and grandchildren, and already had a job. They felt psychologically stable and they were able to fulfil their daily needs. As stated by one respondent *"I have become independent and no more counting on my parent in-law to fulfil my daily needs. I have my own kitchen. I also join Support group activities that make me feel calm, have more friends, and more knowledge."*

However, 5 respondents reported negative changes in family life in 2013, and 7 in 2014, such as their husbands were still temperamental and took money from her, parent in-law often intervened in their household affair, and her husband took the children to his parent's house. One respondent regretted to have re-married with her husband who conducted violence. As stated by respondent *"I had no other choice than re-marrying my ex-husband for the sake of the children. He was rude and threatened to hurt the children if we leave him."* Six respondents reported that they have suffered from illness, sadness, accident, even parent's illness and death. As described by one of respondent "*I have been suffered from headache, cold, easily get tired since the past one year. My husband always snaps at me and is always rude to me.*"

In 2014, 6 respondents reported positive changes in their social life such as social activities with their friends. For example, a respondent who got divorced said "*I love my recent job and have many friends."*

4 out of 7 respondents who still visited LRC-KJHAM reported positive changes in economic and family life in 2013. One of the respondents stated that she *"has accepted her condition, more relax in facing problems, more patient, and has more income than her husband."* On the other hand, 3 respondents who are still visiting LRC-KJHAM reported negative life due to illness. 2 respondents reported positive changes in marriage life and 2 reported negative changes.

### *Overall changes*

On the one hand, respondents who remained married reported at the endline that they were trying to accept the household condition and be more patient. Some respondents who separated from their husband felt more relaxed and moved towards divorce, while others were struggling to make ends meet and get detached from the past due to unsettled family conditions. For example, one respondent said that *"As time goes by, I'm able to arrange my life and work to meet my needs and my child's, therefore my husband will not underestimate me as a woman."*

On the other hand, all respondents who got divorced felt more relaxed and patient with their health improving.[30] One respondent said that she was "*trying to be strong and tough for the children*" as she had now the responsibility to provide for her children and herself. Two respondents also quickly found a new husband who has been treating them well, while a few other respondents also found new boyfriends and their social life improved. Hence, most of the divorced respondents have moved on with their lives and become more relaxed and free of abuse.

### *Attribution*

The qualitative data show that the respondents who turned to LRC-KJHAM not only received legal assistance but also moral support and counselling from survivors of LRC-KJHAM who have experience with their situations. This contributed to improving the respondents' self-esteem and confidence, especially for women who were members of the support group.

Through assisting in the divorce, LRC-KJHAM directly contributed to breaking the cycle of abuse when the women were ready to make this step. Hence, LRC-KJHAM assisted women in carrying out their resolution and informed them about their options and the procedure. Despite the stigma of divorced women in Indonesian culture, respondents who got divorced felt more relieved and relaxed, and managed to find new friends and companions.

However, LRC-KJHAM was not the only source of help. Respondents also confided in their close friends and looked to them for moral support. Support and advice from parents and siblings was also an important factor in dealing with their household problems. Some respondents also got engaged in religious activities to ease their mind.

Nonetheless, the everyday life of respondents has been governed by work and earning a living to provide for themselves and their children, especially after a divorce. Several respondents achieved successes in obtaining a better job or starting their own business.

Overall, we find that LRC-KJHAM is an important source of help for escaping the abusive situation, especially for women who cannot lean on support from their family and who have the time to go to LRC-KJHAM. Respondents felt that LRC-KJHAM really supported victims of domestic violence. However, it was the close friends and family that send most of the respondents to LRC-KJHAM and provided continuous support for the women through their everyday life.

## 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular, we look at the size of the impact, whether the project addresses an important issue for the beneficiaries, and the satisfaction of beneficiaries (self-reported impact).

### 9.1. The size of the impact

The results show that most women got free of domestic violence and increased their autonomy either through divorce or separation or because the husband was not as abusive anymore, which translated

[30] An exception is the case of the respondent who remarried her abusive ex-husband on the request of her child.

into an 80% reduction in the number of types of abuse suffered by the respondents and a 38% reduction in the abusive traits of the (ex-) husbands towards their wives if they still communicated. But 5 respondents (25%) were still psychologically abused and one of them also sexually abused by her (ex-) husband. LRC-KJHAM contributed to these changes through the counselling and legal assistance provided for the respondents. However, the support from family and friends and successes in employment were just as important for the women to become more courageous and self-confident.

The psychological well-being of respondents improved by 44% during the evaluation period. This change is probably due to the encouragement received from these sources. However, respondents who experienced less abuse also suffered from less distress, and respondents who solved their cases and settled the divorce consistently reported to feel more relaxed and relieved.

We do not observe any significant changes in the empowerment of the respondents, except for a substantial increase in their self-esteem. No changes were found with respect to the attitude towards their rights in marriage.

The data show sizable reductions in domestic abuse and psychological distress. However, it is difficult to quantify the attribution of LRC-KJHAM in these changes.

## 9.2. Does the project address an important issue for the beneficiaries?

A first indication that LRC-KJHAM indeed addresses an important issue for the beneficiaries is that 85% of the respondents visited LRC-KJHAM more than once. As one respondent stated "*I visited LRC-KJHAM for about 10 times to have consultation for my divorce and my children's rights."* Also, most women agree that the support group activities were or would be very helpful for them. However, most women cannot participate in the support group (only 5 of 20 women were a member of the support group all through the evaluation period) due to the distance to the meeting and the time of the meeting (during working hours).

From the interviews it became clear that woman do need LRC-KJHAM services when filing for a divorce. They indicate the need to receive help and guidance before and during court since most woman do not have any experience at all in this area.

In addition, LRC-KJHAM is very valuable for respondents who cannot afford to hire a lawyer to handle their case. LRC-KJHAM offers free of charge services both for counselling and legal assistance until the case is closed.

## 9.3. Satisfaction of beneficiaries (self-reported impact)

A first indication to whether or not LRC-KJHAM contributed to the measured changes in a woman's exposure to violence, psychological health and improved self-esteem can found in the answer to the question: did you receive the kind of help you were looking for the first time you visited LRC-KJHAM? (Table 30 in Annex VI). 13 women indicated that this was indeed the case, 5 women indicated this was partly the case and 2 women indicated this was not the case, though 1 of these women did visit LRC-KJHAM more than once. In addition, the number of women visiting LRC-KJHAM decreased over time because many women settled their divorce and needed no more help. The respondents who found the

services of LRC-KJHAM useful, usually visited LRC-KJHAM 2-4 times before their case was finished, while support group members visited more often (Table 3).

To be able to tell more about the impact of LRC-KJHAM's services on the women, the self-reported impact was assessed as well. Regarding empowerment, women were asked how the services received at LRC-KJHAM have changed them on a number of occasions (e.g. 'I became more confident and brave') (see Table 31). The responses are indicated on a scale of -2 'Strongly disagree' to +2 'Strongly Agree'. The information was collected at the midline survey (2013). The results are very positive, which may be due to social norms in responding. Almost all women agree or strongly agree with every statement given, indicating that due to the services of LRC-KJHAM they consider themselves more empowered and are in a better psychological health condition. Especially the members of the support group show high results.

One statement in particular is given in the table below: 'I feel more emotionally stable and less stressed due to services of LRC-KJHAM'. On average, women responded positively to this statement: the average score is close to 0.8, meaning that most women agree, though not strongly agree, with feeling more emotionally stable and less stressed due to LRC-KJHAM. No difference in this score is found between the 2012 and 2013.

**Table 10: Service satisfaction and self-reported impact**

| Sample | Total sample | |
|---|---|---|
| **Sample size** | 13 | 20 |
| **Year** | 2012 | 2013 |
| Feel more emotionally stable and less stressed due to services of LRC-KJHAM (scale from -2 to +2) | 0.77<br>(0.60) | 0.75<br>(0.79) |

Source: Respondent survey E7; MFS II Evaluation Indonesia
Notes: Standard deviations given in parentheses.

Table 32 in Annex VI reports the service satisfaction of the women with the services of LRC-KJHAM by service type (scale of -2 'Not satisfied at all' to 2 'very satisfied'). In general women had a neutral to satisfied opinion on the service quality for all four components (psychological counselling, legal advice, legal aid, support group). Especially the legal aid services score high (1.4). Due to the low sample size at the midline it is difficult to compare the service satisfaction rates between the years.

In conclusion, the women are quite satisfied with the services provided and indicate that these services had a positive effect on their psychological well-being.

## 10. Evaluation question 4: Efficiency of project

This subsection addresses evaluation question 4: Were the development interventions of the Southern partner organisations efficient?

Unfortunately, we are not able to evaluate neither the efficiency nor the effectiveness of the project. Therefore, in this section we put forward our arguments for failing to evaluate the question on efficiency. However, first, the available cost information for the LRC-KJHAM project is discussed below.

## 10.1. Project costs

To collect information on the costs of the project, we conducted a structured interview with the director, head of internal affairs and head of field operations[31] of LRC-KJHAM on 19 July 2013 using the 'budget survey' as described in section 5.1. In addition, we had correspondence with LRC-KJHAM in 2014 to obtain information about the new contract with Hivos. However, the contract of LRC-KJHAM and Hivos for 2013-2015 will not be taken into account in this section because the project activities differ from the evaluated project. The cost figures for the 2010-2012 period in this section are based on actual expenditure data.

Table 11 summarizes the available cost information for the LRC-KJHAM project. The contract period for the evaluated project ran between 1 October 2010 and 31 December 2012. Therefore, for 2010 we have separated the cost information for the contract period (Oct-Dec) and for the previous contract period (Jan-Sept). The total project costs reported by LRC-KJHAM to Hivos are reported in column 3 in the table in Indonesian rupiahs (IDR) and in euros in column 4 (using a yearly average exchange rate). Hivos funded the total project budget. Unfortunately, we do not have information about the share of costs used for providing counselling and legal aid services to victims of GBV, and other activities not evaluated in this report.

The total project costs for the contract period (1 October 2010 - 31 December 2012) were in total 1,127,831,300 IDR or 312,458.50 International dollars at 2011 prices.[32] Hence, 97% of the available project budget has been used.[33]

The total number of beneficiaries for the Hivos project is reported in column 6 of Table 11. These numbers include beneficiaries for all project activities, not only the beneficiaries of counselling and legal aid. In fact, in 2012, among the 1,288 beneficiaries, only 114 beneficiaries have been reached through the handling of cases of violence victims (including litigation), among which 49 cases were related to domestic violence. The majority of beneficiaries have been reached through the campaign against violence against women and the distribution of campaign materials (589 people).

[31] The interview was conducted with Fakthurozi, director of LRC-KJHAM, Helen Intania, head of internal affairs, and Eko Roesanto Fiaryanto, head of field operations.

[32] PPP conversion factor to 2011 international dollars is calculated using the World Development Indicators: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#.

[33] The project budget was 95,000 EUR or 1,168,500,000 IDR (using exchange rate of 12,300 IDR/EUR as in the contract between Hivos and LRC-KJHAM) for the period between 1 October 2010 – 31 December 2012.

**Table 11: Overview of the costs and number of beneficiaries**

| Year | Number of months | Total costs [IDR][1] | Total cost [EUR, current prices][2] | Percentage of costs funded by CFA | Beneficiaries (population) | Cost per beneficiary per year [Int$ 2011][3] |
|---|---|---|---|---|---|---|
| **2010 (Jan-Sept)** | 9 | 433,580,040 | 35,789.88 | 100% | 307 | N.A. |
| **2010 (Oct-Dec)** | 3 | 84,719,800 | 6,993.20 | 100% | 65 | N.A. |
| **2011** | 12 | 521,555,750 | 42,527.38 | 100% | 415 | N.A. |
| **2012** | 12 | 521,555,750 | 43,149.43 | 100% | 1,288 | N.A. |

## 10.2. Assessment

There are a number of factors that complicate the calculation of cost per beneficiary. Firstly, the majority of costs of LRC-KJHAM related to psychological counselling, legal advice and legal aid to victims of GBV are fixed – at least in the medium term (like staff costs). As a consequence, if in a given period more clients turn for assistance at LRC-KJHAM, the cost per beneficiary decreases. However, as the nature of service provision, the number of clients (to some extent) is an external factor to LRC-KJHAM. In addition, the availability of the counselling and legal advice and aid services is valuable in itself.

Secondly, a high number of beneficiaries may show a large turn-over of clients. Hence, it would be more informative to look at the cost per hour for counselling and legal aid/advice. However, unfortunately, we do not have information on these.[34]

Thirdly, we lack information about the total costs associated with counselling and legal aid services. As discussed above, a large number of beneficiaries have been reached through other activities of LRC-KJHAM. Therefore, it is not sensible to calculate the cost per beneficiary based on the information displayed in Table 11.

Taking the above concerns into account, providing a reliable (and sensible) estimate of the cost per beneficiary for the LRC-KJHAM project goes beyond the scope of this evaluation. Therefore, we refrain from going further in answering evaluation question 4 than the information on project costs provided in section 10.1.

[34] Assuming no idle time, it would be possible to calculate the cost per hour based on the wages to the counsellors and the costs associated with the space used for counselling and communication costs. However, we do not attempt to do such a calculation.

# 11. Contribution of Capacity Development and Civil Society

LRC-KJHAM has not been selected for either the capacity development or civil society strengthening components of the MFS II evaluation.

# 12. Conclusion

LRC-KJHAM provides counselling and legal aid services to victims of GBV. The results show that most women got free of domestic violence and were able to increase their autonomy either through divorce or separation or because the husband was not as abusive anymore. But 5 respondents (25%) were still psychologically abused by their (ex-) husband at the endline. In general, we observed an increase in the self-esteem and confidence of most respondents, while respondents who got divorced reported feelings of relief.

LRC-KJHAM contributed to these changes through the counselling and legal assistance provided for the respondents. Respondents felt that the survivors at LRC-KJHAM were patient and friendly and they really defended domestic violence victims. The knowledge and moral support received from these survivors provided strength for the respondents in solving their problems at court or in the household.

However, the support from family and friends and successes in employment were at least as important for the women to become more courageous and self-confident. In fact, respondents first confided their household problems to their close friends and family (parents and siblings) when they could not take the pressure and abuse anymore after a long period of suppressed insecurity and fear. It was usually these friends and family who advised the respondents to seek help at LRC-KJHAM.

These findings are almost perfectly in line with the findings in the literature, which showed that counselling and support group activities can help to emotionally strengthen survivors and improve a number of skills and characteristics, like self-esteem, assertiveness and coping abilities. The literature is not conclusive on whether counselling and support group activities actually result in changing the abusive situation. Indeed, while we observe a decrease in domestic violence, we also reported that 25% of the women were still psychologically abused by their (ex-) husband at the endline. With respect to women's attitude towards marriage and family, our findings deviate from the literature, which shows improvements in women's traditional attitudes towards marriage and the family, and marital functioning, whereas we found no changes with respect to the attitude towards their rights in marriage.

In addition, the results of the qualitative study with support group members and paralegals reported in Annex VIII provide some concluding remarks:

1. The risk of being stigmatized by the community, and the fear of not being able to support themselves and their children, is what usually keeps women from filing for divorce or reporting the abusive behaviour of their husbands to the police. Changing this patriarchal culture requires continuous advocacy of policy change with regard to gender equality.
2. Most of our informants had initially tried to cope with the abuse on their own and had waited a long time before confiding to a friend or relative about the abuse. In the end, none of them had made the step to contact LRC-KJHAM on their own. Instead, all of them had to be motivated by a

friend, relative, neighbour, acquaintance or public officer before they would seek help. In conducting active outreach to clients, it might thus be useful for LRC-KJHAM to include the victims' social circle and the relevant public institutions in their targeting.

3. LRC-KJHAM's strategy to change victims of gender based violence into survivors and active agents that are able to change their own situation as well as those of others is well chosen. By empowering victims and giving them the courage, skills, and will to actively speak up in court and actively commit their own knowledge and experiences to inspire and help other victims, the victims themselves become advocates for the fight against gender based violence. By changing shame and disgrace into power, they are able to gradually change the negative connotations that are traditionally associated with 'divorce' and 'assertiveness' in women, and inspire and encourage other victims to fight for their own rights, and ultimately those of others.
4. Our data shows that, even though LRC-KJHAM never suggests divorce as a solution, victims of domestic violence preferred to file for divorce immediately, without first reporting the abuse and going through the full legal process. This is problematic because any abuse that is reported after the divorce will legally not be sentenced as 'domestic violence', but rather as 'violence against women' for which lighter punishment applies. The fact that many women still decide to directly file for divorce supports the idea that victims know too little about legal procedures. Much can thus still be gained by training and educating the victims on their rights.
5. The synergy between LRC-KJHAM, victims, and government is the key to successfully handling gender based violence cases. The fact that women's right to protection from gender based violence is now recorded as a law, has given policy makers a discourse, and socialization of gender justice and equality already seems to be occurring at various levels. The presence of PPT Seruni - an integrated service centre at the city level - is proof that the government of Semarang is serious about dealing with gender based violence issues.

Finally, the MFS synthesis team asked to score each project along a few indicators. Table 12 displays the indicators and the scores we deemed valid for the project.

**Table 12: Overall project scoring**

| Statement | Score | Remarks |
|---|---|---|
| **1. The project was well designed** | 9 | The project integrates the counselling and legal aid services to victims of gender-based violence with providing these services by trained paralegal survivors who have a good understanding of the respondent's situation. The support group activities provide encouragement and empower survivors of domestic or other gender-based violence. |
| **2. The project was implemented as designed** | 9 | The project was implemented as designed. |
| **3. The project reached all its objectives** | 9 | Objectives were set as the number of served clients and trained paralegals. LRC-KJHAM assisted all clients that turned her for help. |
| **4. The observed results are attributable to the project interventions** | 4 | Other factors such as family, friends and work play a more important role in the outcomes. However, this is not the shortcoming of LRC-KJHAM's activities but the nature of the service. |
| **5. The observed results are relevant to the project beneficiaries** | 10 | Women want to be free of abuse. |
| **6. The project was implemented in the most efficient way** | N.A. | We did not evaluate efficiency of the project due to reasons mentioned in section 10.2. |

Notes: Scores are on a scale of 1 to 10, with 1 being "no agreement at all" and 10 being "completely agree with statement".

# Annex I. SPO description

LRC-KJHAM was established in Semarang - Central Java in July 1999, first as a task force and from 2002 onwards as an independent NGO. LRC-JKHAM was initiated by activists who wanted to promote gender injustice and equal rights for women in the society. LRC-KJHAM is now known as a woman organisation that consistent in defending the rights of women victims of gender based violence. Dominated by young activists, LRC-KJHAM has been growing as the leading organisation for advocating women victims of violence.

From its inception, LRC-KJHAM gained financial support from various national and international agencies. With three years of partnership between Hivos and LRC-KJHAM through EU funded programme 'Women Access to Justice', this organisation has made significant results on the ground related to services for women victims of violence. LRC-KJHAM was able to facilitate the establishment of four integrated service centre (ISC, or 'one stop crisis centre'/OSCC) for women victims of gender based violence at four sub-districts in Semarang district.

The basic idea of ISC is to provide an integrated service unit to handling women victims of gender based violence. By integration means that the victim gets support for psychological counselling, but also treatment (mental and physical treatments) if needed through referring victim to the relevant institutions (police, hospital etc.); and also legal aid to get legal support and rights.

LRC-KJHAM (supported by HIVOS) commits to the establishment of such a centre in all areas of the province. In developing the centres, LRC-KJHAM collaborated with the local government (district and city levels) to integrate the centre in the local governmental system of handling the issues of gender based violence. LRC-KJHAM also succeeded in advocating the local governments to provide funding to run the ISCs.

Presently, in Semarang city there are 9 sub-districts have ISC, in Kendal District there are 2 sub-districts had established 2 ISCs; while in Grobogan there are 2 ISCs established in 2 sub-districts. However, in Kendal District, Grobogan District, and Semarang city, almost all sub-district have initiated to establish the ISCS (35 centres/units), though the ISCs have not yet operated well, because most of sub-districts government indeed had issued the decree to establish the ISC but they had not yet provided a specific place for delivering the service. Up to now, LRC-KJHAM (supported by HIVOS) commits to the establishment of such a unit in all areas of the province.

As noted above, LRC-KJHAM has a good partnership with the government both at the provincial, district/cities, and sub-district levels. The partnership is indicated through the involvement of LRC-KJHAM in drafting local regulation and policy concerning protection of women and children against violence (for example, Local government regulation no: 3/2009 on protection of women and children against violence).

LRC-KJHAM also commits to support and develop women at the community level through working in partnership with women groups at the outreach communities (Support Group in the Semarang City, Wedoro in Grobogan district, and Pribumi in Kendal district). LRC-KJHAM introduces FPAR and WRIA to these women's group as tools for reviewing government policy. Thus, women are able to participate in monitor and evaluate the government programme and policy.

Finally, LRC-KJHAM has unique characteristics. Not only has the capability to give service (legal assistance) for the victims, this organisation also has capability to provide inputs and give new perspectives to local government in term of gender sensitive regulations and able to give legal advice to legal enforcers. For example: LRC-KJHAM is assisting the legal enforcers (police and attorney) to prepare the indictments against Syekh Puji-a very rich guy who own a famous Moslem boarding school in Semarang, who marry an under-age woman. Local government also has requested LRC-KJHAM to assist the establishment of the ISC for women victims of violence in two other cities. LRC-KJHAM's dream to make this organisation as one of the legal resource centre for women with its feminist approach is right on track. [35]

# Annex II. Overview outcome indicators and indices

This annex provides a detailed description about the used outcome indicators. In addition, it shows the variables which were used to construct the outcome indicator indices.

Outcomes are reported for the total sample (n=20) and for women who had used the services of LRC-KJHAM since the baseline (n=7). Panel A and B provide the outcomes for the baseline (2012), the midline (2013) and the endline (2014) with the changes between midline-baseline, endline-midline and between the endline and the baseline. These changes show the absolute difference in the outcomes. Panel C provides the outcomes only for the baseline and the endline with the change and Panel D provides the outcomes for the baseline, endline and midline and the changes between midline-baseline and endline-baseline. The outcomes for the rights of wife index were only available for the baseline and the endline.

### *Panel A. Exposure to domestic violence*

- Abused by husband/partner in the past 12 months
  - *Any abuse*: reports on the number of women who had experienced either physical, psychological or sexual abuse in the past 12 months
  - *Physical*: reports on the number of women who had experienced psychological abuse in the past 12 months
  - *Psychological*: reports on the number of women who had experienced physical abuse in the past 12 months
  - *Sexual*: reports on the number of women who had experienced sexual abuse in the past 12 months
- Number of types of abuse by husband/partner: shows the mean number of types of abuse (physical, psychological and sexual) by husband/partner per woman

### *Panel B. Psychological health of women*

For these tables, the women had to indicate on a scale from 1 to 5, where 1 is not at all and 5 is all the time, how often they felt in the ways described in the tables in the past month. If the described feeling was positive, the woman experienced a negative feeling if she indicated 1 or 2. This was made into a dummy, where 1 indicates negative feelings if the woman indicated 1 or 2 and 0 indicates positive feelings if she indicated 3, 4 or 5. This was the other way around if the described feeling was negative. Then the dummy is 0 if the woman indicated 1 or 2 and 1 if she indicated 3, 4 or 5. This means that a higher value of the indicators shows more negative feelings. The questions that described a positive feeling, for which the scale has been reversed to let a higher value indicate a more negative feeling, are indicated below with '(positive)'.

- *Psychological distress index*: mean of the number of components (reported in Table 22) per woman that were applicable to the women. This is on a scale from 0 to 12, since there are 12 components in this index. The more components applicable to a women, the more psychological distress she had experienced. It also is the sum of the social dysfunction index, the anxiety index and the losing confidence in yourself index.
- *Social dysfunction index*: it is the sum of the 6 components reported below the index, which shows the mean of the number of those components per woman that were applicable to the

women. The method described above was applied to the following 6 components, which show the fraction (between 0 and 1) of the women who experienced this feeling:
    - Played a useful part in things (positive)
    - Able to concentrate in everything (positive)
    - Feeling capable of making decisions (positive)
    - Enjoying normal day-to-day activities (positive)
    - Able to face up emotional problems (positive)
    - Feeling reasonably happy in general (positive)
- *Anxiety index*: it is the sum of the 4 components reported below the index, which shows the mean of the number of those components per woman that were applicable to the women. The method described above was applied to the following 4 components, which show the fraction (between 0 and 1) of the women who experienced this feeling:
    - Lost much sleep over worry
    - Felt under strain
    - Could not overcome emotional problems
    - Thought of yourself as a worthless person
- *Losing confidence in yourself index*: it is the sum of the 2 components reported below the index, which shows the mean of the number of those components per woman that were applicable to the women. The method described above was applied to the following 2 components, which show the fraction (between 0 and 1) of the women who experienced this feeling:
    - Felt depressed
    - Losing confidence in yourself

### *Panel C. Women's empowerment (attitude towards themselves)*

The following indices are constructed with statements for which the women reported their level of agreement on a scale from -2 to +2, where -2 means 'strongly disagree', -1 means 'disagree', 0 means 'neither agree nor disagree', 1 means 'agree' and 2 means 'strongly agree'. The indices show the average level of agreement over the included statements. A higher value of the index shows more positive feelings. Sometimes agreement with a statement indicates negative feelings. Therefore, the scale for these statements were reversed, so that -2 means 'strongly agree' and +2 means 'strongly disagree'. That way, those statements can be used in the average. They are indicated by '(negative)'.

- *Self-efficacy index*: the following statements are included:
    - On the whole, I'm able to take charge of my life
    - I make commitments not to think of myself as worthless
- *Self-esteem index:* the following statements are included:
    - I feel I do not have much to be proud of (negative)
    - I take a positive attitude towards myself
    - I wish I could have more respect for myself (negative)
    - On the whole, I am satisfied with myself
- *Control index:* the following statement are included:
    - It is not always wise to plan far ahead because many things are a matter of good or bad fortune (negative)
    - Often I feel that I have little influence over the things that happen to me (negative)

- *Dependency:* level of agreement on a scale from -2 to +2 with 'my dependence on my partner makes me feel disappointed in myself' (negative)
- *Support:* level of agreement on a scale from -2 to +2 with 'I have someone who listens when I need to talk about my problems'

### *Panel D. Empowerment in marriage*

- *Rights of wife index*: this index is constructed with 9 statements for which the women had to indicate whether they agreed or disagreed. If the statement indicates that the woman has little rights (indicated with '(negative)'), disagreement is given the value 1 and agreement the value 0. This is the other way around if the statement indicates many rights for the woman. The rights of wife index gives the mean number of statements per woman with which the women agreed. So, a higher value of the index indicates that the women think they have more rights. The following statements are included in the index:
    - A good wife obeys her husband even if she disagrees (negative)
    - A woman should be able to choose her own friends even if her husband disapproves
    - Family problems should only be discussed with people in the family (negative)
    - If a man mistreats his wife, others outside of the family should intervene
    - It is important for a man to show his wife who is the boss (negative)
    - A woman should be allowed to have a full or part-time job outside the household even if her husband disapproves
    - A husband has the right to know where his wife is at all times (negative)
    - After finishing her housework, a wife should be allowed to participate in social activities in the community
    - It's a wife's obligation to have sex with her husband even if she doesn't feel like it (negative)
- *Any good reason for a husband to hit his wife*: reports on the number of women who indicated that at least one of the following reasons authorizes the husband to hit his wife:
    - She goes out without telling him
    - She neglects the children
    - She argues with him
    - She burns the food
    - She disobeys him
    - She refuses to have sexual intercourse with him
- *Number of good reasons for a husband to hit his wife*: shows the mean number of the above mentioned reasons that the women agreed with
- *Any occasion a wife can refuse to have sex*: reports on the number of women who indicated that at least one of the following occasions authorizes the wife to refuse to have sex:
    - She feels sick or tired
    - If he slept with another woman
    - She doesn't want to have sex
- *Number of occasions a wife can refuse to have sex:* shows the mean number of the above mentioned occasions that the women agreed with

# Annex VIII. Qualitative report on the evaluation of LRC-KJHAM's Gender Based Violence programme

## 1. INTRODUCTION

### 1.1. Methods of study

As part of the evaluation of the project of LRC-KJHAM we have conducted a qualitative research amongst the direct beneficiaries of the project. Firstly, we have conducted in-depth interviews with 4 agencies; LRC-KJHAM, Seruni, Provincial PPT, and PPT city/BAPPERMAS in order to learn more about the project context and the relationship between LRC-KJHAM and government. Secondly, to find out more about LRC-KJHAM's project activities, its clients, and the ways in which LRC-KJHAM's project has impacted its clients' lives, in depth interviews have been conducted with 9 female clients of LRC-KJHAM. 6 of these clients have been members of the LRC-KJHAM support group for over a year, and the other 3 clients for less than a year. We have also held a focus group discussion with 5 female (ex-)clients who have become paralegals for LRC-KJHAM.

The interviews were carried out in the place that was most practical and convenient for the informant. As a result, most of the interviews were carried out in LRC-KJHAM's headquarters, and some interviews were conducted in respondents' homes (2), in a respondent's workplace (1), in a restaurant (1), and in the Women Empowerment Office (3).

### 1.2. Informant Selection and Characteristics

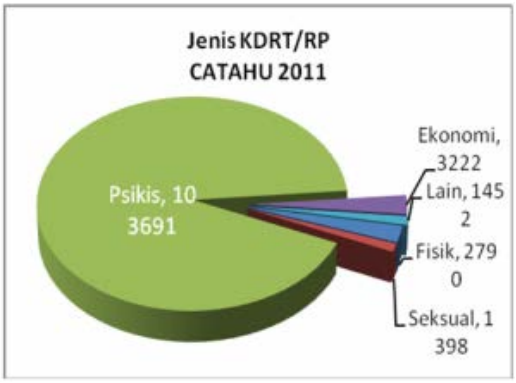
The selection of the informants was carried out by LRC-KJHAM. The reason for this is that –to protect the clients' privacy- it is LRC-KJHAM's policy that only their counsellors have the right to contact the clients. It was therefore arranged that the LRC-KJHAM personnel invited the clients to partake in the research and informed them about the purpose of the study. After they acquired the client's consent, the LRC-KJHAM personnel provided us with the clients' names and telephone numbers, which we used to contact them and set a time and place for the interview. It should be noted that the informants were selected based on their participation in the support group or their status as paralegal. Their views may therefore not necessarily represent those of the women that chose not to participate in the support group.

From our 14 informants, 7 were between 23-40 years old and 7 between 40-55 years old. 10 women were already divorced, 2 women were in the process of being divorced, 1 woman had an uncertain marital status, and 1 woman was never married but had problems with the father of her children. The educational level of the informants was highly varied, ranging from 4'th grade elementary school to Post Graduate studies. All of the women reported to have jobs, i.e. as sellers, employees of a private company, and entrepreneurs. All of them were mothers of 2-5 children, and held custody over their children. One of the women however reported that her husband had illegally taken her children away from her. All of the informants had been victims of gender based violence (GBV) or domestic violence (KDRT[36]) and had experienced psychological abuse. Some of the women also reported physical

[36]This abbreviation stands for '*Kekerasan Dalam Rumah Tangga*', which is the Indonesian term for domestic violence.

abuse (4), economic abuse (1), or abuse which involved their children (3). Most of the conflicts occurred within their households and 10 out of 14 women reported their husband's cheating as one of the major causes of conflict and ultimately divorce.

## 2. BACKGROUND CONTEXT



### 2.1. Scope of the Gender Based Violence Problem

Over the last few years reports of domestic violence against women have increased. According to the National Commission on Violence against Women (Komnas Perempuan) 119.107 cases of violence against women had been reported in Indonesia in 2011. Most of these reports were filed in Central Java Province (25.628 cases) which is also the working area of LRC-KJHAM, followed by East Java (24.555 cases) and West Java (17.720 cases). Almost 97% of the reports (110.468 cases) have been filed as 'domestic violence' cases. Another 1.405 cases involved violence within dating relationships.

From the different types of violence against women in the domestic domain, psychological violence ranked the highest with 103.691 cases, followed by economic violence (3.222 cases), physical violence (2.700 cases), and sexual violence (1.398 cases). The age of the victims that reported the violence ranged between 13-40 years. According to Komnas Perempuan (2012) the most vulnerable age group among them is 25-40 years.

In Central Java district Komnas Perempuan recorded an additional 268 cases of violence against women in 'the public domain', meaning that the victim and offender didn't have any kinship or marital relationship to each other. In these cases offenders were e.g. employers, neighbours, teachers, colleagues, community figures or complete strangers.

**Figure 3: Number of registered cases of domestic violence by type**

Source: Komnas Perempuan (2012)

### 2.2. Rights and Access to Justice for Female Victims of Gender Based Violence

In 2004 the Indonesian Government implemented law no. 23 (the PKDRT[37] law) on the Elimination of Domestic Violence. However, in 2011 Komnas Perempuan's annual records showed a 13.2% increase in

[37] This abbreviation stands for '*PenghapusanKekerasan Dalam Rumah Tangga'*, which means the elimination of domestic violence.

the rating of domestic violence cases compared to 2003. Even though this increase could well be the result of a positive trend whereby more victims that would previously have kept the violence silence have come to find it easier to report their cases, the numbers still attest to the fact that domestic violence in an ongoing problem within Indonesian society.

The PKDRT law of 2004, was a huge encouragement to female victims of domestic violence who were now for the first time legally entitled to report any violence they experienced at the hands of their husband. As a result of the implementation of this law, institutions providing services to female and child victims of GBV started coming into being. In 2011, Komnas Perempuan recorded a total of 395 of these institutions (both government and non-government initiatives) across 33 provinces in Indonesia, providing for example counsellors, gender-sensitive judges/district attorneys and database officers.

In spite of the efforts taken by these institutions, local government is often still slow to provide protection to victims of gender based violence. This is problematic, because reporting a husband's misconduct or filing for a divorce brings the victim in a vulnerable position. Only in 2009 Central Java Province issued the By-law no. 3/2009 which governs the protection for women and children that become the victim of domestic and/or gender based violence. In its article 4 the rights of female victims are listed as follows:

a. The freedom to give testimony without consequences for her safety, and the right to obtain protection for herself, her family, and her belongings;
b. The right to choose and determine the type of protection and safety support;
c. The right to be free from having to answer sensitive questions;
d. The right to receive updates on her case development and court verdict;
e. The right to receive quick, correct, comfortable and appropriate service;
f. The right to recovery and social reintegration;
g. The right to obtain legal, psychological, religious, economic, and social assistance, and assistance in translation.

In article 5 of the By-law the obligations of the local government are listed as follows:

a. Prevent any violence;
b. Provide protection to victims;
c. Provide recovery service and social reintegration;
d. Encourage and improve community participation;
e. Cooperate with service providers for preventive measures;
f. Protection and recovery of victims.

As a result of this By-law, local governments are authorized to form integrated services centres (PPTKs) and commissions for the protection of female and child victims of domestic and/or gender based violence, which have the following functions:

a. Prepare policy formulation and protection programmes for victims(women and children) of domestic and gender based violence;
b. Resolve disputes between service providers;
c. Develop protection systems for victims of domestic and gender based violence;

d. Observation, supervision and reporting with regard to the protection of domestic and gender based violence victims.

LRC-KJHAM is one of the institutions which provides protection services to, and engages in policy advocacy on the protection of victimized women and children. Its aim is to empower victims of domestic and gender based violence to become 'survivors' who are strong and knowledgeable enough to solve their problems and even help other victims to solve their problems by becoming "paralegals" for LRC-KJHAM, serving at an integrated sub-district service centre (PPTK). Semarang City currently counts 16 of those PPTKs in 16 sub-districts.

## 2.3. Divorce Due to Gender Based Violence: A Difficult Choice for Women

The root of domestic violence in Indonesia can -at least in part-be found in gender inequality, particularly within marital relations. Among certain ethnic groups in Indonesia religious and traditional marriage rites and practices exist that reflect and enforce existing gender inequality by instilling a sense of superiority of the husband over the wife and providing him with the means to justify the assertion of this superiority. An example of such a practice is the payment of a bride price, which the groom has to pay to the bride's family in exchange for their consent to their marriage. By paying the bride price, which is often so high that the groom is barely able to afford it, the groom may feel that his wife has become his property and he can therefore treat her as he pleases, even if this entails abusive behaviour towards her. Another marital practice involves the father of the bride taking on the role of his daughter's representative during the wedding ceremony. The husband thus swears the marital oath to the father of the bride, instead of to his bride herself. Many victims attest that, consequently, their husbands tell them during fights that "he is not bound by his oath to treat her well or stay faithful, because he hasn't sworn the marital oath directly to her".

Within Indonesian law and culture, the husband is always regarded as the head of the household and expected to be the breadwinner. The notion of the husband as the head of household is also stated in the marriage law no. 1, dating from 1974. It is also part of the 'covenant of marriage' which is read by the marriage officer of the office of local religious affairs (*Kantor Urusan Agama*) during Muslim wedding ceremonies. The idea that the husband is the most important person within the household, regardless of his ability, and the wife comes second is therefore continually reinforced within Indonesian society. The husband's culturally-instilled superior position as head and provider has grave implications for women's willingness and ability to report domestic violence and/or file for divorce. Worries about how to support herself and her children after a separation or divorce, can inhibit women from taking action to stop the abuse.

Moreover, women that report their husband to the police face the threat of 'revictimization', which means that a husband will requite his wife's actions by pressing made up charges against her, such as accusations of libel, mistreatment of the husband, etc. It can also happen that an offending husband tries to turn the tables by enticing his wife to attack him, so he can file an actual report against his wife to the police. The National Commission of Women recorded 20 cases of revictimization against women in 2011. 12 of these cases were related to domestic violence.

In most domestic violence cases quite some time passes before the woman comes to realize that her husband's abusive behaviour towards her is not right. Their husbands commonly deny that they have committed violent acts against their wife, and merely view their behaviour as part of the life cycle. Woman often try to find the blame in themselves (for example their lack of household managing skills), and it is usually only after a while that they start to wonder if they can ever achieve happiness this way and start to think about how to proceed with their lives.

Nevertheless, the National Commission for Women found that 95% of the divorce cases approved by the Religious High Court in 2011 were due to domestic violence against the wife. This data shows that women that fall victim to domestic violence can find ways to access justice and free themselves from their abusive husbands. Unfortunately, the data doesn't disclose the type of divorce, which can be either *gugat cerai* (divorce sued by the wife) or *cerai talak* (divorce sued by the husband).

## 3. ACCESS TO HELP

### 3.1. Access of Victims to LRC-KJHAM's Services

LRC-KJHAM experienced a significant increase in client numbers between 2011 and 2013. They recorded 30 cases of gender based violence from January – October 2011 (10 months), 47 cases from November 2011 – October 2012 (12 months), and 44 cases from November 2012 – June 2013 (8 months).

All of the informants sought help from LRC-KJHAM after they were recommended to do so by a friend, a family member, or church mates or by authority figures such as the women empowerment organisation, a government officer, a PA officer, a lawyer, a law lecturer of UNDIP (Diponegoro University), a doctor, or staff members of LBH (*Lembaga Bantuan Hukum*). None of the informants were familiar with LRC-KJHAM before. This data suggests that victims' knowledge on how to access service facilities such as LRC-KJHAM is still limited, but luckily LRC-KJHAM seems to be well known by the relevant institutions.

### 3.2. Psychological Violence and the Female Gender Role as Debilitating Factors to Help Seeking

Even though the abuse our 14 informants experienced took different shapes for each of them, the common denominator among them was that all the women suffered from forms of psychological abuse. In the PKDRT Law psychological abuse is defined as: "Acts that result in fear, loss of confidence, loss of the ability to act, a sense of helplessness, and/or severe psychological suffering on a person" (Chapter 7, 2004).

All of our informants reported to have experienced insecurity and fear. These insecurities would typically manifest themselves as feelings of helplessness and self-blaming. The women mentioned that they would first question themselves and would try to find out what it was that they were doing wrong to provoke this kind of behaviour from their husband. Was it the way they dressed? Their lack of cooking or household skills? The way they managed the finances? Weren't they serving their husband right? If the women were unable to detect the problem, they would typically proceed to assume that their husband behaved this way because he was tired or was dealing with a problem. The women's only initial response was to simply brace themselves for his bad temper.

Examples of a husband's behaviour that left the women feeling insecure and afraid were verbal threats, absent behaviour such not coming home for multiple days without notifying her, unanswered calls, having no phone-connection, not paying attention to her or fully ignoring her, and withholding money from her. One of our informants testified that her husband used to give her money every month, but later decided to give her the money per day as if he didn't trust her with it. Near the end of their marriage he only wanted to give her money when there was an urgent reason for her to spend it. Our informants reported that these types of behaviour made them feel uncomfortable, guilty, and fearful of their husband's temper. It would also make them worry about their husband being unfaithful or even marrying another woman. As a result of these negative thoughts and feelings the informants said they lost concentration and became more sensitive and irritable towards their kids. Also, during the focus group discussion almost all of the informants recognized that the situation had an impact on their menstrual periods. *"Oh, yeah, yeah, it impacts on our irregular menstruation.."* yelled the participants. One of the informants mentioned that she felt that her worries disturbed her prayer.

An inherent problem of psychological violence is that it is difficult to prove. The victims realize this, and therefore psychological violence often stays under-reported. This problem is exacerbated by the fact that patriarchal Javanese culture views woman as calm, gentle and patient in nature. Women are therefore implicitly expected to quietly endure the suffering that life brings them. Women that portray feelings of jealousy, shock, disappointment, and anger towards their husband and thereby fail to subscribe to the cultural notion of the "good wife", risk being stigmatized by their community and being perceived as a disgrace to their family. This often results in the victim being blamed for the situation. Speaking up about your problems to your relatives or friends and reporting the abuse to the authorities therefore requires a lot of courage, and fear of the consequences often prevents women from doing so at an early stage. Instead, they stay silent and hope that their husband's behaviour will change with time. The following statement of one of our informants illustrates this point:

> At first, I didn't mind if my husband was unemployed since I was the one who was working. I tried to be patient and I just hoped things would change that my husband would get a job. But after three years of marriage, I didn't see any changes and I have had two children. And then I started to wonder, how much longer do I have to hold on to this situation? (Informant, 33 years old, university graduate).

### 3.3. Motivation behind Seeking for Help

During the interviews and focus group discussion, the majority of the informants conveyed that a lot of time went by before they decided to report the violence they experienced to the police or to seek other legal aid to solve their issues. All informants said that they had initially "tried to understand the situation" and "tried to hang on and stay patient". Only when the situation worsened, and they were no longer able to carry the burden and couldn't contain their feelings anymore, they decided to tell their friends or relatives. When the informants were asked what eventually motivated them to file for divorce and/or ask for other legal aid, they said that they had just reached a point where "they couldn't take it anymore" and had no other choice than to end the abuse. 3 of the focus group participants, for example, exclaimed: "I can't believe I have gone through this".

The informants described the following situations as turning points that triggered them to finally seek help: Finding out that the husband had cheated on them (4) or finding out that the husband

wanted to marry another woman (5). 1 of the informants said that her husband had even asked for her approval to marry another woman, 2 informants' husbands had filed for divorce themselves, and 1 informant's husband had left her and already had a child with another woman. 2 other informants answered that they finally decided to take action after an incident where their husband badly hurt them physically. 1 of these informants got beat up while she was pregnant with her second child. The other was stabbed in the arm with a knife and was also accused of cheating. Another informant was accused of forging the marriage certificate after she tried to get her husband to acknowledge her child. Lastly, 2 other informants said the situation had become unbearable because the husband refused to provide financial support for her and the children.

It is important to note that none of the informants made the step to report the abuse or to file for divorce on their own. Even though the women generally realized that they didn't deserve the abusive behaviour, all of them needed a push from either a friend, family member, neighbour, acquaintance, or public officer before they would take action. For example: One informant said she only got motivated to overcome her abusive situation when her friend, who found out about her household issues, mocked her for not doing anything about it.

> I felt very bad when my friend told me that she pitied me because my husband did not have a job. She asked me whether or not I knew that all he does every day is just hanging out (Informant, 50 years old, 5 years at LRC-KJHAM).

Another informant, who –together with her children- was repeatedly physically abused by her husband, said she only went to the authorities after her neighbours found out about the abuse and told her to get a physical examination and report her husband to the police.

Female victims of domestic violence generally only take action after having received support from family or friends. One of the reasons is that these women often have trouble to determine if the violence they endure actually qualifies as human right violence or if it's merely a natural part of life that they are unlucky enough to have to experience. They often need others to remind them that seeking help in order to overcome the abusive situation is part of their rights.

# 4. LRC-KJHAM'S SERVICES AND ACTIVITIES: IMPACTS AND SERVICE SATISFACTION

## 4.1. Project Strategy

The main objective of LRC-KJHAM is to strengthen the access of marginalized/poor female victims of gender based violence to legal resources. It attempts to accomplish this objective by providing psychological counselling, legal aid services and support groups in order to empower victims of gender based violence to become 'survivors' that have the ability and willingness to fight for their rights and happiness, and ultimately even become 'agents of change' committed to supporting – and fighting for the rights of- other victims.

At the time of our study, 7 informants had already had their cases settled with the help of LRC-KJHAM, 6 informants were still being helped by LCR-KJHAM on their -as yet unsolved- cases, and 1

informant, who had only recently gotten into contact with LRC-KJHAM, had only joined the support group once and had not yet received any other services by LRC-KJHAM.

Overall, the informants were very satisfied with the help they received from the LRC-KJHAM staff, and reported predominantly positive effects of the services on their lives. In this chapter we will report about the different activities and services that LRC-KJHAM provides to its clients, and the self-reported impacts of those activities and services on the lives of our informants.

## 4.2. Counselling

After our informants sought help from LRC-KJHAM, they first received a psychological counselling session. During this session the informant, who was henceforward called '*mitra*' (meaning: partner), was encouraged to share all the problems she faced with the counsellor.

The success of each counselling session is highly dependent on the skills and ability of the counsellor to make the victim feel comfortable, and to make her talk freely, so that the right way to help the victim can be established. According to our informants, the counsellors of LRC-KJHAM had listened patiently to their stories, had made notes, had tried to help and comfort them, and had made clear that the victims could contact them any time. At least 4 of the informants emphasized that the counselling session had had a positive, comforting, and motivational impact on them:

> After I attended the counselling, I felt free from the burden of this problem for the first time. I have told the counsellor about all of my misery. I felt so far and it made my mind at ease. I became aware about what I should do next in my life, and I realized that I should stop crying since it would not solve my problem (Informant, 38 years old, 2 years at LRC-KJHAM).

The informant remarked that she "felt like she had been lift up from the abyss and someone guided her back to the right path". After the counselling session she regained the courage to live her life the way she wanted it, and to start a new and better life.

One other informant told her counsellor about the physical abuse she endured at the hands of her husband, and about how she resented him so much that she was planning to take revenge. However, as a result of the counselling session she could let go of these thoughts, as she had learnt that her plan was unwise and she could instead get her rights by following the law.

## 4.3. Legal Aid

After the counselling session, the informants were offered legal assistance and guidance, for example throughout divorce trials, custody trials and in reporting violence to the police. The informants mentioned that the LRC-KJHAM staff had, among other things, helped them to prepare the necessary documents for court (4), helped them to write and report their story in a chronological fashion (3), taught them what their rights were (2) and taught them how they should answer questions in court (2). 1 informant said that LRC_KJHAM had contacted her husband's lawyer for her, and 1 other informant mentioned that LRC-KJHAM had paid for a DNA test and helped her use it as evidence in court. 5 informants also explicitly mentioned that LRC-KJHAM had given them "encouragement to face the trial".

The victims that lived in an area with a PPTK (a sub-district integrated service centre) were also referred to a PPTK-paralegal for further assistance. In the most serious cases LRC-KJHAM also

cooperates with attorneys from LBH in Semarang city, in order to further facilitate the victim's access to other relevant service providers such as the police, prosecutors, judiciaries, and sometimes the mass media.

The informants conveyed that they were happy with the legal aid provided by LRC-KJHAM. The fact that LRC-KJHAM provides lawyers that are free of charge is an appealing advantage for many of the victims, who would otherwise not have been able to afford the costs of a trial.

> I have never imagined before that I would have a lawyer by my side. I could never meet a lawyer before because I could not afford one, but now I can meet him every time I want to talk to him about my problem. And all the staffs in KJHAM served me very well (Informant, 34 years old, 2 months at LRC-KJHAM).

Another large advantage of LRC-KJHAM's services mentioned by the informants is the support and genuine care that was shown by the staff. According to the informants, this was not something that could be attained from a private lawyer that one can hire. One of the informants described a bad experience she had had in the past when she hired a lawyer that didn't seem to care about her at all, and even turned out to plot against her with her own husband. The lawyer from LRC-KJHAM however, had stood by her and had fought for her rights from start to the end of her divorce process.

### 4.4. Support Group

Soon after our informants got involved with LRC-KJHAM (mostly right after the first counselling session) they were informed about LRC-KJHAM's support group for victims of gender based violence, and invited to attend it:

> Here they have a support group, if you're interested to join, it's a good one, there are lots of friends for sharing (quote form the counsellors as remembered by informant, 55 years old, 13 years as paralegal).

All of our informants decided to join the support group. Most of them were enthusiastic to join, hoping to learn from others' experiences (2), to share their story and find support from kindred spirits (5), to gain confidence (2), or in order to help others (5). Others hoped to receive useful materials (5), to have an opportunity to witness another victim's court session, or to participate in a demonstration to support policy changes (7). One informant expressed that she was reluctant to join the support group at first, but had changed her mind after she attended a meeting and realized how useful it could be for herself and others.

Initially, LRC-KJHAM's idea to form a support group was born at a time when they suffered a shortage of counsellors and were looking for alternative ways to keep enabling their clients to share their stories with others. LRC-KJHAM's support group later evolved into a self-contained group, which is run by ex-clients of LRC-KJHAM who have experience in organisation-management. The new support group was given the name '*Sekar Taji'*, which means: 'spurred flower' or 'able to defend'. Membership of the support group is voluntary, and attendance of the support group meetings is non-compulsory. Members will receive a text message on their phone, notifying them about an upcoming meeting, and can choose per meeting if they wish to attend or not.

The support group activities do not only consist of meetings where the victims share their stories. The members also actively help each other to solve problems, and sometimes undertake outside activities to fight for GBV victim's rights and policy reform. When we asked our informants how they participated in the support groups, they answered that they -apart from going to the regular meetings- also attended and/or assisted during other victims' trials (3), delivered invitations to trials (2), helped other victims write reports (1), gave advise and encouragement (3), made efforts to socialize the community on gender based violence issues (2), held audiences (1), organised fieldwork (1), and participated in demonstrations to compel a just verdict from the court (3).

Without exception the informants were happy to be members of the support group and all of them reported positive feelings and experiences with regard to their membership of (or encounters with) the support group. The positive impacts reported by the informants can be broadly summarized in 2 categories: feelings of empowerment and feelings of support.

Firstly, informants reported that the support group had empowered them by increasing their skills, knowledge (9) and confidence (4), and by helping them to become more independent (6), stronger (5), and better able to keep up their spirits and persevere in their struggle to change their situation (4).

> I used to weep while revealing the problems to KJHAM. But in the end I could lift my chin up after receiving enlightenment and encouragement from KJHAM. It was my own decision to divorce my husband (Informant, 42 years old, 9 years as paralegal).

> My husband still talks in a loud voice and sometimes gets angry with the children without reason, but I now talk back when he is angry, and I have never done that before I participated in KJHAM (Informant, 38 years old, 2 years at LRC-KJHAM).

> The skill in counselling has increased. I am more confident with myself. I used to face difficulty to speak even about my own problem. But now I have the confidence to answer every question including those from the government officers (Informant, 50 years old, 5 years at LRC-KJHAM).

> My knowledge has become broader. I even convinced the judge to allow me to participate during the trial even though I'm not a lawyer (Informant, 54 years old, 3 years at LRC-KJHAM).

> I can feel it and it has been very helpful. I learned a lot about law, computer, writing chronological stories, and completing documents to the court. We have been encouraged to move on and to be independent (Informant, 35 years old, 5 years at LRC-KJHAM).

Secondly, almost all informants mentioned that they felt comforted by – and drew strength from - hearing the stories of others and/or sharing their own experiences. It made them realize that they weren't alone in their hardship (7) and helped them to get a different perspective on what they had experienced. 4 of the informants reported they felt calmer and were able to smile again.

> At least I can ease the heartache. I can smile and think and realize that I am not alone. Some other women experienced even worse violence than I did (Informant, 38 years old, 2 years at LRC-KJHAM).

> I feel that my problem is not that big compared to those that other victims had. And they have been fighting for their rights for about two years (Informant, 34 years old, 2 months at LRC-KJHAM).

> I was able to adapt myself in the group during meetings, and I could express my sadness and release my feelings so that I became calmer (Informant, 35 years old, 5 years at LRC-KJHAM).

Statements made by the informants suggest that solidarity within the support group is very high, just as the drive to help other victims:

> Other victims can become like me and other women here. I can't leave KJHAM. The solidarity is awesome. We work together. We comfort each other. It's a great experience (Informant, 50 years old, 5 years at LRC-KJHAM).

One informant said that she and other support group members had once participated in a demonstration at a domestic violence trial without even personally knowing the victim. Another informant, who was getting into a taxi after a support group meeting, emphasized that she and other members were still enthusiastic about participating in the support group activities, even though they didn't receive any travel reimbursement anymore because the money from the sponsor had run out.

For some victims the drive to help other victims seemed to stem from a willingness to return the favour LRC-KJHAM had done them:

> I have the chance to learn from the other victim's community, and together we set up a plan of activity based on the need of women victims. Now I have the ability to speak in public. And I'm actively participating in KJHAM activities. That's all I can do to repay what KJHAM has done for me (Informant, 50 years old, 5 years at LRC-KJHAM).

> I was recommended by KJHAM to attend a meeting of the support group, and finally realized that I was not alone. Even I learned that many others have experienced worse. I was moved and I decided to participate in giving support to other victims (Informant, 23 years old, 3 years as paralegal).

Also, the fact that the informants had been victims, but had risen as survivors, and were now even able to help others seemed to instil a sense of proud in them:

> Usually someone will help after they have become capable to help, even though they were a victim, they are still able to help (Informant, 42 years old, 9 years as paralegal).

> I became a daredevil after joined the support group. We have people of various conditions here. Some are experiencing unfinished cases. Well we encourage them to keep on going (Informant, 50 years old, 5 years at LRC-KJHAM).

> I'm glad because I improved my knowledge by helping other women during trials. I'm also able to tell them what to do (Informant, 54 years old, 3 years at LRC-KJHAM).

The only recommendation for improvement for the support group meeting model was about the time at which the meetings were held:

> It's a pity that the meeting is conducted in the morning. The working hours, that's what made me often absent. But I always attend if I don't have any urgent things at work. My life became more valuable by participating in the support group (Informant, 54 years old, 3 years at LRC-KJHAM).

### 4.5. Paralegal Training

LRC-KJHAM also offers members of the support group that have managed to overcome their abusive situation (i.e. survivors) the opportunity to become official paralegals, that support – and fight for the rights of - other victims of gender based violence.

5 of our informants were paralegals. In order to become a paralegal the women were required to follow paralegal-trainings organised by LRC-KJHAM. During the trainings a variety of gender based violence related topics were covered. The women were also taught how to mentor and counsel other victims, how to conduct advocacy, and how the referral system works. After the paralegal-trainings, 3 informants were offered full time jobs at a PPTK (Sub-district Integrated Service Centre), where they are now in charge of non-litigation matters.[38] The other 2 informants offer advice and assistance directly to LRC-KJHAM clients and help to refer them to relevant service providers.

The informants had decided to participate in the paralegal trainings for different reasons: 1 woman wanted to broaden her knowledge and understanding, another said she was uneducated but was curious about the law, another felt moved by her own consciousness to share her experiences with others, and another said she was moved and empowered by LRC-KJHAM to help other victims.

The most inspiring parts of the training according to the informants were: learning about the law (4), learning about the duties of the spouse after divorce (1), learning how to prepare files for court (1), and learning how to assist the victim (1). The informants appeared to take their jobs as paralegals very seriously:

> I always communicate with the other victims, and I'm ready when I'm needed at any time. My hand phone is on for 24 hours a day. I am ready and I act fast (Informant, 55 years old, 13 years as paralegal).

> To be a paralegal means awareness to help other victims based on personal experience and being ready to provide assistance at any time (Informant, 43 years old, 5 years as paralegal).

> My hand phone is always active and ready to assist the victim. Paralegals are willing to work full time (Informant, 41 years old, 2 years as paralegal).

By working hard, they felt that they could truly really make a difference for other victims:

> I am able to be independent thanks to KJHAM. Now I try to make other women realize and assist them until their case is settled and they understand their rights as female victim (Informant, 55 years old, 13 years as paralegal).

> Alumni of KJHAM are shatterproof and strong. We really help women to settle their problems (Informant, 23 years old, 3 years as paralegal).

[38] Semarang city has 16 sub-districts, each of which has its own PPTK. At the beginning of LRC-KJHAM's activities, the paralegals that were trained by LRC-KJHAM were only placed at 4 of the 16 different PPTK's. Over the years the relationship between LRC-KJHAM and local government has strengthened and at the time of the interviews almost all of the 16 PPTKs have employed paralegals that were trained by LRC-KJHAM.

### 4.6. Conclusions about Programme Effectiveness and Client Satisfaction

From the answers given by the informants we can conclude that LRC-KJHAM's effort to change victims of gender based violence into survivors and active agents that are able to change their own situation as well as those of others has been quite successful, at least among our informants. The 5 paralegals we interviewed even conveyed that the paralegals had plans to become an independent organisation, not reliant on LRC-KJHAM.

When the informants were asked if they had any suggestions on how LRC-KJHAM could increase the impact of its activities almost all of them answered that they should just keep going on the way they were. The only advice given was that they should "become even more solid and improve the distribution of the tasks among their staff" (informant, 35 years old, 5 years at LRC-KJHAM) and that they "should add more advocacy resources (Informant, 55 years old, 13 years as paralegal) and lawyers" (all paralegals).

## 5. THE COOPERATION BETWEEN LRC-KJHAM AND GOVERNMENT

*"KJHAM has made many contributions, uncountable on fingers"*

The expression above was made by one of the informants who was interviewed about LRC-KJHAM's role in solving the gender based violence in Semarang and its surroundings. The presence of LRC-KJHAM is felt not only by its direct beneficiaries -the victims of gender based violence- but also by other stakeholders such as the Semarang government and development organisations.

The cooperation between LRC-KJHAM and the local government started when, as a result of legislative changes, local government began to allocate more of its APBD[39]funds to GBV issues, and LRC-KJHAM started to push the local government to provide the necessary services for victims of GBV.

Starting out with the critical idea that gender based violence was first and foremost government responsibility, LRC-KJHAM began to assemble all relevant stakeholders for the united task of preparing PPTKs: integrated service points at sub-district level. The choice to set up PPTKs at the sub-district level was consciously made, as most of the sub-district governments were already equipped with the right support facilities.

LRC-KJHAM has been a main initiator of the founding of the PPTKs. Setting up the PPTKs has not been an easy task and has required a lot of perseverance on the side of LRC-KJHAM's staff. On the one hand they had to forge close relationships with government officials, while on the other hand constantly staying critical and protecting their independent position. LRC-KJHAM realizes that its ability to succeed in advocacy and policy influencing is closely intertwined with the quality of its relationship with local government. LRC-KJHAM is therefore sometimes willing to make concessions and adjust its plans and strategy, if doing so means they can ensure local government's support and achieve practical results. This willingness to compromise is what sets LRC-KJHAM apart from other NGOs dealing with GBV issues, and has made LRC-KJHAM the mouthpiece through which community needs are conveyed to local government.

[39] APBD is an abbreviation of "Anggaran Pendapatan dan Belanje Daerah", which is the revenue and expenditure budget.

Also after the foundation of the PPTKs, LRC-KJHAM and local government have kept working in close collaboration, i.a. with regard to staff training, mentoring, and providing assistance to victims. For example, when a victim seeks help at a PPTK, LRC-KJHAM has the responsibility to provide a lawyer that can accompany the victim in trial, since there are no lawyers/attorneys at the PPTKs. LRC-KJHAM also keeps the PPTKs updated on the number of victims that report at LRC-KJHAM, so local government can monitor the scope of GBV in the area. In return, LRC-KJHAM receives part of its funding from local government.

Networking with governmental agencies and authorities will keep being important for LRC-KJHAM, especially for advocacy purposes for cases that are presented in District of Religious Court. LRC-KJHAM's strategy aims to empower the victims of gender based violence to become agents of change that can themselves play a role in making policy change happen.

## 6. LESSONS LEARNED AND DISCUSSION

1. According to data released by Komnas Perempuan, the implementation of the Presidential Instruction (Inpres) on Gender Mainstreaming no. 9 year 2000, and the PKDRT law no. 23 year 2004, have not proven sufficient in abolishing gender based violence in Indonesia. Patriarchal culture and its traditional and religious values, norms and beliefs with regard to womanhood and a woman's role within marriage put women in a subordinate position and generally make them dependent on their spouses, both financially and with regard to their position within the community. By pushing for a divorce women are transgressing cultural norms on how a woman or wife should behave, and risk being stigmatized and marginalized by their community. This, and fear of not being able to support themselves and their children, is what usually keeps women from filing for a divorce or reporting the abusive behaviour of their husbands to the authorities. Changing these patriarchal cultural beliefs and practices is difficult and requires time and serious effort. Continuous advocacy of policy changes with regard to gender equality is therefore of extreme importance.

2. Most of our informants had initially tried to cope with the abuse on their own and had waited a long time before confiding to a friend or relative about the abuse. In the end none of them had made the step to contact LRC-KJHAM on their own. Instead, all of them had to be motivated by a friend, relative, neighbour, acquaintance, or public officer before they would seek help. In conducting active outreach to clients, it might thus be useful for LRC-KJHAM to include the victims' social circle and the relevant public institutions in their targeting.

3. LRC-KJHAM's strategy to change victims of gender based violence into survivors and active agents that are able to change their own situation as well as those of others is well chosen. By empowering victims and giving them the courage, skills, and will to actively speak up in court and actively commit their own knowledge and experiences to inspire and help other victims, the victims themselves become advocates for the fight against gender based violence. By changing shame and disgrace into power, they are able to gradually change the negative connotations that are traditionally associated with 'divorce' and 'assertiveness' in women, and inspire and encourage

other victims to fight for their own rights, and ultimately those of others. This should create a snowball effect through which influence on law and culture will be exponentially exerted.

4. Our data shows that, even though LRC-KJHAM never suggests divorce as a solution, victims of domestic violence preferred to file for divorce immediately, without first reporting the abuse and going through the full legal process. This is problematic because any abuse that is reported after the divorce is granted will legally not be sentenced as 'domestic violence', but rather as 'violence against women' for which lighter punishment applies. The fact that many women still decide to directly file for divorce supports the idea that victims know too little about legal procedures. Much can thus still be gained by training and educating the victims on their rights.

5. The synergy between LRC-KJHAM, victims, and government is the key to successfully handling gender based violence cases. The fact that women's right to protection from gender based violence is now recorded as a law, has given policy makers a discourse, and socialization of gender justice and equality already seems to be occurring at various levels. The presence of PPT Seruni: an integrated service centre at the city level, is proof that the government of Semarang is serious about dealing with gender based violence issues.

# 1. Introduction

## 1.1. Project context

Traditional (*adat*) structures and laws have existed in Aceh for hundreds of years. The *Mukim* institution was originally developed for religious reasons: it was too small for a *Gampong* (village) to hold Friday prayer ceremonies, which needs to be participated by at least 40 males. Therefore, some *Gampongs* created a federation of villages consisting of several (3-12) villages or *Gampongs*. In the past, the size of a *Mukim* was about 1,000 people. The leader of the *Mukim* is called *Imam Mukim*, and he played social, cultural and political roles, and sometimes even military roles. The leader of religious affairs in the *Mukim* is called *Imam Masjid.* The mosque in the *Mukim* is usually called *Masjid Jami'* (the great mosque), which was used for holding Friday prayer of Muslims from different *Gampongs* in the *Mukim*.

In the past, *Mukims* played a central role in social and economic activities of Aceh people. Its role included government administrative, customary (*adat*) and law (*hukom*) roles (Syarif 2010: 67). The division of authority between the *Gampong* and *Mukim* (association of *Gampongs*) was that the *Mukim* deals with issues which cannot be resolved at the *Gampong* level, and it was also the authorized reference for religious affairs. The *Mukim* also dealt with external affairs, while the *Gampong* addressed internal affairs.

However, the *Mukim* institution was weakened as a repercussion of modernization and, especially, centralization of power by the New Order regime. Following the implementation of Law number 5/1979 on Village Governance, *Mukims* lost their central role and authority as the law only recognizes the authority of the *Gampong* which is seen as a village, the smallest administration unit of government. Without legal recognition from the administration and the lack of financial resources, the *Mukims* played no significant role in Aceh society during the New Order regime. At the same time, the nature of *Gampong* which characterized with collegial type of leadership (altogether with *Teungku Meunasah* and *Tuha Peut*)[1] shifted to be a centralistic kind of leadership. In short, the head of village became the sole authority at the village level (Syarif 2010: 69-70).

Following the collapse of the New Order Regime in 1998 and in the aftermath of the tsunami disaster in 2004, there have been new streams to revive and to revitalize *adat* structure and laws in Aceh. Both the national and local government provided support to improve the capacity of the *Gampong* to involve in the development process. However, there are still too little efforts and too few resources available to enhance the capacity of the 6,408 *Gampongs* and 755 *Mukims* throughout Aceh. There is also a lack of clear rules of engagement between *adat* structures and the law and government's rules.

The Yayasan Rumpun Bambu Indonesia (YRBI) project aims to enhance the capacities of both *Gampong* and *Mukim* to effectively deal with problems related to land tenure, natural hazards, natural resources and spatial management in Aceh. The project is important, particularly, in the context of post-tsunami and post-conflict of Aceh, where society was quite significantly divided into conflicting groups and its environment was severely devastated due to the disaster. While the problems of post-conflict and post-

[1] *Teungku Meunasah* means leader of the village mosque, and he was in charge of religious affairs in the *Gampong*. *Tuah Peut* stands for representative council, usually elected elderly leaders representing the interest of the villagers. There are *Tuah Peut* both at the *Gampong* and *Mukim* level.

tsunami are particular located in Aceh, the weakness of traditional institutions was widespread throughout the archipelago.

Following massive and intensive rehabilitation and reconstruction programmes, land tenure and environmental problems have become new crucial issues in Aceh. Besides resulting in hundreds of thousands of deaths and colossal destruction in Aceh, the tsunami has also brought about another serious problem: the massive loss of land tenure documents. In some areas it has led to conflicting issues regarding boundaries between the *Gampongs* and *Mukims*. The situation has deteriorated in some areas, particularly when new natural resource exploitation projects took place. In several cases, both the *Gampongs* and the *Mukims* have not been involved in producing the license for natural resource exploitation which at times ended up in conflict between villagers and companies as well as among the villagers.

With these emerging problems in the backdrop, YRBI seeks to empower the traditional *Gampong* and *Mukim* institutions in Aceh to play more important roles in resolving conflict between groups as well as in better managing natural resources for more prosperous and sustainable society.

## 1.2. Evaluation objectives

This report evaluates the Empowerment of *Mukim* and *Gampong* Capacity in Spatial Management Phase II of Yayasan Rumpun Bambu Indonesia (YRBI) funded by ICCO. This project has been selected as part of the MFS II evaluation for Indonesia under the Achievement of Millennium Development Goals (MDG) component[2] under the MDG theme on good governance and civil society building.[3] In particular, the current evaluation focusses on the following research questions: how did the capacity of *Mukim* and *Gampong* on natural resource management and disasters management change? Are there *Gampong*/*Mukim* regulations produced about natural resource management? Are there local wisdom documentations about natural resource management produced? How did the management structure of community forest areas change? How did the attitude and awareness of the people towards natural resources change?

We investigate whether the project had a favourable effect on the above mentioned outcomes by looking at the changes in the outcome variables between the baseline and endline periods for the project beneficiaries. Data was collected in six communities (two *Mukims*) using structured community and household surveys in 2012, and the same respondents were re-interviewed in 2014 whenever it was possible. In order to validate the data from the quantitative surveys, we collected additional qualitative information at some of the project locations in the form of focus group discussion (FGDs) with project stakeholders and beneficiaries to deepen our understanding of the project context and the project results. The survey respondents were selected randomly in their villages. However, we tried to interview a gender-balanced sample. One out of the three communities per *Mukim* was randomly selected for the FGDs. The FGDs were conducted with members of the representative council of the village (*Tuha Peut Gampong*), *Mukim*, and male, female and youth groups.

[2] The project is described in more detail in section 3.

[3] Please note that this project has been also evaluated under the Capacity Development of Southern Partner Organisations component of the MFS II Evaluation.

As specified in the Terms of Reference for this evaluation, the report addresses five evaluation questions to assess the project outcomes:

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?
2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern partner organisations efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

## 1.3. Summary of findings

The evaluation focuses on two of YRBI's project sites: *Mukims* Siem and Lamteuba. YRBI has been working with villages in *Mukim* Siem since 2010 and with villages in *Mukim* Lamteuba since 2008. Therefore, before the baseline survey, mapping of village boundaries were conducted in many of the surveyed villages by YRBI (Table 14 in Annex III). However, both *Mukims* agreed to enhance the cooperation with YRBI in the follow-up project (2011-2013) in order to the revitalize of traditional *adat* institutions, and continue with the mapping activities.

The final objective of the YRBI project is to assist Gampongs and Mukims in strengthening and revitalizing traditional Mukim institutions, especially with regard to informed and just management of natural resources. To reach this objective, YRBI works closely with the communities and traditional institutions using participatory mapping to identify Mukim and Gampong territory (settle boundary disputes) and natural, cultural and social resources. Both the quantitative and qualitative data show progress in the mapping of boundaries (2 of 6 surveyed villages indicating mapping activities, and 6 of 17 disputes resolved in Mukim Siem) and natural resources (2 of 6 villages indicating mapping of natural resources/rice fields). The qualitative study also indicates that YRBI facilitated the communities throughout the process of participatory mapping. However, more work needs to be done to complete the mapping activities and solve all boundary disputes (within the Mukim and with other Mukims).

In both surveyed Mukims, the traditional institution of Keujruen Blang Mukim responsible for the management of farming land has been established. Some documentation and regulations have already been produced regarding the management of irrigation, planting time, harvest time, giving instruction for farmers, and solving land conflict. However, the qualitative data shows that these institutions are not yet fully functional. This is also supported by the community survey data, which indicates that not all villages are yet aware of YRBI's activities with respect to natural resource management and the Keujruen Blang Mukim, even though all villages are aware of the mapping activities of YRBI (before and during the evaluation period). In addition, a few villages also indicated that YRBI assisted them in reforestation efforts, organised trainings on natural resource management and on the sustainable use of natural resources, and implemented livelihood activities (seed distribution).

Turning to the findings at the villager level, the survey data shows that respondents find the role of *Imam Mukim* important in their village both at the baseline (4.0 and 3.8 out of 5) and at the endline (4.1

and 4.5). During the evaluation period, the attitude towards traditional institutions has increased in both *Mukims* but more so in *Mukim* Siem (from 0.9 to 1.1 on a scale of -2 to 2 compared to from 0.9 to 1.0 in Lamteuba). In Siem, we also observe that the attitude towards sustainable forest use has increased significantly (from 0.7 to 1.0 on a scale of -2 to +2) despite being less dependent on forest resources. The change in this indicator in the forest dependent Lamteuba is also positive but insignificant. In general, the improvement could be driven by the increased awareness that forests play an important role in protecting clean water sources. The data shows that access to clean water is an important community issue due to increasing water scarcity: at the baseline 43.4% of the respondents in Siem and 16.4% in Lamteuba mention this as one three most important issues in their village, while at the endline these percentages have increased to 76.6% in Siem and 40% in Lamteuba.

Finally, we find some indication that mutual trust has increased in the communities, and people feel more secure about their control over their land, preservation of traditional culture and even their own lives. However, these improvements are only significant in Siem.

Overall, we find that the mapping activities have already yielded some positive results, such as the resolution of some of the border conflicts, increased awareness regarding the sustainable use of natural resoures and an increased sense of security and peace within the communities. These developments are more pronounced in *Mukim* Siem.

### 1.4. Structure of the report

The rest of this report proceeds as follows: section 2 describes the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1) till 4) in turn. Section 11 describes the relationship between the Capacity Development and Civil Society component to the MDG component. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. The project implementation and the SPO is described in Annex II. Regarding the survey data, the construction of the outcome indicators and indices is summarized in Annex II, while Annex III provides a description of the study locations; Annex IV in turn reports detailed descriptive statistics of the sample, while detailed figures on the change in outcome indicators is presented in Annex V. Finally, the results of the qualitative data collection are presented in Annex VI, and an extended version of the literature review can be found in Annex VII.

## 2. Literature overview

In relation to the YRBI project, we summarize existing literature on the implementation and effectiveness of participatory mapping projects.

Even though the existence of participatory mapping activities is very important in a country like Indonesia where an estimated 48 million indigenous people still depend on the forest for their livelihood, but where mining, logging and oil palm industry are destroying more than 1 million hectares of

rainforest territory each year[4] (Telapak & Gekko Studio 2011), the academic literature on participatory mapping within specific Indonesian context is quite limited. This may, at least in part, have to do with the political sensitivities involved in mapping, that can be especially critical for Indonesian indigenous peoples that have since long had a particularly uneasy relation with government and, until very recently, had to cope with a severe lack of legal protection.

Despite the lack of scientific literature over participatory mapping, there was no lack of participatory mapping projects in Indonesia. In fact, over the past 1.5 decades, communities from nearly every region in Indonesia have been trained in the technical and facilitation skills required to undertake participatory mapping , and by 2009 1.5 million hectares of land had already been mapped by local communities (IFAD 2009: 22). The Indonesian community mapping network (Jaringan Kerja Pemetaan Partisipatif or JKPP), established by the mapping activists in 1996 in Bogor, West Java, has been instrumental in achieving these goals (IFAD 2009: 22). I.e. by forming an alliance with Aliansi Masyarakat *Adat* Nusantara or Alliance of Indigenous Movement in the Archipelago (AMAN) and the Forest Watch Indonesia to advocate for the customary maps to become officially recognized and fed into the "Ancestral Domain Registration Agency" (Badan Registrasi Wilayah *Adat*): The government's official national database of forest cover. In 2011 AMAN signed a Memorandum of Understanding (MoU) with the National Land Agency (Badan Pertanahan Nasional), which officially stated that "indigenous" maps would be integrated into governmental data (Harjati Sanmukri 2013: 123).

Scientific evidence on the effectiveness of participatory mapping is also limited in the international context. Therefore, a large part of the remaining of this section discusses what participatory mapping is and how it is implemented in terms tools and methods. Finally, we present a short summary of reported impacts of participatory mapping. For further details on the development and methods of participatory mapping, and considerations about "good practice" the reader is referred to Annex VI.

Participatory mapping is a general term[5] used to define a set of approaches and techniques that combine the tools of modern cartography with participatory methods to create a map of a local community's habitat that represents this community's spatial knowledge (Rainforest Foundation UK 2014). "NGO's, from small local ones to large international ones, often play a crucial role as interlocutors, trainers, advocates and facilitators in these mapping activities" (IFAD 2009: 5).

Participatory mapping is used over the whole world, and the maps that are produced can take on many forms, and can be used to achieve various different purposes. Looking at the available literature and documentation on participatory mapping initiatives the most common aim of participatory mapping appears to be to help marginalized groups, in particular indigenous, pastoralist and forest dwellers, to claim and/or defend their (access to) ancestral lands and its resources, typically by working towards

[4] Making Indonesia the fastest forest clearing nation in the world since 2012, and also the world's third largest emitter of carbon dioxide emissions, behind China and the United States (Telapak & Gekko Studio 2011).

[5] The numerous initiatives throughout the world aren't always referred to with the words 'participatory mapping', but can go by many different terms, including: "indigenous mapping" (IFAD 2009: 6) , "…"participatory land use mapping," "participatory resource mapping" (Mbile *et al*. 2003), "community mapping" (Bennagen & Royo 2000, Eghenter 2000, Fox 2002), "community-based mapping" (Flavelle 2002), "ethnocartography" (Chapin & Threlkeld 2001, Gonzalez *et al*. 1995), and "counter-mapping" (Peluso 1995, Kosek 1998, Hodgson & Schroeder 2002)…" (as cited in Chapin *et al*. 2005: 622-623).

legal recognition of their land rights, using the maps as evidence of their continued residency. The maps can also serve as a tool for community land use planning and natural resource management, and can be used to bring resource-related problems, such as the impacts of logging, mining, and 'land grab' activities, to the attention of governmental authorities and decision makers (Chapin et al. 2005: 620; Di Gessa 2008; Rainforest Foundation UK 2014; Literat 2013: 200; IFAD 2009: 9-12, 39). Some indigenous groups are now using mapping to monitor and defend lands against deforestation, illegal timber extraction, prospecting, and colonization (Teague c. 2010: 10). Other purposes of participatory mapping activities include the strengthening of indigenous political organisation, economic development planning, the documentation of history and customs for culture preservation, education of indigenous youths and/or the general public (Chapin et al. 2005: 620), and support for conflict resolution in territory-related disputes (Di Gessa 2008).

What further distinguishes participatory mapping from traditional cartography and map-making is the process by which the maps are made (IFAD 2009: 4): Community members are involved (preferably) throughout the whole mapping process and recognized as capable research collaborators and experts on their own local surroundings and needs (IFAD 2009: 4; Pathways Through Participation 2010: 1). According to Fox *et al*. (2003, as cited in Wright *et al*. 2009: 261) the reasons for choosing a participatory mapping approach are usually not only practical (i.e. the actual production of the map and using it as evidence for land claims, or as community advocacy tools), but also intrinsic, as the communal aspect of the mapping process can enhance group awareness and cultural identity, facilitate the passing down of historical knowledge through generations, and build trust and communication between people.

Throughout the past decades, mapping has become increasingly popular and prominent (Pathways Through Participation 2010: 13), which "many commentators ascribe to the developments in Participatory Rural Appraisal (PRA) which emerged in the late 1980s in South Asia and combined insights from agro-ecosystem analysis with Rapid Rural Appraisal (RRA)" (Ibid: 2).

Looking at the implementation of mapping projects, they usually loosely follow the following steps:

1. "**Ground preparation**: before the project starts project leaders and indigenous leaders explain the objectives and importance of the mapping work to the community, the technical team is recruited and collaboration with NGO's and government agencies is sought;
2. **First workshop – orientation and training**: Project staff and indigenous leaders explain the objectives and methodology to the surveyors and technical team and data collection tools are developed;
3. **First fieldwork – gathering data and sketch mapping**;
4. **Second workshop – transcription of data onto new maps**;
5. **Second fieldwork – verification of collected data by the community**; and
6. **Third workshop – correcting and completing final maps**: Surveyors reunite with the cartographers to incorporate information that has been verified in the field and put the draft maps in final form

(Chapin & Threlkeld 2001; IFAD 2009: 30).

Turning to the effectiveness of participatory mapping projects, over the years, many researchers have noted the positive impacts that participatory mapping can have on a community:

> Participation in mapping seems to have encouraged some indigenous communities to demand title to lands (Toledo Maya Cultural Council, 1997; Leake, 2000; Herlihy, 2003; Herlihy and Knapp, 2003), to defend and claim their rights to control natural resources (Smith, 2003; Brown, 2006), and to design conservation and resource management plans that are compatible with local practices (Mohamed and Ventura, 2000; McCall and Minang, 2005; Brown, 2006; Bauer, 2009). Researchers have argued that, in addition to producing maps, when implemented with a stress on participation and with facilitation of discussions within communities, indigenous mapping empowers indigenous peoples in land and resource use rights against potential encroachers (Poole, 2003; Smith, 2003; Brown, 2006; Finley-Brook, 2007) (Reyes-Garcia *et al*. ca. 2012a: 2-3).

In addition to these positive effects, researchers have also observed negative consequences resulting from participatory mapping. For instance, Authors such as Mwangi, Hodgson & Schroeder, Fox, Bryant, and Roth have noted issues such as increased privatization of land, loss of indigenous conceptions of space, greater exposure of valuable natural resources, increased taxation by the state, and increase or intensification of conflicts, either within the village, with neighbouring villages, or with other external actors such as companies or governmental authorities (Reyes-Garcia *et al*. 2012b: 651). Increase of conflicts due to participatory mapping, is one of the most frequently reported drawbacks of participatory mapping. Researchers such as Offen, Peluso, Hale, and Vandergeest have argued that: "Participatory mapping might intensify internal conflicts because it might bring to light overlapping uses of land and resources or erode traditional ways of dealing with internal conflicts…" (Ibid). Furthermore, it has been reasoned by i.a. Peluso and Rundstrom that "…participatory mapping might increase the number of conflicts with external actors, as the maps produced might challenge the maps made by state and corporate authorities" (Ibid).

Reyes-Garcia *et al*. have attempted to validate the theory that participatory mapping systematically increases the number of conflicts, using an experimental research design whereby 32 native Amazonian villages with and without conflicts with outsiders were randomly assigned to a treatment group (those where a participatory mapping project would be implemented by them) and a control group (those where a participatory mapping project would not (yet) be implemented by them[6]).[7] Contrary to others' previous findings, the results of their research show no statistically significant differences in the measured variables (i.e. number of conflicts, negative opinion, neutral attitude, and negative attitudes towards outsiders) between treatment and control villages (2012b: 656).

Reyes-Garcia *et al*. explain their deviating results by arguing that previous studies, which were based on direct observations rather than a randomized experimental design, might have been subject to selection bias, because the villages participating in participatory mapping projects are generally the ones that are chosen or volunteering to participate in participatory mapping due to the fact that they are expected to experience – or are already experiencing – conflicts over land rights and resources (2012b: 651, 656). Their results support the argument that mapping projects do not bring about conflicts per se, rather "…the process and the results of participatory mapping can help in conflict resolution or contribute to

[6] For the sake of fairness, participatory mapping projects were also implemented in the control villages, but only after all research data for the post-intervention study had been collected (Reyes-Garcia *et al.* 2012b: 653).
[7] All these villages were located in Tsimane' territory. The Tsimane' are a native Amazonian society of foragers and farmers in Bolivia.

conflict generation or exacerbation depending on the political and socio-economic context in which they are conducted" (Ibid: 657).

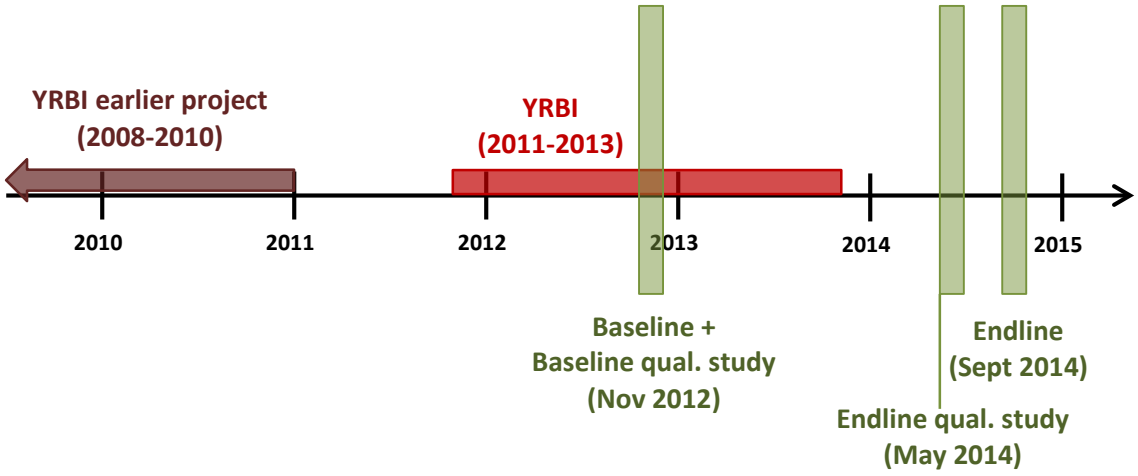
# 3. The project

## 3.1. Project description

The first phase of the YRBI project was implemented between 2008 and 2010. For the current project period (1 November 2011 - 31 October 2013), the project aims at the revitalization of traditional (*adat*) structures and law with the main strategy of strengthening *adat* institutions[8] (called *Mukim* and *Gampong*) and advocacy for the formal recognition of these traditional institutions and structures by both the people and the Indonesian government.[9] The project works with *Mukims* already involved in the previous phase of the project. At these locations, an enhanced programme is implemented in terms of depth and intensity. However, the project also targets new locations that are interested in the revitalization of their traditional institutions.

At the project locations and in its office in Banda Aceh, YRBI conducts consultative workshops; trainings on participatory mapping and community-based spatial planning; regular discussions on the empowerment of traditional institutions and structures; and workshop in traditional institutions, especially for youth. Through raising awareness, YRBI aims to enable communities to make informed decisions in land conflict resolution (between villages and also with local government) and natural resource extraction (by corporations and local people). By doing so, it is expected that the management and distribution of natural resources would be fair and just, both socially and ecologically.

These activities serve YRBI's two final objectives: firstly, the objective to strengthen communities' awareness and capacity to manage and control natural resources and sources of water; and secondly, to ensure a fair and just management and distribution of natural resources in an ecological and social way, in which local communities can participate equally and enjoy its benefit optimally.



Annex I provides further information about both YRBI and the project implementation.

## 3.2. Project implementation

Figure 1 summarizes the project periods and the evaluation activities. In the evaluation, we focus on the activities of YRBI in two *Mukims*: *Mukim* Siem and *Mukim* Lamteuba. In these *Mukims* YRBI has been working on mapping village boundaries since 2010 and 2008, respectively.[10] However, in 2012, the *Mukims* and YRBI agreed to enhance the cooperation in terms of reviving traditional *adat* institutions.[11]

[8] *Gampong* is a community or village, while *Mukim* is a collection of neighboring *Gampong*'s that traditionally used to belong under the same mosque and *adat* regulation.
[9] Source: NWO Joint MFS II evaluations Country-Specific Information Indonesia
[10] Hence, the baseline survey does not provide us with true baseline information.
[11] We decided to focus the evaluation on these *Mukims* due to YRBI's focus at these locations on revitalizing and documenting traditional institutions.

**Figure 1: Timing of project activities and the evaluation**

Below, the project's activities are summarized in Mukims Siem and Lamteuba based on project reports. The activities are grouped around three main themes: area management; custom-based dispute resolution; and institutional strengthening of the *Mukims*. Information regarding meetings, discussions and workshops at other project locations are summarized in Table 11 in Annex I.

### *Mukim Siem*

In 2012, a number of achievements have been made in Siem: a socialization meeting has been held about customary methods for spatial dispute resolution between *Gampongs* and *Mukim.* The result of this discussion has been documented, and the method has been applied in settling boundary issues between *Gampongs* in Siem. The regional government of Aceh Besar recognized the process of boundary dispute resolution in *Mukim* Siem and ensured Siem of its support for giving formal recognition of the resolved boundary disputes.

As a result of the above, community participatory mapping activities in *Mukim* Siem resulted inthe reinforcement of *Gampong* boundaries in Siem, specifically settling the boundary coordinates of *Gampongs* Lambitra and Siem, and the communities of Siem built a common understanding about the meaning of communal areas. As promised, the Government of Aceh Besar recognized the village agreements about the boundaries in the following year.

The community participatory mapping activities have also continued in 2013, with 5 boundary agreements reached between villages in Siem: *Gampong* Lamklat made 3 boundary agreements with *Gampongs* Lamasan, Lamreh and Lieue, while *Gampong* Lambiheu reached 2 boundary agreements with *Gampongs* Lamreh and Siem, all located in *Mukim* Siem. These agreements were also approved by the Government of Aceh Besar. In addition, the regional administration and land use map of *Mukim* Siem has been completed.

In 2013, YRBI also assisted Siem in strengthening the *Mukim*'s natural resource management by introducing management of the *blang* area (rice plantation land) (meeting on 2 March 2013), and

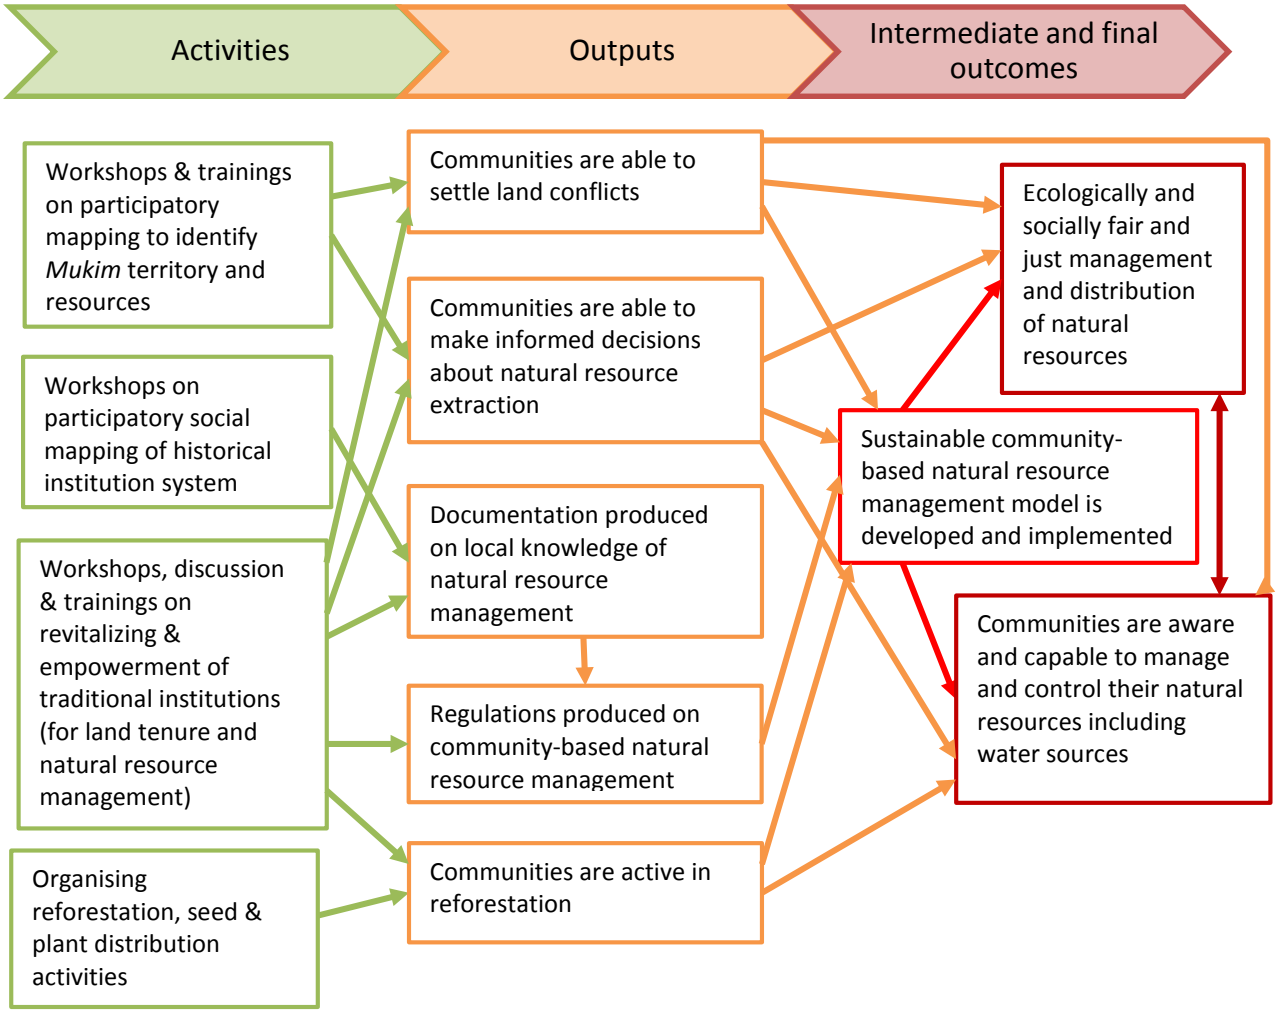
producing local wisdom documentation of the new regulations. The concerning rice fields (*blang* area) have also been mapped using participatory mapping. On November 14 2013, *Mukim* Siem made a site visit to *Mukim* Lamteuba regarding the implementation of the *blang* regulations there.

Finally, in 2013 a community agreement has also been reached to donate 3 hectares of community land for reforestation.

#### *Mukim Lamteuba*

The project report mentions that Lamteuba had a famers' initiative to develop a pilot project planting Jember Coffee in their fields before 2012. However, YRBI's project mostly focused on the establishment and working of the traditional institution of *Keujruen Blang Mukim.*[12] This institution has gained recognition and support as a traditional institution that is authorized to regulate the management of rice fields. In order to strengthen the *Keujruen Blang,* participatory mapping of the *blang* areas (rice fields) have been carried out in 2012 to build a common understanding with the communities regarding the areas belonging in the *blang* area. Between April and July in 2012, the following aspects of the *blang* region were mapped: the area belonging to the *blang* region, the traditional rice field drainage network and social data on customary rice field management areas were compiled.

To further develop the *blang* institution, identification of the rice management system using customary system *meublang* was carried out and the local wisdom about natural resource management has been documented in 2012.



In 2013, a meeting on youth roles in strengthening indigenous institutions was held (27 April), and a site visit to *Mukim* Abdya was organised (19-20 October).

### 3.3. Result chain

A schematic description of the YRBI project's result chain is displayed in Figure 2. As mentioned before, the two final objectives of the project are that communities are aware and capable to manage and control their natural resources including water sources, and that natural resources are managed and distributed in an ecologically and socially fair and just way, in which local communities can participate equally and enjoy its benefit optimally. These to outcomes are interlinked to each other and they are linked to the intermediate outcome to reach this goal is to strengthen and support communities to be able to develop and implement sustainable community-based natural resource management mechanisms according to their needs.

[12] *Keujruen Blang* is a customary leader regarding management of irrigation, planting time, harvest time, giving instruction for farmers, and solving land conflict.

**Figure 2: Result chain**

In order to achieve these outcomes, YRBI carries out trainings, workshops and discussions on the following topics: participatory mapping to identify *Mukim* territory and resources; participatory social mapping of historical institution system; revitalizing and empowerment of traditional institutions (for land tenure and natural resource management) and reforestation, including seed & plant distribution activities.

As a result of the activities related to participatory mapping, communities will be able to settle land disputes and document their local knowledge, and they will have a better awareness of their natural and social resources. As a result they will be able to make informed decisions about their natural resources. In turn, as a result of the activities related to revitalizing traditional institutions, communities will be able to use the information gathered through participatory mapping to establish traditional institutions and make new regulations according to the needs of the community. YRBI focuses on reviving traditional institutions governing land tenure and natural resource management. A good example of this is the establishment of the traditional institution *Keujruen Blang Mukim* in both Lamteuba and Siem

responsible for regulating and managing irrigation, planting time, harvest time, giving instruction for farmers, and solving land conflict.

In addition, YRBI also promotes reforestation and it is also involved in some small-scale seed and plant distribution activities.

All these activities jointly contribute to achieving the final objectives of the project in terms of the wise management and just distribution of natural resources.

Please note that there are a number of factors influencing the outputs and outcomes displayed on the figure. However, to keep the figure as simple as possible, we have omitted these external factors from the figure. The project log-frame[13] of YRBI identifies some of the external factors to the project such as the commitments of the *Mukims* and *Gampongs* to the project's objectives and the commitment of the regional government to involve the communities in policy arrangements.

### 3.4. Possible unintended impacts

Possible negative unintended effects of the project are that the mapping of community borders and discussions about natural resource management brings out conflicts with other stakeholders which are then resolved in a way that counters the community's interests.

## 4. Evaluation questions and outcome variables

### 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. In the baseline report specific evaluations questions were specified. Table 1 shows these five questions and what it implies for this project.

[13] Source: Logframe Proposal YRBI ICCO 2011-2013 and Proposal YRBI ICCO 2010-2013.

**Table 1: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| **1** | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | • How did the capacity of *Mukim* and *Gampong* on natural resource management and disasters management change?<br>• Are there *Gampong*/*Mukim* regulations produced about natural resource management?<br>• Are there local wisdom documentations about natural resource management produced?<br>• How did the management structure of community forest areas change?<br>• How did the attitude and awareness of the people towards natural resources change? |
| **2** | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Are the observed changes above attributable to the intervention? |
| **3** | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>• Does the project address an important issue for the beneficiaries? |
| **4** | Efficiency: Were the development interventions of the Southern partner organisations efficient? | Was the intervention cost effective? |
| **5** | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

Regarding the evaluation questions on the change in outcomes, the table shows the specific evaluation questions we posed at the baseline period. Linking these questions to the result chain (Figure 2), we observe that questions 2-4 relate to outputs of the YRBI projects in terms of wisdom documentation, regulations and management structure of natural resources. These results are measureable at the village level. The last question is aimed at investigating the effects of the project (which is mostly at community level) on the village population.

Finally, the first question, regarding the capacity of *Mukim* and *Gampong* on natural resource management, is only investigated through qualitative data collection, along with the achievements of the other final objectives displayed on Figure 2.

The next section discusses how the evaluation questions are linked to outcome indicators for the quantitative survey at the community and household level.

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators. The outcome indicators are split up into 6 groups: access to information on (local)

governance; satisfaction with local governance; role of traditional institutions; management of natural resources; household's attitude towards forests/plantations; and the sense of control of villagers.

Table 2 displays the outcome indicators of the main analysis, the scale of these variables and whether the indicator is a uniform indicator, while Annex II describes the outcome indicators in more detail and highlights the components per index. Since there are many possible and interesting outcome indicators, some of the variables are grouped into indices for the main analysis, while the results for the individual components are presented in Annex V.

The first two groups are linked to the uniform indicators specified by the synthesis team for the goal on Good Governance (Table 2) and to villagers' attitude towards *Mukim* institutions. The index on villagers' perception of the role of traditional institutions in their community further investigates the latter. The indicators on natural resource management and on household's attitude towards forests/plantations are related to the specific evaluation questions specified in Table 1. Finally, the indices on the sense of control of villagers measure whether the settling of boundary disputes and revitalization of traditional institutions affect the sense of control of villagers. Therefore, these indicators could be linked to the final outcomes of the project.

Finally, please note some of the questions posed in Table 1 are not answered by the outcome indicators listed in Table 2 (questions 1-3). Regarding these questions, we present some results among the explanatory tables. However, the main discussion is left for the qualitative study reported in Annex VI.

**Table 2: Overview outcome indicators**

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator (Good Governance) |
|---|---|---|---|
| **Panel A. Access to information on (local) governance** | | | X |
| Level of agreement with statement: 'I feel well-informed about the decisions made by the village leaders.' | (-2;2) | Household survey | |
| Percentage respondents who know about the policies of the district government related to agriculture and the use of land | (0-100%) | Household survey | |
| **Panel B. Satisfaction with local governance** | | | X |
| Index for satisfaction with local governance at village level | (-2;2) | Household survey | |
| Percentage of respondents who know the name of the *Mukim* leader (imam *Mukim*) | (0-100%) | Household survey | |
| Level of agreement with 'The *Mukim* institution serves the benefit of all people in this village' | (-2;2) | Household survey | |
| Importance of the role of imam *Mukim* in the village | (1;5) | Household survey | |
| Index for satisfaction with local governance at sub-district level | (-2;2) | Household survey | |
| Corruption at village leadership | (1;3) | Household survey | |
| Corruption at district government | (1;3) | Household survey | |
| **Panel C. Role of traditional institutions** | | | |
| Index for positive attitude towards traditional laws and culture | (-2;2) | Household survey | |
| **Panel D. Management of natural resources** | | | |
| Existence of regulations about the use and protection of the community forests in the village | (0;n) | Community survey | |
| Regulations are communicated by community meetings or farmer group meetings | (0;n) | Community survey | |
| Regulations are communicated to all villagers (including women and children) | (0;n) | Community survey | |
| Regulations are taught at school | (0;n) | Community survey | |
| Percentage of respondents who report that there are any rules/regulations about the use of community forests in the village | (0-100%) | Household survey | |
| Satisfaction with regulations | (-2;2) | Household survey | |
| **Panel E. Households' attitude towards forests/plantations** | | | |
| Dependence on forest resources | (-2;2) | Household | |

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator (Good Governance) |
|---|---|---|---|
| | | survey | |
| Index for positive attitude towards sustainable forest use | (-2;2) | Household survey | |
| Index for access to forest resources | (-2;2) | Household survey | |
| Percentage of respondents who think that the activities of the government/industry will be harmful | (0-100%) | Household survey | |
| **Panel F. Sense of control of villages** | | | |
| Index for trust in village | (-2;2) | Household survey | |
| Index for sense of control regarding their own life | (-2;2) | Household survey | |
| Index for sense of control regarding land | (-2;2) | Household survey | |
| Index for sense of control regarding preservation of traditional culture | (-2;2) | Household survey | |
| Note: n is the number of villages in the area | | | |

# 5. Data collection

## 5.1. Survey instruments

We collected three types of data: quantitative, qualitative, and financial data. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

To analyse the impact of the programmes, two surveys have been conducted to collect quantitative data:

- Respondent survey: a short survey was administered with randomly selected community members regarding their perceptions on governance, natural resource management, and their sense of control.
- Community survey: the community survey was administered together with the household surveys both during the baseline and endline period. The head of the community or another local leader was interviewed regarding matters of the community.

The baseline data have been collected in November 2012, while the endline data was collected in September 2014

### *Qualitative data*

To gain more insight into the implementation and the impacts of the project qualitative field work was conducted in two communities (one per *Mukim*) in November 2012 and May 2014. In-depth interviews

were conducted with the general facilitator of the YRBI project, the local facilitators and local leaders in the *Mukim* and the *Gampong*; and focus group discussions were carried out with 3 different groups: women that were part of a women's group, men that were part of a farmers' group, and young people (aged 16-24 years) that were part of a youth group. The results of this study are summarized in Annex VI.

### *Financial data collection*

To collect information about the costs of the project, we conducted a project cost survey with YRBI in July 2013.

## 5.2. Sampling outcome

### *Sampling design*

In 2012 YRBI has started to implement its *Mukim* level programme in two *Mukims*: *Mukim* Siem in sub-district Darussalam and *Mukim* Lamteuba in sub-district Seulimeum. Therefore, we have selected these two *Mukims* for the evaluation. The project activity has started in September 2012, while we have collected data in November 2012.

Both *Mukims* have 8 *Gampongs*, hence a total of 16 communities participate in the project. Among these we have selected 3 *Gampongs* per *Mukim*. The 6 communities were selected as a combination of YRBI's recommendation (we have selected 2 out of 3 proposed villages) and variation in population and agricultural and forest areas[14].

In each village, 20 people were interviewed for the villager survey. The respondents were chosen randomly, however, stratified by gender (50-50%). If participatory mapping was done in the village, then randomly selected participants of the mapping activity were also interviewed. For the endline survey, we planned to re-interview the same respondents as much as possible. However, if some of the baseline respondents could not be interviewed, we replaced them by a randomly selected community member with similar characteristics in terms of gender and age. The total sample size for the villager surveys was 120 respondents in both survey rounds.

### *Sampling outcome*

Table 3 summarizes the sampling plan and outcome. In both the baseline and endline period the planned number of households have been interviewed (120 in total). The last column of the table (panel sample) shows the number of respondents that were interviewed both for the baseline and endline survey. In the villages, 112 (93.3%) of the baseline respondents were re-interviewed.

One of the baseline respondents has moved out of the village and three could not be interviewed because they were travelling. For the four other baseline respondents who were not re-interviewed, the reason is unknown.

[14] Based on administrative data from PODES 2008.

**Table 3: Sampling outcome**

| Assignment group | Villages | Respondents baseline | Respondents endline | Panel sample |
|---|---|---|---|---|
| Lamteuba | 3 | 60 | 60 | 56 |
| Siem | 3 | 60 | 60 | 56 |
| **Total** | **6** | **120** | **120** | **112** |
| Source: Household survey E8, MFS II Evaluation Indonesia | | | | |

In the data analysis, we use data from all respondents when discussing the baseline and endline outcomes separately. However, when reporting on the change in variables or performing statistical tests on the significance of the change, we only use the so called *panel sample*, respondents for we have two rounds of data.

# 6. Descriptive statistics

This section summarizes the main characteristics of the two communities using the baseline and endline surveys. In addition, the exposure of the study locations to the mapping and traditional institution strengthening activities is discussed. Additional tables are provided in Annex IV.

## 6.1. Community characteristics

The evaluation focuses on two *Mukims* in Aceh Besar: *Mukim* Siem and *Mukim* Lamteuba, where YRBI has been conducting extensive project activities. However, these two *Mukims* have very different characteristics.

*Mukim* Siem is part of the Darussalam sub-district. It is comprised of 8 *Gampongs* (villages) and is located close to the provincial capital resulting in a more heterogeneous, educated, and open-minded society. Even though a fair amount of inhabitants still work in agriculture and husbandry, the majority of them work in the city as government officers or employees or as education workers, and do not rely on the forests for their livelihood (Annex VI).

*Mukim* Lamteuba is located at the foot of Mount Seulawah of Seulimum sub-district. It also consists of 8 *Gampongs*, but unlike Mukin Siem, it is located in a remote area, far away from the hustle and bustle of city life. At its border lies a protected forest and there are many rice fields in the surroundings. For their livelihoods, the inhabitants depend on farming, gardening, and raising livestock. The people of Lamteuba speak Acehnese in daily life as well as in schools. Very few speak the National Indonesian language (Bahasa Indonesia) fluently. People are generally less educated (middle or high school), and they are cautious about foreign researchers as they have been let down by NGOs in the past. What distinguishes *Mukim* Lamteuba from other *Mukims* is that its customs and traditions are still well preserved (Annex VI).

Despite their different characteristics, both *Mukims* are interested in YRBI's project that aimed to map *Gampong* and *Mukim* boundaries; assist the *Mukims* in resolving persisting boundary-disputes between *Gampongs* and *Mukims*; and revitalize traditional institutions responsible for the management of natural resources. The latter one has particular importance for the *Mukims* as they are experiencing an increasing water scarcity, and a decline in important forest products, such as honey and timber, as a result of plantation building and the ongoing illegal logging activities (often supported by the local apparatus) in their industrial forests.

Further details about the project locations can be found in Annex III (description of the project locations) and Annex VI (report about the qualitative study).

## 6.2. Intervention in the communities

Next, we turn to describing the type of project activities that have taken place before and during the evaluation period. We are particularly interested in activities related to land mapping and the strengthening of traditional institutions.

Table 4 summarizes the number of villages that reported participatory mapping and other natural resource management related trainings and meetings in the 2 years preceding the baseline survey (Base) and during the evaluation period (End).

**Table 4: Trainings related to natural resource management and mapping**

| **Assignment group** | **Siem** | | **Lamteuba** | |
|---|---|---|---|---|
| **Sample size** | n=3 | n=3 | n=3 | n=3 |
| **Survey year** | Base | End | Base | End |
| **Natural resource management related trainings and workshops in the past two years:** | | | | |
| *Forest/natural resource mapping* | 0 | 2 | 1 | 0 |
| *Efforts at reforestation* | 1 | 1 | 1 | 2 |
| *Awareness raising campaigns about use and protection of natural resources* | 0 | 1 | 0 | 0 |
| *Training on natural resource management* | 0 | 0 | 1 | 1 |
| *Training on sustainable use of natural resources* | 0 | 0 | 0 | 2 |
| Source: Community survey E8, MFS II Evaluation Indonesia | | | | |

YRBI has been working with villages in *Mukim* Siem since 2010 and with villages in *Mukim* Lamteuba since 2008. Mapping of village boundaries has been conducted in almost all surveyed villages before by YRBI (Table 14 in Annex III). However, both *Mukims* re-joined YRBI's follow up project in 2011-2013 to proceed with the previously unfinished activities.

The table shows that before the baseline period, no trainings related to natural resources have taken place in Siem. *Gampong* Lamklat started efforts at reforestation, however, this was the initiative of the *Mukim* and not YRBI (Table 12 in Annex III). In Lamteuba, *Gampong* Lamteuba Droe reported forest

mapping before the baseline survey assisted by YRBI, while in *Gampong* Blang Tingkeum trainings on natural resource management (co-assisted by YRBI) and reforestation efforts (unrelated to YRBI) have taken place.

A number of mapping, training and reforestation activities have taken place in the surveyed villages during the evaluation period. According to the quantitative study, forest/natural resource mapping activities were carried out in 2 villages in *Mukim* Siem during the evaluation period, and were aimed at mapping the rice fields (*blang* area). In addition, 2 villages in *Mukim* Lamteuba reported that YRBI assisted them (and also other villages in the *Mukim*) in village boundary mapping (Table 14 in Annex III).

Furthermore, the qualitative study indicates that YRBI facilitated the communities throughout the process of participatory mapping, for example by training members of the local mapping teams to use GPS-devices to collect coordinate points. However, both the maps of *Mukim* Siem and *Mukim* Lamteuba have still not been completed. The map of *Mukim* Siem is estimated to be 60-70% finished, as many border points between villages could not yet be resolved. The map of *Mukim* Lamteuba is nearly finished, but still misses some information about the exact borders between *Mukim* Lamteuba and some of its neighboring *Mukims* (Annex VI).

In the qualitative study it was found that, during the evaluation period, YRBI also organised a variety of trainings, workshops, and discussions on the importance of natural resource management and the strengthening of traditional institutions in *Mukim* Siem and *Mukim* Lamteuba. The discussions covered topics such as participatory mapping, setting standards in collaboration with the village community, and the empowerment of indigenous institutions and structures. The trainings and workshops taught community leaders about the revitalization of the *Tuha Peut* (representative council of the *Gampong* or *Mukim*), land rights and indigenous rights, the documentation of customary laws (*reusam)*, and reforestation. Also, field visits were made. YRBI also organised a training and discussion on the strengthening of the traditional institution of *Keujrun Blang*, and appointed a *Keujrun Ciek* in every *Gampong* (Annex VI).

In the endline survey (see Table 4, and Table 13 and Table 14 in Annex III) 3 out of 6 villages reported to have undertaken YRBI activities other than the mapping:[15] in *Gampong* Lamklat (Siem) YRBI assisted the reforestation efforts, while in *Gampong* Lamteuba Droe (Lamteuba) YRBI organised trainings on natural resource management and on the sustainable use of natural resources, and assisted the village in strengthening *Mukim* institutions and producing *blang* regulation. In *Gampong* Blang Tingkeum (Lamteuba), YRBI assisted the community in settling conflicts and protecting water sources (for irrigation). However, the informants in the villages indicated that similar activities have also taken place in other villages of the *Mukim.* In addition, 2 villages in Siem and 1 Lamteuba reported that YRBI also implemented activities related to (sustainable) livelihood activities in their community.

[15] Differences in results between the qualitative and quantitative study may also stem from the fact that the informants from the qualitative study were more likely to be familiar with YRBI, as most of them were selected based on their participation in one or more of the project activities. In addition, in the qualitative study we interviewed *Mukim* representatives, who are knowledgeable about activities in all *Gampongs*, while the quantitative study focused on 3 randomly selected *Gampongs* in the *Mukims*.

During the project period, other organisations were also active in some of the project villages. In *Gampong* Lamreh (Siem), an awareness raising campaign about the use and protection of natural resources was held by the department of agriculture. In *Gampong* Lamteuba Droe the farming group and BNN organised awareness campaigns and reforestation activities, and in Blang Tingkeum village the NGO BNN was reported to have organised efforts at reforestation and trainings on sustainable natural resource use.

Summarizing, the quantitative and qualitative studies both show that YRBI has conducted several activities in the study area during the evaluation period. The activities are in line with those reported in section 3.2 based on the project reports. However, we also observe some differences: in *Mukim* Siem, only the qualitative but not the quantitative data indicate the settling of boundary disputes and the revitalization of the *Keujrun Blang* institution for the management of the rice fields, while some communities indicated YRBI's involvement in livelihood activities which are not included in the project reports for *Mukim* Siem. In *Mukim* Lamteuba, the revitalization of the *Keujrun Blang* institution is only mentioned by one of the surveyed villages. In addition, the villages indicated village boundary mapping activities, which were not discussed in the project reports. These data suggest that the surveyed villages perceive YRBI's contribution mostly in terms of the village mapping, and less in strengthening the traditional *Mukim* institutions.

## 6.3. Comparison of main respondent characteristics

To provide a better insight into the general characteristics of our sample, Table 5 displays a number of the respondents' socio-economic characteristics, including age, gender, religion, and the main economic activity.[16]

Table 5 shows the characteristics of the respondents in the two treatment locations at the baseline survey (Base), at the endline survey (End), and for respondents that have been interviewed in both survey rounds (panel sample) the difference in their endline and baseline responses (Change). Therefore, the values in the change column can be different from the difference of the variables at the end- and baseline. The significance of the change is also reported (p-value) for the panel sample. The p-value shows the probability that the change in the variable is zero. Hence, if the p-value is small (say smaller than 5%), it indicates that the change is significantly different from zero (at 5% significance level).[17]

We did not expect the distribution of characteristics to change between the baseline and endline period except for age: 2 years have gone by between the two survey rounds. However, some other significant changes in the socio-economic characteristics of the households are observed between the baseline and endline period, with regard to the respondents' main economic activity: In *Mukim* Siem a significantly larger percentage of respondents reports to be self-employed/running a family business, working in a company, and working as a teacher. In the meantime, the percentage of casual workers (both within and without the agricultural sector) has declined. This is consistent with information from the qualitative study that suggests that the people of *Mukim* Siem have grown less dependent on their natural

[16] The baseline report already described most of these time invariant characteristics of the sample between different groups (see table 11 of the baseline report).
[17] In calculating the p-value, we used robust standard errors clustered at the village level.

resources for their livelihoods over the past 2 years (Annex VI). Interestingly, the percentage of respondents that report 'higher education' as their highest attended level of education has significantly dropped at the endline study in *Mukim* Siem, which suggests misreporting either at the baseline or at the endline.

**Table 5: General characteristics of the sample**

| Treatment area | Siem | | | | Lamteuba | | | |
|---|---|---|---|---|---|---|---|---|
| Reporting period | Base | End | Change | p-value | Base | End | Change | p-value |

Notes: Robust standard errors corrected for clustering at the village level are used to calculate p-values. P-values are not defined for variables where there was no change.
* p-value<0.10; ** p-value<0.05; ***p-value <0.01.

## 6.4. Treatment exposure of respondents

Looking at the knowledge and participation of respondents in the YRBI project, Table 6 shows that at the endline study, 21.7% of the respondents in *Mukim* Siem, and 30% of the respondents in *Mukim* Lamteuba had participated in at least one of YRBI's participatory mapping activities. In addition, the table also shows that during the evaluation period YRBI has become more known among the survey respondents: 10-16% more respondents have heard of YRBI at the endline compared to the baseline. While 72% of the respondents in *Mukim* Lamteuba were familiar with YRBI at the endline, this figure was only 22% in *Mukim* Siem.[18]

Results from the qualitative study indicate that the participants of these mapping activities, as well as YRBI's trainings, workshops, and discussions were predominantly important community figures, such as the *Mukim* and *Gampong* government officials, and leaders of the youth groups. Because high positions are mostly held by the men in society, there were far less women than men among the project participants. However, some women were involved in the mapping process as part of the mapping team in *Mukim* Siem. YRBI has actively invited women and youth to participate in the mapping process, and has at least succeeded in involving many young people in the mapping process in both *Mukims*. Knowledge gained during the project activities was also reported to be spread throughout the wider community via 'word of mouth' and during meetings at the *meunasah* (Annex VI).

[18] This might be explained by the fact that YRBI tends not to introduce its organisation as they are afraid that the communities would ask for money. This situation is caused by the NGOs pouring money in the region after the tsunami of 2004. Instead, YRBI would approach communities by saying that they would like to help them. In addition, in Siem YRBI is mostly working with the members of the *Mukim* government and village leaders, but not so much with the general population. (Information is based on correspondence with ICCO and YRBI at the baseline reporting phase.)

# 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured between the base- and endline survey (2012-2014) are grouped into 6 sub-sections: access to information on (local) governance, satisfaction with local governance, role of traditional institutions, management of natural resources, household's attitude towards forests/plantations, and sense of control of villagers. Some of the outcome indicators combine multiple variables into one index. The components of these indices are presented in Annex V, and a set of even more detailed tables can be found in Annex IV.

Table 7 displays the results for the community level outcome indicator 'Management of natural resources'. The table only reports the baseline and endline values of the indicators (and not the change) because of the small sample size for the communities (1 and 3 villages per treatment group).

At the household level, Table 8 displays the results for all outcome indicators including the changes in the outcome variables. The table structure is similar to the table on respondent characteristics with the exception that in Table 8 we also report on the standard deviations of the variables below the mean in parenthesis.

The following subsections discuss the levels and changes in the outcome indicators. Information about the construction of the outcome indicators and indices is summarized in Annex II. Annex IV and Annex V provide more detailed information on the separate outcomes for the indicators in the indices. Annex VI contains a report of the results of the qualitative study.

**Table 7: Outcomes indicators at the community level**

| Variable \ Treatment area | Siem | | Lamteuba | |
|---|---|---|---|---|
| Survey year | Base | End | Base | End |
| Sample size | (n=1) | | (n=3) | |
| **D. Management of natural resources** | | | | |
| Existence of regulations about the use and protection of the community forests in the village | 0 | 1 | 2 | 2 |
| Regulations are communicated to the villagers by […] | | | | |
| *Community meetings* | 0 | 1 | 2 | 2 |
| *Posters* | 0 | 0 | 1 | 0 |
| *Signs at forest* | 0 | 1 | 1 | 1 |
| *Letter* | 0 | 0 | 0 | 1 |
| Regulations are communicated to all villagers (including women and children) | 0 | 1 | 2 | 2 |
| Regulations are taught at school | 0 | 0 | 1 | 0 |

Source: Community survey E8, MFS II Evaluation Indonesia
Notes:
- n=1 for Siem, because two villages in Siem said that they have no community forest at both baseline and endline
- two villages from Lamteuba answered that they do not know whether regulations are taught at school at the endline

### *Access to information on (local) governance*

During the project period (2012-2014) no significant improvements were found with regard to the respondents' access to information on decisions made by village leaders and their knowledge about district government's policies related to agriculture and the use of land. On the contrary, at the endline a significantly lower number of respondents in *Mukim* Lamteuba reported to feel 'well informed' about local government decision making. However, on average the villagers of Lamteuba still felt moderately happy about their access to information with a score of 0.2 on a scale of -2 to +2 at the endline. The number of respondents of *Mukim* Lamteuba that reported to be knowledgeable about district government policies also dropped significantly, from 30% at the baseline to only 16.7% at the endline. In *Mukim* Siem, this percentage was around 35% at the endline.

This drop in satisfaction with government information provision in *Mukim* Lamteuba could have to do with the change in *Mukim* government leadership that took place in Lamteuba halfway the project

period (2013). The new Imeum *Mukim* (traditional *Mukim* leader) is reported to be "less assertive" than his popular predecessor, and has not yet released any new regulations in his one year reign (Annex VI).

### *Satisfaction with local governance*

In both *Mukim* Siem and *Mukim* Lamteuba, the respondents were rather unsatisfied with the local governance at the village (*Gampong*) level (around -0.4 on a scale of -2 to +2, with a significant drop in satisfaction in *Mukim* Siem between baseline and endline), whereas they were satisfied with the local governance at the sub-district level (around 1.0). Interestingly, the respondents did report higher levels of corruptions at the district government level (around 2.1 on a scale of 1-3) than at the village government level (1.4 for Siem and 1.2 for Lamteuba). No significant changes in this regard were measured between the baseline and the endline study.

Because YRBI's project particularly focuses on strengthening the *Mukim* government, we expected to see an increase in the indicators for satisfaction on the *Mukim* government level. However, apart from an increased number of people that know the name of the *Mukim* leader in *Mukim* Siem (from 71.7% at baseline to 85% at endline) no significant changes were measured. Nevertheless, the respondents in both areas remain of the opinion that the *Mukim* institution serves the benefit of all people in the village (1.4 on a scale of -2 to 2), and keep rating the importance of the role of the Imam *Mukim* in the village around a 4.1 in Siem, and a 4.5 in Lamteuba (on a scale of 1-5). In *Mukim* Lamteuba this last indicator increased (but not significant) with 0.7 point between baseline and endline. These outcomes suggest that the respondents have positive feelings towards the *Mukim* institution and therefore might like to see a strengthening of this institution in their society.

### *Role of traditional institutions*

Because YRBI's project aims to revitalize traditional structures in the project locations, it is important to measure the attitude of the villagers towards traditional institutions, laws and culture. Results from the household endline survey show that the attitudes in both project locations are overall positive (1.1 for Siem and 1.0 for Lamteuba on a scale of -2 to 2). While the attitudes of the respondents in Siem have slightly (but significantly) increased by 0.3 point over the course of the project, the attitudes of the respondents in Lamteuba have more or less stayed the same.

However, the qualitative study shows evidence that both communities have grown more and more supportive of the *Mukim* institution over the past years. It is also important to note that findings from the qualitative study indicate that, with the help of the YRBI project, the *Mukim* institutions have increased their role in society over the past 2 years. Both *Mukim* governments (but that of Siem more so than that of Lamteuba) are playing an increasingly important role in conflict resolution, education, reviving traditional institutions for natural resource management, and the preservation of indigenous culture (Annex VI).

Currently, both *Mukim* governments are undertaking efforts to revive old customs and traditions that have disappeared during the New Order Reign, for example by collecting information from the village elders and by teaching women the old custom of corpse-bathing. The community members that were interviewed for the qualitative study also reported to place a high value on their traditional culture and customs, and claimed to play an active role in their preservation. YRBI's initiative to help the people document their cultural customs, laws, and tradition, was happily received by the communities. Even

though, at the time of the qualitative study, the people were still in the middle of the documentation process, they already expressed their good hope that the documentation could help them educate their children, as well as 'legitimize' their existence in the eyes of outsiders (Annex VI)

### *Management of natural resources*

Results from the community survey (Table 7) show that there have been some improvements in the management of natural resources in *Mukim* Siem. In the village of study regulations about the use and protection of the community forests were now reported to be present. At the time of the baseline study, regulations were not communicated to the villagers[19], but at the time of the endline study community meetings and signs in the forest were now reported to be used for this purpose. Two villages in *Mukim* Lamteuba already had regulations that were being communicated to the villagers at the time of the baseline study. This had not changed over the course of the project.

The improvements in natural resource management in *Mukim* Siem are not seen in the outcomes of the household survey (see Table 19). At the endline, only 16.7% of the respondents reported that there were any rules or regulations for the use of community forests in the village, and this percentage had not significantly increased since the baseline. To compare, in *Mukim* Lamteuba the percentage of villagers that reported to know about such regulations lay much higher, at 96.7% at the endline, which could be explained by the higher importance of forest resources in *Mukim* Lamteuba. However, the satisfaction with the regulations had remained comparably low for both study areas from baseline to endline, with a score of -0.5 for Siem and -0.4 for Lamteuba (on a scale from -2 to +2) at the endline.

The results from the qualitative study more or less mirror those of the household survey, as both measure no real significant improvement on forest preservation and natural resource management at the end of the project period. However, results from the qualitative study show that YRBI's project did cause some promising developments that could lead to actual positive impacts on sustainable resource management in the future: Informants of the qualitative study stated that the project had helped the *Mukim* governments to restore the traditional institutions responsible for natural resource management (the *Panglima Glie* and *Keujreun Blang*). However, due to a lack of government support these institutions were not yet able to operate at their full potential, and as such real results were not yet noticeable in the *Mukims* (Annex VI).

### *A. Households' attitude towards forests/plantations*

As expected, results from the endline survey show that the people of semi-urban *Mukim* Siem -of which only 1 out of 3 villages has a community forest- are still far less dependent on forest resources (-0.8 on a scale of -2 to + 2) than the people of rural *Mukim* Lamteuba (0.9), and over the course of the project *Mukim* Siem's access to forest resources has not changed significantly. However, Siem's respondents' attitude towards sustainable forest use seems to have grown significantly more positive. The index for 'positive attitude towards sustainable forest use' as shown in Table 8 is composed of 3 questions, and Siem shows a significant positive change for 2 of those questions, i.e.: "I take from the forest what my family needs without thinking about others" and "we have to use our forest with moderation and respect" (see Table 23). In *Mukim* Lamteuba, the villagers seem to have retained their generally positive

[19] Or at least not in any of the ways suggested in the questionnaire.

attitude towards sustainable forest use, as no significant changes in attitude between the baseline and endline were measured.

The improved attitude towards sustainable forest use in *Mukim* Siem was not confirmed by the qualitative study. On the contrary, the informants reported that the community members of Siem had actually grown more apathetic towards their forests' sustainability. If this would be true, the cause of this apathy can probably (at least partly) be sought in the fact that the community has grown less dependent on their forests (Annex VI).

### *B. Sense of control of villagers*

The index for 'trust in the village' in Table 8 shows a positive development. In both *Mukims* the amount of trust people have in their community members has significantly increased, resulting in high scores of 1.6 (on a scale from -2 to +2) for *Mukim* Siem and 1.5 for *Mukim* Lamteuba (also see Table 23). In *Mukim* Siem, the respondents' sense of control regarding their own lives had also significantly increased to a score of 1.1, as well as their sense of control over land (to 1.0 at endline). In *Mukim* Lamteuba no significant changes in this regard were measured, but its respondents remained to give high scores on both indices (1.2. for sense of control over own lives and 1.0 for sense of control over land at endline).

As a result of YRBI's project we had expected to see an increase in the communities' sense of control regarding the preservation of their traditional culture. However, only a very small significant increase of 0.1 was measured in *Mukim* Siem. In fact, for both *Mukims* the score for this index (0.3 for Siem and 0.6 for Lamteuba) was much lower than the score for the other 2 indices. This corresponds with the qualitative study that found that the community members worried that their old customs and traditions that were no longer practiced in everyday life would disappear for good when the elders in their communities die (Annex VI).

An explanation for the stagnation in sense of control regarding the preservation of traditional culture over the course of the project could be that YRBI's project has made people even more strongly aware that they might forever lose (parts of) their culture if they won't speedily undertake action, thereby enhancing their worries about the issue. This increased concern could, in its turn, negate the positive effects that the actual undertaking of the activities (such as documentation of traditional customs and the revitalization of *adat* structures) may have on their hope and faith for the future. However, our study has not provided sufficient information to conclusively prove this is the case.

### *Other issues: conflict resolution*

An important goal of the participatory mapping project of YRBI which is not directly captured in the uniform outcome indicators is conflict resolution. In *Mukim* Siem, the Imeum *Mukim* reported that his main reason to join the participatory mapping project was to resolve the boundary disputes between different *Gampongs* (villages) in *Mukim* Siem. With the help of YRBI, *Mukim* Siem has succeeded in determining 6 of the 17 unresolved boundary points between the *Gampongs* during the mapping process, thereby restoring some feeling of safety and peace within the community, especially for the people living in the border areas between villages (Annex VI). This development is reflected in the results of the endline survey where the percentage of respondents that knows the boundaries of his or her village has significantly increased by 30.4 percentage points (Table 21).

# 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

## 8.1. Methodology

We use before-after methodology for the evaluation of the YRBI project complemented with a qualitative survey. We have not sampled any comparison villages because the small sample size would not allow statistical analysis of the differences between the treatment and comparison group. Instead, we opted for using mixed methods: complement the quantitative survey with in-depth interviews to understand the driving factors behind the changes in the outcome indicators.

In addition, we rely on the results chain discussed in section 3.3 to validate the impacts of the project on the outcome variables: only if the changes in the outcome variables are accompanied by improvements or accomplishment of the outputs and intermediate results of the project can we attribute changes to the project (necessary but not sufficient condition).

## 8.2. Results

Data from the endline survey indicates that the project has been implemented seriously. 50% of the respondents in both *Mukims* knew that participatory mapping had been conducted in their villages. In *Mukim* Lamteuba 30% of the respondents participated in the mapping activities. In *Mukim* Siem this was 21.7%. During the qualitative study a variety of other YRBI activities related to natural resource management and traditional institution strengthening were reported to have taken place in the villages as well.

The objectives of the mapping project were to eliminate potential conflicts over boundaries, and to have the maps serve as a tool to improve regional planning and natural resource management, as well as to educate future generations.

Findings from the qualitative study indicate that, even though the maps of both *Mukims* are not yet completed, the mapping process has already achieved some positive results for the communities of Siem and Lamteuba. In *Mukim* Siem a number of boundary conflicts between the *Mukim*'s villages were resolved during (and as a result of) the mapping process, restoring a sense of peace in the community and making the people that live in the border areas feel safer on their land. This was also reflected in the results of the endline survey that showed that *Mukim* Siem's villagers' sense of control with regard to land had significantly increased. Several villages have also already found ways to put the map to use. For example, by attaching it to fundraising proposals, by using it as a reference to see which *Gampong* should handle the administration of a land-purchase, and by using it as lecture material.

However, because the maps are unfinished, YRBI has not yet been able to reach its ultimate goal of the mapping project: 'to submit the maps to the local government in order to claim the communities' rights over their indigenous lands and the natural resources in it', thereby leaving the communities' forests vulnerable to land grab attempts and further environmental destruction by government and companies.

At the time of the endline study, forest land was still being converted into plantations and fields, and illegal mining, often supported by the local apparatus, was still taking place in the industrial forests. As a result, water sources keep reducing in number and size, and forest products such as wood and honey keep growing scarcer.

Both the quantitative and qualitative studies indicate that no significant improvements in forest preservation and natural resource management have yet taken place as a result of the project. The combined data also suggests that the project has not managed to significantly increase people's awareness and attitudes regarding the importance of natural resource preservation[20] (not taking away from the fact that the attitudes overall attitudes were still relatively positive). However, the qualitative study indicates that YRBI has succeeded in its goal to help the *Mukim* governments of Siem and Lamteuba to revitalize some of the traditional institutions responsible for natural resource management: the *Panglima Glie* and the *Keujreun Blang Mukim*. Even though these institutions are currently not yet able to operate at their full potential due to conflicting governmental rules and regulations, with the right support they may lead to improvements in natural resource management in the future.

Strengthening traditional institutions, in particular the *Mukim* institution, and enhancing their capacity to effectively deal with conflict management, land tenure, and the management of natural resources was an important focus of the YRBI project. Findings from the qualitative study indicate that the *Mukim* governments have actually increased their role in society over the past 2 years. With the help of YRBI, the *Mukim* governments, and especially that of *Mukim* Siem, have taken on a leading role in conflict resolution attempts during the mapping process, and have increased their attempts to revitalize traditional institutions for natural resource management and to revive and preserve indigenous culture, customs, and laws.

Data from the quantitative study shows that peoples' attitudes towards traditional institutions, laws, and culture were already positive at baseline, and have only slightly increased in *Mukim* Siem and have stayed the same in *Mukim* Lamteuba over the course of the project. Either way, YRBI has managed to enthuse and persuade people to start documenting their customary laws, customs, and traditions, under YRBI's assistance. Even though the wisdom documentation is still in process, the qualitative study suggests that it has given people hope that their culture and traditions will be preserved for the future. Nevertheless, against our expectations, a higher sense of control regarding the preservation of traditional culture was barely found among the respondents of the endline study. A potential explanation for this could however be that YRBI's project has simultaneously increased peoples' awareness about the impending loss of their customs and traditions, thereby increasing their worries, while at the same time given the people hope that their culture can be saved by documentation efforts, etc.

Despite the increased role of the *Mukim* government in the communities, the endline study showed that the satisfaction with the *Mukim* government had only slightly increased in *Mukim* Siem and had stayed the same in *Mukim* Lamteuba. However, satisfaction was already high at the time of the baseline, so no

[20] The studies showed conflicting findings for *Mukim* Siem: the quantitative study found a significant improvement in attitude, and the qualitative study found a significant deterioration. Both studies found no change in attitude for *Mukim* Lamteuba.

large changes were expected to happen. The qualitative study, in its turn, indicated that people have grown more supportive of the *Mukim* institution over the past years, which brings with it a potential for traditional institution to keep growing over the coming years.

A final interesting observation is that, although the YRBI project was more widely known among the respondents of *Mukim* Lamteuba (71.7% against 21.7% in Siem at the endline, see Table 17), overall the project seems to have had a bigger impact on the villagers in *Mukim* Siem than it did in *Mukim* Lamteuba. This is curious because the people of *Mukim* Lamteuba are far more reliant on their forest lands and resources than the people of *Mukim* Siem, so one would think they have higher stakes in achieving positive outcomes of the project. However, when we look at the endline (and baseline) values of the indicators, it becomes clear that indeed most of the indicators in *Mukim* Lamteuba are at least as high as in *Mukim* Siem at the endline (and at the baseline). Nonetheless, in both *Mukims* the local leaders can play a role in further improving the attitude and sense of control of households.

In summary, the YRBI project has only partly fulfilled its objectives, but it has planted seeds that might lead to more improvements in conflict management, land tenure, and natural and cultural resource management in the future.

# 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular we look at the size of the impact, and whether the project addresses an important issue for the beneficiaries.

## 9.1. The size of the impact

The size of the impact is not easy to determine. On the one hand, the quantitative study indicates that no significant improvements for any of the outcome indicators have taken place in *Mukim* Lamteuba during the evaluation period. In *Mukim* Siem, only small significant improvements were measured with regard to the villagers' sense of control, and their attitudes towards sustainable forest use and traditional laws and culture. On the other hand, the qualitative study disproves that attitudes towards sustainable forest use have improved, but does indicate that some real improvements have been made in terms of conflict resolution, culture preservation, and the strengthening of the traditional *Mukim* institution and its role in society, especially in *Mukim* Siem.

## 9.2. Does the project address an important issue for the beneficiaries?

The survey respondents were asked to indicate the 3 most important issues for their communities. At the baseline, the most common responses were road conditions/access to the village (36.7% in Siem and 33.3% in Lamteuba) and education (30% in Siem and 41.7% in Lamteuba), but also livelihood improvement (48.3% in Siem and 56.7% in Lamteuba) and access to clean water (43.4% in Siem and 16.4% in Lamteuba). Hence, it seems that YRBI's project addressed at least some of the issues that were deemed urgent by the communities (access to clean water).

On the other hand, other issues that are addressed by YRBI's project don't seem to be thought of as very important in the communities. For example, almost none of the respondents reported 'resolving disputes with neighboring villages' or 'the conservation of traditional values/culture' as one of the most important issues.

Interestingly, almost none of the respondents thought that 'exploitation of natural resources' was an urgent issue. At the baseline only 1.7% of the respondents of *Mukim* Siem, and 0% of the respondents of *Mukim* Lamteuba thought that natural resource protection was an important problem (which only slightly increased to 5% and 3.3% at the endline), and only 6.7% of *Mukim* Siem's respondents reported that 'industry (mining, road building, etc.)' was a problem. However, at the endline the respondents' worries about clean water had grown even more (to 76.6% in Siem and 40% in Lamteuba). This may indicate a lack of understanding about the likely causes for water scarcity (i.e. environmental destruction due to mining activities and conversion of lands to plantations), or a reluctance to admit to it due to financial interests in the mining activities.

At the endline the percentage of respondents that reports livelihood improvement as an urgent issue has declined for both *Mukims* to only 16.7% in Siem and to 38.3% in Lamteuba. Even though this could be interpreted as a good sign, this decline is probably not due to any improvements in natural resource management or availability of forest resources, as no indications of improvements in these matters were found during the study.

# 10. Evaluation question 4: Efficiency of project

This subsection addresses evaluation question 4: Were the development interventions of the Southern partner organisations efficient?

Unfortunately, we are not able to evaluate neither the efficiency nor the effectiveness of the project. Therefore, in this section we put forward our arguments for failing to evaluate the question on efficiency. However, first, the available cost information for the YRBI project is discussed below.

## 10.1. Project costs

To collect information on the costs of the project, we conducted a structured interview with YRBI in July 2013 using the 'budget survey' as described in section 5.1. In 2014, we had additional correspondence with YRBI to obtain cost figures for the second half of 2013 and the final project report. Therefore, the cost data are based on actual expenditures.

Table 9 summarizes the available cost information. The last contract of YRBI with ICCO ran from 1 November 2011 until 31 October 2013.[21] Therefore, for 2011, we have reported the project costs of the previous phase (Jan-Oct 2011) and the current contract (Nov-Dec 2011). The total project costs for the reporting period are reported in column 3 of the table in Indonesian rupiahs (IDR) and in euros (using

[21] However, the financial report of YRBI covers 1 November 2012 – 31 December 2013. Therefore, in the table we also assume that costs have occurred during the whole year in 2013.

yearly average exchange rates) in column 4. The total costs cover all project activities of YRBI, hence they are not exclusive to the surveyed locations (*Mukim* Siem and *Mukim* Lamteuba). The total costs for the last contract (2011-2013) have been 1,900,294,443 rupiahs or 147,915 euros.[22] This amount is 53% of the budget of the YRBI project.[23]

Column 5 shows the percentage of these costs that have been funded by ICCO. For the last contract, ICCO covered 73% of all project costs using MFS II funds. The remaining amount has been covered by YRBI. The percentage of budget actually used was 65% from ICCO's share and 36% from YRBI's share of the budget. [24]

Unfortunately, we do not have information about the number of beneficiaries. On the one hand, the direct beneficiaries of the project are the people who participate in the activities conducted by YRBI. According to information from YRBI, the total number of participants was 356 in 2011, 288 in 2012 and 88 in the first half of 2013. However, this information may be misleading on at least two grounds: firstly, a wider population benefits from the results of the activities (the population of villages and *Mukims*); and, secondly, some of the participants may attend multiple activities and may be counted multiple times.

Finally, the last column of Table 9 indicates that we are not able to provide an estimate of the cost per beneficiary of the project. The reasons for this are argued below.

**Table 9: Overview of the costs and number of beneficiaries**

| Year | Number of months | Total costs [IDR] | Total cost [EUR, current prices][1] | Percentage of costs funded by CFA | Beneficiaries[2] (population) | Cost per beneficiary per year [Int$ 2011][3] |
|---|---|---|---|---|---|---|
| **2011 (Jan-Oct)** | 10 | 1,074,620,503 | 87,623.98 | 76% | N.K. | N.A. |
| **2011 (Nov-Dec)** | 2 | 138,496,558 | 11,292.94 | 59% | N.K. | N.A. |
| **2012** | 12 | 924,345,550 | 76,473.09 | 66% | N.K. | N.A. |
| **2013** | 12 | 837,452,335 | 60,148.84 | 85% | N.K. | N.A. |

2. N.K.=not known
3. N.A.=not applicable

[22] Unfortunately, we do not have information about the exchange rate used for the project. Instead we use the annual average exchange rate from http://www.oanda.com/currency/historical-rates/. The exchange rates used are 12,264 IDR/EUR in 2011, 12,087 IDR/EUR in 2012 and 13,923 IDR/EUR in 2013.
[23] Based on the NWO Joint MFS II evaluations Country-Specific Information Indonesia, the budget of the project was 315,130 EUR, which amounts to 3,560,969,000 IDR using an exchange rate of 11,300 IDR/EUR (the exchange rate used in contract between ICCO and YRBI).
[24] ICCO awarded 190,000 EUR or 2,147,000,000 IDR (using 11,300 IDR/EUR exchange rate) for the project and covered 1,395,808,642 IDR from the actual costs for the contract period.

### 10.2. Assessment

There are a number of factors that make the calculation of cost effectiveness a challenge. Firstly, the project of YRBI is a continuous effort at strengthening the *Mukim* institution and assisting villages and *Mukims* to settle boundary disputes and map the boundary of their land. However, this is a lengthy process: based on the qualitative study of this project, the maps have not yet been finalized during the project period due to remaining boundary disputes that remain to be negotiated. Therefore, there is not yet a final output for this component of the project.[25]

Secondly, we are not able to separate the project costs for the surveyed locations.

Thirdly, we also do not have information about the number of beneficiaries over the complete project area, which would allow us to estimate the amount of costs per beneficiary over the whole project area.

Fourthly, beneficiaries of the project are not only the participants of the workshops who are the local leaders, but in a broader perspective the project benefits the whole community and *Mukim*.

Finally, given that the mapping, reforestation and management of the rice plantation activities all relate to land, it would be sensible to calculate the project costs per hectares of land mapped and/or sustainably managed. However, we also lack the information about the size of the project area.

Taking the above concerns into account, providing a reliable (and meaningful) estimate of the cost per beneficiary goes beyond the scope of this evaluation. Therefore, we refrain from going further in answering evaluation question 4 than the information on project costs provided in section 10.1.

### 10.3. Benchmark costs

Regarding costs of participatory mapping projects in general, the Synthesis team found Dongus et al. (2007) which report the detailed costs of a community-based mapping procedure without electronic devices in the field for Tanzania.[26] The mapping activity was aimed at the surveillance of malaria mosquitoes' larval. However, the method of implementing the participatory mapping is similar to the YRBI project. Synthesis team (2014) report that the costs of the mapping were 2,270.00 Int$ (in 2011 prices) per $km^2$.

## 11. Contribution of Capacity Development and Civil Society

The YRBI project has also been selected for the Capacity Development component of the MFS II Evaluation. Regarding the contribution of the capacity development of ICCO and the ICCO Alliance to YRBI during the implementation of the project, the Capacity Development endline report concludes that ICCO played a key role in the growing recognition of YRBI as a leading organisation in *Mukim* and *Gampong* sovereignty issues in Aceh and Indonesia. During the evaluation period, local communities

[25] Note that the institutional strengthening in *Mukim* Lamteuba, the establishment of the keujruen blang *Mukim* traditional institution (for rice plantation management), can be regarded as an outcome of the project.

[26] The procedure included the development of sketch maps by the community members, laminated aerial photographs as well as the actual GIS analysis.

started to invite YRBI more due to an increased trust in the YRBI and due to *Mukim* and *Gampong* issues becoming mainstream both in local governments and communities. According to the report, communities' trust increased in YRBI as a result of the successful activities (village mapping and honey production) of YRBI that led to the empowerment of the communities. During the trainings, communities also learned how to make their own (social) maps and the resulting maps have been used by the communities.

During the evaluation period, YRBI participated in 3 trainings organised by ICCO: participatory mapping internship (October 2013 – January 2014), 'Making markets work for the poor' (March 2014 – ongoing), resource mobilisation training (February 2013). Possibly, these have not yet contributed to the results found in the MDG report, however, they have certainly developed the capacity of YRBI in carrying out their project activities on *Mukim* and *Gampong* issues.

Unfortunately, since YRBI's contract with ICCO terminated, YRBI has not yet found a new funding source, and therefore, the number of staff and project activities had to be reduced.

## 12. Conclusion

The collected data suggest that YRBI was only partially successful in delivering on its objectives of strengthening traditional institutions and local people's awareness and capacity to resolve land related conflicts and manage and control their natural resources in a sustainable way.

Even though the maps of the project locations could not yet be finished and submitted to the government due to unresolved boundary conflicts, the mapping activities have already yielded some results, such as the resolution of some of the border conflicts and an increased sense of security and peace within the communities. YRBI's mapping activities, as well as their trainings, workshops, discussions, and documentation efforts have helped the *Mukim* institution to take on a bigger role in society, in particular with regard to conflict resolution and the preservation of traditional culture, customs, and laws. No real improvements on natural resource management or the condition of the communities' forest and forest resources have yet occurred, but with the right amount of support from the community and the government, the traditional institutions that were revitalized by the *Mukim* government with the help of YRBI (the *Panglima Glie* and *Keujreun Blang*) could become to play an important role in forest preservation in the future.

YRBI could play an important role in obtaining this support, by proceeding to help *Mukim* Lamteuba and *Mukim* Siem in resolving their remaining boundaries, finishing their maps, and submitting those maps to the government so that they can get their rights over their indigenous lands legitimized, and will be legally able to manage them in their own customary and sustainable way.

The literature review showed that participatory mapping is not only recognized as a practical tool; the participatory approach is also noted to have an intrinsic value, i.e. it can impact group communication and awareness, cultural identity and empowerment. The materialized results of the YRBI project (e.g. resolving some border conflicts, preservation of traditional culture, customs, and laws) are in line with both features mentioned in the literature. Though not all positive features mentioned in the literature

have been realised yet by the YRBI project due to some obstacles in the implementation of the project. However, it is expected that with continuation and finishing of the project these results will be realised (e.g. legalizing the maps, improving natural resource management). The literature also mentioned some possible negative consequences of participatory mapping (e.g. greater exposure of valuable natural resources, increase of conflicts), which are not found for the YRBI project. Finally, the MFS synthesis team asked to score each project along a few indicators. Table 10 displays the indicators and the scores we deemed valid for the project.

**Table 10: Overall project scoring**

| Statement | Score | Comments |
|---|---|---|
| **1. The project was well designed** | 8 | The project addresses the importance of informed and just community management of limited natural resources through participatory workshops on mapping, producing documenting traditional regulations, and producing new regulations. YRBI works closely with the *Mukims* and communities in achieving the project results. Hence, the project is able to transfer knowledge and empower the communities. |
| **2. The project was implemented as designed** | 9 | The data shows that the project was to a large extent implemented as designed. |
| **3. The project reached all its objectives** | 7 | No, not all results have been achieved as yet: some boundary conflicts still need to be solved in both Siem and Lamteuba before the maps can be completed. YRBI has managed to revitalize at least some of the traditional institutions for natural resource management and produced some documentation and regulations, but the documentation is not completed yet and the institutions are not yet working at their full potential, so there is still work left to be done. |
| **4. The observed results are attributable to the project interventions** | 8 | We are not able to attribute the few observed (significant) results of the quantitative study to the project with the data of the qualitative study. However, in the qualitative study some alternative results were found that could be attributed to the project (such as 6 resolved boundary conflicts, increased feeling of peace and security with regard to land, revitalization of traditional institutions for natural resource management, increased role of the *Mukim* institution). |
| **5. The observed results are relevant to the project beneficiaries** | 7 | Access to clean water, sanitation issues, and livelihood improvement are thought to be important, but no results are yet observed there. On the other hand, results in boundary conflict resolution are achieved, but those were not deemed very urgent by the respondents (according to Table 16). |
| **6. The project was implemented in the most efficient way** | NA | |

Notes: Scores are on a scale of 1 to 10, with 1 being “no agreement at all” and 10 being “completely agree with statement”.
NA = not applicable

# Annex I. SPO and project description

### *SPO description*

In 1995 YRBI was established by 4 founders concerned with empowering indigenous institutions, agriculture and environment. In 1998, YRBI still had no donors and the organisation consisted of a staff of six people and ten volunteers. As YRBI was dealing with the legal aspects of palm oil extraction, it had to function undercover. The main issues YRBI was engaged with at this point were: democracy and human rights advocacy, identifying conflict origins and (eventually) reducing those, solving local conflicts using traditional wisdom and finally the engagement with issues concerning the sustainable use of natural resources[5].

In 1999 the Programme of Panglima Laut was funded by local fishermen and in 2000 one of YRBI's volunteers were kidnapped by Brimob (Indonesian police force). In 2001 YRBI had its Standard Operational Procedures elaborated and the YRBI's office was moved to Banda Aceh. From 2001 to 2004 YRBI had a staff of 11 people and was funded by DAI-OTI-USAID in its programme on civil society mapping, democracy and human rights.

After the tsunami in Aceh in 2004, YRBI worked mainly on humanitarian and emergency issues overseeing the participatory dimensions (i.e. cash for work). During this period YRBI began to engage with ICCO through JKPP (Jaringkan Kerja Pemetaan Participatif)[27], an NGO based in Bogor. Through JKPP, ICCO provided funding for mapping of areas affected by the tsunami and village planning between 2005-2008.

In 2008, YRBI began to get direct support from ICCO for the project 'Empowerment of *Mukim* and *Gampong* Capacity'. In the project, YRBI has shifted the focus of its activities from the village level (*Gampong*) to the level of the traditional *Mukim* institution, which encompasses a handful of villages.

Since 2009 YRBI is also trying to revive its 'original way' to conduct the programmes based on local support and voluntarism. Yet it's quite difficult since many people have already got accustomed to 'receiving cash' for participating in programmes.

**Vision**

YRBI envisions a community that "will be able to manage natural resources independently and develop the potential of the region to achieve the prosperous life in a fair way."

**Mission**

The mission of YRBI can be summarized as follows:

a. Building up and strengthening capacity of community in managing the areas and natural resources.
b. Strengthening community/civil based economy.

[27] *Jaringkan Kerja Pemetaan Participatif* means Community Mapping Network.

c. Strengthening local community culture and values.
d. Strengthening public policy based on community justification and decision as well.
e. Strengthening community cooperation and solidarity among community members.

### *Project description*

YRBI works on revitalization of traditional structures & law and strengthening traditional institutions (called *Mukim* and *Gampong*) as well as advocacy for recognition of these traditional institutions and structures by both the people and the government. It carries out consultative workshops, trainings on participatory mapping and community-based spatial planning, regular discussions on empowerment of traditional institutions and structures and workshop in traditional institutions, especially for youth. By doing so, it is expected that the management and distribution of natural resources would be fair and just both socially and ecologically.

The project activities in the *Gampongs* and *Mukims* usually begin with Programme Workshop, in which YRBI discusses basic idea of the programme and its realization process. The objective is to make participants of this programme understanding the steps and the channel of the programme in order to get commitment and support from local people. Through this activity, YRBI identifies and asks for commitment from local leader to participate in the programme. In *Mukim* area, process to get commitment from local leaders may take quite long time since some *Gampong* leaders should make an agreement before having commitment at *Mukim* level.

The next activity is conducting Participatory *Mukim* Appraisal. This activity is carried out as early process in doing mapping programme of *Mukim* and the empowerment of *Mukim* institution. The objective is to get accurate and adequate data about the *Mukim*, in order to easily identify the requirement and developing field activities agenda. The next activities include Participatory Mapping of *Mukim* area, Training of *Gampong*/*Mukim* regulations and decision making for *adat* leaders and head of village (Keuchik), Training for Tuha Peut to make Rule of *Gampong*, Training of land tenure and customary right (the *adat* Aceh) for youth.

### *Planned project activities and outputs*

**Activities**[28]

Four types of activities were planned.

First, capacity building of the Mukim and Gampong institutions to manage natural resources and natural disasters. This involves the following activities:

- Organising workshop on YRBI's programme to obtain local input for enhancing engagement of community members in the project (Phase1)
- Participatory investigation and social mapping to identify the historical institutional system, customary law, and social and natural resources; and drafting a Participatory Rural Appraisal Report (Phase1)
- Organise regular meetings (every three months) for Mukim and Gampong (Phase2)
- Organise training on land tenure and customary rights for young people (Phase2)

[28] Source: Logframe Proposal YRBI ICCO 2011-2013 and Proposal YRBI ICCO 2010-2013.

Second, introduction of the Gampong and Mukim regulations on community-based natural resource management. This involves the following activities (Phase2):

- Organising participatory mapping activities to identify Mukim territory and resources.
- Drafting documentation on Mukim and Gampong spatial planning and identify executive teams in communities.
- Organising workshop on revitalising the traditional representative council of tuha peut[29] and its role in Gampong and Mukim governance.
- Organising training for tuha peut to formulate Gampong regulations together with communities.

Third, drafting of documentation on local knowledge of natural resource management, which involves (Phase 2):

- Drafting of documentation on Mukim and Gampong regulations.
- Conducting research on community cattle land system and regulation.
- Publishing Peureude bulletin and info sheet "Suara Mukim" once every three months.
- Organising Assistance programme.

Fourth, decreasing the impact of climate change through the following activities planned (Phase 2):

- Organise field trip to identify rivers and water sources that need to be protected.
- Organise re-forestation, seed and plant distribution activities.

**Outputs**

- Increased capacity of the Mukims and Gampongs in Mukim Aceh Besar, and Aceh Selatan to manage natural resources and natural disasters.
- Gampong and Mukim regulations produced on community-based natural resource management.
- Documentation on local knowledge of natural resource management available.
- Activation of communities in re-forestation activities to decrease the impact of climate change.

[29] *Tuha peut* means representative council. There are such councils both at the *Gampong* and *Mukim* level.

### *Project implementation*

The table below provides an overview of the implementation of the YRBI project through summarizing the regular meetings during the project period. The information is taken from the Final report of YRBI to ICCO (2014).

**Table 11: Project meetings and their results (2012-2013)**

| No. | Thema/ Implementations | Output | Outcome |
|---|---|---|---|
| **1** | Empowerment Indigenous and Mukim Institutions of Indigenous workshop in **Mukim Gunong Biram**<br><br>Sunday/25 November 2012<br><br>Participants:<br>34 persons (Keuchik, Sekgam, Tuha Peut, Ketua Pemuda, Imeum Mukim, Sekretaris Mukim) | There was public commitment to strengthen indigenous Mukim in a Mukim area management<br>Blang potential exploration areas and meublang customs rules<br>Mukim and Village boundary dispute settlement<br>There needs to be joint efforts from all people in Mukim to defend the land for availability of land and to sustainability their economy in the long term.<br>Tuha Peut Mukim Gunong Biram which will be established as much 11 people, with a proportion as follows: 6 people village representatives, 1 person women representative, and 1 person youth representative and 1 person representatives of the community appointed by the Imeum Mukim.<br>There was early multiple data / information regarding the deployment of region and the management rules<br>Decision-making system should be built on the gampong levels and Mukim level with regard to Management of Natural Resources. | Process of formation tuha peut Mukim have been started.<br><br>There was imeum initiative Mukim and gampong leaders to conduct between gampong boundaries in the Mukim area with custom approach. # Annex II. Overview outcome indicators and indices

This annex provides a detailed description about the used outcome indicators. In addition, it shows the variables which were used to construct the outcome indicator indices for levels of satisfaction, attitudes and sense of control.

Data from the community survey as well as data from the household survey were used. Outcomes are reported per treatment area (Siem and Lamteuba), each consisting of three villages. For the household data, the sample size can differ because the answer 'don't know' is changed to a missing value or because a respondent could skip a question if he/she had no knowledge about what was asked (answered 'no' to a previous question). This was the case if a respondent answered 'don't know' to a question with a scale, so it did not make sense to incorporate the answer in the scale. The missing value due to a skip was kept missing if we only wanted to know the percentage of the respondents that knew about the topic of the question that answered 'yes'. If we were interested in the answers of the total sample, it made sense to change the 'don't know' answers to 'no' because that way the percentage of all the respondents that answered 'yes' could be reported. For the same reason some missing values were changed to 'no'.

The household sample consists of 120 households at the baseline, of which 112 were re-interviewed and 8 were replaced at the endline.

All the indices are created using the same method. Villagers reported their level of agreement with certain statements on a scale from -2 to +2, where -2 means 'strongly disagree', -1 means 'disagree', 0 means 'neither agree nor disagree', 1 means 'agree' and 2 means 'strongly agree'. The indices show the average level of agreement over the included statements. Sometimes agreement with a statement indicates dissatisfaction/a negative attitude, while the index shows satisfaction/a positive attitude. Therefore, the scale for these statements were reversed, so that -2 means 'strongly agree' and +2 means 'strongly disagree'. That way, those statements can be used in the average. They are indicated by (negative).

### *Panel A. Access to information on (local) governance*

In order to assess the level of satisfaction with local governance, it is important to know whether the respondents are well-informed about the governance at the village level and the district level.

- Level of agreement with statement: 'I feel well-informed about the decisions made by the village leaders.' […] (scale -2 to +2): this indicator provides the average of the level of agreement on the same scale as the indices.
- Percentage of respondents that knows about the policies of the district government related to agriculture and the use of land

### *Panel B. Satisfaction with local governance*

Two indices for the level of satisfaction with local governance were constructed for different levels of governance. Also the opinion of the level of corruption of the respondents is reported at these levels. It is expected that more corruption is associated with less satisfaction.

- Index for satisfaction with local governance at village level: the following statements are included in this index.
    - Villagers should be given more room to be involved in village decision making (negative)
    - I trust that village leaders will do what is the best for our community.
    - More effort should be taken by the village leaders to preserve traditional/*adat* culture in this village (negative)
- Satisfaction with local governance at *Mukim* level
    - Percentage of respondents who know the name of the *Mukim* leader (imam *Mukim*): the respondents were asked if they are able to tell the name of their *Mukim* leader. The percentage of the respondents who answered 'yes' is reported here.
    - Level of agreement with 'The *Mukim* institution serves the benefit of all people in this village' (scale -2 to +2): this indicator provides the average of the level of agreement on the same scale as the indices.
    - Importance of the role of imam *Mukim* in the village (scale 1 to 5): the respondents were asked to indicate how important they think the role of imam *Mukim* is in their village of a scale from 1 to 5, where 1 is very little and 5 is very much. The average over the respondents is provided for each area.
- Index for satisfaction with local governance at the sub-district level: the following statements are included in this index.
    - I'm confident of the district official's ability to their job.
    - The sub-district officials support this village in preserving traditional culture.
    - The sub-district officials can be trusted to represent our interest in protecting our rights to land.
- Level of corruption: for scale of following indicators is from 1 to 3, with 1 being 'no corruption', 2 being 'some corruption' and 3 being 'a lot of corruption'. These are the answers that the respondents could choose from (apart from 'don't know'). The average over the respondents is shown.
    - In your opinion, how much corruption is there at the […]?
        - Village leadership
        - District government

### *Panel C. Role of traditional institutions*

- Index for a positive attitude towards traditional laws and culture: the following statements are included in this index.
    - Customary laws should be used to govern the way of life in this village.
    - Some people have no respect for customary laws anymore in this village (negative)

### *Panel D. Management of natural resources*

For management of natural resources, data was collected on the existence of management structure and the level of satisfaction with the management structure.

- Existence: for this indicator, outcomes from the community survey were used. In the table it is reported per area how many villages said that they have regulations regarding the use and protections of community forests.
- Dissemination of information: these questions report on how regulations are communicated to the villagers and to what extent. The table shows how many villages per area indicated that the following is applicable to them. The outcomes come from the community survey.
    - How are the regulations communicated to the villagers?
      From the data it was found that the regulations were either communicated through community meetings, posters, and signs at the forest or a letter, as indicated in the table.
    - Are regulations communicated to all villagers (including women and children)?
    - Are regulations taught at school?
- Percentage of respondents that knows about regulations for the use of community forests: this indicator shows the percentage of respondents that answered 'yes' to the question whether there are any rules/regulations about the use of community forests in the village.
- Satisfaction with regulations (scale from -2 to 2): the villagers were asked about their level of agreement with the following statement on the same scale from -2 to 2. Since agreement with the statement shows dissatisfaction with the regulations, the scale was reversed in the same way as with the indices.
    - Natural resources are not sufficiently protected by the village regulations.

### *Panel E. Households' attitude towards forests/plantations*

The sample size deviates from the other panels, because only respondents that indicated that there are community forests in or around their village are included.

- Dependence on forest resources: villagers were asked to what extent they agree with the following statement on the same scale from -2 to 2:
    - My family depends on the forest for our livelihood.
- Index for a positive attitude towards sustainable forest use:
    - I take from the forest what my family needs without thinking about others (negative)
    - I think all villagers should use the community forest as they want (negative)
    - We have to use our forests with moderation and respect.
- Index for access to forest resources:
    - Villager's access to forest resources is fair in my community.
    - I'm satisfied with my family's share of forest resources in this village.
    - Our forests are abundant and luscious.
    - I feel that my access to forest resources is secure in this village.

We also wanted to report on the attitude towards disputed forest areas with local government/industry. However, too few respondents indicated that their village has a dispute or conflict with the government or the industry to be able to calculate the outcome indicators. Conflicts with the government or industry turn out not to be an issue in these areas.

### *Panel F. Sense of control of villagers*

- Index for trust in village:
  - People in my community look out for each other.
  - I feel I can trust my neighbours to look after my house if I am away.
- Index for sense of control regarding own life:
  - I feel that my opinion is taken into account in my community.
  - Often I feel that I have little influence over the things that happen to me (negative)
  - I feel satisfied with my life.
  - On the whole, I'm able to take charge of my life.
- Index for sense of control regarding land:
  - I think there is nothing we can do to keep our traditional lands against the government/industry (negative)
  - I'm confident that if we the villagers act together, we can make things happen for this village
    I think that our village has the right to our traditional lands.
  - I feel that I have no influence on preserving our forests and nature (negative)
- Index for sense of control regarding traditional institutions:
  - I feel that I can contribute to preserving traditional/*adat* culture in my community.
  - I feel that it is difficult to protect traditional culture nowadays (negative)

# Annex III. Description of study locations

## *Mukim Siem*

### ***Gampong* Lamklat**

*Gampong* Lamklat is located in the sub-district Darussalam (District Aceh Besar) and belongs to Ke*Mukim*an Siem. This village is about 7 km away from the capital city of Aceh Besar and about 1.5 km from the sub-district downtown of Darussalam. Geographically, *Gampong* Lamkat belongs to the rural area as the area has many farming areas. Still, the area can be considered as an advanced area. Most of the villagers work as government officers and some other work as farmers, traders, animal breeders, or labourers. One of the characteristics of Lamkat village is the friendly villagers and welcome new comers warmly of which many are high educated people.

### ***Gampong* Lamreh**

*Gampong* Lamreh is located side by side with *Gampong* Lamklat. The geographic and demographic conditions are quite the same. There is no forest area in Lamreh, and many of the villagers have farming land outside the village. Many of the villagers have a high education level. Those who have high education level have contributed a lot to the development of the village. In short, the development and infrastructure in this city are good.

### ***Gampong* Krueng Kalee**

Krueng Kalee village also belongs to Ke*Mukim*an Siem and the location is close to sub-district Darussalam which is about 1 km away (8 km to the capital city of the province). This village is close to a forest area. Many of the villagers are working in farming areas, plantation, and also government offices. Many farmers in the village also grow secondary crops. Some of them also work as traders, animal breeders, and labourers. Many of the villagers have their own vehicle. Compared to the previous two villages, villagers of Krueng Kalee have a lower education level. Yet the characteristic of villagers is almost the same, they are friendly to guests or new comers.

## *Mukim Lamteuba*

### ***Gampong* Lamteuba Dro**

*Gampong* Lamteuba Dro belongs to Ke*Mukim*an Lamteuba in sub-district Seulimuem. This village is located about 20 km away from the capital city of Seulimuem. This village is located on the valley of Mount Seulawah agam. This area belonged to a conflicted area between GAM and TNI (Aceh Independence Movement and National Armies). Generally, people here have short-tempered characters and they tend to hold grudge. They even do not hesitate to use violence.

Since the village has many rice field areas, most villagers are farmers and some of them are gardening. Most villagers completed middle school or high school. As the quality of human resource of this village is low and the government has never paid any attention to this area, *Gampong* Lamteuba Dro is less developed. Therefore, it took a harder effort to persuade the villagers to participate in this study because they are sick and tired of the promises researchers are giving to the village.

***Gampong* Blang Tingkeum**

*Gampong* Blang Tingkeum is located about 20 km away from sub-district Seulimuem. Public transportation is available and private vehicles can access the village as well. This village lies on the mountain area with a lot of rice fields and seasonal areas. The main livelihood of the villagers is farming. Some of the villagers also work as animal breeders or grow plants in the forest. As many villagers are living in poor economic condition not many of them have high education level and working conditions are hard. The average education level is middle school and high school. The new Keuchik (village head) is quite capable in gathering villagers for social and religious activities which indirectly changed people's hard character into more flexible one. This can be seen from their better attitude in welcoming new comers. They believed that those new comers' will bring good changes for the village in the future.

***Gampong* Lam Apeng**

*Gampong* Lam Apeng is located side by side with *Gampong* Blang Tingkeum and has the same distance to the sub-district Seulimuem as *Gampong* Blang Tingkeum. Just like the other *Gampongs* in *Mukim*an Lamteuba, most of the villagers are farmers. Some of them are also living from forest commodities such as candlenuts and rattan.

The attitudes of the residents are reclusive and they tend to be cold and suspicious to new comers, suspecting that the strangers would make use of them. They have been disappointed many times in the past by promises of researches. Villagers of this *Gampong* are less developed than those of *Gampong* Lamteuba Dro and *Gampong* Blang Tingkeum. *Gampong* Lam Apeng has less inhabitants, but their low educational level and the incapability of the village leader has made the village be under-developed area. In addition, their bleak history of the conflict in the past has influenced the backwardness character of people in this village.

The following tables show per village which NGOs and other organisations implemented activities related to natural resource management and mapping. While Table 12 reports on this for the baseline, Table 13 does the same for the endline.

### *Trainings related to natural resource management and mapping*

**Table 12: Trainings related to natural resource management and mapping per village (baseline)**

Notes: After the name of the village, the active NGO('s) are reported between parentheses

### *Activities of YRBI*

**Table 14: Activities of YRBI in survey areas**

| Activity | Siem | Lamteuba |
|---|---|---|
| **Village boundary mapping** | ***Lamreh (2012)*** ***Krueng Kalee (2010)*** ***Lamklat (2012)*** | ***Lamteuba Droe (2011, 2013)*** ***Lamapeng (2009, 2014)*** |
| **Socialization meeting** | ***Lamreh (2010)*** ***Lamklat (2014)*** | - |
| **Environmental awareness raising** | ***Lamklat (2012)*** | ***Lamteuba Droe (2013)*** |
| **Strengthening *Mukim* institutions/*blang* regulation** | - | ***Lamteuba Droe (2013)*** |
| **Protection of water sources** | - | ***Blang Tingkeum (2013)*** |
| **Settlement of disputes** | - | ***Blang Tingkeum (2013)*** |

Source: Community survey E8, MFS II Evaluation Indonesia
Notes: After the name of the village, the active NGO('s) are reported between parentheses

Differences between Table 13 (Table 12) and Table 14 may arise as the first tables show results to the question whether certain activities had taken place in the village and information is obtained about these activities. On the other hand, Table 14 reports on all the activities that YRBI has undertaken in the villages and *Mukims* as reported by the informants in response to an open-ended question. Informats also indicated that most of the activities undertaken in their villages were also implemented in other villages within the *Mukim*. In addition, some of the informants in *Mukim* Lamteuba indicated that they know that YRBI conducted activities with youth and on indigenous issues in other villages.

Finally, at the endline, we also asked the informants about the NGOs that are active in their village. YRBI was mentioned by 5 of the 6 villages. In addition to the activities already discussed, two villages in *Mukim* Siem and one in Lamteube mentioned that YRBI implemented (sustainable) livelihood activities in their village.[30]

[30] Other NGOs active in the surveyed villages were Anisa Center in Lamklat (Siem) working on livelihood activities and education; Walhi and Lupa Simulasi Bencana in Lamteuba Droe (Lamteuba) assisting the community in natural resource management and disaster risk reduction, respectively. No other NGO was mentioned during the survey.

# Annex IV. Descriptive Statistics

**Table 15: Respondent characteristics II**

| **Treatment area** | **Siem** | | | | **Lamteuba** | | | |
|---|---|---|---|---|---|---|---|---|

# Annex VI. Qualitative Report on the Evaluation of YRBI

## PARTICIPATORY MAPPING

## 1. INTRODUCTION

### 1.1. Context of the project

Traditional (*adat*) structures and laws have existed in Aceh for hundreds of years, and in the past the traditional *Mukim* institution played an important role in the social and economic activities of Aceh's people. As a result of the centralization of power by the New Order regime and its implementation of Law no. 5/1979 on Village Governance, the *Mukims* lost their central role and authority.

After the Indonesian Revolution ended the 30 decades of the New Order reign in 1998, a new State's law (no. 44/1999) was issued that granted Aceh the status of "special autonomy" and allowed them to re-implement their own traditional customs and institutions. This was set forth by law no. 11 (issued in 2006) and law no. 10 (issued in 2008) that formally recognized and thereby further reinforced customary institutions in undertaking conflict resolution and taking more control over the management of their natural resources. However, the prolonged marginalization of the *Mukim* institution has left marks on Aceh's social structure, customs, and society as a whole that are still noticeable today:

1. Feelings of unity and solidarity among members of *Mukim* communities have weakened;
2. People have become less committed to their *Mukim*, and are therefore less willing to voluntarily contribute to –and participate in- community building activities. People now expect some kind of payment in return for a lost day's work;
3. The role of customary rules in society has weakened, especially rules that were previously executed by the *Mukim* institution;
4. *Mukim* and *Gampong* communities have lost power and sovereignty over the natural resources that exist in their surroundings;
5. Horizontal conflicts about boundaries have emerged among different *Gampongs* (villages) that previously felt a common identity as part of the *Mukim* their *Gampongs* all belonged to, but were now forced to redefine themselves at the village-level.[31]

The *Yayasan Rumpun Bambu Indonesia* Foundation (YRBI), located in Banda Aceh Indonesia, aims to enhance the capacities of both the *Gampong* and *Mukim* institution in Aceh to effectively deal with problems related to land tenure, natural hazards, natural resources and spatial management. In order to achieve these goals YRBI implements a variety of activities such as trainings on participatory mapping, workshops and discussions on the empowerment of traditional institutions and structures, assistance in the documentation of customary laws and regulations (*reusam*), the publishing of informative bulletins about natural resource management, and advocacy for the formal recognition of

[31] These examples were taken from the testimony of the *Imeum Mukim* of *Mukim* Siem.

the traditional institutions and structures by both the community members and the Indonesian Government.

The main activity of the YRBI project is the facilitation of participatory mapping activities in the *Mukims*, with the aim of revitalizing the traditional *Mukim* institution, and letting it regain the rights and authority it once held in Aceh's society in terms of conflict management and the management of natural resources. Together with the communities, YRBI plans the mapping activities; partakes in negotiations about boundaries; collects GPS data of the *Gampongs*' and *Mukims*' borders and their forests and lands; and processes the data into maps.

The ultimate goals of the map are to eliminate potential conflicts over boundaries, and to serve as a tool to improve regional planning and natural resource management, as well as to educate future generations. The project is important for Aceh's communities that still struggle with the environmental damage that was caused by the tsunami they suffered in 2004, and the effects of new natural resource exploitation projects that are taking place without their consent in some areas. Furthermore, recent conflict has left Aceh society divided, and the massive loss of land tenure documents due to the tsunami has led to an increased number of boundary-conflicts between *Gampongs* and between *Mukims*.

With its project YRBI aims to work towards the attainment of the Millennium Development Goal 'good governance and civil society building'. To a lesser extent, it is also aimed at 'reducing poverty and hunger', and 'creating a sustainable environment, forests, and biodiversity' (MDGs 1 and 7a and b). This is in line with YRBI's final objectives, which are to strengthen peoples' awareness and capacity to manage and control natural resources and sources of water, and to ensure a fair and just management and distribution of natural resources in an ecological and social way, in which local communities can participate equally and enjoy its benefit optimally.

## 1.2. Study area

Our evaluation focuses on the 2 *Mukims* in Aceh Besar YRBI has implemented its programme in, namely: *Mukim* Siem and *Mukim* Lamteuba.

*Mukim* Siem is part of the Darussalam sub district. It is comprised of 8 *Gampongs* (villages), named Lamreh, Siem, Krueng Kalee, Lambiheu Siem, Lamklat, Lambitra, Lie Eu, and Lampasan. *Mukim* Siem is located close to the provincial capital resulting in a more heterogeneous, educated, and open-minded society. Even though a fair amount of inhabitants still work in agriculture and husbandry, the majority of them work in the city as government officers or employees, or as education workers.

*Mukim* Lamteuba is located at the foot of Mount Seulawah of Seulimum sub-district. It consists of 8 *Gampongs*: Ateuk, Blang Tingkeum, Lam Apeng, Lambada, Lam Pantee, Lamteuba droe, Meurah, and Pulo. *Mukim* Lamteuba is located in a remote area, far away from the hustle and bustle of city life. At its border lies a protected forest and there are many rice fields in the surroundings. For their livelihoods the inhabitants depend on farming, gardening, and raising livestock. The people of Lamteuba speak Acehnese in daily life as well as in schools. Very few speak the National Indonesian language (Bahasa Indonesia) fluently. What distinguishes *Mukim* Lamteuba from other *Mukims* is that its customs and traditions are still well preserved.

### 1.3. Evaluation methods

Our qualitative research in *Mukim* Siem and *Mukim* Lamteuba was conducted in 2 parts. In November 2012 (at the same time as the implementation of the quantitative Baseline Survey) we collected information about the region, the characteristics of the village government and the *Mukim* and *Gampong* institutions, the position and influence of marginalized groups, the ways natural resources were managed, the manner in which conflicts were handled, as well as catching a first glimpse of YRBI's project activities. In May 2014,[32] we collected additional information about the activities that had in the meantime been undertaken by YRBI, as well as the changes that had taken place in the communities in the past 2 years, in particular with regard to the role and influence of traditional institutions (*Mukim* and *Gampong* government) and the way in which they handled conflicts, natural resource management, etc.

To answer to the evaluation questions, focus group discussions were carried out with 3 different groups in each *Mukim*: women that were part of a women's group, men that were part of a farmers' group, and young people (aged 16-24 years) that were part of a youth group.[33]

In addition, in-depth interviews were conducted with the general facilitator of the YRBI project, the local facilitators, the *Imeum Mukims* (heads of *Mukim*), the *Keuciks* (heads of *Gampong*), representatives from the *Tuha Peut Inoeng* (women's council), representatives of the *Tuha Peut Mukim* (representative council of the *Mukim*), the Panglima Glies (the persons responsible for the natural resource management) on both *Mukim* and *Gampong* level, and representatives of the *Keujrun Blang* (traditional institution that regulates the management of rice fields), also both on *Mukim* and *Gampong* level. All of the informants had taken part in one or more of YRBI's activities and were thus knowledgeable about the project.

### 1.4. Evaluation questions and report structure

Firstly, to provide a more detailed description of the context of the project villages, the following research questions were asked: What do the research communities look like? How are they governed? How do the communities use, manage and monitor their natural and cultural resources? What land right conflicts are there in the communities and how are they handled? Secondly, to determine the success of the YRBI programme, the following research questions were discussed: How was the project implemented in the 2 *Mukims*? What was the project's impact on village governance –primarily the role and influence of the traditional institutions (*Mukim* and *Gampong*)-, the lives of the community members and their ability to manage their natural resources in a sustainable way?

[32] Our research activities were initially scheduled for early April 2014, but were delayed by the ongoing legislative elections and the labour-intensive harvest period that succeeded it. By the time we were about to go down in the field, a Mosque-caretaker was murdered in *Mukim* Lamteuba. Because the village government wanted time to investigate the murder case, our research was delayed by 4 more days.

[33] The participants of the focus group discussions were selected i.a. based on the fact that they had taken part in at least 1 of YRBI's project activities. However, YRBI's activities were mostly catered towards community leaders and figures, and thus, not many 'common' women, young people, and farmers had taken part in them. As a result we weren't able to arrange the desired number of 6-8 participants per focus group. Instead the focus groups were attended by an average of 5 informants. Another small obstacle we encountered was that some participants expected to receive money as compensation for participating in the interviews, and were confused and disappointed when they found out we weren't able to give them any.

This report will be structured broadly along the lines of these research questions: Chapter 2 describes how the lives of the villagers are governed and how the roles of the traditional institutions in governing and regulating social life have changed over the past 2 years. Chapter 3 discusses the position of women, youth, and newcomers in the communities and their influence within *Mukim* structure. Chapter 4 provides more in-depth information about how the communities manage and monitor their natural and cultural resources. Topics that are covered in this chapter are livelihood, access and availability of land and resources, land conversion, environmental damage, attitudes towards the preservation of natural resources and traditional culture and customs, and local wisdom documentation. Chapter 5 investigates land right conflicts that have occurred during the project period. Turning to YRBI's programme, Chapter 6 discusses the project implementation with a particular focus on the participatory mapping activities, and addresses the practicalities and limitations of the project implementation. Finally, in Chapter 7 we reflect on the impacts of the YRBI programme on the ability of the *Mukim* and *Gampong* institutions to manage natural and cultural resources in a sustainable way, to solve (land) conflicts, and to govern the lives of the community members.

# 2. VILLAGE GOVERNANCE

## 2.1. Role and influence of traditional institutions

After the decree of Law no. 8 in 2009 on the Duties and Functions of the *Mukim* Government, the *Mukim* government in Aceh began to recover from its collapse and gradually increased its role in governance, community development, natural resource management, and the strengthening of customary law. In *Mukim* Siem, for example, the *Mukim* government started to collect information from the community's elders on cultural customs that had disappeared during the period of the New Order Regime, with the intention to revive those customs in present-day society. In turn, in *Mukim* Lamteuba the *adat blang* (customs of traditional rice field management) have been restored to their previous state, with the exception of some ceremonies that are considered incompatible with the *Shari'a* (Islamic law). For example, the ritual of setting aside a portion of food as an offering to the gods during the *adat blang* festival is considered to be a Hindu custom and will therefore not be practiced again.

The *Imeum Mukims* (the traditional leaders of the *Mukims*) have regained their front role and responsibility in implementing the customary rules and regulations. Every member of the *Mukim*'s society has to obey the customs and traditions, regardless of their age or position, and anyone that violates the rules, for example the rules of *blang* such as going to the field and planting rice on Fridays, are subject to the sanctions that have been determined by the customary law.[34]

In *Mukim* Siem and *Mukim* Lamteuba, the *Mukim* and *Gampong* institutions once again play an important role in conflict settlement within the society. When a dispute or conflict occurs, attempts to settle it are first made at the village level, involving the *Keucik* (the head of the *Gampong*), its staff, and the *Tuha Peut Gampong* (representative council at the *Gampong* level). When the conflict or dispute can't be resolved, it is brought before the *Imeum Mukim* and the *Tuha Peut Mukim* (representative council at the *Mukim* level) who will try to resolve the issue together. When the conflict can't be solved

[34] A common sanction for youth that have violated a *blang* rule is the burning of the equipment they used to work on the field on the prohibited day.

at the *Mukim* level either, it will be brought to the police. Interesting to note is that the police only takes on cases that have already been through the previous stages of dispute settlement. In practice, most of the disputes can be settled at the *Gampong* level.

In the past 2 years the *Mukim* government in *Mukim* Siem has increased its role in the strengthening of traditional institutions. For example by undertaking activities to form a *Keujrun Blang Mukim* (institution for the regulation of the management of rice fields), to empower female traditional leaders, and to resolve boundary disputes between *Gampong* and between *Mukim* aided by YRBI's participatory mapping project. In this last regard, the *Mukim* government has been quite successful, as it has managed to resolve 6 border point disputes in only 2 years, compared to the boundary dispute committee of Aceh Besar district level that only managed to resolve 1 border point in a year's time. The *Mukim* government in Siem has also taken efforts to rebuild a dormitory next to the mosque that in past times was used for religious learning practices into a kindergarten. The kindergarten, as well as the mosque itself, are being managed by the *Mukim* government[35].

The *Mukim* government in *Mukim* Lamteuba has experienced less improvement in influence and capacity over the past 2 years than the *Mukim* government of Siem. This is partly due to the fact that, at the time of the interview, the present *Imeum Mukim* had only held office for about a year. According to a number of our informants the current *Imeum Mukim* is less assertive, especially in terms of conflict resolution and forest preservation, than their previous *Imeum Mukim*, whom they considered a respected community leader. Existing regulations to preserve the forest, including the revitalization of the *Keujrun Blang*, are for example all achievements of the former *Imeum Mukim*'s reign. The former *Imeum Mukim* has also managed to remain influential after his office, making it hard for the new *Imeum Mukim* to fully gain the trust and support of the community.

> *The current one [Imeum Mukim] is less likely to know the ins and outs of Lamteuba. The current one, although young, this is not our condemnation of him, is less assertive. The previous one would be stricter about violation (Informant from the focus group discussion with youth in Lamteuba).*

One area where the *Mukim* government in *Mukim* Lamteuba has managed to increase its role is in primary education. Since 2 years, the *Mukim* government participates in the meetings of the school committee, and plays an active role in the resolution of school conflicts.

## 2.2. Government and community support for traditional institutions

Due to the new governmental decrees that recognize and support the function, role, and authority of traditional institutions, government law is now largely compatible with Acehnese customary laws, leaving room for the traditional *Mukim* and *Gampong* institutions to carry out their customary laws and regulations without too much resistance.

There are, however, several governmental rules that restrict the position of traditional institutions. An example of this is the founding of the Farmer Water User Association (P3A) by the government. The P3A takes care of water and irrigation systems, a role that should be held by the

[35] Both *Mukim* Siem and *Mukim* Lamteuba have 1 mosque, which is managed by *Mukim* government.

*Keujrun Ciek* (leader of the *Keujrun Blang* institution) according to custom. Because they cannot defy government authority, the *Keujrun Cieks* in *Mukim* Siem and *Mukim* Lamteuba have not been able to perform their roles and functions according to *Mukim* custom. Nowadays they serve merely as the extension of P3A, and aren't able to make independent decisions.

Even though the *Mukim* institution enjoys the moral support of the government, financial support in order to improve the performance of the *Mukim* government has largely stayed behind. Even though the *Gampong* government routinely receives funds from the Indonesian State Budget (APBD), this is not the case for the *Mukim* government. Whereas all staff of the *Gampong* government earn 'toil money' of about 300.000 to 1.000.000 rupiah per month according to position, the only member of the *Mukim* government that receives toil money is the *Imeum Mukim* (an amount of about 900.000 rupiah per month).

With the *Mukim* government taking on more and more responsibilities over the past 2 years, the communities' support towards them has grown.

## 3. REPRESENTATION OF WOMEN, YOUTH, AND NEWCOMERS IN TRADITIONAL INSTITUTIONS AND ACEH SOCIETY

Women, youth and newcomers are all represented in the *Mukim* structure, and in the past 2 years their roles have increased, especially those of women. However, the actual impact women have on decision-making processes is still limited, as most governance activities are carried out at night when women are not allowed out of their homes. Positions in *Mukim* government can be held by natives and non-natives (newcomers) alike, even though in reality it is mostly natives that fulfill these positions as they are thought to be more aware of the ins and outs of the area as well as the characteristics of the *Mukim*. Within the communities the revival of the *Mukim* government is thought to provide benefits to all members of the society alike, and among them a common desire exists to restore the function of the traditional institutions to their previous state.

### 3.1. Women

In *Mukim* Siem women generally spend most of their time at home, fulfilling their domestic duties while their husbands earn the family's living. They are often still dependent on men and have to ask their husbands' permission for everything they want to do. However, over time roles are gradually changing and it is becoming more common and socially acceptable for a man and woman to assist each other in their respective tasks. With regard to household decision-making men are generally still dominant. For decisions about social event (such as whether the family should participate in a festivity) men are expected to consult their wives before making a decision.

In community life, women have an important role in the implementation of traditional rituals such as marriages, funerals, etc. In the past 2 years, the government of *Mukim* Siem has tried to empower female traditional leaders by organising trainings to teach them to execute the important ritual of 'corpse bathing', a procedure for which almost no woman in the *Mukim* was previously qualified and that was handled by people from outside the *Mukim*. *Mukim* Siem is also one of the *Mukims* that has shown to pay considerable attention to the role of women in decision-making

processes, and has recently even provided women with the opportunity to become a member of the *Tuha Peut* (representative council) at both *Mukim* and *Gampong* level.

The lives of the women in *Mukim* Siem and *Mukim* Lamteuba have changed considerably in the past 5 years. They now have more freedom to move and to spend their leisure time elsewhere then at home. Young women in *Mukim* Siem are also more likely to follow a formal higher education. An undergraduate study is often sufficient to get a job, but nowadays many girls continue school up to post graduate level.

In *Mukim* Siem there are several women's NGOs that work together with YRBI to help to strengthen the position of women in the community. Examples are 'Annisa Center' and 'RPUK' (Women Volunteers for Humanity) that aim to empower women by encouraging them to become involved in traditional governance as well as in social life. One example of the NGOs' successes is the case of a female member of the *Tuha Peut Gampong* (the village council) that got dismissed from her position by the Keuchik (the customary *Gampong*/village leader). The woman urged the Keuchik to ask the staff of one of the NGOs about the importance of the position of women in the governance structure. The Keuchik granted her request and went to discuss the issue with the NGO staff member and as a result decided to revoke the dismissal.

## 3.2. Newcomers

Because *Mukim* Siem is in the proximity of the city and schools, a steady stream of immigrants moves to its villages, increasing from year to year. Most native inhabitants don't consider the immigrants a problem, as long as they make an effort to mingle with the natives in all community activities. In *Gampong* Lambitra in *Mukim* Siem, many immigrants have become staff or even leaders of the traditional government. This can happen because newcomers have often received higher formal education than the local people and are therefore considered capable and knowledgeable by the majority of the community. It is for example not uncommon for newcomers to become members of the *Tuha Peut* as representatives of the intellectuals. There are, however, also some native people that are concerned about this development and would prefer to see the positions filled by local people. Nonetheless, a good example of the increasing openness towards newcomers is that of the Keucik in *Gampong* Siem who is accepted by the villagers despite not being a native:

> *After being here for 10 years people can accept me as the head of the village. 5 years ago, I was already a member of the* Tuha Peut *before becoming* Keucik*. Now the acceptance is better since they don't actually care where people are from. For instance, there are Javanese in Lamklat, there are also Palembangnese and others. So there are newcomers in the governance, both at the* Gampong *and at the* Mukim *level (Keuchik of* Gampong *Siem in* Mukim *Siem).*

Even though *Mukim* Siem and *Mukim* Lamteuba both have a welcoming attitude towards newcomers, in Lamteuba there are some restrictions: Only after a period of at least 2 years at *Mukim* Lamteuba will a newcomer officially be entrusted to carry out any duty. In practice, governance positions are, however, almost always filled by locals, who are thought to be more knowledgeable about

*Mukim* Lamteuba's affairs and problems. Skilled newcomers usually won't get any higher up than a position as manager of public lands.

### 3.3. Youth

In *Mukim* Siem, youth are likened to "a fence that preserves the society's culture". Meaning that, if the young people in the society properly fulfill their role in society, the society will prosper because of it. Youth play a role in the governance structure at both *Gampong* and *Mukim* level, albeit a very small one. In community life, youth engage in activities that require physical fitness, such as putting up tents, and serving dishes and beverages during public ceremonies, thereby carefully following traditional routines. Every *Gampong* has a youth club: a youth organisation that provides a forum for youth to be creative, while at the same time working on the preservation of traditional culture, for example by learning and practicing traditional arts and sports. In terms of decision-making youth are not very influential. When they are present during meetings, they mostly listen to what the older people have to say. The young people that participated in our focus group discussions explained that they felt that they didn't have the authority to give advice or an opinion during a decision-making process, and that it was enough for them to listen to the older people making the decisions.

## 4. RESOURCE MANAGEMENT

### 4.1. Natural resource management

#### *People's livelihood*

The majority of the people in *Mukim* Siem work as farmers, most of them on the rice fields. In addition, they raise cattle that is allowed to roam freely on the pastures. Over the last few years the income of the community has increased due to the construction of a government funded irrigation system in several villages in *Mukim* Siem. As a result, people can grow and harvest rice twice a year, making them hopeful about the future. The villages located in the higher areas of *Mukim* Siem don't have access to the irrigation system and can only grow and harvest rice once a year. Meanwhile, people are getting less dependent on forest products for their livelihoods. The community forest in *Mukim* Siem is no longer productive and merely functions as a protection for the springs and the supply of water. The rice farmers are shadowed by concerns about the reduction of agricultural land. It is expected that the rice fields will increasingly become smaller in the coming 5-10 years, as lands get turned into housing areas.

The people in *Mukim* Lamteuba are mostly farmers, gardeners or cattle breeders. Rice is the main agricultural commodity, but the people of *Mukim* Lamteuba also cultivate yellow beans, chili, chocolate, *Jabon*, and Patchouli. People make long days, taking care of their plantations, fields, and gardens. They start working early in the morning and go home only at -or even past- sunset. It is hard for the farmers to earn enough money, and according to several of our informants there are still people that illegally grow marijuana to make ends meet.[36]

[36] *Mukim* Lamteuba is well known for its illegal marijuana farmers. The government has even run programs through the BNN (the '*Badan Narkotica Nasional*' – the 'National Agency for Narcotics) that were aimed at enabling people to switch from planting marijuana to planting other agricultural products. However, according to

> *People in Lamteuba are very much dependent on forests, since we're all farmers. Almost 95% of the people are farmers. Besides being used as the protection of the water for irrigation, forests can also function as farming field and a place for raising cattle (Informants from the focus group discussion with women in Mukim Lamteuba).*

### *Availability and use of land*

The *Mukim* Siem region consists of residential areas, rice fields, plantations, moors, HTI (*Hutan Tanaman Industri*—Industrial Plantation Forest), and also livestock grazing areas. The moors around the settlements are planted with vegetables. In the foothills are the cattle pastures, and at the top of the hill lies an industrial plantation that belongs to the state.

Meanwhile in *Mukim* Lamteuba region, there are residential areas and paddy fields. There is also a community forest at the foot of Mount Seulawah. The community forest is considered public land and anyone in the community is allowed to manage a piece of the land that belongs to his *Gampong*. If someone desires to do so, they only have to notify their *Keucik*, after which the land will be delimited with a fence.[37] *Mukim* Lamteuba also has protected forests, which are still maintained by the local community.

In the past 2 years, forests have been converted into plantations in both *Mukims*. In *Mukim* Lamteuba some additional forest has also been converted into husbandry area. After the tsunami in 2004, large-scale tree felling activities took place in the area of *Mukim* Lamteuba in order to rebuild the houses that were destroyed by the water. The large sudden reduction of the tree population also affected the water availability. Therefore, the *Imeum Mukim* ordered a rule that prohibited people from cutting down trees in the forest. Nowadays a *Mukim* Government policy still exists that ordains that every tree that is cut down should be replaced by 5 new trees that have 'economic value', such as Jabon trees, chocolate trees, or patchouli trees.[38]

> *Even if it is not a protected forest, it is suggested by Mr. Mukim that we should plant five trees after cutting one (Informants from the focus group discussion with women in Mukim Lamteuba).*

Many people see the economic benefits of the conversion of communal forest and lands into fields or plantations, as this enables them to use the land for farming and gardening. However, as pastures are getting narrower, it makes it more difficult for people that raise livestock to keep their animals from wandering down to the neighboring *Mukims*' areas.

Before, farmers in *Mukim* Lamteuba planted crops such as corn and soybeans, but due to Lamteuba's remote location it was difficult to distribute and trade them. Therefore, the farmers converted their fields into *Jabon* plantations, which is easier to grow and has greater market potential.

---

our informants these programs have failed, and are now only remembered by the public as "the free programme from the government".

[37] Managing a piece of the community forest's land is optional and not all community members choose to do so as it requires effort, energy, and money.

[38] This rule has existed for over 2 years, and YRBI did not contribute to its issuance.

In *Mukim* Siem, conversion of forest land has been happening for over the last 5 years. Most of the *Mukim*'s plantation areas belong to the state, but people living in *Gampong* Kruen Kale and *Gampong* Siem, both near the industrial forest, also cleared land to turn it into chicken farms and chili plantations. In the community forest is a pond that functions as a water reservoir during the rainy season. Last year, the community has started to construct drains with funding from the APBA[39]. The construction is expected to be finished in a year's time.

With the aim of securing the water availability, a tree planting ceremony was organised by YRBI in August 2013. During the ceremony 6 types of trees were planted around the water reservoir: teak, *sengon*, jackfruit, *jabon*, mahogany, and *tanjung*. However, because the trees were planted during the dry season and the public forest land was rocky and shallow (only 1-2 meters deep) the trees had all died. According to the Panglima Glie (the head of natural resource management) the most suitable type of tree to be planted in this area is the banyan tree, because its roots spread into the surface of the soil. Another tree planting ceremony is now planned for November 2014 during the rainy season.

### *Environmental damage*

Some of our informants stated that no environmental damage had occurred over the past 2 years in their *Mukims*. But in fact, illegal logging was –and is still being- done in the industrial forest of both *Mukim* Siem and *Mukim* Lamteuba, and is often supported by the local apparatus. The logging has led to a reduced size and number of springs, which has impacted almost all inhabitant of the *Mukims*, but most especially the farmers who have had disappointing harvests as a result of the water scarcity. The balding forests also cause distress to people that are looking for trees to use as firewood, or to build a house with. Forest honey, that has long been an important forest product for the people of *Mukim* Lamteuba, is also getting increasingly scarce.

> *There was a time when every one kilometer we walked, we saw wood for household. Now even after passing 5 kilometers, we aren't able to see wood (Informant from the focus group discussion with farmers in Mukim Lamteuba).*

Even though it was part of its original project objectives, YRBI has not organised any trainings or activities on disaster risk management. There has, however, been a disaster simulation in the area, which was organised by the BNPB (The National Board for Disaster Management).

### *Attitudes towards natural resources*

Over the past years, the people of *Mukim* Siem have grown more apathetic towards the preservation of their forests, and less and less people are interested to participate in the management and monitoring of the community's natural resources. At the time of our interviews there were no activities or plans to protect the community's forests, other than the tree planting ceremony and the 'cut 1 tree - replace 5' policy. The disinterest in the forests' sustainability is most likely due to the fact that the people of *Mukim* Siem are no longer dependent on the forests' resources for their livelihoods. Some of our informants mentioned that they didn't feel that the forest had anything to offer them, and according to

[39] APBA is an abbreviation of 'Anggaran Pendapatan dan Belanja Aceh'. Translated: the income and expenditure budget of Aceh.

many the responsibility for the forest should only lie with the *Gampongs* that are located close to the forest.

There are however still some people that worry about the future of the forests and the rapidly declining number of various species of birds that live in them. The *Mukim* government as a traditional institution also concerns itself with the sustainability of the community forest, and plans to manage and safeguard its natural resources in accordance with the customary rules that exist in Aceh. A very important aspect of this is the *Mukim* government's effort to reactivate the traditional institution of the Panglima Glie, which is responsible for natural resource management. At the moment of the interview, the Panglima Glie did not yet operate at its full potential. The power and right to reprimand and give sanctions to perpetrators of the rules of *blang* were still held by the *Keuciks*.

In *Mukim* Lamteuba there were no important changes in people's perceptions and attitudes towards the preservation of their natural resources over the past 2 years. Because the people are still highly dependent on the forests for their livelihoods, and still feel connected to their forests, they continue to be driven to protect them. Perpetrators that are caught doing illegal logging will be arrested, taken to the police, and punished by having their timber mills burned down by the community.

> *The community participated in monitoring the forest. Anytime they see someone that destructs the forest, they will at least tell the Keucik or Mukim (Keujrun Blang of Mukim Lamteuba during an in-depth interview).*

> *People are still able to preserve the natural resources up to now. They can protect themselves from the influence of outsiders. They have laws and rules in regard to the natural resources so outsiders cannot exploit the natural resources in Lamteuba (Informant from the focus group discussion with women in Mukim Lamteuba).*

In spite of these repercussions, illegal logging unfortunately keeps occurring.

## 4.2. Cultural resource management

The indigenous culture and traditional customs in *Mukim* Siem and *Mukim* Lamteuba are still very well preserved, and are considered to be very important by the communities. Traditional wisdom regulates the lives of the people, from their birth to their death. All important life phases, such as birth, marriage, pregnancy, and death are governed by customs that have been passed down from generation to generation. Religious rituals and ceremonies such as the Prophet's birthday are also still carried out in accordance with what has been taught by the ancestors. However, with the demise of the *Mukim* institution during the 3 decades of the New Order Regime some cultural customs and traditions were no longer practiced in daily-life and disappeared over time.

The *Mukim* governments in *Mukim* Siem and *Mukim* Lamteuba play an important role in preserving their culture and in reviving old customs and traditions that are almost lost. For example, by interviewing and collecting information from the elders in the community. The role of the *Mukim* government is growing more and more important by the year. The community members in *Mukim* Siem and *Mukim* Lamteuba also play an active role in preserving their cultural customs and traditions, which

they hold in high regard. Their efforts, such as teaching women in the community the traditional custom of corpse bathing (described in chapter 3), have proven quite successful over time.

### 4.3. Documentation of local customs, traditions, and customary laws

At the initiative of YRBI, the people of *Mukim* Siem and *Mukim* Lamteuba have started the process of documenting their customary laws, customs, and traditions. The people were happy with YRBI's initiative, as they fear that their culture and traditions will disappear when the elders in their communities die. They have a strong urge to preserve their customs and to pass them on to coming generations, and recognize that having their cultural customs, laws and traditions 'recorded on paper' may also help to legitimate their existence in the eyes of outsiders.

The role of YRBI is to assist the *Mukim* governments throughout the whole documentation process: From collecting the information (mainly from the elders in the communities that are knowledgeable about the old customs), to the preparation of the drafts, until the final approval of the documentation.

At the moment of our interviews, the process was on its way but had not yet reached the stage of documentation. Once the documentation will be completed, the rules that are written down (for example rules about conflict resolution) will not be rigidly applied, but its application will be adapted to the particular situation at hand. According to Mr. *Mukim*: "…the common law is flexible, in accordance with the changing times."

For the future, there is a plan to document the *Blang* regulation.

## 5. LAND CONFLICTS

According to our informants, no conflicts with people or companies from outside the community have happened in the past 2 years. However, a serious dispute about land borders recently occurred between *Gampong* Lamklat and *Gampong* Lampasan, both belonging to the same *Mukim*. Both parties claimed to have received legalization from the elders on their inheritance rights over the land, and neither of them was willing to give in. The conflict got amplified by the process of participatory mapping that required the people to determine the exact borders between the *Gampongs*. At the end of 2013 they planned a fight with each other and people from both *Gampongs* stood ready to attack each other with machetes. The conflict could eventually be resolved by inviting and consulting local community leaders that were still respected by both parties. But, as a result the process of mapping was temporarily halted.

Conflicts over land boundaries between neighboring *Gampongs* can be seen as a repercussion from the demise of the *Mukim* structure. In previous times, people shared a common identity as a member of the *Mukim*, and for *Gampongs* that belonged to the same *Mukim* it didn't matter that much where the borders between them lay. Therefore village boundaries were rarely an issue. Nowadays the *Mukim* government once again plays a very important role in resolving such conflicts. For example, settlement procedures and principles are now being documented by them.

> *For instance, between Gampong Lambada and Gampong Kan, there is a pole or a wall or a sign that can be consulted with the elders from both villages. Then people can have discussion*

*and decisions can be taken without any fight (Informant from the focus group discussion with youth in Mukim Lamteuba).*

Other land-related problems that could potentially turn into a conflict in the future are border issues between some other *Gampongs* in *Mukim* Siem, and the fact that a large amount of community land is rented to and managed by people from outside the community in *Mukim* Lamteuba, as a result of which there are now more outsiders working on the land than local people.

# 6. PROJECT IMPLEMENTATION

## 6.1. Participatory mapping

### *Preparation and socialization*

Participatory mapping at *Mukim* Siem was done at the initiative of the *Imeum Mukim*, who was looking for a way to resolve the inter-village disputes within *Mukim* Siem. The *Imeum Mukim* decided to participate after attending a socialization meeting held by YRBI. At the same time, some other *Mukims* in Aceh that had also never done participatory mapping, also joined the project. *Mukim* Lamteuba had already conducted participatory mapping in 2008, approximately one year prior to YRBI's cooperation with ICCO but decided to join the activities of YRBI as well.

In March 2011 the *Imeum Mukim* of *Mukim* Siem performed the first *Duek Pakat Mukim* meeting[40]. It was attended by the staff of all the 8 *Gampongs* of *Mukim* Siem. The purpose of the event was to establish a mutual agreement that the boundary disputes between the *Gampongs* in *Mukim* Siem would be resolved in an integrated and comprehensive manner. During the meeting the *Imeum Mukim* stressed that the success of the project depended on the community's own efforts, and that they should prepare themselves to put in energy and to make costs. After they had reached an agreement the *Imeum Mukim* requested technical support from YRBI for the collection of the coordinate points in the region that was to be mapped, and the map making.

Next, a second *Duek Pakat Mukim* meeting was held in May 2011, which was again attended by the *Imeum Mukim* and the staff of the 8 *Gampongs*. The purpose of this meeting was to form a mapping team (also called the 'boundary demarcation team'), comprised of young volunteers including adolescent women from the community. The team members were then trained to use GPS-devices to collect coordinate points. This training was supervised by YRBI. During the meeting an additional 'Boundary Dispute Resolution Committee' was formed, made up of village elders (*ureung tuha*) that were knowledgeable about borders. The formation of this boundary dispute resolution committee was stipulated by the *Imeum Mukim* Siem in Decree no. 01/SK/MS/VII/2011.

A third *Duek Pakat Mukim* meeting was held in July 2011 and was attended by the *Imeum Mukim*, the staff of the 8 *Gampongs* and the Boundary Dispute Resolution Committee. During this meeting the concepts and principles of boundary dispute resolution between villages in *Mukim* Siem region were issued and captured in the *Mukim* government's decree no. S02/SK/MS/VIII/2011.

[40] Meaning: '*Mukim* discussion meeting'.

In October 2011, the members of the Boundary Dispute Committee were officially appointed during an inauguration ceremony, with the help of a *peusijuek* ritual[41]. The public inauguration was held in order to introduce the committee to the community, gain social legitimacy, and to encourage the committee members to carry out their new duties. The ceremony was attended by people from all levels of society, the staff of the *Gampong* and *Mukim* governments, as well as the staff of the sub-district government of Darussalam.

### *Determining the coordinate points*

The next phase of the mapping process was the collection of the coordinate points for the map. The mapping team of *Mukim* Siem took coordinates of village boundaries, public facilities, and other important sites in the villages. Meanwhile, *Mukim* Siem invited the *Gampongs*' leaders, elders from the Boundary Dispute Resolution Committee, and other people that were considered knowledgeable about the topic, to indicate where the boundaries of their *Gampongs* lay. After all this information was collected, visits were made to the sites of these borders to confirm there was an agreement about the boundaries between the different villages.

The mapping process proceeded almost the same in *Mukim* Lamteuba. However, in *Mukim* Lamteuba they had no Boundary Dispute Resolution Committee, and therefore the *Keuciks* and *Imeum Mukim* played a particularly important role in the dispute resolution within and between the *Gampongs*. Another difference was the absence of women in the mapping process in *Mukim* Lamteuba. In *Mukim* Siem young men and young women were actively involved in the participatory process, while in *Mukim* Lamteuba only the male youth leaders participated.

### *Map finalization*

At the time of our research, the map of *Mukim* Siem was about 60-70% completed. The reason the map was not yet finished, was the fact that there were still many unresolved boundary points between the *Gampongs*. Of the 17 boundary points across the region of *Mukim* Siem, 1 point was already agreed upon, and 6 points were resolved during the mapping process. For the 6 points that were resolved during the participatory mapping process, papers were signed, and then the boundaries were marked with stakes. The event was witnessed by district and sub-district officials and made into a news item. The remaining 10 boundary points, including the points between *Gampong* Lamklat and *Gampong* Lampasan that led to the conflict described in chapter 5, had proved more problematic and had not yet been resolved.

The mapping process in *Mukim* Lamteuba did not end up in conflict since the border points between the *Gampongs* were already clear before the start of the project. However, the mapping process is not yet completely finished either because there are still some disagreements about the exact borders between *Mukim* Lamteuba and some of its neighboring *Mukims*, such as *Mukim* Lampanah.[42]

---

[41] *Peusijuek* rituals are usually held by the community's religious leaders or village elders. The ritual is very common in rural Acehnese communities, and is held to obtain good luck. For example in starting a business, resolving disputes, building a new house, celebrating a graduation, etc. Source: http://id.wikipedia.org/wiki/Peusijuek. Viewed on 27-01-2015.

[42] *Mukim* Lamteuba wants to claim some of the land that is currently owned by *Mukim* Lampanah, which according to their elders belongs to *Mukim* Lamteuba. But *Mukim* Lampanah does not (yet) accept their claim.

The target date for the completion of the map of *Mukim* Siem was set at August of 2014. However, due to the existing problems, this did not prove to be feasible. YRBI has committed to proceed with its customary institution strengthening programme and participatory mapping activities until the maps are finished. How long this will exactly take is difficult to predict.

## 6.2. Trainings and discussions

Besides the facilitation during the participatory mapping process, YRBI also organised trainings, workshops, and discussions on participatory mapping and the strengthening of traditional institutions in *Mukim* Siem and *Mukim* Lamteuba. The activities were carried out in various places, for example at the YRBI office in Banda Aceh, in the *Mukim*'s Mosque, and in the village *meunasah*[43]. The discussions covered topics such as participatory mapping, setting standards in collaboration with the village community, and the empowerment of indigenous institutions and structures. The trainings and workshops taught community leaders about the revitalization of the *Tuha Peut* (representative council of the *Gampong* or *Mukim*), land rights and indigenous rights, the documentation of customary laws (*reusam)*, and reforestation. Also, field visits were made. YRBI also organised a training and discussion on the strengthening of the traditional institution of *Keujrun Blang*, and appointed a *Keujrun Ciek* in every *Gampong*.

The participants of the trainings, workshops, and discussion were predominantly staff members of the *Mukim* and *Gampong* governments, members of the *Tuha Peut*, and representatives from the youth groups. Only a small amount of women participated in the activities, namely the women that were already involved in government activities in *Mukim* Siem.

## 6.3. Reflection on the project activities

### *Reflections on participatory mapping*

Despite the fact that until now not all conflicts over boundaries could be resolved, the mapping process has already achieved some positive results for the communities. Most of the people in *Mukim* Siem and *Mukim* Lamteuba could already feel the benefits of the map, especially people living in the border areas between villages, who said they now felt safer on the land they live on because there is more clarity about the boundaries. Even though the maps are not yet completely finished, several villages have also already taken the maps into use. For example, by attaching it to a proposal to get a donation from PNMP[44], by attaching it in the *musrembang* proposals, and by using it as a reference to see which *Gampong* should handle the administration of, for example, a land-purchase. The map has also been used as lecture material by an undergraduate student from *Mukim* Siem.

[43] The *meunasah* is a traditional religious institution that plays an important part in community activities, e.g. holding community meetings, providing (religious) teachings, decision making, and the performance of marriage ceremonies. Source: http://www.thejakartapost.com/news/2005/01/19/meunasah039-play-strategic-role-life-acehnese.html# sthash.E9jy8HJX.dpuf. Viewed on 27-01-2015.

[44] PNPM Generasi is an innovative social assistance programme from the Indonesian government designed to address three lagging Millennium Development Goals: Maternal Health, Child Health, and Universal Education. Source: http://web.worldbank.org/WBSITE/EXTERNAL/NEWS/0,,contentMDK:23234251~menuPK:141311~pagePK:34370~piPK:34424~theSitePK:4607,00.html.

> *The map is very useful. The community or village can know their boundaries, and the children and grandchildren of our descendants will know clearly what is their land or the land inherited from their parents, and not to take land belonging to another person or village. With the mapping, the public will be more careful when opening the land for farming or plantations, lest the land is already owned by someone else (Informants from the focus group discussion with women in Mukim Lamteuba).*

YRBI has committed itself to finishing the mapping project with the final goal of submitting the map to the local government in order to claim the communities' rights over their indigenous land. Thus, when the maps are completed even more positive results may be achieved.

### *Reflections on the trainings, workshops, and discussions*

Even though the communities have attempted to apply the knowledge they gained from the trainings and discussion of YRBI, the results of these attempts are not yet satisfactory. Not yet all people understand the need to strengthen traditional institutions, and the need for property rights and customary land management. As a result *Mukim* Siem and *Mukim* Lamteuba have managed to revive the traditional institutions of the *Keujrun Blang*, and the Panglima Glie but have not yet managed to fully restore their previous function and authority. For example, the *Keujrun Cieks* cannot take care of the water and irrigation systems because conflicting governmental rules and regulations exist that prevent them from executing their tasks. Likewise, the authority to punish perpetrators of the rules of *blang* (for example by handing out fines to people whose livestock have damaged crops), is still held by the village head, even though according to custom this right belongs to the Panglima Glie. In order for the communities' attempts to apply the knowledge from YRBI's trainings and workshops to succeed, involvement and support will be needed from all layers of society.

### *Reflections on the distribution of benefits*

The group that most directly benefitted from YRBI's project were the community members with high positions. The trainings, workshops, and discussions were predominantly attended by *Mukim* and *Gampong* government officials, and other community leaders such as leaders of the youth groups. Because high positions are mostly held by the men in society, there were far less women than men among the direct beneficiaries of the project. However, some women were involved in the mapping process as part of the mapping team in *Mukim* Siem. YRBI has actively invited women and youth to participate in the mapping process, and has at least succeeded in involving many young people in the mapping process in both *Mukims*. Community members that were not involved in the project also benefitted from the project activities because knowledge was often informally transferred from the participants to the rest of the community, for example whilst enjoying a cup of coffee together in a local coffee shop. There were also some government staff members that took the opportunity to inform their community members about what they had learned at one of YRBI's events, during a meeting at the *meunasah.*

## 7. IMPACTS OF THE YRBI PROGRAMME

YRBI has empowered the *Mukim* governments by helping them to restore some of the traditional institutions: the Panglima Glie and the *Keujrun Blang Mukim*, including the appointment of its staff members: the *Keujrun Cieks*. However, these institutions aren't yet able to operate at their full potential. As such, real results with regard to forest preservation and sustainable natural resource management are not yet noticeable in the *Mukims*. Forest land is still being converted into plantations and fields, and illegal mining, often supported by the local apparatus, keeps taking place in the industrial forests. As a result, water sources keep reducing in number and size, and forest products such as wood and honey keep growing scarcer. The project has not (yet) managed to improve the attitudes of the communities towards the importance of the preservation of forests and natural resources. While the attitudes of the people of *Mukim* Lamteuba have pretty much stayed the same, the people of *Mukim* Siem, who are no longer solely reliant on the forest, have grown more apathetic towards their forests' and natural resources' sustainability over the past 2 years.

However, YRBI's project activities have made some other noticeable impacts on society. YRBI's participatory mapping project has helped the *Mukim* government to take control in solving some of the boundary disputes between its *Gampongs* (Siem), thereby restoring some feeling of safety and peace within the community.

Furthermore, YRBI has managed to enthuse and persuade people to start documenting their customary laws, customs, and traditions. Even though the wisdom documentation is still in process, it has given people hope that their culture and traditions will be preserved for the future. With regard to cultural resource management, the role of the *Mukim* government has continued to grow over the years, and has keep doing so during the period of the project.

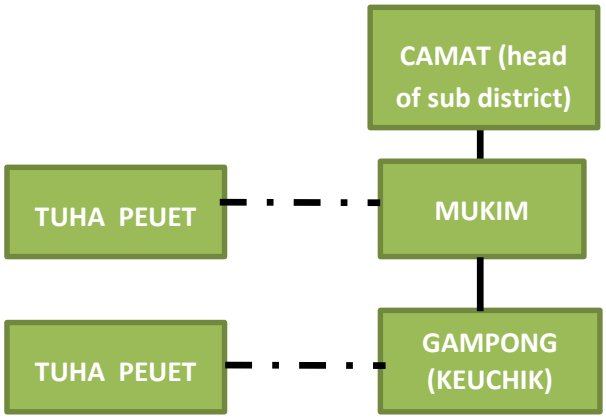
Lastly, the position of women within Siem's and Lamteuba's society also seems to have improved over the past years. Women enjoy more freedom, and are now able to become members of traditional government. Developments such as these are usually the result of many factors, and cannot be unilaterally attributed to the effects of YRBI's project.[45] However, anecdotal evidence -such as the example of the female leader that got re-assigned as member of the *Tuha Peut* after an NGO staff member educated the *Keucik* about the importance of the presence of women in governance structure- shows that present NGOs can make a difference. In the past 2 years, the government of *Mukim* Siem has also taken an active role in the empowerment of women by skilling them in the traditional art of corpse bathing.

With the *Mukim* government taking on more and more responsibilities over the past 2 years, the communities' support towards them has grown.

[45] And the concurrent existence of multiple NGOs working towards women emancipation in the region make it even more difficult to distinguish the real contribution of YRBI in this regard.

## APPENDIX A: The Profile of Mukim and Gampong

Historically, Aceh has its own mechanism in the implementation of government administration and development based on norms influenced by Islam. In the past there were five main institutions in the kingdom in Aceh, i.e



(1) **Sultan**: ruler / king of Aceh Sultanate
(2) **Panglima Sagoe**: leader of Mukim federation during the reign of Aceh sultanate in Aceh Besar (*Sagoe Nukim*/ *Aceh lhee Sagoe*)
(3) **Ulee Balang**: a royal family member in Aceh community who leads a *Kenegerian* or *Nanggroë,* which is an area at district level of Indonesian current governmental structure. *Ulee balang* is awarded with customary title of *Teuku* for male and *Cut* for female.
(4) **Imeum Mukim**: administration head of *Mukim*, who governs several *Gampongs*
(5) **Keucik**: Head of *Gampong* or village, who governs the village and is master of all administration management in the village.

Hence, traditionally, *Mukim* was considered as one of the most important institutions in Aceh playing a role in both the administration and in the implementation of customary rules and traditions. Under the New Order regime, the *Mukim* institution was weakened as a repercussion of modernization and centralization of power. As a result of Law No. 5/1979 about the Village Administration, the role of *Mukims* was reduced to only represent a customary institution without any role in administration.

After the collapse of the New Order regime in 1998, the Special Autonomy Law of 2001 made it possible for the province of Nanggroe Aceh Darussalam Province (NAD) to revitalize traditional *adat* institutions including the role of *Mukims* in governance through the enactment of a series of *Qanuns* or local laws: *Qanun* No. 4/2003 on *Mukim* Administration acknowledged *Mukims* as a government and custom institution. This was later reaffirmed by *Qanun* No. 11/2006 on the Aceh Administration. *Qanun* No. 9/2008 on the Development of Custom Life specified the regulations on the role of the *Mukims* in the completion of legal action or dispute at *Mukim* level.

*Qanun* No. 4/2003 on *Mukim* administration and *Qanun* No. 5/2003 on *Gampong* administration defined *Mukim* as the governmental unit in NAD Province, which consists of several *Gampongs* with certain boundaries and its own property; and holds position directly under the *Camat* (head of subdistrict). At the same time, *Gampong* is defined as governmental unit under *Mukim* and led by a *Keuchik*; and it has the right to conduct its own domestic affairs. Article 3 of *Qanun* No. 4/2003 acknowledges that *Mukims* have duties to govern, to implement development, to develop community and increase the implementation of Syari'at Islam. In order to reinforce the role of *Mukims*, the government of Aceh Besar established the *Qanun* No. 8/2009 on *Mukim* Administration.

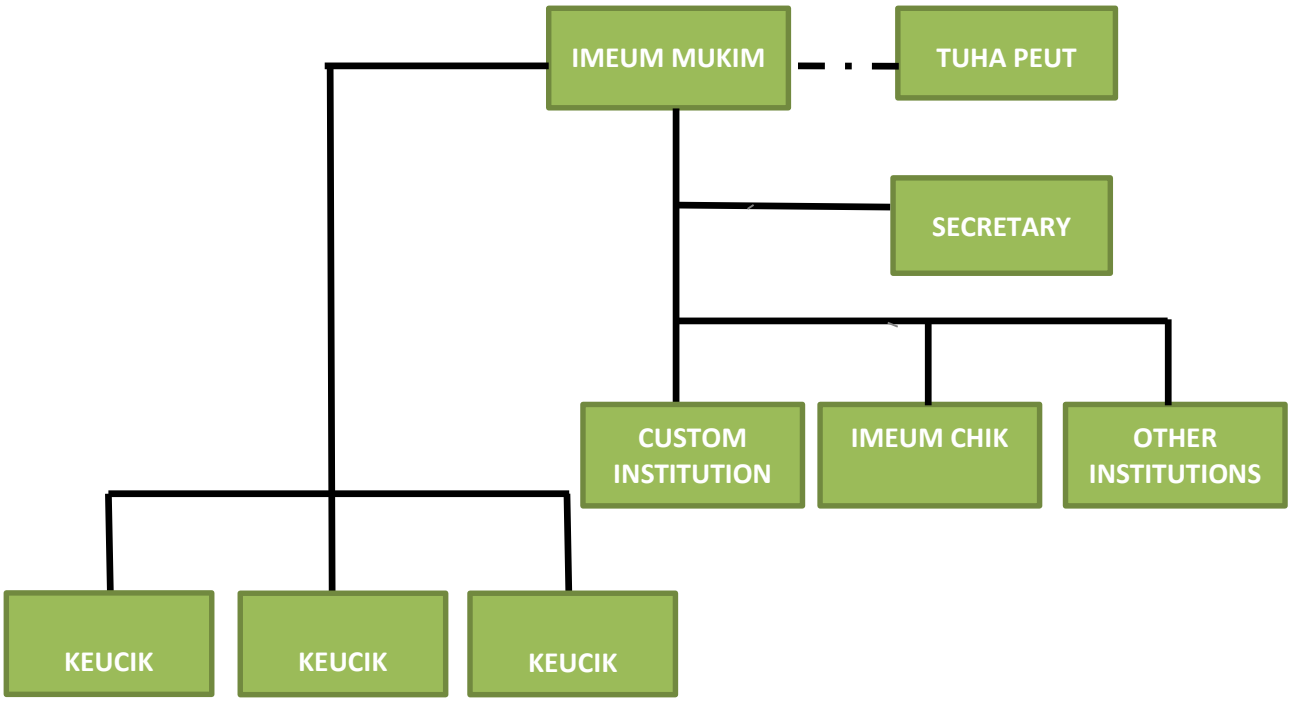


**Figure 3: Mukim in hierarchy of government structure**

The *Qanun* on *Mukim* administration explained that *Mukim* is led by an *Imuem Mukim*, who is elected by a *Mukim* meeting and legalized by the Bupati (head of district). According to the *Qanun* of Aceh Besar District No. 8/2009, the structure of governance in the *Mukim* consists of: [46]

- Imuem Mukim
- Secretary of Mukim
- Mukim Deliberation Committee / Majelis Musyawarah Mukim
- The completion of customary in Mukim / Penyelesaian Perselisihan Adat Mukim
- Imeum Chiek

**Figure 4: Mukim's Structure**

[46] Please check the List of terms at the end of this document to see the description and function of this institution.

Figure 4 describes the *Mukim* governance structure of *Mukim* Siem based on information from the *Imeum Mukim* of Siem (Asnawi Zainun). Almost all lines are command lines, except for *Tuha Peut*, which has coordination line. *Tuha Peut* has several roles in community: one of its roles is to maintain community's tradition and culture, habit, and local culture; another one is to supervise the performance of the *Mukim*. The custom institutions mentioned above in the *Mukim* structure are *keujreun blang*[47], *panglima uteun* or *panglima glie*[48], *panglima laot*[49], etc. While others institutions are formed according to the needs in each *Mukim*. For example, *Mukim* Siem has a youth institution and LPTQ[50]. In some mukims, the position of *Imuem Chiek* is at the same level with *Imuem Mukim*, but in general *Imuem Chiek* is under the command line of *Imuem Mukim*.

One aspect of *Mukim* governance that has been revived is its role in dispute resolution. According to the customary law, there are some levels of settlement: if a dispute or problem arises, kinship approach usually comes first to solve the problems; dispute resolution will only extend to the *Keucik* if it has not been solved at the kinship level, in which case he will give advice to finish the problem in peace; if the problem cannot be resolved at this level, it will be brought to *Meunasah*, where the customary law is applied; if it is still not solved, the *Imuem Mukim* will try to find solution, through the customary law. Only after all these stages of problem resolution have proved to be unsuccessful, is the problem reported to the police. In addition to the *Mukim*'s role in dispute resolution, *Mukims* also serve as a mouthpiece between *Gampongs* and the subdistrict.

According to *Qanun* of Aceh Besar No. 8/2009 regarding Mukim Governance Chapter II section 5 article 1, *Mukim* has an authority to supervise the ecological life as well as to manage the natural sources in their area.

Considering the enormities of community's expectation to restore mukim's role in government and custom in people's life in *Mukim* Siem, the community had done many efforts to revitalize it. Land purchase and sale, for instance, requires a signature of the *Imeum Mukim* before the contract is submitted to the sub-district.

Even though the law of *Mukim* existence is powerful, it does not mean that the functions of the *Mukim* can be easily implemented. On the one hand, the long reduced functionality of *Mukims* has resulted in some loss of knowledge. On the other hand, the functioning of *Mukims* is severely affected by the lack of support from the federal government in both moral and material grounds (such as budget, office building, facilities and infrastructure, as well as incentives for *Mukim* activities). As a consequence, despite the revitalization efforts, a decline in *Mukim* fuction can be observed in the society.

[47] Keujreun Blang is the customary leader regarding management of irrigation, planting time, harvest time, giving instruction for farmers, and solving land conflict.

[48] Pawang glie or Pawang Uteun is the head of custom who governs the management of community forest, either the timber or non-timber forest products (honey, rambung sap, bird nests, rattan, resin, etc), meurusa, picking up wasee glee, providing adivise/instruction regarding forest management, and solving conflicts of glee law violation.

[49] Panglima Laot is the customary leader regarding management of fishing, giving instruction for the fishermen, and solving conflict amongst the fishermen.

[50] LPTQ (Al-qur'an Recital foundation/Tilawatil Qur'an) a foundation with interest in encouraging the moslems to study and memorize Al-Quran as well as to practice the messages of Al-quran in the middle of Aceh community.

## APPENDIX B: LIST OF TERMS

**Imeum Mukim**: administration head of Mukim, who governs several Gampongs.

**Keucik**: Head of Gampong, who governs a gampong and master all administration management in Gampong.

**Keujreun Blang**: customary leader regarding management of irrigation, planting time, harvest time, giving instruction for farmers, and solving land conflict.

**LPTQ** (Al-qur'an Recital foundation/Tilawatil Qur'an): a foundation with interest in encouraging the moslems to study and memorize Al-Quran as well as to practice the messages of Al-quran in the middle of Aceh community.

**Meunasah:** a worship place and a place to study and have gatherings for the islamic community, particularly those in rural area of Aceh. Meunasah is derived from arabic (madrasah), which means a place to gather and to attain knowledge as well as a place for the community to have discussion.

**Muspika**: discussion amongst leaders in sub-district which is attended by sub-district head/Camat, commander of *koramil* (Danramil), and head of police sector (Kapolsek).

**Panglima Laot**: customary leader regarding management of fishing, giving instruction for the fishermen, and solving conflict amongst the fishermen.

**Panglima Sagoe**: leader of Mukim federation during the reign of Aceh sultanate in Aceh Besar (Sagoe Mukim/ Aceh lhee Sagoe)

**Pawang Glie** or **Pawang Uteun**: head of custom who governs the management of community forest, either the timber or non-timber forest products (honey, rambung sap, bird nests, rattan, resin, etc), *meurusa*, picking up *wasee glee*, providing adivise/instruction regarding forest management, and solving conflicts of glee law violation.

**Qanun**: local government regulations which governs government administration and community life of Aceh Province.

**Reusam**: customary law/regulation at gampong level which is aplied in Aceh.

**Sultan**: ruler / king of Aceh Sultanate

**Tuha Peut Inoeng:** representative group for women that represents women's aspiration in community.

**Ulee Balang**: a royal family member in Aceh community who leads a Kenegerian or Nanggroë, that is an area at district level of Indonesian current governmental structure. Ulee Balang is awarded with customary title of Teuku for male, while Cut for female.

# Annex VII. Literature review on participatory mapping[51]

## *Introduction*

Even though the existence of participatory mapping activities is very important in a country like Indonesia where an estimated 48 million indigenous people still depend on the forest for their livelihood, but where mining, logging and oil palm industry are destroying more than 1 million hectares of rainforest territory each year[52] (Telapak & Gekko Studio 2011), the academic literature on participatory mapping within specific Indonesian context is quite limited. This may, at least in part, have to do with the political sensitivities involved in mapping, that can be especially critical for Indonesian indigenous peoples that have since long had a particularly uneasy relation with government and, until very recently, had to cope with a severe lack of legal protection. Luckily, a lot of additional information can be found in manuals, project evaluations, working papers, and online blogs, tutorial videos, etc. which are most often published in more recent years by the international organisations that implement the mapping projects in Indonesia. This literature review therefore draws on academic literature on participatory mapping both within and without Indonesian context, as well as other (mostly online) sources that are more specifically focused on mapping projects undertaken in Indonesia or Southeast Asia. It will cover the following topics: What is participatory mapping, what tools and methods are used, history and development of participatory mapping, reported impacts, and considerations about "good practice".

## *What is participatory mapping?*

Participatory mapping is a general term[53] used to define a set of approaches and techniques that combine the tools of modern cartography with participatory methods to create a map of a local community's habitat that represents this community's spatial knowledge (Rainforest Foundation UK 2014). "NGO's, from small local ones to large international ones, often play a crucial role as interlocutors, trainers, advocates and facilitators in these mapping activities" (IFAD 2009: 5).

Participatory mapping is used over the whole world, and the maps that are produced can take on many forms, and can be used to achieve various different purposes. Looking at the available literature and documentation on participatory mapping initiatives the most common aim of participatory mapping appears to be to help marginalized groups, in particular indigenous, pastoralist and forest dwellers, to claim and/or defend their (access to) ancestral lands and its resources, typically by working towards legal recognition of their land rights, using the maps as evidence of their continued residency. The maps can also serve as a tool for community land use planning and natural resource management, and can be used to bring resource-related problems, such as the impacts of logging, mining, and 'land grab' activities, to the attention of governmental authorities and decision makers

[51] Please note beforehand that part of this text has been taken over into the main text of the report. In addition, this annex is also included as annex in MDG projects E2, E3 and E9.

[52] Making Indonesia the fastest forest clearing nation in the world since 2012, and also the world's third largest emitter of carbon dioxide emissions, behind China and the United States (Telapak & Gekko Studio 2011).

[53] The numerous initiatives throughout the world aren't always referred to with the words 'participatory mapping', but can go by many different terms, including: "indigenous mapping" (IFAD 2009: 6) , "…"participatory land use mapping," "participatory resource mapping" (Mbile *et al*. 2003), "community mapping" (Bennagen & Royo 2000, Eghenter 2000, Fox 2002), "community-based mapping" (Flavelle 2002), "ethnocartography" (Chapin & Threlkeld 2001, Gonzalez *et al*. 1995), and "counter-mapping" (Peluso 1995, Kosek 1998, Hodgson & Schroeder 2002)…" (as cited in Chapin *et al*. 2005: 622-623).

(Chapin *et al*. 2005: 620; Di Gessa 2008; Rainforest Foundation UK 2014; Literat 2013: 200; IFAD 2009: 9-12, 39). Some indigenous groups are now using mapping to monitor and defend lands against deforestation, illegal timber extraction, prospecting, and colonization (Teague c. 2010: 10). Other purposes of participatory mapping activities include the strengthening of indigenous political organisation, economic development planning, the documentation of history and customs for culture preservation, education of indigenous youths and/or the general public (Chapin *et al*. 2005: 620), and support for conflict resolution in territory-related disputes (Di Gessa 2008).

Participatory mapping processes in general don't follow usual cartographic conventions. The maps that are produced often represent a socially or culturally distinct understanding of landscape and include information that is excluded from mainstream or official maps. The aim is to create a map that depicts local knowledge about the environment, and represents and serves the agenda of the community (IFAD 2009: 7). Participatory maps can present spatial information at various scales, from detailed information of village layout and infrastructure, to a more general depiction of large areas. Elements that can be included in a map are for instance: territorial land boundaries, land-use occupancy, hunting- fishing- and gathering grounds, the location/distribution of flora and fauna, important landmarks such as rivers, caves, roads, and location of houses, but also information on rainfall patterns, health patterns, wealth distributions, etc. Furthermore, the maps can depict places of social, cultural and/or historical significance, such as ancestral burial grounds, sacred areas, cultural sites and trails, and information on cultural customs, traditions, and mythology (IFAD 2009: 6-7).

What further distinguishes participatory mapping from traditional cartography and map-making is the process by which the maps are made (IFAD 2009: 4): Community members are involved (preferably) throughout the whole mapping process and recognized as capable research collaborators and experts on their own local surroundings and needs (IFAD 2009: 4; Pathways Through Participation 2010: 1). According to Fox *et al*. (2003, as cited in Wright *et al*. 2009: 261) the reasons for choosing a participatory mapping approach are usually not only practical (i.e. the actual production of the map and using it as evidence for land claims, or as community advocacy tools), but also intrinsic, as the communal aspect of the mapping process can enhance group awareness and cultural identity, facilitate the passing down of historical knowledge through generations, and build trust and communication between people.

### *Tools and methods*

Participatory mapping uses a range of tools and methods, of which some of the principles ones are:

**"hands on mapping"**, which is a basic method in which the community draws a map from memory on the ground (also called "ground mapping") or on paper (also called "sketch mapping");

**"Participatory mapping using scale maps and images"**, where local knowledge and information is added to a pre-existing image (such as an aerial or satellite image);

**"Participatory 3-D modelling (P3DM)"**, which is used for hilly or mountainous areas. Layers of elevation are cut out of cardboard in the shape and contours of the landscape and placed on top of each other, after which paint, pins and strings are used to show surface information and to indicate boundaries and conflict areas. Data depicted on such a 3-D model can also be extracted, digitized and incorporated into a Geographical Information System (GIS);

**"GPS based field mapping"**, in which geographical reference points of boundaries, landmarks, etc. are collected and are put on top of a map, often using GIS to store, retrieve and analyse the GPS data;

**"Computer based map making"**, where graphic software (such as Adobe Illustrator) and GIS are used to make geographically accurate maps, and;
**"Multimedia and internet-based mapping"**, which draws on Web 2.0 technology to create interactive, computer based maps that contain links to digital video, pictures, audio and written text (Pathways Through Participation 2010: 4). This increasingly popular method, makes it better possible to document the complexities and the oral and visual aspects of local knowledge (Di Gessa 2008: 6-9; IFAD 2009: 13-19; Rainforest Foundation UK 2011).[54]

The choice of methods to be used in a participatory mapping project is determined by many factors, such as the problems the community is facing and wants to resolve, the available resources (financial, and in terms of staff and equipment), and the community's physical context (is it hilly or plain) (IFAD 2009: 13) as well as its cultural context (norms, values, customs) (Rainforest Foundation UK 2011).

### *History and development*

#### Over the world

Local people have been drawing maps of their territories to develop a sense of place and identity for centuries (Pathways Through Participation 2010: 2). However, mapping of indigenous lands as a participatory exercise and a means for "securing tenure, managing natural resources, and strengthening cultures", often facilitated by outsiders, is a more recent phenomenon (Chapin *et al*. 2005: 619).

According to Chapin *et al.* the first participatory mapping exercises started in Canada and Alaska in the 1960's (2005: 619). The rest of the world only followed much later, approximately 25-30 years ago, when participatory mapping projects started to rapidly proliferate from Southeast Asia through Central Asia, Africa, Europe, North-, South- and Central America to Australasia (IFAD 2009: 7).

"In the development literature, mapping is identified as having many different sources – from social anthropology to participatory action research and popular education" (Pathways Through Participation 2010: 2). Throughout the years, mapping has become increasingly popular and prominent (Ibid: 13), which "many commentators ascribe to the developments in Participatory Rural Appraisal (PRA) which emerged in the late 1980s in South Asia and combined insights from agro-ecosystem analysis with Rapid Rural Appraisal (RRA)" (Ibid: 2).

"The more technically oriented participatory mapping work began filling the field in the mid- and late 1990s, when computerized mapping technology became more widely available" (Chapin *et al*. 2005: 623). "Those engaged in participatory mapping are increasingly taking advantage of new, digital and web-based Technologies" (Teague c. 2010: 13), which are being developed and improved by large corporations such as Google (Google Maps and Google Earth), ESRI (developers of the principal GIS used word-wide) and Garmin (producer of GPS hardware and software) especially for this purpose (Teague c. 2010: 13).

[54] More information on the different methodologies and their advantages, disadvantages, ways of implementation, suitable contexts, etc. can be found in the manuals of IFAD (2009) and Di Gessa (2008). For additional information on participatory 3-D modelling in specific also see Vandergeest (1996), Rubiano *et al.* (1997), Rambaldi & Callosa-Tarr (2000), Flavelle (2002), Hoare *et al.* (2002), De Vera *et al*. (2003), and Rhoades & Moates (2003) (as cited in Chapin *et al.* 2005: 623)

**In Indonesia**

According to Peluso early forms of participatory mapping entered Indonesia in the 1980s via conventional (eco) conservation projects by international organisations such as the World Wildlife Fund (WWF), after which Indonesian activists took the opportunity to "… reinterpret this kind of mapping as a sort of resistance and counter-movement to state mapping, which did not consider people's rights but instead was a basis for exploitive development projects under the Suharto regime" (1995: 398-400, as cited in Hartjati Sanmukri 2013: 123).

Over the past 1.5 decade, communities from nearly every region in Indonesia have been trained in the technical and facilitation skills required to undertake participatory mapping, and by 2009 1.5 million hectares of land had already been mapped by local communities (IFAD 2009: 22). The Indonesian community mapping network (Jaringan Kerja Pemetaan Partisipatif or JKPP), established by the mapping activists in 1996 in Bogor, West Java, has been instrumental in achieving these goals (IFAD 2009: 22). I.a. by forming an alliance with AMAN and the Forest Watch Indonesia to advocate for the customary maps to become officially recognized and fed into the "Ancestral Domain Registration Agency" (Badan Registrasi Wilayah Adat): The government's official national database of forest cover. In 2011 AMAN signed an MoU with the National Land Agency (Badan Pertanahan Nasional), which officially stated that "indigenous" maps would be integrated into governmental data (Hartjati Sanmukri 2013: 123).

On May 16'th 2013 another important milestone for the recognition of indigenous peoples' ancestral land rights was reached, when – in response to a petition of AMAN - the constitutional court in Jakarta ruled that the customary forests of indigenous peoples should no longer be classed as falling in "State Forest Areas"[55] (Forest Peoples Programme 2013), officially giving customary forest its own status and position in the Forestry Law, and - at least in theory - returning the rights over the customary forests (seized by the state through UUK[56]) to its indigenous inhabitants (REDD-Monitor 2013). This development could greatly enhance the success rate of indigenous people's endeavours to lay claims to their lands and thereby protect their sources of livelihood in the future.

### *Reported impacts of participatory mapping*

Over the years, many researchers have noted the positive impacts that participatory mapping can have on a community:

> *Participation in mapping seems to have encouraged some indigenous communities to demand title to lands (Toledo Maya Cultural Council, 1997; Leake, 2000; Herlihy, 2003; Herlihy and Knapp, 2003), to defend and claim their rights to control natural resources (Smith, 2003; Brown, 2006), and to design conservation and resource management plans that are compatible with local practices (Mohamed and Ventura, 2000; McCall and Minang, 2005; Brown, 2006; Bauer, 2009). Researchers have argued that, in addition to producing maps, when implemented with a stress on participation and with facilitation of discussions within communities, indigenous mapping empowers indigenous peoples in land and resource use*

[55] The petition of AMAN (*Aliansi Masyarakat Adat Nusantara*), which was filed with the court some 14 months before the ruling, objected to the way the 1999 Forestry Act treats indigenous peoples' 'customary forests' as providing only weak use-rights within State Forest Areas" (Forest Peoples Programme 2013)

[56] UUK is the abbreviation for Undang-Undang Kehutanan: Act No. 41/1999 on Forestry, saying: "customary forest is STATE FOREST in indigenous territory" (IWGIA 2013). The new ruling has replaced this law.

*rights against potential encroachers (Poole, 2003; Smith, 2003; Brown, 2006; Finley-Brook, 2007) (Reyes-Garcia et al. ca. 2012a: 2-3).*

In addition to these positive effects, researchers have also observed negative consequences resulting from participatory mapping. For instance, Authors such as Mwangi, Hodgson & Schroeder, Fox, Bryant, and Roth have noted issues such as increased privatization of land, loss of indigenous conceptions of space, greater exposure of valuable natural resources, increased taxation by the state, and increase or intensification of conflicts, either within the village, with neighbouring villages, or with other external actors such as companies or governmental authorities (Reyes-Garcia *et al*. 2012b: 651). Increase of conflicts due to participatory mapping, is one of the most frequently reported drawbacks of participatory mapping. Researchers such as Offen, Peluso, Hale, and Vandergeest have argued that: "Participatory mapping might intensify internal conflicts because it might bring to light overlapping uses of land and resources or erode traditional ways of dealing with internal conflicts…" (Ibid). Furthermore, it has been reasoned by i.a. Peluso and Rundstrom that "…participatory mapping might increase the number of conflicts with external actors, as the maps produced might challenge the maps made by state and corporate authorities" (Ibid).

Reyes-Garcia *et al*. have attempted to validate the theory that participatory mapping systematically increases the number of conflicts, using an experimental research design whereby 32 native Amazonian villages with and without conflicts with outsiders were randomly assigned to a treatment group (those where a participatory mapping project would be implemented by them) and a control group (those where a participatory mapping project would not (yet) be implemented by them[57]).[58] Contrary to others' previous findings, the results of their research show no statistically significant differences in the measured variables (i.e. number of conflicts, negative opinion, neutral attitude, and negative attitudes towards outsiders) between treatment and control villages (2012b: 656).

Reyes-Garcia *et al*. explain their deviating results by arguing that previous studies, which were based on direct observations rather than a randomized experimental design, might have been subject to selection bias, because the villages participating in participatory mapping projects are generally the ones that are chosen or volunteering to participate in participatory mapping due to the fact that they are expected to experience – or are already experiencing – conflicts over land rights and resources (2012b: 651, 656). Their results support the argument that mapping projects do not bring about conflicts per se, rather "…the process and the results of participatory mapping can help in conflict resolution or contribute to conflict generation or exacerbation depending on the political and socio-economic context in which they are conducted" (Ibid: 657).

[57] For the sake of fairness, participatory mapping projects were also implemented in the control villages, but only after all research data for the post-intervention study had been collected (Reyes-Garcia *et al.* 2012b: 653).

[58] All these villages were located in Tsimane' territory. The Tsimane' are a native Amazonian society of foragers and farmers in Bolivia.

## *Good practice*

### How to organise a mapping process

Considerations on how to successfully undertake a participatory mapping programme, in part focus on the question of "what constitutes as an ideal way to organise a mapping process". There are many philosophical and technical differences in implementing participatory mapping initiatives, and the fact that they are carried out in many different settings, makes it impossible to distinguish a single definitive blueprint process that proves successful regardless of context (Di Gessa 2008: 2; IFAD 2009: 30). It is, however, generally agreed upon that a structured approach to the mapping process is necessary for it to succeed.

In this regard, the International Fund for Agricultural Development (IFAD 2009) identified some broad steps that are typically adopted in the deployment of participatory mapping initiatives, i.e.: Preparing the community for the mapping activity; Determining the purpose(s) of making a map; Collecting information; Creating the map and determining the legend; Analysing and evaluating the information, and; Using and communicating the community's spatial information (IFAD 2009: 32-38). These steps correspond with Chapin & Threlkeld's "ethnocartography model": a coherent and structured methodology that provides a 6 step approach to the process of mapping indigenous lands. According to the IFAD (2009: 32) most mapping projects loosely follow the steps of this approach, which entail: 1. "**ground preparation**: before the project starts project leaders and indigenous leaders explain the objectives and importance of the mapping work to the community, the technical team is recruited and collaboration with NGO's and government agencies is sought; 2. **First workshop – orientation and training**: Project staff and indigenous leaders explain the objectives and methodology to the surveyors and technical team and data collection tools are developed; 3. **First fieldwork – gathering data and sketch mapping**; 4. **Second workshop – transcription of data onto new maps**; 5. **Second fieldwork – verification of collected data by the community**, and; 6. **Third workshop – correcting and completing final maps**: Surveyors reunite with the cartographers to incorporate information that has been verified in the field and put the draft maps in final form (Chapin & Threlkeld 2001; IFAD 2009: 30).

### Ethical considerations

In one of his later works, Chapin points out that in the past guidebooks about participatory mapping that have grown out of work in Southeast Asia, have focused mostly on the technical aspects of mapping, avoiding the more politically sensitive aspects and ethical considerations brought along by the mapping.[59] The first manual to actually focus on these matters within Indonesian context was "Mapping people's forests: the role of mapping in planning community-based management of conservation areas in Indonesia" by C. Eghenter in 2000 (Chapin *et al*. 2005: 627). Over the years the focus on ethical considerations about potential negative consequences of mapping and the moral responsibilities of the project instigators towards the communities that partake in the mapping projects has become more pronounced. More and more authors broach these kinds of issues in their articles, books and manuals, even if only in afterthought.

[59] Examples of these "technical" guidebooks on participatory mapping are: Drawing on Local Knowledge: A Community Mapping Training Manual (Momberg *et al*. 1995); Mapping Our Land (Flavelle 2002); and Manual on Participatory 3-Dimensional Modelling (Rambaldi & Callosa-Tarr 2000) (as cited in Chapin *et al*. 2005: 627).

In the literature, a prominent topic with regard to "ethical practice" is that of "empowerment". Projects should be dedicated to achieving community empowerment, meaning that cartographers should focus on teaching the indigenous people how to read, interpret, produce and use maps, and should let them take as much control and responsibility over the mapping process as possible, thereby ensuring that the community will also be able to update their map and develop their own map-use strategies after the project has finished (Chapin & Threlkeld 2001: 128; Di Gessa 2008: 15; IFAD 2009: 25). Good practice, in this regard, also (perversely) means that mappers sometimes have to deliberately disregard or simplify available technologies to make sure the community will be able to access, understand and use them in the future without outside help (Chapin *et al.* 2005: 259; Di Gessa 2008: 5). Ownership rights should also belong to the community itself, enabling them to protect their own interests by deciding for themselves which data they want to publicly disclose, and which (potentially sensitive) data they want to keep private (Chapin & Threlkeld 2001: 134; IFAD 2009: 27-28).

According to i.a. Chapin & Threlkeld (2001) and Teague c. (2010), good practice in participatory mapping exercises also requires a culturally sensitive approach on the part of the international project instigators (NGO's, CBO's, etc.) and staff involved in the mapping process. They should make an effort to view the world from the eyes of the indigenous community, respecting and prioritizing the community's needs, and "carefully considering the challenges inherent in translating indigenous knowledge (which is often based on different epistemologies and conceptions of space and time than their own) into Western Cartesian cartographic formats" (Teague c. 2010: 15). For instance, knowledge about boundaries can easily be misrepresented as indigenous peoples often have a "fluid sense" of their borders, which can be overlapping, incomplete, shifting and/or dependent on seasonal variations (Chapin & Threlkeld 2001: 133)

Another topic that is quite extensively covered in the literature is the project initiators' (perceived) ethical responsibility to ensure that the benefits of the participatory mapping exercise are evenly felt throughout the community. It is deemed important that the map should represent the views and wishes of all the different groups within the community, and consequently many authors highlight the fact that special effort should be put into making sure that the map reflects the perceptions and needs of (potentially) marginalized groups, such as women, the elderly, youth, or immigrants (Chapin & Threlkeld 2001: 127; IFAD 2009: 27-28). Furthermore, it is thought important that members of all groups (and not only the village elite) are encouraged to participate in the actual mapping process, among other things to make sure that pre-existing power structures favouring certain groups' access to land are not reinforced (Teague c. 2010: 14), and to prevent new power imbalances between the people that know how to use the advanced technology, and those who don't (Wright *et al*. 2009: 260). Conversely, authors such as Mei-Po Kwan and Diane Rocheleau, who write from a feminist perspective, note the importance of taking into consideration and addressing the disrupting effect that mapping can have on existing gender relations (Teague c. 2010: 14).

An interesting development is that, over the past years, a special interest seems to be taken in the issue of "who controls GIS and with what power" (Spiegel *et al*. 2012: 345). Authors such as Chapin *et al.* (2005), Di Gessa (2008), Spiegel *et al*. (2012), Teague (c. 2010), and Wright *et al*. (2009) raise concerns on how skill levels needed for the handling of GIS are often gendered and age based (Teague c. 2010: 13), and on how a lack of electricity and internet access in remote communities and the cost of the equipment, causes the knowledge and handling of the GIS technology and/or the processing of the

GPS data to remain outside of the community, in the hands of a small - already privileged - elite of experts, thus enhancing existing power structures (Chapin *et al.* 2005: 629; Di Gessa 2008: 14-15).

Other topics on "good practice" in participatory mapping that are less pronounced but still present in the literature are: The importance of ensuring the long term commitment and support to initiatives of external parties (NGO's, CBO's, universities, development partners, etc.) (IFAD 2009: 25); A good selection of the mapping team. For instance: Chapin & Threlkeld have provided a list of desirable characteristics for facilitators (2001: 127), and lastly; The responsibility to make the local community aware of potential risks of mapping (such as boundary conflicts, risks of documenting sensitive information) before the start of the activities, and to put an effort into mitigating negative impacts that occur in the wake of the process (Di Gessa 2008: 1,3; IFAD 2009: 28-29).

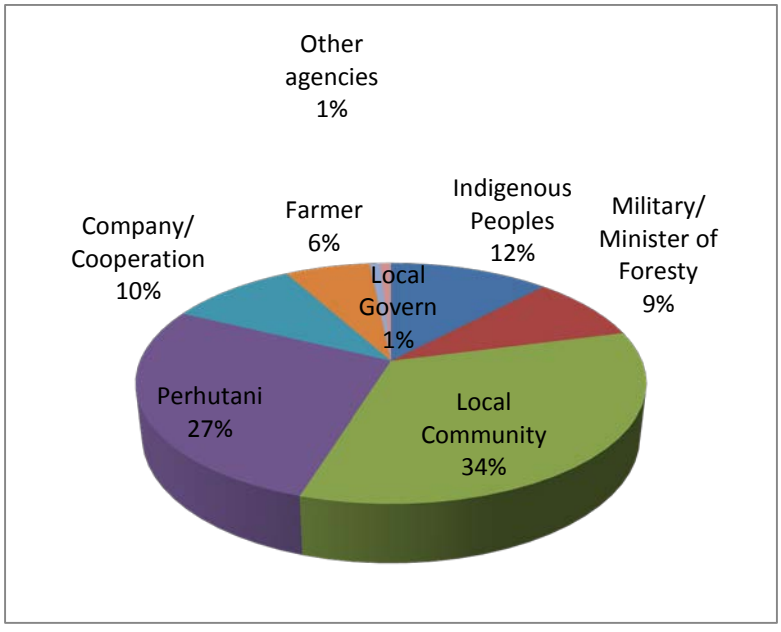
# 1. Introduction



## 1.1. Project context

Community empowerment programmes for indigenous communities are very important in a country like Indonesia where an estimated 48 million indigenous people still depend on the forest for their livelihood, but where mining, logging and oil palm industry are destroying more than 1 million hectares of rainforest territory each year (Telapak & Gekko Studio 2011).

According to Konsorsium Pembaruan Agraria (KPA, Consortium for Agrarian Reform), as quoted by Mustofa (2012), there were 163 land-right related conflict incidents in Indonesia in 2011. The number increased quite significantly from 106 conflict incidents in 2010. In terms of casualties, there were about 22 farmers/villagers who died in the conflicting issues and areas. The conflict involved more than 69,975 families, with approximately about 472,948 hectares of land. Of the 163 cases, there were 97 plantation cases (60%), 36 forestry cases (22%), and 1 case of coastal area (1%). Looking at the distribution of violent incidents, most agrarian cases took place in East Java (36), North Sumatera (25), Southeast Sulawesi (15), Central Java (12), Jambi (11), Riau (10), South Sumatera (9), Lampung (5), and the rest dispersed in many provinces of Indonesia.

According to Association for Community and Ecologic-Based Law Reform (HuMa), from 110 agrarian cases, it was about 2.7 million hectares of land which became the object of dispute, involving government and corporations as the main players. Aliansi Masyarakat Adat Nusantara (Alliance of Indigenous Movement in the Archipelago, AMAN) notes that in 2011 there were various kinds of human rights violations towards indigenous people, including criminalization and arresting some of its activists.

**Figure 1: Types of forestry conflicts**

Source: HuMa (2011)

In data compiled by HuMa in 2011, about 46% of forestry conflict has involved indigenous and local communities against outsiders due to many reasons, see Figure 1. In most of the cases, conflict exploded because forest communities' land and territory were grabbed by outsiders without consent or even consultation with communities.

With all these data as the backdrop, it is important to strengthen the security of communities' rights and justice and justice on land and natural resources tenure. As also indicated in Figure 1, the Ministry of Forestry and Perhutani (a state-owned forestry company) are the main parties involved in conflicts along with companies/cooperatives. It is also important to notice that following the changing political system from authoritarian to a (more) democratic one, a new policy of decentralization has also been implemented, which transfers authority from central to local government. Thus, dispute between national and local governments sometimes happens.

Differences of interest may lead to further disputes and conflicts in the future. Nonetheless, a major victory for the rights' of indigenous communities was achieved in May 2013, when the constitutional court in Jakarta ruled that the customary forests of indigenous peoples should no longer be classed as falling in 'State Forest Areas' paving the way for a wider recognition of indigenous peoples' rights all over Indonesia (Forest Peoples Programme 2013). However, in reality, it turns out that the implementation of these new policies is problematic, as it is often difficult for the indigenous people to effectively prove their claims to ancestral lands on their own, and political dynamics (the frequent turnover of persons in charge of in the local government) often hinders the implementation of the policies.

Therefore, indigenous communities are in the need of outside help evermore to promote their cases. HuMa is one of the organisations: through its nationwide network, HuMa seeks to empower communities' rights through holding training on customary law and legal pluralism so that people have legal instrument to defend their rights.

Working together with Wallacea, a local Non-Governmental Organisation (NGO) partner based in Palopo, HuMa developed a programme in Rampi sub-district (in South Sulawesi province). Rampi is a buffer ecological zone which contains the sources of clean water for three provinces, namely West Sulawesi, Central Sulawesi and South Sulawesi. Rampi also consists of some indigenous communities which still apply customary law in their daily life: customary law mechanism is used to resolve cases instead of legal process. However, some outsider groups attempted to make use of its rich natural resources by neglecting customary law. Thus, HuMa seeks to empower local people by holding training on customary law and legal pluralism to empower people with a legal instrument for the defending their rights. HuMa also attempts to set up local regulations and promoting deliberative process to avoid harm and conflict to happen as a consequence of development activities. By carrying out empowerment programmes and promoting local capacities on the ground, like participatory mapping, community law facilitators (PHR), and trainings on sustainable natural resource management, it is expected to pave the way to increase pressure on changing local and national natural resource policy toward (more) democracy and (more) respect for human rights.

## 1.2. Evaluation objectives

This report evaluates 'The Security of Strengthening Communities Rights and Justice' project[1] of the Association for Community and Ecologic-Based Law Reform (HuMa) with funding from ICCO as part of the MFS II evaluation for Indonesia under the Achievement of Millennium Development Goals (MDG) component. The project works on the goals on Good Governance and Civil Society Building and on the Millennium Development Goals on sustainable living environment, forests and biodiversity (MDG 7a and 7b). For the evaluation, the project's achievements in relation to the Good Governance theme were selected. However, objectives related to sustainable living environment are also partially assessed. In particular, the current evaluation focusses on the following research questions: how did the awareness of rights (for natural resources) for the community leaders and the population change? How did the ease of conflict resolution change in the community? Did the community take any measures to strengthen its position in the ownership of natural resources? How did the size of community forests change?

We investigate whether the project had a favourable effect on the above mentioned outcomes by looking at the changes in the outcome variables between the baseline and endline periods for the project beneficiaries.

In the project, HuMa assists many community based organisations (CBOs) and NGOs - threatened by (potential) natural resource conflicts – in community law facilitator (PHR)[2] trainings mostly through 2-3 days long workshops and financial assistance.[3] The current evaluation provides a case study of one such activity in Rampi sub-district (South Sulawesi province) that lasted longer than average with more than a week.[4]

To evaluate the case of Rampi, data was collected in three of seven villages using structured community and household surveys in 2012, and the same respondents were re-interviewed in 2014 whenever it was possible. A total of 40 randomly selected survey respondents were interviewed from the pool of villagers knowledgeable about local governance. These quantitative data are analysed using before-after methodology: comparing outcomes before and after the project implementation. Both the project context and the small sample size (7 villages in total) did not make it feasible to compare the change in outcomes to a comparison group. Instead, in order to validate the findings from the quantitative surveys, we collected additional qualitative information at all of the project locations in the form of focus group discussion (FGDs) with community members and in-depth interviews with local leaders to deepen our understanding of the project context and results.

As specified in the Terms of Reference for this evaluation, the report addresses five evaluation questions to assess the project outcomes:

[1] The project is described in more detail in section 3.
[2] PHR is an abbreviation of *Pendamping Hukum Rakyat,* translated: 'Community law facilitator'.
[3] For the complete list of assisted locations see Annex I.
[4] Based on information from HuMa, the length of this project was planned at approximately one month. However, the HuMa Annual Report 2012 shows that the trainings were conducted within 8 days. The approximated one month period may include additional days for travel and discussions with the project partner, etc.

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?
2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern partner organisations efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

## 1.3. Summary of findings

The ultimate objective of HuMa's project is the expansion of the social movement that supports law reform based on social and ecological justice in order to protect and strengthen the land rights of marginalized communities. HuMa's main strategy to achieve this goal is through training and education of community law and resource development facilitators (PHR) in communities threatened by (potential) conflicts related to natural resources and land tenure.

This evaluation provides a case study for the implementation and results of one such training and workshops in Rampi sub-district (South Sulawesi province), where HuMa with its local partner Wallacea conducted trainings on participatory mapping, indigenous law, natural resources and agrarian conflict in June-July 2012. HuMa participated only in the initial trainings, while Wallacea continued the implementation of the project through other funding. At the time of the endline survey in June 2014, the map of the villages (the main project activity) has not yet been completed. However, the participatory explorations for providing data for the maps and the PHR discussions have already benefitted the villagers.

Rampi sub-district is situated in a remote hilly area that still has abundant natural resources and luscious forests. Life in Rampi is still governed by traditional laws and culture. Villagers have the most trust in the council of elders, while the trust in the village head significantly decreased over the evaluation period. Villagers are also somewhat unsatisfied with the village governance.

During the evaluation period, the quantitative study found little change in the village and villager level outcome indicators used to evaluate the project. In particular, we find mixed results related to natural resource management. On the one hand, villagers' awareness of forest regulations decreased, while on the other hand, new community rules related to sustainable forest resource management regarding emerging mining sites were enacted.

The HuMa/Wallacea project increased the awareness of villagers related to their natural resources as households' dependence to forest resources have increased (not significant) and also became more diverse (for example, medicinal use). The qualitative study also found that the residents of Rampi became more worried about the potential damaging effect of gold mining on Rampi's ecosystem, and their stories showed that they are willing to fight for their forests. The quantitative data verifies that villagers report a high sense of control regarding their lives and their land. In addition, we observe a small increase on the amount of influence they have on their own lives. Nonetheless, pristine rivers and forests are at imminent risk of contamination and (illegal) resource extraction as the immediate

economic benefits from mining and illegal logging may overweight the long-term benefits provided by a healthy eco-system. Therefore, HuMa and Wallacea chose a crucial time to implement their PHR project in Rampi.

### 1.4. Structure of the report

The rest of this report proceeds as follows: section 2 describes the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1) till 4) in turn. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. The project implementation and the SPO is described in Annex I. Regarding the survey data, the construction of the outcome indicators and indices is summarized in Annex II, while Annex III provides a description of the study locations. Annex IV presents detailed descriptive statistics and explanatory variables of the sample; detailed figures on the change in outcome indicators is presented in Annex V. Annex VI in turn provides additional explanatory tables. The results of the qualitative data collection are presented in Annex VII and an extensive version of the literature review on participatory mapping is provided in Annex VIII.

## 2. Literature overview

The central component of HuMa's project is community law facilitator workshops. However, in the case study in Rampi, the main focus is on participatory mapping and participatory informal discussions on PHR related topics. Therefore, the literature overview, below, summarizes existing literature on the implementation and effectiveness of participatory mapping projects.

Even though the existence of participatory mapping activities is very important in a country like Indonesia where an estimated 48 million indigenous people still depend on the forest for their livelihood, but where mining, logging and oil palm industry are destroying more than 1 million hectares of rainforest territory each year[5] (Telapak & Gekko Studio 2011), the academic literature on participatory mapping within specific Indonesian context is quite limited. This may, at least in part, have to do with the political sensitivities involved in mapping, that can be especially critical for Indonesian indigenous peoples that have since long had a particularly uneasy relation with government and, until very recently, had to cope with a severe lack of legal protection.

Despite the lack of scientific literature over participatory mapping, there was no lack of participatory mapping projects in Indonesia. In fact, over the past 1.5 decades, communities from nearly every region in Indonesia have been trained in the technical and facilitation skills required to undertake participatory mapping , and by 2009 1.5 million hectares of land had already been mapped by local communities (IFAD 2009: 22). The Indonesian community mapping network (Jaringan Kerja Pemetaan Partisipatif or JKPP), established by the mapping activists in 1996 in Bogor, West Java, has been instrumental in achieving these goals (IFAD 2009: 22). I.e. by forming an alliance with Aliansi Masyarakat Adat Nusantara

[5] Making Indonesia the fastest forest clearing nation in the world since 2012, and also the world's third largest emitter of carbon dioxide emissions, behind China and the United States (Telapak & Gekko Studio 2011).

or Alliance of Indigenous Movement in the Archipelago (AMAN) and the Forest Watch Indonesia to advocate for the customary maps to become officially recognized and fed into the "Ancestral Domain Registration Agency" (Badan Registrasi Wilayah Adat): The government's official national database of forest cover. In 2011 AMAN signed a Memorandum of Understanding (MoU) with the National Land Agency (Badan Pertanahan Nasional), which officially stated that "indigenous" maps would be integrated into governmental data (Harjati Sanmukri 2013: 123).

Scientific evidence on the effectiveness of participatory mapping is also limited in the international context. Therefore, a large part of the remaining of this section discusses what participatory mapping is and how it is implemented in terms tools and methods. Finally, we present a short summary of reported impacts of participatory mapping. For further details on the development and methods of participatory mapping, and considerations about "good practice" the reader is referred to Annex VIII.

Participatory mapping is a general term[6] used to define a set of approaches and techniques that combine the tools of modern cartography with participatory methods to create a map of a local community's habitat that represents this community's spatial knowledge (Rainforest Foundation UK 2014). "NGO's, from small local ones to large international ones, often play a crucial role as interlocutors, trainers, advocates and facilitators in these mapping activities" (IFAD 2009: 5).

Participatory mapping is used over the whole world, and the maps that are produced can take on many forms, and can be used to achieve various different purposes. Looking at the available literature and documentation on participatory mapping initiatives the most common aim of participatory mapping appears to be to help marginalized groups, in particular indigenous, pastoralist and forest dwellers, to claim and/or defend their (access to) ancestral lands and its resources, typically by working towards legal recognition of their land rights, using the maps as evidence of their continued residency. The maps can also serve as a tool for community land use planning and natural resource management, and can be used to bring resource-related problems, such as the impacts of logging, mining, and 'land grab' activities, to the attention of governmental authorities and decision makers (Chapin et al. 2005: 620; Di Gessa 2008; Rainforest Foundation UK 2014; Literat 2013: 200; IFAD 2009: 9-12, 39). Some indigenous groups are now using mapping to monitor and defend lands against deforestation, illegal timber extraction, prospecting, and colonization (Teague c. 2010: 10). Other purposes of participatory mapping activities include the strengthening of indigenous political organisation, economic development planning, the documentation of history and customs for culture preservation, education of indigenous youths and/or the general public (Chapin et al. 2005: 620), and support for conflict resolution in territory-related disputes (Di Gessa 2008).

What further distinguishes participatory mapping from traditional cartography and map-making is the process by which the maps are made (IFAD 2009: 4): Community members are involved (preferably) throughout the whole mapping process and recognized as capable research collaborators and experts

[6] The numerous initiatives throughout the world aren't always referred to with the words 'participatory mapping', but can go by many different terms, including: "indigenous mapping" (IFAD 2009: 6) , "…"participatory land use mapping," "participatory resource mapping" (Mbile *et al*. 2003), "community mapping" (Bennagen & Royo 2000, Eghenter 2000, Fox 2002), "community-based mapping" (Flavelle 2002), "ethnocartography" (Chapin & Threlkeld 2001, Gonzalez *et al*. 1995), and "counter-mapping" (Peluso 1995, Kosek 1998, Hodgson & Schroeder 2002)…" (as cited in Chapin *et al*. 2005: 622-623).

on their own local surroundings and needs (IFAD 2009: 4; Pathways Through Participation 2010: 1). According to Fox *et al*. (2003, as cited in Wright *et al*. 2009: 261) the reasons for choosing a participatory mapping approach are usually not only practical (i.e. the actual production of the map and using it as evidence for land claims, or as community advocacy tools), but also intrinsic, as the communal aspect of the mapping process can enhance group awareness and cultural identity, facilitate the passing down of historical knowledge through generations, and build trust and communication between people.

Throughout the past decades, mapping has become increasingly popular and prominent (Pathways Through Participation 2010: 13), which "many commentators ascribe to the developments in Participatory Rural Appraisal (PRA) which emerged in the late 1980s in South Asia and combined insights from agro-ecosystem analysis with Rapid Rural Appraisal (RRA)" (Ibid: 2).

Looking at the implementation of mapping projects, they usually loosely follow the following steps:

1. "**Ground preparation**: before the project starts project leaders and indigenous leaders explain the objectives and importance of the mapping work to the community, the technical team is recruited and collaboration with NGO's and government agencies is sought;
2. **First workshop – orientation and training**: Project staff and indigenous leaders explain the objectives and methodology to the surveyors and technical team and data collection tools are developed;
3. **First fieldwork – gathering data and sketch mapping**;
4. **Second workshop – transcription of data onto new maps**;
5. **Second fieldwork – verification of collected data by the community**; and
6. **Third workshop – correcting and completing final maps**: Surveyors reunite with the cartographers to incorporate information that has been verified in the field and put the draft maps in final form

(Chapin & Threlkeld 2001; IFAD 2009: 30).

Turning to the effectiveness of participatory mapping projects, over the years, many researchers have noted the positive impacts that participatory mapping can have on a community:

> Participation in mapping seems to have encouraged some indigenous communities to demand title to lands (Toledo Maya Cultural Council, 1997; Leake, 2000; Herlihy, 2003; Herlihy and Knapp, 2003), to defend and claim their rights to control natural resources (Smith, 2003; Brown, 2006), and to design conservation and resource management plans that are compatible with local practices (Mohamed and Ventura, 2000; McCall and Minang, 2005; Brown, 2006; Bauer, 2009). Researchers have argued that, in addition to producing maps, when implemented with a stress on participation and with facilitation of discussions within communities, indigenous mapping empowers indigenous peoples in land and resource use rights against potential encroachers (Poole, 2003; Smith, 2003; Brown, 2006; Finley-Brook, 2007) (Reyes-Garcia *et al*. ca. 2012a: 2-3).

In addition to these positive effects, researchers have also observed negative consequences resulting from participatory mapping. For instance, Authors such as Mwangi, Hodgson & Schroeder, Fox, Bryant, and Roth have noted issues such as increased privatization of land, loss of indigenous conceptions of space, greater exposure of valuable natural resources, increased taxation by the state, and increase or intensification of conflicts, either within the village, with neighbouring villages, or with other external

actors such as companies or governmental authorities (Reyes-Garcia *et al*. 2012b: 651). Increase of conflicts due to participatory mapping, is one of the most frequently reported drawbacks of participatory mapping. Researchers such as Offen, Peluso, Hale, and Vandergeest have argued that: "Participatory mapping might intensify internal conflicts because it might bring to light overlapping uses of land and resources or erode traditional ways of dealing with internal conflicts…" (Ibid). Furthermore, it has been reasoned by i.a. Peluso and Rundstrom that "…participatory mapping might increase the number of conflicts with external actors, as the maps produced might challenge the maps made by state and corporate authorities" (Ibid).

Reyes-Garcia *et al*. have attempted to validate the theory that participatory mapping systematically increases the number of conflicts, using an experimental research design whereby 32 native Amazonian villages with and without conflicts with outsiders were randomly assigned to a treatment group (those where a participatory mapping project would be implemented by them) and a control group (those where a participatory mapping project would not (yet) be implemented by them[7]).[8] Contrary to others' previous findings, the results of their research show no statistically significant differences in the measured variables (i.e. number of conflicts, negative opinion, neutral attitude, and negative attitudes towards outsiders) between treatment and control villages (2012b: 656).

Reyes-Garcia *et al*. explain their deviating results by arguing that previous studies, which were based on direct observations rather than a randomized experimental design, might have been subject to selection bias, because the villages participating in participatory mapping projects are generally the ones that are chosen or volunteering to participate in participatory mapping due to the fact that they are expected to experience – or are already experiencing – conflicts over land rights and resources (2012b: 651, 656). Their results support the argument that mapping projects do not bring about conflicts per se, rather "…the process and the results of participatory mapping can help in conflict resolution or contribute to conflict generation or exacerbation depending on the political and socio-economic context in which they are conducted" (Ibid: 657).

# 3. The project

## 3.1. Project description

The "Security of Strengthening Communities Rights and Justice" project of HuMa ran between 1 March 2011 and 31 December 2013.[9] The final project objectives were twofold: first, the project aimed at the expansion of a social movement that supports law reform based on social and ecological justice in order to protect and strengthen the land rights of marginalised communities. To achieve this goal, HuMa works together with local and national level partners. The second goal was to strengthen HuMa itself as a more influential, competent, and independent organisation (institutional development).

[7] For the sake of fairness, participatory mapping projects were also implemented in the control villages, but only after all research data for the post-intervention study had been collected (Reyes-Garcia *et al.* 2012b: 653).
[8] All these villages were located in Tsimane' territory. The Tsimane' are a native Amazonian society of foragers and farmers in Bolivia.
[9] ICCO is also funding a follow-up project with HuMa called "Indonesian Community Law Facilitators (PHR) (INCLaF) Programme" between 1 January 2014 and 31 December 2015.

On the one hand, HuMa's advocacy and legal reform movement heavily relies on the power of community law and resource development facilitators (PHR) on the ground, who carry out legal advocacy at the local level together with HuMa's local partners. Therefore, HuMa established PHR training and education as a main strategy. On the other hand, at the national level, HuMa acts as an intermediary, which links the results of legal reform works conducted by PHR to larger arenas, particularly in supporting resolution of natural resources conflicts through national and regional campaign. (HuMa, 2013)

## 3.2. Project implementation

In the evaluation, we focus on PHR trainings as these are the project activities that most directly reach direct beneficiaries (population of villages).[10] Therefore, only these are discussed in more detail.

HuMa and its partner NGOs provide community law and recourse development facilitator (PHR) trainings to influential people in community (religious leaders, village leaders, artists, lawyers). The aim of the training is to increase knowledge, awareness and capacity in the following topics: constitutional rights, paralegal material, revitalization of people's law (indigenous law, customary law), legal pluralism (the co-existence of state and people's law), gender issues (less patriarchal society), critical legal study, and tools like participatory mapping.

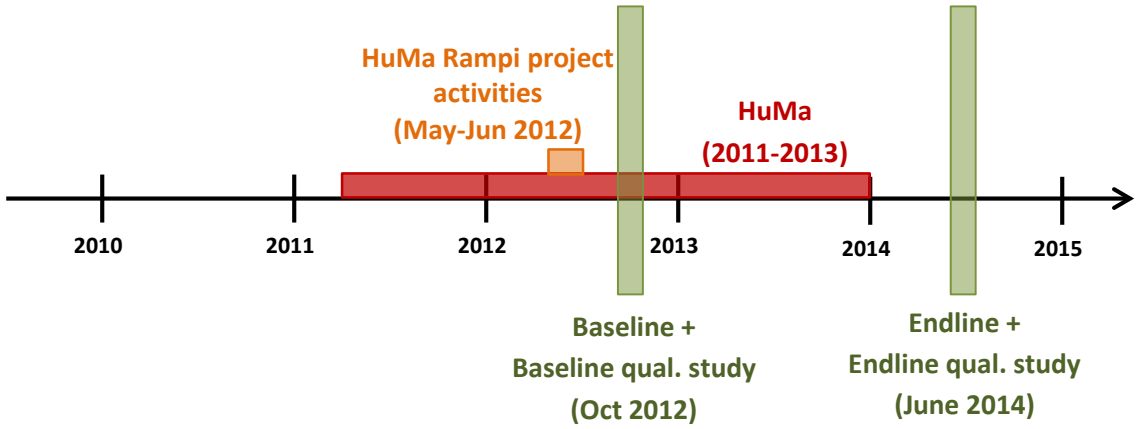
The logic of the PHR trainings is that the trained community members spread the knowledge to the whole community, and possibly also to neighbouring communities through family, friend and ethnic network. Through the increased critical awareness of their rights, communities will make more informed decisions about the use of their land. For example, contracts with corporations who are extracting natural resources. They are able to organise protests against unjust regulations, which HuMa will support through legal assistance and advocacy. The more cases are in process, the higher the probability to change the district and national regulation about land use rights.

In 2011, 19 PHR trainings were conducted with 268 participants (Table 12 in Annex I). The number of trainings was 21 and 19 in 2012 and 2013, respectively, but the number of participants increased to 579 and 569 people (Table 13 and Table 14). Most of these beneficiaries are spread over 7 provinces[11] served by HuMa and its partners.

For the evaluation, we have selected one of the project locations where HuMa conducted PHR trainings in 2012.[12] Trainings in the 7 villages of Rampi sub-district in South Sulawesi province were carried out between end June and beginning of July (Table 13), while the baseline evaluation was conducted in October 2012 (Figure 2). This location was chosen for the project, as the trainings were conducted by a HuMa staff member and a local NGO (Wallacea), and the project activities were expected to last for

[10] Annex I summarizes all project activities, and the location and topics of the PHR trainings.

[11] These provinces are West Java, Central Java, West Sumatra, Central Sulawesi, South Sulawesi, West Kalimantan and Central Kalimantan. In 2012, HuMa also conducted trainings in East Nusa Tenggara, which is not included in the ICCO project description. However,



[12] Hence, we are only evaluating one of many activities of HuMa that is funded by ICCO and MFS II. Therefore, the findings of the survey cannot be generalised for the effectiveness of PHR trainings and the impact of HuMa's programme on the beneficiaries.

approximately one month involving 400 participants in 7 villages.[13] The area was threatened by the development of gold mining industry, and other local issues (see section 5.2). HuMa conducted trainings on participatory mapping, indigenous law, natural resources and agrarian conflict. Hence, the activities were an introduction to PHR. We expected that during the evaluation period these activities would be potentially followed up by further PHR trainings.

However, HuMa did not continue its activities in Rampi as no further intervention was deemed necessary (yet). In addition, as discussed in the qualitative report in Annex VII, the maps have not yet been completed in Rampi during the evaluation period despite the commitment of Wallacea, HuMa's partner in Rampi, to complete the project activity. Wallacea indeed continued the activity started with HuMa, however, after finding funding from a different source (Oxfam).

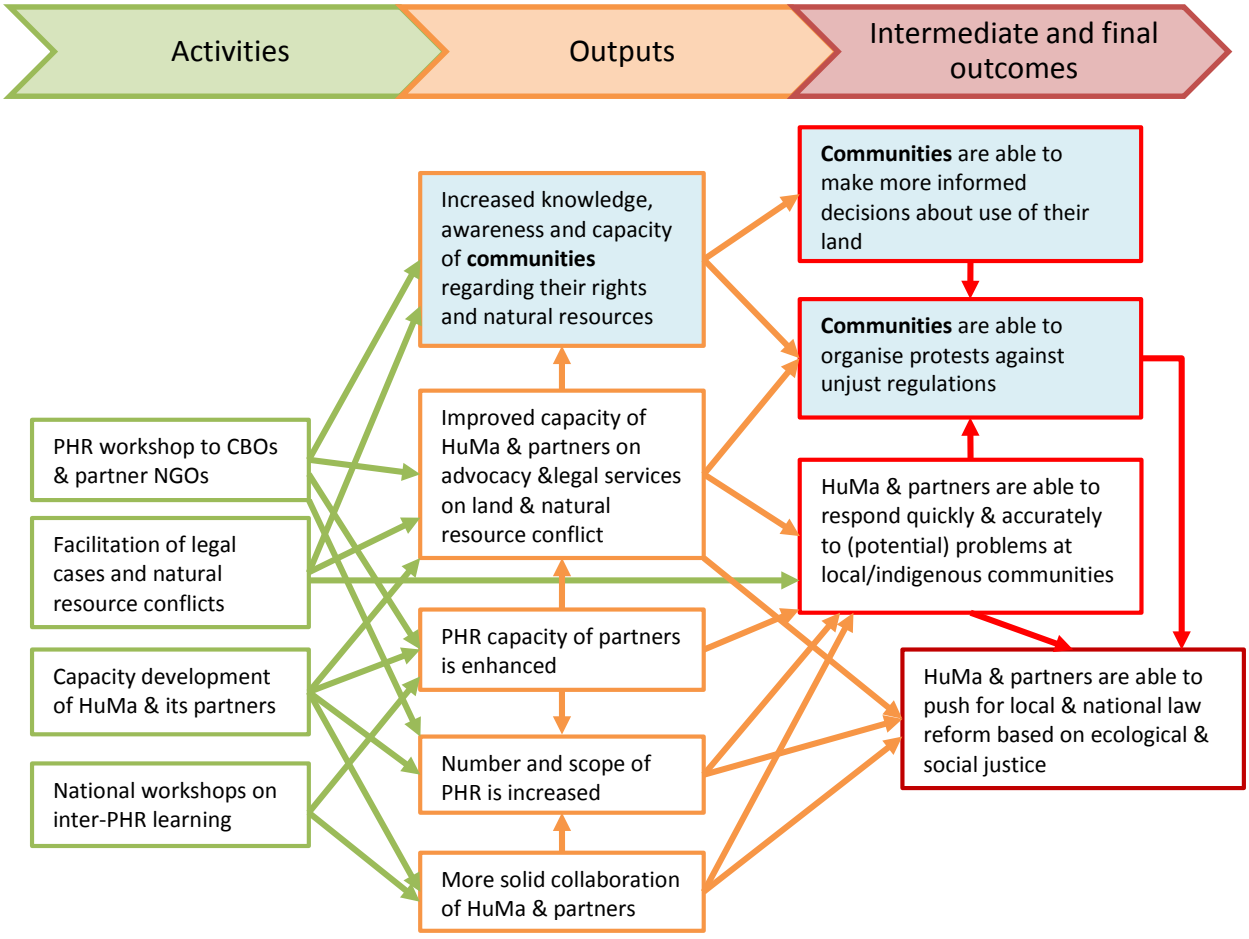
In 2013, HuMa was actually extensively working with Wallacea in South Sulawesi: 8 of 19 PHR trainings were conducted in the area and the director of Wallacea was invited to give key note speeches at several workshops organised by HuMa.

**Figure 2: Timing of intervention**

Annex I provides further information about HuMa, Wallacea and the project. The remaining of this report focuses on the evaluation of the project activities in Rampi. Hence, the effectiveness of the HuMa project is assessed though this case study.

## 3.3. Result chain

The result chain is displayed in Figure 3. As mentioned before, the final objective of the project is the expansion of a social movement that supports law reform based on social and ecological justice in order to protect and strengthen the land rights of marginalized communities.



To achieve this goal, HuMa and its partner NGOs work closely together to identify and quickly react to emerging (potential) natural resource and land tenure threats in communities. At these locations, HuMa

[13] Information from HuMa based on the project plans.

and its local partner provides workshops to local leaders on community law and natural resource management and other tools. The aim is that communities are able to make informed decisions about their natural resources, and are able to organise protests against unjust actions of corporations and the local government. If the community wants to take legal action regarding the occurring natural resource conflict, HuMa and its partners are ready to facilitate the litigation procedure. The more communities take action against unjust legal treatment, the more the social movement on law reform can expand.

In addition to supporting community initiatives, the project is also a continuous effort at improving the capacity of both HuMa and its partners through workshops, research and learning, as the policy situation can bring about new opportunities and challenges through changing local and national laws and emerging cases of conflicts.

**Figure 3: Result chain**

## 3.4. Possible unintended impacts

Possible negative unintended effects of the project are that the mapping of community borders and discussions about natural resource management brings out conflicts with other stakeholders, such as

other communities or corporations, which are then resolved in a way that counters the community's interests.

# 4. Evaluation questions and outcome variables

## 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. In the baseline report specific evaluations questions were specified. Table 1 shows these five questions and what it implies for this project.

**Table 1: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| 1 | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | • How did the awareness of rights (for natural resources) for the community leaders and the population change?<br>• How did the ease of conflict resolution change in the community?<br>• Did the community take any measures to strengthen its position in the ownership of natural resources?<br>• How did the size of community forests change? |
| 2 | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Are the observed changes above attributable to the intervention? |
| 3 | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>• Does the project address an important issue for the beneficiaries? |
| 4 | Efficiency: Were the development interventions of the Southern partner organisations efficient? | Was the intervention cost effective? |
| 5 | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

The above questions are sequentially linked to the project result chain presented in Figure 3. In addition to the questions at the community level, in the evaluation we are also interested about the project's impacts at the villager level: Did the project's effects trickle down from local leaders to the ordinary villagers? We are particularly interested about villagers' attitudes towards natural resources and how empowered they feel in their communities. Therefore, most of the outcome indicators – presented in the next section - investigate the project's effects at the villager level.

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators. The outcome indicators are split up into 6 groups: access to information on (local) governance; satisfaction with local governance; role of traditional institutions; management of natural resources; household's attitude towards forests/plantations; and the sense of control of villagers. The first two of these categories are linked to the uniform indicators specified by the synthesis team for the goal on Good Governance,[14] while the remaining factors are linked to the evaluation questions presented above. Since there are many possible and interesting outcome indicators, some of the variables are grouped into indices for the main analysis.

Table 2 displays the outcome indicators of the main analysis, the scale of these variables and whether the indicator is a uniform indicator, while Annex II describes the outcome indicators in more detail and highlights the components per index.

**Table 2: Overview outcome indicators**

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| **Panel A. Access to information on (local) governance** | | | X |
| Level of agreement with statement: 'I feel well-informed about the decisions made by the village leaders.' | (-2;2) | Household survey | |
| Percentage respondents that knows about the policies of the district government related to agriculture and the use of land in Rampi | (0-100%) | Household survey | |
| **Panel B. Satisfaction with local governance** | | | X |
| Index for satisfaction with local governance at village level | (-2;2) | Household survey | |
| Index for satisfaction with local governance at sub-district level | (-2;2) | Household survey | |
| Corruption at village leadership | (1;3) | Household survey | |
| Corruption at district government | (1;3) | Household survey | |
| **Panel C. Role of traditional institutions** | | | |
| Index for positive attitude towards traditional laws and culture | (-2;2) | Household survey | |
| **Panel D. Management of natural resources** | | | |
| Existence of regulations about the use and protection of the community forests in the village | (no; yes) | Community survey | |

[14] These indicator groups are not necessarily linked to the planned project outcomes.

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| Regulations are communicated by community meetings or farmer group meetings | (no; yes) | Community survey | |
| Regulations are communicated to all villagers (including women and children) | (no; yes) | Community survey | |
| Regulations are taught at school | (no; yes) | Community survey | |
| Percentage of respondents who report that there are any rules/regulations about the use of community forests in the village | (0-100%) | Household survey | |
| Satisfaction with regulations | (-2;2) | Household survey | |
| **Panel E. Households' attitude towards forests/plantations** | | | |
| Dependence on forest resources | (-2;2) | Household survey | |
| Index for positive attitude towards sustainable forest use | (-2;2) | Household survey | |
| Index for access to forest resources | (-2;2) | Household survey | |
| Percentage of respondents who think that the activities of the government/industry will be harmful | (0-100%) | Household survey | |
| **Panel F. Sense of control of villagers** | | | |
| Index for trust in village | (-2;2) | Household survey | |
| Index for sense of control regarding their own life | (-2;2) | Household survey | |
| Index for sense of control regarding land | (-2;2) | Household survey | |
| Index for sense of control regarding preservation of traditional culture | (-2;2) | Household survey | |

# 5. Data collection

This section describes the survey instruments and the sampling design and outcome at the school level and student level in turn.

## 5.1. Survey instruments

We collected three types of data: quantitative, qualitative, and financial data. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

To analyse the impact of the programmes, two surveys have been conducted to collect quantitative data:

- Respondent survey: a short survey was administered with randomly selected community members regarding their perceptions on governance, natural resource management, and their sense of control.

- Community survey: the community survey was administered together with the household surveys both during the baseline and endline period. The head of the community or another local leader was interviewed regarding matters of the community.

The baseline data have been collected in October 2012, while the endline data was collected in June 2014.

### *Qualitative data*

To gain more insight into the implementation and the impacts of the project qualitative field work was conducted in all three sampled communities parallel to the quantitative data collection. At the baseline, focus group discussions (FGDs) were conducted separately with local leaders who participated in the PHR trainings and those that did not. The topic of these interviews were focused on the governance and natural resource management, land related conflicts and their resolution in the communities. The collected data revealed that the PHR trainings were informally carried out. Hence, most local leaders and villagers participated in the project.

Therefore, at the endline, we followed a different study design: in each village 2 FGDs were held - 1 with men that were part of a farmer group and 1 with women working in the farming trade. All of these informants had taken part in the project activities of Wallacea and HuMa. Furthermore, in each village in-depth interviews were conducted with a number of village representatives: the *Tokey Bola* (customary leader), the village head, the *Topebeloi* (agriculture and forest expert), and the *Pobeloi* (land reclaimer). In Onondowa village the position of *Topebeloi* and *Pobeloi* were occupied by the same person. The results of this study are reported in Annex VII.

### *Financial data collection*

To collect information about the costs of the project, we conducted a project cost survey with the programme officer, programme coordinator, and executive director of HuMa on 21 May 2014.

## 5.2. Sampling outcome

### *Sampling design*

From the 7 villages participating in the Rampi project activity, we have selected 3 villages for the evaluation. The villages were selected based on information from the narrative report[15] on the Rampi activities. During the training, threats and problems were identified, which are related to gold mining, protected forests, forest fires, boundary problems with neighbouring villages and a new airport in the area. In the selection of villages we aimed to cover villages with different issues. Hence, sampling was not random at the village level.

For the structured villager surveys we randomly sampled from villagers knowledgeable about local governance aiming at a gender balanced sample. Regarding the sample size, in one of the villages (Onondowa) 20 villagers were interviewed, while in the other two villages only 10 villagers due to the small size of these villages based on administrative data[16].

[15] Narrative report Rampi (Laporan Kegiatan Rampi), received on 7 September 2012.
[16] Source: PODES 2008 survey.

For the endline survey, we planned to re-interview the same respondents as much as possible. However, if some of the baseline respondents could not be interviewed, we replaced them by a randomly selected community member with similar characteristics in terms of gender and age. The total sample size for the villager surveys was 40 respondents in both survey rounds.

### *Sampling outcome*

Table 3 summarizes the sample sizes. In both the baseline and endline period the planned number of households have been interviewed (40 in total). The last column of the table (panel sample) shows the number of respondents that were interviewed both for the baseline and endline survey. In the villages, 33 (82.5%) of the baseline respondents were re-interviewed.

**Table 3: Sampling outcome**

| Assignment group | Villages | Respondents baseline | Respondents endline | Panel sample |
|---|---|---|---|---|
| Total | **3** | **40** | **40** | **33** |
| Source: Household survey E9, MFS II Evaluation Indonesia | | | | |

In the data analysis, we use data from all respondents when discussing the baseline and endline outcomes separately. However, when reporting on the change in variables or performing statistical tests on the significance of the change, we only use the so called *panel sample*, respondents for whom we have two rounds of data.

# 6. Descriptive statistics

This section summarizes the main characteristics of the community using the baseline and endline surveys. In addition, the exposure of the study locations to the mapping and traditional institution strengthening activities is discussed. Additional information about the survey locations can be found in Annex III and Annex VII, and about the villager and village characteristics in Annex IV.

## 6.1. Community characteristics

Our evaluation focuses on three villages in the Rampi sub-district that all deal with different issues related to natural resources, as mentioned in section 5.2. These villages are Rampi, Dodolo and Onondowa. Onondowa is the capital of the Rampi sub-district and is the only village that has educational and health facilities. However, at the endline it does reports these facilities as important community issues (Table 16 in Annex IV). It is also the only village with communication facilities such as mobile network coverage. Residents from Rampi and Dodolo have to go to Onondowa to be able to communicate with the outside world. Even though Onondowa is the capital, Rampi village is one step ahead with regard to electricity. Rampi sub-district is a mountainous area covered with forests, and as such all the villages in the area are difficult to access. Comparing the 3 villages, Onondowa has better accessibility than Rampi and Dodolo, including a new airport.

Even though all the villages cope with different issues, they are similar in their residents' main economic activity, which is farming, and in their dependence on natural resources. Since natural resources, such as gold, are abundant in the sub-district, the potential for conflicts with mining companies and the government is very much present.

Further details about the project locations can be found in Table 15 and Table 16 in Annex IV and in section 2 of Annex VII (qualitative study).

## 6.2. Intervention in the communities

Next, we turn to describing the type of project activities that have taken place before and during the evaluation period.

Table 4 shows per village which NGOs implemented which activities during the past 12 and 24 months at the baseline and endline, respectively. The two main activities of the "Security of Strengthening Communities Rights & Justice Program" are community law facilitation (PHR) training and participatory mapping. The activities on natural resource management and land rights are part of the PHR training.

Before the baseline, only mapping activities took place. These were implemented by YPS and AMAN. AMAN is a network and movement working on the empowerment of indigenous communities in Indonesia that HuMa and Wallacea are part of. Since this information comes from the community survey, it might be possible that Wallacea is not recognized in Dodolo as an NGO separate from AMAN. Indeed, in the qualitative research (Annex VI) it is found that Wallacea implemented the mapping activities. The activities included trainings on how to use Global Positioning System (GPS) devices, collecting the GPS points in the forest and discussing the data. The processing of the GPS data is fully done by Wallacea, but the maps are not finished yet.

During the evaluation period, activities on natural resource management and land rights have been carried out in all three villages. In addition, infrastructure development has been carried out in Rampi, and sustainable livelihood activities were held in Dodolo and Onondowa. Table 4 shows that Wallacea has been working together with AMAN while implementing the activities in Rampi and Onondowa. In Dodolo, only AMAN was reported to be active. As discussed before, the fact that Wallacea is not mentioned in Dodolo, is most likely because Wallacea is not recognized as a separate NGO there. As discussed in the qualitative report (Annex VI), Wallacea has implemented PHR activities in all three villages.

**Table 4: NGOs and their activities in the past 12 months (baseline) / 2 years (endline)**

| Village | Type of activity | Name of NGO | |
|---|---|---|---|
| | Survey year | Base | End |
| Rampi | Mapping the territory/area | YBS, AMAN | |
| | Natural resource management | | WALLACEA, AMAN |
| | Land rights | | WALLACEA, AMAN |
| | Infrastructure development | | AMAN |
| Dodolo | Legal mapping | AMAN | |
| | Sustainable livelihood activities | | AMAN |
| | Natural resource management | | AMAN |
| | Land rights | | AMAN |
| Onondowa | Mapping the territory/area | AMAN | |
| | Sustainable livelihood activities | | WALLACEA, AMAN |
| | Natural resource management | | WALLACEA, AMAN |
| | Land rights | | WALLACEA, AMAN |
| Source: Community survey E9, MFS II Evaluation Indonesia | | | |

The aim of PHR activities is to train influential people in the villages to become 'community law facilitators' that know how to successfully manage and maintain their forests, know how to fight for the rights over their lands, and will pass on their knowledge to their communities.

However, for its implementation in the villages in Rampi sub-district, HuMa and Wallacea has chosen a slightly different strategy whereby they refrained from using the limiting term 'PHR', so that they could adapt a more informal approach, allowing them to not only target the influential people in the villages, but also directly involve the general population in their activities. HuMa and Wallacea for example organised non-formal discussions among small groups of residents that were gathered in the fields, farms, churches, houses, *baruga*, and other public places. In each village various topics were discussed such as farming and agriculture, natural resource management, forest conservation, the destruction of nature, and mapping. In Onondowa, a movie about the environment was shown and people from other villages were also invited to watch it. The participants of these PHR activities varied from group to group, but included farmers, women, youth, as well as local leaders (Annex VI).

## 6.3. Respondent characteristics

To provide a better insight into the general characteristics of our sample, Table 5 displays a number of the respondents' socio-economic characteristics, including age, gender, religion, and the main economic activity. It shows the characteristics of the respondents at the baseline survey (Base), at the endline survey (End), and for respondents that have been interviewed in both survey rounds (panel sample) the

difference in their endline and baseline responses (Change). Therefore, the values in the change column can be different from the difference of the variables at the end- and baseline. The significance of the change is also reported (p-value) for the panel sample. The p-value shows the probability that the change in the variable is zero. Hence, if the p-value is small (say smaller than 5%), it indicates that the change is significantly different from zero (at 5% significance level).[17]

At the baseline, only 20% of the respondents were women despite our intention to interview a gender balanced sample. This outcome is explained by the traditional gender roles in the Rampi society, especially related to issues on governance.

Most of the respondents had a secondary education or higher (70%) and lived from farming (67% at baseline), while almost all respondents were married, and all of them were protestant. We did not expect the distribution of characteristics to change between the baseline and endline period except for age: 2 years have gone by between the two survey rounds. Indeed, the results show that there were no significant changes between the baseline and the endline except for age.

Regarding the participation of villagers in community life, the data shows that most of the respondents attended at least one village meeting over the past 12 months (87.5%) and many of them participated in the discussions there (65% at baseline and 80% at endline, see Table 18 in Annex IV).[18] The three most important community issues for the respondents were education, access to the village and healthcare (Table 17).

[17] In calculating the p-value, we used robust standard errors clustered at the village level.
[18] This is not surprising, as we sampled respondents knowledgeable about governance.

**Table 5: General characteristics of the sample**

| Reporting period | Base | End | Change | p-value |
|---|---|---|---|---|
| **Sample size** | 40 | 40 | 33 | |
| Gender (% female) | 20.0 | 27.5 | 6.1 | 0.484 |
| Age | 43.3 | 44.8 | 1.9** | 0.016 |
| Religion (%) | | | | |
| *Protestant* | 100.0 | 100.0 | 0.0 | |
| Marital status (%) | | | | |
| *Currently Married* | 92.5 | 92.5 | 0.0 | |
| *Widowed* | 0.0 | 2.5 | 0.0 | |
| *Never Married* | 7.5 | 5.0 | 0.0 | |
| Highest level of education attended by the respondent (%) | | | | |
| *Primary education* | 30.0 | 30.0 | -3.0 | 0.484 |
| *Secondary education* | 52.5 | 60.0 | 3.0 | 0.484 |
| *Higher education* | 17.5 | 10.0 | 0.0 | |
| Main economic activity (%) | | | | |
| *Farming* | 67.5 | 75.0 | 0.0 | |
| *Casual worker not in agriculture* | 2.5 | 2.5 | 0.0 | |
| *Worker in company* | 2.5 | 2.5 | 0.0 | |
| *Teacher* | 10.0 | 10.0 | 0.0 | |
| *Civil servant* | 7.5 | 2.5 | -3.0 | 0.280 |
| *Student* | 5.0 | 0.0 | 0.0 | |
| *Housewife* | 2.5 | 2.5 | 0.0 | |
| *Too old, sick or weak to work (at home)* | 0.0 | 2.5 | 3.0 | 0.280 |
| *Priest* | 2.5 | 2.5 | 0.0 | |

Source: Household survey E9; MFS II Evaluation Indonesia
Notes: Robust standard errors corrected for clustering at the village level are used to calculate p-values.
* p-value<0.10; ** p-value<0.05; ***p-value <0.01. P-values are not defined for variables where there was no change.

## 6.4. Treatment exposure

For the treatment exposure, we look at the exposure to participatory mapping and PHR activities.

Looking at the knowledge of respondents about the Wallacea programme, Table 6 shows that the number of respondents who have heard about participatory mapping has significantly increased between the baseline (45%) and endline study (65%). Results from the qualitative study indicate that the participants of these mapping activities were village leaders, village officials, members of the customary board, religious leaders, as well as the community members, including youth. Women were underrepresented during the mapping process. Even though some women joined the socialization workshops, their role mostly stayed limited to providing food for the other participants. No women were made part of the mapping team.

**Table 6: Participatory development plans**

| Reporting period | Base | End | Change | p-value |
|---|---|---|---|---|
| **Sample size** | 40 | 40 | 33 | |
| Percentage of respondents who have heard about participatory mapping (%) | 45.0 (50.4) | 65.0 (48.3) | 21.2* (60.0) | 0.059 |
| Percentage of respondents who think it is/was useful for their community to conduct participatory mapping if they heard about it (%)[1] | 100.0 (0.0) | 100.0 (0.0) | 0.0 (0.0) | |

Source: Household survey E9; MFS II Evaluation Indonesia
Notes: Standard deviations given in parentheses. Robust standard errors corrected for clustering at the village level are used to calculate p-values. P-values are not defined for variables where there was no change.
* p-value<0.10; ** p-value<0.05; ***p-value <0.01.

1. Sample size deviates, the number of observations in the columns, in order, are 18, 26 and 10

With regard to the PHR activities, the respondents' knowledge about these activities seemed to have only slightly (and not significantly) increased from 2.5% to 25% (see Table 7). However, this low percentage is probably caused by the fact that Wallacea chose to refrain from using the term 'PHR' in relation to the discussions and workshops organised by them, as described in paragraph 6.2. During the qualitative study none of the informants recognized the term 'PHR'. However, the informants confirmed the activities had taken place by reciting stories about the discussions and workshops, and their relevance and benefits to the community. The percentage of respondents who heard about HuMa and Wallacea did significantly increase for both NGOs, but at the time of the endline study not more than half of the respondents were aware of them.

**Table 7: Knowledge of the project**

| Reporting period | Base | End | Change | p-value |
|---|---|---|---|---|
| **Sample size** | 40 | 40 | 33 | |
| Percentage respondents who heard about (PHR) (%) | 2.5 (0.9) | 25.0 (43.9) | 21.7 (43.7) | 0.223 |
| Percentage of respondents who heard about HuMa (%) | 2.6 (0.8) | 32.5 (47.4) | 27.8* (46.9) | 0.092 |
| Percentage of respondents who heard about Wallacea (%) | 3.0 (0.0) | 27.5 (45.2) | 27.3* (46.7) | 0.055 |

Notes: Standard deviations given in parentheses. Robust standard errors corrected for clustering at the village level are used to calculate p-values.
* p-value<0.10; ** p-value<0.05; ***p-value <0.01.

# 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured between the base- and endline survey (2012-2014) are grouped into 7 categories: access to information on (local) governance; satisfaction with local governance; role of traditional institutions; management of natural resources; household's attitude towards forests/plantations; the sense of control of villagers, and unintended effects. Some of the outcome indicators combine multiple variables into one index.

Table 8 displays the results for the community level outcome indicator 'Management of natural resources'. The table only reports the baseline and endline values of the indicators (and not the change) because of the small sample size for the community (3 villages).

At the household level, Table 9 displays the results for all outcome indicators including the changes in the outcome variables. The table structure is similar to the table on respondent characteristics with the exception that in Table 9 we also report on the standard deviations of the variables below the mean in parenthesis.

The following subsections discuss the levels and changes in the outcome indicators. Information about the construction of the outcome indicators and indices is summarized in Annex II. The components of these indices are presented in Annex V, and a set of even more detailed tables can be found in Annex VI. Annex VII contains a report of the results of the qualitative study.

3. Sample size deviates, the number of observations in the columns, in order, are 10, 20 and 4

### *Access to information on (local) governance*

During the evaluation period (2012-2014) no significant changes were found with regard to the respondents' access to information on decisions made by village leaders and their knowledge about district government's policies related to agriculture and the use of land. The respondents still feel rather well-informed about the decisions made by the village leaders (0.8 on a scale of -2 to +2). However, even though the change is not significant, it does seem that more people know about the district government's policies (40% at the endline versus 20% at the baseline study).

### *Satisfaction with local governance*

The level of satisfaction on the village level as well as on district level has not changed significantly over the course of the project. The respondents are still quite satisfied with the governance at the district level (1.0 on a scale of -2 to +2 at endline), but remain unsatisfied with the governance at the village level (-0.4). Interestingly, the respondents did report higher levels of corruption at the district government level (1.9 on a scale of 1-3) than at the village government level (1.5). The reported level of corruption at the district level had even significantly increased from 1.4 at the baseline to 1.9 at the endline study. This does not necessarily mean that the district government has indeed grown more corrupt over the years, as it could also be a sign that people's awareness about corruption has increased.

Table 20 in Annex IV shows that the local leaders that were interviewed for the community survey had actually grown less satisfied with the district government in Rampi and Dodolo. In both villages the local leaders reported to feel less support from sub-district officials with regard to the preservation of the village's traditional culture and the protection of its land rights (from a score of 2.0 at the baseline to 1.0 and -1.0 at the endline on a scale of -2 to +2). The level of satisfaction in Onondowa was already lower at the baseline and did not change over the course of the project (1.0).

### *Role of traditional institutions*

Results from the endline study show no significant change in the respondents' attitude towards traditional laws and culture. The respondents' attitude remains quite positive with a score of 1.2 (on a scale of -2 to +2). However, it is important to note that the result in Table 9 is the combined average of the 3 villages, and results from the community survey (Table 27) suggest that attitudes have actually changed per village. Dodolo and Onondowa report a decrease in the villagers' respect for customary laws, while Rampi reports an increase in respect.

The qualitative study found that the residents of Rampi sub-district have a rich local culture, and still adhere to a lot of their traditional customs. It also shows that its residents are committed to preserve their culture, customs, and historical/cultural sites in the forest. Rampi has a special women's group that

is concerned with the preservation of Rampi culture, and the customary board has been undertaking efforts to preserve Rampi's cultural customs and traditions by documenting them in the form of written reports, pictures, and videos. Even though HuMa and Wallacea did not play any role in the documentation of Rampi's culture or the founding of the women's group (which already existed before the project was implemented), the qualitative study suggests that the mapping activities did have an effect on the attitudes of the villagers towards the preservation of their traditional culture. Some informants mentioned, for example, that the mapping had made them realize even more how great their traditional culture was and how important it was to preserve it (Annex VII).

According to the qualitative study the customary board is very strong in Rampi sub-district. Not only because the board and the customary law are well respected by the villagers, but also because some village heads often spend time away from the village for long periods of time in which case the leadership role will be entirely fulfilled by the *Tokey Bola* (the customary leader of the village). The study suggests that, overall, our informants seemed to think more highly of the customary leader than the village leader. The results displayed in Table 22 seem to be in line with these findings, and even show a significant and large increase (from only 7.5% to 40% ) in the percentage of respondents that trust the council of elders the most among the local leaders. Meanwhile the number of villagers that trust the village leader the most has dropped drastically with 42.4 percentage point to only 27.5% at the endline study, indicating an increased trust in traditional institutions and customary ways.

### *Management of natural resources*

According to the results of the community survey (Table 8), at the time of the baseline study, regulations about the use and the protections of the community forests were already present in all the three villages and communicated to the villagers by community meetings. By the time of the endline, the regulations were also communicated through farmer group meetings in Rampi and Dodolo, indicating an improvement in the communication.

However, this reported improvement in communication is not seen reflected in the outcomes of the household survey. The percentage of respondents that know about regulations for the use of community forests actually significantly decreased between the baseline and the endline with 27.3 percentage points (p=0.001), indicating a worsening of the communication. This suggests that HuMa/Wallacea's objective to train people in the village to become community law facilitators that actively pass on their knowledge about forest resource management and land rights to their communities, has not (or at least not yet) been realized.

In addition, the respondents were still not satisfied with the regulations at the time of the endline study (-0.1 on a scale of -2 to +2).

The qualitative study shows that the management and use of natural resources in Rampi sub-district heavily rely on the customary laws[19], and that with the emergence of gold mining sites new rules related to sustainable forest resource management (such as the prohibition of the use of chemicals in mining activities) have been –and are in the process of being- made by the customary board. However,

[19] Examples of these customary laws are: 'Residents may not damage others' plants, may not burn their forests and fields, may not use chemical fertilizers when planting rice, and may not cut too many trees' (Annex VI).

according to our informants HuMa and Wallacea did not play a direct role in the establishments of these new rules and we don't have enough evidence to definitively attribute this development to the projects' indirect workings.

### *Households' attitude towards forests/plantations*

Even though peoples' dependency on forest resources on average seems to have grown over the course of the project (however not significantly, and with the community survey indicating that dependency has increased in Dodolo, decreased in Rampi, and stayed the same in Onondowa, see Table 24), while at the same time their satisfaction with their family's share of forest resources has significantly decreased (from 1.6 to 0.9 on a scale of -2 to +2) (see Annex V, index for access to forest resources), no changes in the respondents' attitudes towards sustainable forest use were found in the quantitative study. However, it seems that an increased number of respondents have become aware that the activities of the government/industry will be harmful to their forests (from 30% at baseline to 85% at endline, but the change is not significant). Results in Table 17 suggest the same, as at the baseline survey none of the respondents reported industry to be one of the three most important community issues, versus 30% (p=0.06) of the respondents at the endline survey.

The qualitative study also showed conflicting results. On the one hand the informants claimed that the residents of Rampi are worried about the potential damaging effect gold mining may have on Rampi's ecosystem, and their stories showed that they are willing to fight for their forests. The customary leaders have, for example, with the assistance of AMAN arranged a meeting with the local government to discuss their worries about the pegs that the Department of Forestry has planted on their lands[20], and have visited an existing mining company to complain about environmental damage and even threatened them with legal actions. Recently, they have also refused to let the new Aribama mining company –that already claims to have received a land acquisition licence from the government to run its business in Rampi- into their territory. A testimony from the *Topebeloi* (agriculture and forest expert) of Dodolo shows that this refusal was fuelled by Wallacea's socialization efforts (Annex VII). At the same time, a contradictory increase in gold mining activities -and damage of natural resources- is occurring in Onondowa, facilitated by both the companies and some of the villages' leaders and local residents themselves who make money from the mining activities (Annex VII).

### *Sense of control of villagers*

No significant changes with regard to the villagers' sense of control were found over the course of the project. The respondents still trust fellow villagers (1.5 on a scale of -2 to +2), still have a rather large sense of control regarding their own life as well as regarding their land (1.2 and 1.1 at endline respectively), and remain to feel quite able to preserve their traditional culture (0.8). The only almost significant change is found for the question on the influence of the respondent on the things that

[20] In this meeting the customary leaders told the government that the community was worried about the peg mounting because they feared that the pegs were put there to indicate the borders of what will become protected forest instead of community land. They asked the government to remove the pegs from their lands. However, at the time of the interviews no action had yet been taken by the government to do so (for more detailed information see Annex VI).

happen to them, which indicate that the respondents feel more in charge of their lives (change of -0.9 on a scale of -2 to +2, p=0.06) (Annex V).

Results from the qualitative study indicate that the project had a positive effect on the sense of control of the villagers. According to the informants the residents of Rampi sub-district worry about the potential damaging effects of gold mining, but have good hope that, with the new knowledge they acquired through the mapping activities, they are able to handle any conflicts over land use and land rights that will occur between the community and companies or government (Annex VII).

#### *Unintended effects*

As a result of the mapping activities a disagreement about village boundaries emerged between Onondowa village and Dodolo village. However, according to the *Tokey Bola* of Onondowa this disagreement could be resolved through discussions and mediation by the customary board. Wallacea has taken responsibility by acting as mediator between the customary leaders of the 2 villagers, and by organising discussions with farmers and (re)measuring borders.

## 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

### 8.1. Methodology

We use before-after methodology for the evaluation of the Rampi project of HuMa complemented with a qualitative survey. We have not sampled any comparison villages because the small sample size would not allow statistical analysis of the differences between the treatment and comparison group. Instead, we opted for using mixed methods: complement the quantitative survey with in-depth interviews to understand the driving factors behind the changes in the outcome indicators.

In addition, we rely on the results chain discussed in section 3.3 to validate the impacts of the project on the outcome variables: only if the changes in the outcome variables are accompanied by improvements or accomplishment of the outputs and intermediate results of the project can we attribute changes to the project (necessary but not sufficient condition).

### 8.2. Results

For Rampi specifically, the project objective on the community level was to increase the knowledge, awareness, and capacity of the community regarding their rights and natural resources, thereby making the community able to make more informed decisions about the use of their land, and strengthening them to undertake action against unjust regulations.

The ultimate goal of HuMa/Wallacea's participatory mapping activities was to create a map that can serve as a tool for the community to claim the rights over their indigenous lands so that they will be able to sustainably manage their forests according to their customary laws and defend them against

outsiders that want to extort the forests' natural riches. However, HuMa/Wallacea have not yet been able to finish the final area map of Rampi sub-district, and as a result no efforts have yet been done to legitimize the map and to get the government to acknowledge Rampi's indigenous people's rights over their forests. Nevertheless, the mapping process in itself has already proven beneficial to the local communities in other ways. The mapping of the boundaries between the villages has, for example, cleared up some uncertainties about the exact location of the borders between Onondowa and Dodolo village, preventing a potential serious escalation of the conflict in the future. The mapping process has also instilled confidence in the participants that they would be able to handle any future conflicts over land use and land rights between the community and companies or government with the help of the knowledge they acquired through the mapping activities.

Results from both the qualitative and quantitative study indicate that PHR activities have taken place in all 3 surveyed villages. Even though the informants of the qualitative study seemed to be satisfied with the implementation, and claimed that the PHR discussions have strongly benefitted the society by increasing the people's knowledge about the importance of preserving the environment and their traditional culture, the qualitative study also found that due to limited budget and the problematic accessibility of Rampi's villages the PHR activities have not been executed with as much attention and thoroughness as they should have been to reach maximum result. In addition, not all participants seemed to have fully understood the materials that were presented during the workshops and discussions.

Our studies suggest that no real improvements with regard to the management of natural resources have yet taken place in the villages. Results from the community survey that suggest an improvement in the communication of regulations about the use and protection of community forests are contradicted by the outcomes of the household survey that show that the number of respondents that know about these regulations had even significantly decreased over the course of the project. This implies that HuMa/Wallacea's goal to train people in the village to become 'community law facilitators' that actively pass on their knowledge about forest resource management and land rights to their communities, has not (or at least not yet) been realized. Informants' stories did show that over the past years new customary rules with regard to sustainable resource management have been made by the customary board as a response to the threats posed by gold mining activities, but there is no evidence to suggest this happened as a result of the workings of HuMa/Wallacea's project activities.

All things taken together, the project seems to have had at least some effect on the knowledge and awareness of the people with regard to sustainable natural resource use. Results from the quantitative study and testimonies from informants of the qualitative study show that peoples' worries about the potential damaging effects of mining activities and forest conversion have grown over the course of the project. And, even though actions against mining companies were already undertaken by residents before the start of the project, the fact that the *Topebeloi* (agriculture and forest expert) of Dodolo explicitly claimed that the communities' refusal of the Aribama mining company was the result of new awareness and insights that people had gained from Wallacea's socialization which had made them "brave to fight", confirms that the project has also had a direct effect on people's behaviour, and thereby (at least partly) achieved its goal of "strengthening communities to undertake action against unjust regulations". However, at the end of the project period, the impact of the project on people's

attitudes did not (yet) seem to be large enough to make the villagers consistently choose the long term benefits of forest preservation over their short term financial benefits gained from the mining activities, as the villages still tolerated –and sometimes even facilitated- other mining activities in their forests that some local leaders and villagers were gaining money from. The net result is that, over the course of the project, Rampi's natural resources have grown even scarcer as a result of mining activities and polluting waste, as well as the people's own wood cutting activities (for construction of houses, etc.). If this situation continues it will have disastrous consequences for Rampi's eco-system and the local communities' ability to survive (Annex VII).

# 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular we look at the size of the impact and whether the project addresses an important issue for the beneficiaries.

## 9.1. The size of the impact

The size of the impact is not easy to determine. On the one hand, the quantitative study indicates that no significant improvements for any of the outcome indicators have taken place in the community. Even though some small improvements (though not significant) were measured with regard to increased trust in customary institutions, and people's awareness about the dangers of industry.

On the other hand, the qualitative study does show that the project has had some positive impact on the community members. I.e. on the attitudes of the villagers towards the preservation of their traditional culture and their sense of control over land. The qualitative study also indicates that people have gained new awareness and insights about protecting natural resources during the project, but the fact that they are inconsistent in their behaviour of applying the new knowledge (e.g. actively refusing one mining company but at the same time tolerating another) makes it hard to determine to what extent their attitudes towards sustainable forest use have actually changed.

## 9.2. Does the project address an important issue for the beneficiaries?

When respondents were asked during the baseline survey what the 3 most important issues for their communities were, most of them answered that those where education (87.5%), road conditions/access to the village (77.5%) and healthcare (52.5%), none of which are addressed by the HuMa/Wallacea's project. Table 17 shows that the particular issues that HuMa/Wallacea's project does address were not deemed urgent by the community members at the time of the baseline study, with the exception of livelihood improvement (30%). For example, the issues of natural resource/environment protection in the village, exploitation of natural resources, industry, pollution, and conservation of traditional culture were not mentioned by any of the respondents. Access to clean water (5%) and access to land (2.5%) were also rarely mentioned as most important issues during the baseline survey. However, for the endline survey a slight increase in people that rate these issues among the 3 most important for their community is visible (and a significant increase for the issue of 'industry' from 0 to 30%), which (in the

best case) could mean that the community's awareness about the issues has increased over the course of the project. However, the outcomes of the endline survey show that education, road conditions, and health remain to be the most pressing issues for the community.

We observe similar figures also in the community survey, where community leaders were asked to list the 5 most important community issues. At the baseline none of them indicated natural resource related issues, while at the endline one village indicated natural resource and environment protection and two villages indicated access to land and natural resources as one of the five most important community issues. Of course, the emergence of these issues may be more driven by the emergence of increased mining interests in the area than due to the project. However, the HuMa/Wallacea project's awareness raising activities certainly contributed to the discussions on deciding the future of the communities' natural resources. In that respect, HuMa and Wallacea delivered their trainings and messages at a crucial time.

Hence, this case study shows that due to the network of local NGOs HuMa is able to reach out to the communities when assistance is most needed regarding natural resource management and land tenure conflicts, even though communities may not yet fully be aware of the importance of these issues.

# 10. Evaluation question 4: Efficiency of project

This subsection addresses evaluation question 4: Were the development interventions of the Southern partner organisations efficient?

Unfortunately, we are not able to evaluate neither the efficiency nor the effectiveness of the project. Therefore, in this section we put forward our arguments for failing to evaluate the question on efficiency. However, first, the available cost information for the HuMa's project in Rampi is discussed below.

## 10.1. Project costs

To collect information on the costs of the project, we conducted a structured interview with the executive director, programme coordinator and programme officer[21] of HuMa on 21 May 2014 using the 'budget survey' as described in section 5.1. During the survey, we were mainly interested in information about HuMa's project in Rampi. We have also interviewed the director of Wallacea, about the project costs in Rampi. In addition, ICCO provided us with the financial (2011-2013) and annul project reports (2011-2013) in January 2015.

Table 10 summarizes the available cost information per year. The total project costs funded by ICCO during the reporting period are reported in column 2 of the table in Indonesian rupiahs (IDR) and in euros (using yearly average exchange rates)[22] in column 3. These are in total, 2,211,821,594 IDR or

[21] The interview was conducted with Mr. Andiko, executive director, Ms. Nurul Firmansyah, programme coordinator, and Mr. Bawor, programme officer.

[22] Unfortunately, we do not have information about the exchange rate used for the project. Instead we use the annual average exchange rate from http://www.oanda.com/currency/historical-rates/. The exchange rates used are 12,264 IDR/EUR in 2011, 12,087 IDR/EUR in 2012 and 13,923 IDR/EUR in 2013.

173,327 EUR. Unfortunately, we do not have information about the actual project costs covered by other sources. However, the total project budget[23] was 615,142 EUR, to which ICCO contributed 180,003 EUR or 29.3% of the budget,[24,25] which is close to the actual costs (102% calculated in IDR and 96% calculated in EUR).

Column 4 shows that the project costs in Rampi were 47,425,000 IDR in 2012, from which HuMa covered 37,425,000 IDR (or 3,096.25 EUR), [26] while the remaining costs were contributed by the local communities in Rampi.

HuMa has not funded other project activities in Rampi after 2012. However, the participatory mapping was not yet completed. Therefore, the local NGO, Wallacea, has looked for other sources of funding to complete the mapping process in Rampi: Oxfam provided has funding through JKPP for the project after 2012. Unfortunately, we do not have information about the costs of the project for this period.

In total, 98 participants attended the trainings facilitated by HuMa in 5 villages in Rampi. However, the data shows that the project involved more people in the project activities. Their number is unfortunately not known. In addition, the number of participants may be misleading regarding the impacts of the project because a wider population benefits from the results of the activities (the population of villages).

Regarding the total number of workshop participants in elementary law training over the whole project area (8 provinces of Indonesia)[27], HuMa reported 268 participants in 2011, 579 participants in 2012, and 569 participants in 2013. However, these numbers only cover the new recruitments, which is only one activity component of HuMa's programme. The total number of project beneficiaries is unknown. Therefore, we are also not able to provide an estimate of the cost per beneficiary of the project. Further reasons for failing to calculate the unit costs of the project are argued below.

[23] Source: HuMa Recapitulation Budget 2011-2013 (Annex 2: Approved Budget). Signed by HuMa 29 July, 2011.
[24] The exchange rate used for calculating the budget is 12,000 IDR per EUR.
[25] The rest of the budget was funded by the Rainforest Foundation (107,763 EUR, only in 2011), the Ford Foundation (144,704 EUR), HuMa and others (178,588 EUR) and the communities participating in the project (4,083 EUR).
[26] We do not know whether all these costs were covered by ICCO, or they were partially funded by other donors of the project (see footnote 25).
[27] These provinces are West Java, Central Java, West Sumatra, Central Sulawesi, South Sulawesi, East Nusa Tenggara, West Kalimantan and Central Kalimantan. East Nusa Tenggara is not included in the ICCO project description, however, HuMa conducted trainings there as well during the project period (2012).

**Table 10: Overview of the costs and number of beneficiaries**

| Year | Total costs [IDR] | Total cost [EUR, current prices][1] | % of costs funded by CFA | Project costs in Rampi [IDR] | Nr. Beneficiaries[2] | Cost per beneficiary per year |
|---|---|---|---|---|---|---|
| **2011** | 640,860,924 | 52,255.46 | N.K. | N.K. | 0 | N.A. |
| **2012** | 755,291,170 | 62,486.86 | N.K. | 47,425,000 | 98 | N.A. |

## 10.2. Assessment

There are two main factors that make the calculation of cost per beneficiary a challenge in Rampi. Firstly, we do not have information about the costs of the project in Rampi since 2012 because all project costs after 2012 have been funded by another NGO. Secondly, the project has not yet been completed: the map is not yet finalized. Hence, we are not able to quantify the costs of the project per output unit (for example, cost of mapping one hectare of land).

Turning to the unit costs of the other project activities, the considerations for the Rampi project apply for these as well. In addition, HuMa has a comprehensive project agenda, simultaneously addressing the grassroots and the policy level issues in furthering the cause of land and natural resource security of indigenous communities. This makes the accounting of project costs complicated. Further, travel costs constitute a substantial part of the project costs as the trainings are given on-site in numerous remote communities every year.

Taking the above concerns into account, providing a reliable (and meaningful) estimate of the cost per beneficiary goes beyond the scope of this evaluation. Therefore, we refrain from going further in answering evaluation question 4 than the information on project costs provided in section 10.1.

# 11. Contribution of Capacity Development and Civil Society

HuMa was not selected for the evaluation of capacity development of the SPO and civil society strengthening.

# 12. Conclusion

The project logic makes the HuMa project better suited for a Civil Society strengthening evaluation than for an MDG evaluation focused at the final beneficiary level. In the evaluation, we relied on a case study in Rampi sub-district (South Sulawesi province) to evaluate the effectiveness of the HuMa project. Given

the small sample size, we are not able to draw strong overall conclusions regarding the HuMa project. Further, because we only evaluated one of many activities of HuMa that is funded by ICCO and MFS II, the findings of the evaluation cannot be generalised for the effectiveness of PHR trainings and the impact of HuMa's programme on the beneficiaries.

It is also important to add that while HuMa assists its partners in conducting PHR trainings to recruit new members for their social movement, most of HuMa's efforts are focused on national level advocacy and capacity development of itself and its partners to be able to quickly respond to emerging opportunities and threats to the social movement on law reform posed by changes in government regulations and new natural resource and land conflicts.

The case study in Rampi shows that HuMa implemented the project in Rampi at a crucial period, when some villages were already affected by the mining industry but before it became an issue for the majority of villages in Rampi. Hence, the project helped the communities make more informed decisions about their natural resources. However, the short term economic benefits from natural resource extraction can be tempting. We can only hope that the surveyed communities (in particular, Onondowa village) carefully considered the short term promised economic benefits from gold mining corporations and long term environmental consequences (such as contamination of the water sources of several sub-districts) of the activities of these mining corporations.

The collected data suggests that HuMa and Wallacea were only partially successful in delivering on their objectives in terms of increasing the communities' critical knowledge and awareness regarding their land rights and natural resources; in terms of increasing the communities' capacity in making informed decisions with regard to land use; and in terms of empowering communities to undertake action against unjust regulations. Even though both the qualitative and quantitative study suggest that peoples' awareness seems to have increased, this awareness was not yet translated into real life results for natural resource- and land management, because financial interests in mining are still in the way of communities consistently changing their behaviour.

In future projects, we recommend that HuMa and Wallacea put more emphasis on overcoming this problem (for example through more focus on behaviour change), as well as make sure that the map is finalized so that when communities are fully willing to actively counter all mining activities and manage their lands in an ecologically sustainable way according to their customary rules, they are able to do so because they are able to exercise their rights over their lands and have the power to fend off any land grabs from companies and government.

Comparing the results to existing literature, the findings of the HuMa project are only partly in line with the findings in the literature, which shows both increases in awareness and in actual actions in the areas of natural resource- and land management, whereas the specific case study of the HuMa project only shows an increase in awareness.

Finally, the MFS synthesis team asked to score each project along a few indicators. Table 11 displays the indicators and the scores we deemed valid for the project.

**Table 11: Overall project scoring**

| Statement | Score | Comment |
|---|---|---|
| **1. The project was well designed** | 8 | The project is well designed in terms of policy advocacy, working with a wide network of partners and constant capacity development of both HuMa and its partners. The widening of the PHR movement is also well designed.<br>Our only concern is that based on our data (also from other project reports) indigenous communities need longer term support than that offered by the PHR trainings. However, HuMa's project logic aims to reach as many threatened groups as quickly as possible. |
| **2. The project was implemented as designed** | 10 | The project was implemented as designed. |
| **3. The project reached all its objectives** | 7 | Based on the available information (one case study), it is difficult to assess whether the project has reached all of its objectives. In terms of outputs, the project has probably reached its objectives. However, at the outcome level, we are uncertain whether the community empowerment using PHR has reached all its objectives. Regarding the law reform, the success of the movement depends on many external factors. During the evaluation period, the movement has achieved some important results. However, the land tenure of indigenous communities is not yet secured. |
| **4. The observed results are attributable to the project interventions** | 7 | HuMa's project is part of a wider movement (including AMAN). Hence, the results are also the achievement of the whole movement. |
| **5. The observed results are relevant to the project beneficiaries** | 7 | Healthcare, access to the village and education seem to be more important concerns of the village population. However, after the project activities and with the realisation of the threat posed by the mining industry, the population's concerns also increased regarding the issues advocated by HuMa. |
| **6. The project was implemented in the most efficient way** | N.A. | |

Notes: Scores are on a scale of 1 to 10, with 1 being "no agreement at all" and 10 being "completely agree with statement".

# Annex I. SPO and project description

### *SPO description*

HuMa is a non-profit non-governmental organisation that focuses on the issue of law reform in the natural resources sector. The concept of law reform proposed by HuMa emphasizes the importance of recognition of indigenous peoples and local communities' rights to natural resources and preservation of the ecology. HuMa believes that indigenous communities and indigenous peoples should be the main actors in law reform processes. It is their vision to build a social movement pushing for law reform which creates a legal system and practices that can deliver justice for marginalized communities and that are supportive of ecological preservation while respecting the values of humanity and social-cultural diversity. It is their mission to:

- Push for the consolidation, capacity development and quantity increase of PHRs or Community Law Resource Development Facilitators through the empowerment of strategic partners.
- Conduct policy advocacy, campaign and various models of legal training to counter the dominant discourse on law reform in land and natural resources sectors.
- Make HuMa a centre of data, information and knowledge development based on empirical realities.
- Strengthen HuMa's institution to become an influential, competent and independent organisation to support social movement and law reform.

HuMa was pioneered by individuals coming from a highly diverse background (activists, academicians and lawyers) who shared similar concerns with regards to legal thinking and practices in the natural resources sector. Indigenous law was very weak during the New Order-Soeharto period. Yet there were increasing numbers of indigenous law related problems in the late and the post New Order era, particularly following the implementation of decentralization policy. In 1997, a number of indigenous communities' movements united to establish Aliansi Masyarakat Adat Nusantara (Alliance of indigenous communities in Indonesia, AMAN) in 1999. In addition to 'bantuan hokum struktural' (structural approach of legal aid) which they had applied from the 1970s onwards, a new approach was launched as Pendamping Hukum Kritis (PHK, critical law facilitator) which eventually became known as Pendamping Hukum Rakyat (PHR) or community law facilitators (INCLAF). HuMa was established in 2001 as the result of a mutual decision made by 6 PHR to create a national organisation that could provide technical assistance and policy advocacy on indigenous community issues.

**Wallacea**

HuMa implements the project in Rampi sub-district in South Sulawesi province together with Wallacea. Wallacea is non-governmental organisation devoted to the empowerment of indigenous and local communities for the achievement of sovereignty over natural resources. Wallacea is an abbreviation of the Forum for Sustainable Environment Celebes Area. Wallacea was established on June 5, 2000. Its mission is to facilitate self-reliance and independence of indigenous communities and to allocate the natural resources equitably and sustainably while ensuring biodiversity.

- Support and develop the values of traditional wisdom which are environmentally friendly.

- Enhance awareness and public participation in environmental conservation and biodiversity.
- Improve and develop the human and economic resources in a fair and sustainable society in the perspective of "Ecology - Economy" and defend of the community and the environment.
- Organise Campaigns and Advocate Pro-People and the Environment policy.

Together with HuMa, Wallacea focuses more on community strengthening by providing community law education to the people (PHR). HuMa and Wallacea have been cooperating on this subject since 2000. HuMa assists Wallacea by realizing funds to finance activities carried out by the Wallacea, providing training on critical legal education, legal substance, legal drafting, advocacy and campaigning case and by helping the academic community in drafting, compiling chapters, etc.

### *Planned project result chain*

**Activities**

The project's activities can be categorized along two institutions: the Indonesian Community Law Facilitators (INCLaF) and the Institutional Development (InDev).

The following activities are related to the development of legal reform movement and PHR capacity and legal services (INCLaF):

- Organising workshops on formulating and assessing PHR and partners' capacity development strategy.
- Conducting evaluation on process and results of PHR development and PHR position in Indonesia's legal reform movement.
- Organising National Workshop on inter-PHR learning in several areas, stages, and issues.
- Formulating a guide on PHR recruitment.
- Create and launch directory of PHR profile via HuMa's web site.
- Organising Elementary and advanced Critical Law Training (PHK) for new PHR recruitment.
- Plan Cross-facilitation of PHR.
- Facilitating handling of legal cases and natural resources conflicts through court and non-court advocacy.
- Organising periodic press conference and short articles as a response of the development on natural resources conflicts and cases and national/regional regulations.
- Conduct routine reviews of court decisions, natural resources conflicts, and regional regulations concerning natural resources.

Regarding InDev, the following activities are planned:

- Review and renew the data directory of HuMa membership.
- Capacity development of members, board of trustees and implementation body of HuMa.
- Capacity development of partners.

**Outputs**

The above activities lead to the following outputs.

Regarding INCLaF:

- PHR and strategic partners' development strategy is perfected.
- PHR recruitment pattern is conducted systematically.

- The number and scope of PHR is increased and expanded.
- A number of PHR have obtained the required capacities, among them are community facilitation/organisation, lobby and policy advocacy, legislative drafting, policy review, and conflict resolution ability/skills.
- Equipment and supporting materials of development of PHR capacity have been provided and utilized in trainings or advocating activities.
- Advocacy and legal services by PHR concerning the problems of indigenous and local communities are able to push for local and national policy change discourse.
- Strategic collaboration between HuMa and its regional partners is getting more solid.
- HuMa has been able to facilitate a part of its partners' needs, especially in terms of their financial resources and human resource capacity development.
- All of PHR and partners' members have been consolidated in one movement of legal reform.

Regarding InDev:

- HuMa organisation and institutional mechanism strengthened.
- Capacity and capability of members, board of trustees, implementation body, and strategic partner staffs are increasingly acknowledged and become an asset to the sustainability of the independent and professional institution.
- Quality services of HuMa are ready to be offered to the public.

**Outcomes**

The capacity and capability of the implementation staff, members, and partners to support efforts toward social movement expansion and law reform has improved. Consequently, HuMa and its strategic partners are able to respond quickly and accurately to problems faced by communities related to land and natural resources tenure and management.

As a result of the above activities the service area of the PHR managed by partners is expanded, and the service actions provided by PHR are capable of influencing other parties to make a change.

**Risks and assumptions**

The log-frame of the project[28] lists the assumptions made regarding the implementation of the project. These mainly relate to active involvement of PHR in the project and the continued interest of activists and community members to get involved in PHR. In addition, it is also assumed that there will not be any social or political change which is repressive to people's movement.

### *HuMa project activities*

In 2011, the project implemented the following activities:

- Assessment of CLRDFs and Partner's capacity development strategy;
- Workshop on formulating of CLRDFs and partners' capacity development strategy;
- Assessment on CLRDFs position in Indonesia's law reform movement;

[28] Source: Logframe HuMa 2011-2015

- Workshop on formulating a guide on CLRDFS recruitment (curriculum, training grade, qualification of resource person/facilitator/trainer, requirement of participants candidacy, supporting tools);
- Dissemination of CLRDFs profile form sheet;
- CLRDFs data entry and verification.
- Making and launching of directory of CLRDFs profile via HuMa's web site;
- Review on existing modules and assessment of training materials based on CLRDFS's needs;
- Workshop on training module development and CLRDFs capacity development
- Elementary Critical Law Training (PHK) for new CLRDFs recruitment;
- Workshop on model learning and supportive tools development CLRDFs (trainer, facilitator, resource person, module, tools)
- Training of Trainer for PHK Facilitators
- Cross-facilitation of CLRDFs
- Need assessment on supporting materials to support CLRDFs capacity development
- Collection of supporting literatures for CLRDFs in their advocacy activities
- Handling of legal cases and natural resources conflicts through court and non-court advocacy
- Routine reviews of court decisions, natural resources conflicts, and regional regulations concerning natural resources
- Periodic press conference as a response of the development on natural resources conflicts and cases and national/regional regulation
- Periodic sending of short articles and opinions to main mass media concerning natural resources conflicts and development of regulations in the national and regional level
- Fund contribution for CLRDFs consolidation forum at the village, sub-district, district, and provincial level
- Facilitating funding for personnel of implementation body, members, governing board, and staffs of strategic partners that have fulfilled the requirements and conditions
- Facilitating peer-mentoring process between personnel of implementation body, members, governing board, and staffs of strategic partners

In 2012, the project implemented the following activities:

- Workshop on formulating of CLRDFs and partners' capacity development strategy;
- Elementary Critical Law Training (PHK) for new CLRDFs recruitment;
- Workshop on model learning and supportive tools development CLRDFs (trainer, facilitator, resource person, module, tools)
- Cross-facilitation of CLRDFs
- Collection of supporting literatures for CLRDFs in their advocacy activities
- Handling of legal cases and natural resources conflicts through court and non-court advocacy
- Routine reviews of court decisions, natural resources conflicts, and regional regulations concerning natural resources
- Periodic press conference as a response of the development on natural resources conflicts and cases and national/regional regulation

- Fund contribution for CLRDFs consolidation forum at the village, sub-district, district, and provincial level

Finally, in 2013 the following activities were implemented:

- Workshop on the Development of School of Community Law Facilitators (SPHR) at the partners level (South Sulawesi, Central Sulawesi, West Kalimantan, West Sumatra, and West Java)
- Consolidation of PHR and Partners for Conflict Resolution and Legal Reform in the Partner's Respective Working Areas
- Translation of Books Used as Learning Materials for PHR and Partners
- Thematic discussions on community rights to natural resources
- Training for Trainers for SPHR Facilitators
- Natural Resources Cases Handling using Litigation and Non-Litigation Method
- Financial and substantive contribution in several trials regarding the case of natural resources
- Regular Study on Court Decisions, Tenurial Conflict and Other Resources, and Regional Policy on Natural Resources Management
- Advocacy on Community Rights Through Market Mechanism

The following PHR or Community Law Resource Development Facilitator (CLRDF) trainings have been implemented during the project period (2011-2013):

**Table 12: HuMa's PHR/CLRDF trainings in 2011**

| Time | Topic of Training | Presented materials by CLRDFs | Participants |
|---|---|---|---|
| **8 - 11 March 2011** | Critical legal thought training and consolidation of high land communities in Palopo South Sulawesi | Module of training on critical legal thought | 22 participants including 2 woman from 5 villages: Battang, Battang Barat, Padang Lambe, Kambo and Latuppa, Palopo City South Sulawesi |
| **13 – 18 March 2011** | Training on participatory mapping and way of indigenous movement in Bowong Langi | ▪ Constitutional rights of citizen<br>▪ Indigenous peoples in national and international law<br>▪ Agrarian law & participatory mapping | 50 participants including some of them are woman from Bowong Langi high land communities (Bone, Gowa, Sinjai) South Sulawesi |
| **13 – 15 April 2011** | Legal training to respond to conflict against cement fabric expansion In Pati Central Java | ▪ Forestry law and forestry problems<br>▪ Mining law and mining problems | 20 participants from Pati's community and supporting alliance |

| Time | Topic of Training | Presented materials by CLRDFs | Participants |
|---|---|---|---|
| **17 – 20 April 2011** | Training and seminar to respond to The Merauke Integrated Food and Energy Estate (MIFEE) in Merauke Papua | ▪ Constitutional rights of citizen<br>▪ Legal contract<br>▪ Basic rights of citizens under the criminal court and system of criminal justice in Indonesia | 22 orang (2 perempuan) from activists and indigenous communities in Merauke Papua |
| **6 – 8 May 2011** | Training on critical legal thought in Nanggung Municipality, Bogor District Central Java | Module of training on critical legal thought | 30 participants from Nanggung Community |
| **5 - 7 July 2011** | Legal training for farmers along coastal southern of Java | ▪ Coastal marine and small islands Law<br>▪ Mining law | 20 participants from coastal southern of Java |
| **22 – 25 July 2011** | Training on critical legal thought to respond to MIFEE | ▪ Citizen's rights under Indonesian law<br>▪ Introduction to and review on agrarian and forestry law | 19 participants from Malind Community in Merauke |
| **28 – 30 July 2011** | Paralegal training for responding the expansion of plantation in Sorolangun Jambi Province | Trial of module of PIL-NET (a lawyer networking where HuMa has given contribution) | 25 participants from indigenous and local communities |
| **17 – 25 September 2011** | Training on critical legal thought for village leader and NGOs in Merauke Papua | Continuing materials on citizen's rights, agrarian law and forestry law<br>Lay down training materials into some follow up actions, such as having consensus to set up advocacy team at village level, making counter draft of district bill on ulayat land, and plan to review the existing license | 20 participants from the networking HuMa's local partner namely Komali in Merauke |
| **30 November 2011** | Legal training and Seminar on strengthening capacity and community based forest management organised by Walhi jambi | Contribute materials on position of adat law in national law, community organisation and how to manage organisation | 30 participants from community |
| **15 – 19 December 2011** | Writing workshop for CLRDFs in Palopo | Legal analysis and legal reasoning | 10 participants of local CLRDFs in Palopo |
| Source: HuMa Annual Report 2011 submitted to ICCO | | | |

**Table 13: HuMa's PHR/CLRDF trainings in 2012**

| Time | Venue | Total Participants |
|---|---|---|
| **17 - 20 February 2012** | Central Java Agricultural Education – Semarang Public Legal Aid - Huma | 31 participants (4 female participants) |
| **22 – 23 March 2012** | Legal Education and preparation of JR with regard to the Law on Procurement of Land for Public Interest Qbar - HuMa | 18 participants (2 female participants) |
| **29 – 30 March 2012** | Work Shop and Training of improvement of Indigenous People Community Organisation (Kamas) in defending and promoting rights of indigenous people for natural resources in Melawi and Sintang. LBBT – Huma | 34 participants (1 Female participants) |
| **11 – 12 April 2012** | PHK for the people of Malalo Region West Sumatra (Advocacy for preparing the mediation with the Regional Government of West Sumatra and Water Power Plant) | 18 participants (5 female participants) |
| **3 – 5 May 2012** | PHK for Matteko, Bolamorang, Bulu Tana, Teko, Baliti communities and other indigenous people communities | 60 participants (20 female participants) |
| **13 – 16 May 2012** | Education for the Formulation of Village Regulation in Melung Village, Kedung Banteng, Banyumas Regency | 14 participants (1 female participant) |
| **20 – 23 May 2012** | Training of PHR for farmers around forests in Java | 23 participants (3 female participants) |
| **24 – 26 May 2012** | Legal Education for PHR in the issue of Natural Resources Management in East Nusa Tenggara | 55 participants (6 female participants) |
| **26 June 2012** | Participative Mapping Education and legal and natural resources/agrarian conflict discussion - Onondowa Rampi Village – Luwu Utara – South Sulawesi | 26 participants |
| **28 June 2012** | Participative Mapping Education and legal and natural resources/agrarian conflict discussion - Tedeboe Village – Luwu Utara – South Sulawesi | 10 participants |
| **30 June 2012** | Participative Mapping Education and legal and natural resources/agrarian conflict discussion – Sulaku Village - Rampi– Luwu Utara – South Sulawesi | 11 participants |
| **1 July 2012** | Participative Mapping Education and legal and natural resources/agrarian conflict discussion – Ceboni Village - Rampi– Luwu Utara – South Sulawesi | 30 participants |
| **3 July 2012** | Participative Mapping Education and legal and natural resources/agrarian conflict discussion – Bangkok Village - Rampi– Luwu Utara – South Sulawesi | 21 participants |
| **5 – 8 July 2012** | Workshop and Training for Criticizing Legal Opportunities (spatial layout and other policies) in Promoting the Legal Recognition and Protection of Customary Area Law of Indigenous People in Naga Tebidah, Sintang Regency, West Kalimantan | 50 (5 Female participants) |
| **4 – 5 August2012** | Environmental Law Training With Regard to the Construction of Power Plant in Baturaden | 20 participants (1 female participants) |
| **3 – 6 September 2012** | Training of Bantaya Facilitators (HuMa provided facilitators and resource persons as its contribution) | 17 participants (5 female participants) |

| Time | Venue | Total Participants |
|---|---|---|
| **18 – 19 October 2012** | PHK Training for the people of Pasir Buncir, Caringin, Bogor, held by RMI | 32 participants |
| **20 – 24 October 2012** | Critical Law Training on village and village regulations in Palu | 25 participants (3 Female participants) |
| **29 – 30 October 2012** | Critical Law and Formulation of Village Regulation Training for the people (held by the Public Forest Work Group) | 14 participants |
| **23 – 28 November 2012** | Critical Law Training for the indigenous people of Delang District, Lamandau, Central Kalimantan (in cooperation with Ecosoc Inst ) | 18 participants (4 Female participants) |
| **13 – 21 November 2012** | Critical Law Training in Sungai Garung Hamlet, Gunung Sengiang Village, Serawai District, Sintang Regency, West Kalimantan Province. | 52 participants (17 Female participants) |
| | Total | 579 participants (77 female participants) |
| Source: HuMa Annual Report 2012 submitted to ICCO | | |

**Table 14: HuMa's PHR/CLRDF trainings in 2013**

| Date | Agenda | Result | Participants |
|---|---|---|---|
| **9th – 10th of January 2012** | Consolidation of and Training for Farmers on Participatory Mapping in Forest Area in Ngrimpak, Temanggung, Central Java. | A map based on factual measurement conducted by the people of Ngrimpak | 18 persons (16 M/2 F) |
| **21st – 23rd of March 2013** | Community Law Training in Dongi, Magani Village, Nuha Luwu Timur, South Sulawesi | A short-term follow-up plan: formulating policy draft for customary regulation in Karunsie Dongi. | 29 persons (11 Females) |
| **24th – 26th of March 2013** | Community Law Training in Liku Dengen Luwu Utara, South Sulawesi | Short-term Follow-up plan: conduct evaluation and discussion on advocacy planning for land recognition (see meeting on 5th – 6th of April 2013). | 30 Persons (10 females) |
| **28th – 30th of March 2013** | Community Law Training in Compong Sidrap, South Sulawesi | Advanced legal training in Village and District level. | 20 Persons (3 Females) |
| **2nd – 3rd of April 2013** | Tribe-Level Discussion in Dongi, Magani Village, Nuha Luwu Timur, South Sulawesi to discuss customary provisions | Customary provisions to strengthen tribe unity in facing a nickel company that has occupied their customary land. | 30 Persons (15 Females) |
| **5th – 6th of April 2013** | Village-Level Discussion in Liku Dengen Luwu Utara, South Sulawesi. | Steps for Advocacy. | 40 Persons (12 Females) |
| **1st – 3rd of April 2013** | Community Law Training in Barugaya Takalar, South Sulawesi | Involved in the handling of criminalization cases of farmers based on the law | 25 Persons (as recorded on paper), actual participants are more than 30 persons. – 10 Females. |
| **15th of April 2013** | Community Law Training in Mateko, Erelembang Village, Tombolopao, Gowa South Sulawesi | Legal understanding on natural resources and forest, and plan for further advocacy towards establishment of agreement with the company | 20 Persons |
| **18th of April 2013** | Community Law Training in Kampung Loka, Bonto Lojong Village, Ulu Ere Sub-district, Bantaeng South Sulawesi | Legal understanding on natural resources and forest, and plan for HKM recognition and participatory mapping | 20 Persons |

| Date | Agenda | Result | Participants |
|---|---|---|---|
| **26th of April 2013** | Water Festival – Kudus. Capacity Building for Youth in Kudus District regarding Advocacy. | Participants understands the rights of community to natural resources | 50 Persons (20 Females) |
| **3rd – 5th of May 2013** | Advocacy Training for College Student, in Collaboration with LKBH UMS- Solo | Work plan for student involvement in providing legal training and assistance in Surakarta and its surroundings | 30 Persons (15 Females) |
| **29th – 30th of July 2013** | Mapping and Legal Training regarding Tenure and Natural Resources Issues in Nanggung Sub-district | Action Plan: Reject Palm Oil Planting. | 18 Persons |
| **2nd – 5th of September 2013** | Critical Legal Training, in Collaboration with Lanting Borneo of West Kalimantan | Plan for Further Advocacy by Local Partner | 14 Persons (6 Females) |
| **7th – 9th of September 2013** | Legal Training for People in Pesisir Kubu raya – in collaboration with Sampan Pontianak | Plan for Further Advocacy by Local Partner | 65 Persons (25 Females) |

# Annex II. Overview outcome indicators and indices

This annex provides a detailed description about the used outcome indicators. In addition, it shows the variables which were used to construct the outcome indicator indices for levels of satisfaction, attitudes and sense of control.

Data from the community survey as well as data from the household survey were used. Outcomes from the community survey are reported per village (Rampi, Dodolo and Onondowa), while outcomes from the household survey are averages for villagers from all three villages. For the household data, the sample size can differ from 40 because the answer 'don't know' is changed to a missing value or because a respondent could skip a question if he/she had no knowledge about what was asked (answered 'no' to a previous question). This was the case if a respondent answered 'don't know' to a question with a scale, so it did not make sense to incorporate the answer in the scale. The missing value due to a skip was kept missing if we only wanted to know the percentage of the respondents that knew about the topic of the question that answered 'yes'. If we were interested in the answers of the total sample, it made sense to change the 'don't know' answers to 'no' because that way the percentage of all the respondents that answered 'yes' could be reported. For the same reason some missing values were changed to 'no'.

All the indices are created using the same method. Villagers reported their level of agreement with certain statements on a scale from -2 to +2, where -2 means 'strongly disagree', -1 means 'disagree', 0 means 'neither agree nor disagree', 1 means 'agree' and 2 means 'strongly agree'. The indices show the average level of agreement over the included statements. Sometimes agreement with a statement indicates dissatisfaction/a negative attitude, while the index shows satisfaction/a positive attitude. Therefore, the scale for these statements were reversed, so that -2 means 'strongly agree' and +2 means 'strongly disagree'. That way, those statements can be used in the average. They are indicated by (negative).

The 'change' variable measures the difference between the baseline and endline outcomes is for respondents that were in the baseline as well as the endline. The p-value indicates whether this change is significant.

### *Access to information on (local) governance*

In order to assess the level of satisfaction with local governance, it is important to know whether the respondents are well-informed about the governance at the village level and the district level.

- Level of agreement with statement: 'I feel well-informed about the decisions made by the village leaders.' […] (scale -2 to +2): this indicator provides the average of the level of agreement on the same scale as the indices.
- Percentage of respondents that knows about the policies of the district government related to agriculture and the use of land in Rampi

### *Satisfaction with local governance*

Two indices for the level of satisfaction with local governance were constructed for different levels of governance. Also the opinion of the level of corruption of the respondents is reported at these levels. It is expected that more corruption is associated with less satisfaction.

- Index for satisfaction with local governance at village level: the following statements are included in this index.
    - Villagers should be given more room to be involved in village decision making (negative)
    - I trust that village leaders will do what is the best for our community.
    - More effort should be taken by the village leaders to preserve traditional/adat culture in this village (negative)
- Index for satisfaction with local governance at the sub-district level: the following statements are included in this index.
    - I'm confident of the district official's ability to their job.
    - The sub-district officials support this village in preserving traditional culture.
    - The sub-district officials can be trusted to represent our interest in protecting our rights to land.
- Level of corruption: for scale of following indicators is from 1 to 3, with 1 being 'no corruption', 2 being 'some corruption' and 3 being 'a lot of corruption'. These are the answers that the respondents could choose from (apart from 'don't know'). The average over the respondents is shown.
    - In your opinion, how much corruption is there at the […]?
        - Village leadership
        - District government

### *Role of traditional institutions*

- Index for a positive attitude towards traditional laws and culture: the following statements are included in this index.
    - Customary laws should be used to govern the way of life in this village.
    - Some people have no respect for customary laws anymore in this village (negative)

### *Management of natural resources*

For management of natural resources, data was collected on the existence of management structure and the level of satisfaction with the management structure.

- Existence: for this indicator, outcomes from the community survey were used. In the table it is reported per village whether there are regulations regarding the use and protections of community forests.
- Dissemination of information: these questions report on how regulations are communicated to the villagers and to what extent. The outcomes come from the community survey.
    - How are the regulations communicated to the villagers?
      From the data it was found that the regulations were either communicated through community meetings or farmer group meetings, as indicated in the table.
    - Are regulations communicated to all villagers (including women and children)?

  - Are regulations taught at school?
- Percentage of respondents that knows about regulations for the use of community forests: this indicator shows the percentage of respondents that answered 'yes' to the question whether there are any rules/regulations about the use of community forests in the village.
- Satisfaction with regulations (scale from -2 to 2): the villagers were asked about their level of agreement with the following statement on the same scale from -2 to 2. Since agreement with the statement shows dissatisfaction with the regulations, the scale was reversed in the same way as with the indices.
  - Natural resources are not sufficiently protected by the village regulations.

### *Households' attitude towards forests/plantations*

- Dependence on forest resources: villagers were asked to what extent they agree with the following statement on the same scale from -2 to 2:
  - My family depends on the forest for our livelihood.
- Index for a positive attitude towards sustainable forest use:
  - I take from the forest what my family needs without thinking about others (negative)
  - I think all villagers should use the community forest as they want (negative)
  - We have to use our forests with moderation and respect.
- Index for access to forest resources:
  - Villager's access to forest resources is fair in my community.
  - I'm satisfied with my family's share of forest resources in this village.
  - Our forests are abundant and luscious.
  - I feel that my access to forest resources is secure in this village.

- Percentage of respondents who think that the activities of the government/industry will be harmful: the respondents were asked whether they think that the activities of the government/industry will be beneficial, harmful, both beneficial and harmful or have no effect. The percentage of the respondents who answered 'harmful' is reported here.

### *Sense of control of villagers*

- Index for trust in village:
  - People in my community look out for each other.
  - I feel I can trust my neighbours to look after my house if I am away.
- Index for sense of control regarding own life:
  - I feel that my opinion is taken into account in my community.
  - Often I feel that I have little influence over the things that happen to me (negative)
  - I feel satisfied with my life.
  - On the whole, I'm able to take charge of my life.
- Index for sense of control regarding land:
  - I think there is nothing we can do to keep our traditional lands against the government/industry (negative)
  - I'm confident that if we the villagers act together, we can make things happen for this village

I think that our village has the right to our traditional lands.
    - I feel that I have no influence on preserving our forests and nature (negative)
- Index for sense of control regarding traditional institutions:
    - I feel that I can contribute to preserving traditional/adat culture in my community.
    - I feel that it is difficult to protect traditional culture nowadays (negative)

# Annex III. Description of study locations

### *Area Description*

Rampi a sub district located in Regency Luwu Utara and included in the northeast area of Province South Sulawesi, sharing a border with Central Sulawesi. The area width of Rampi is around 1.565,65 Km² (BPS, 2011), where most of it is forest and hill areas. Rampi is not everywhere easy to reach.

Rampi consists of 6 villages, they are: Desa Tedeboe, Desa Rampi, Desa Dodolo, Desa Onondowa, Desa Sulaku, Desa Leboni. Desa Onondowa is the largest village and home base of the local government of the sub-district, while the smallest village is Desa Sulaku. All six villages have the status as very backward villages (BPS, 2012). The villages selected for the evaluation are: Desa Dodolo, Desa Rampi, and Desa Onondowa.

### *Desa Dodolo*

The area of Dodolo village is around 218 $km^2$ (BPS, 2012), where most areas consist of forests and hills. The border of Dodolo at the north is Rampi village, at the south is Onondowa village. Dodolo consists of two hamlets or sub-villages, i.e. Dusun Dodolo and Dusun Kontara.

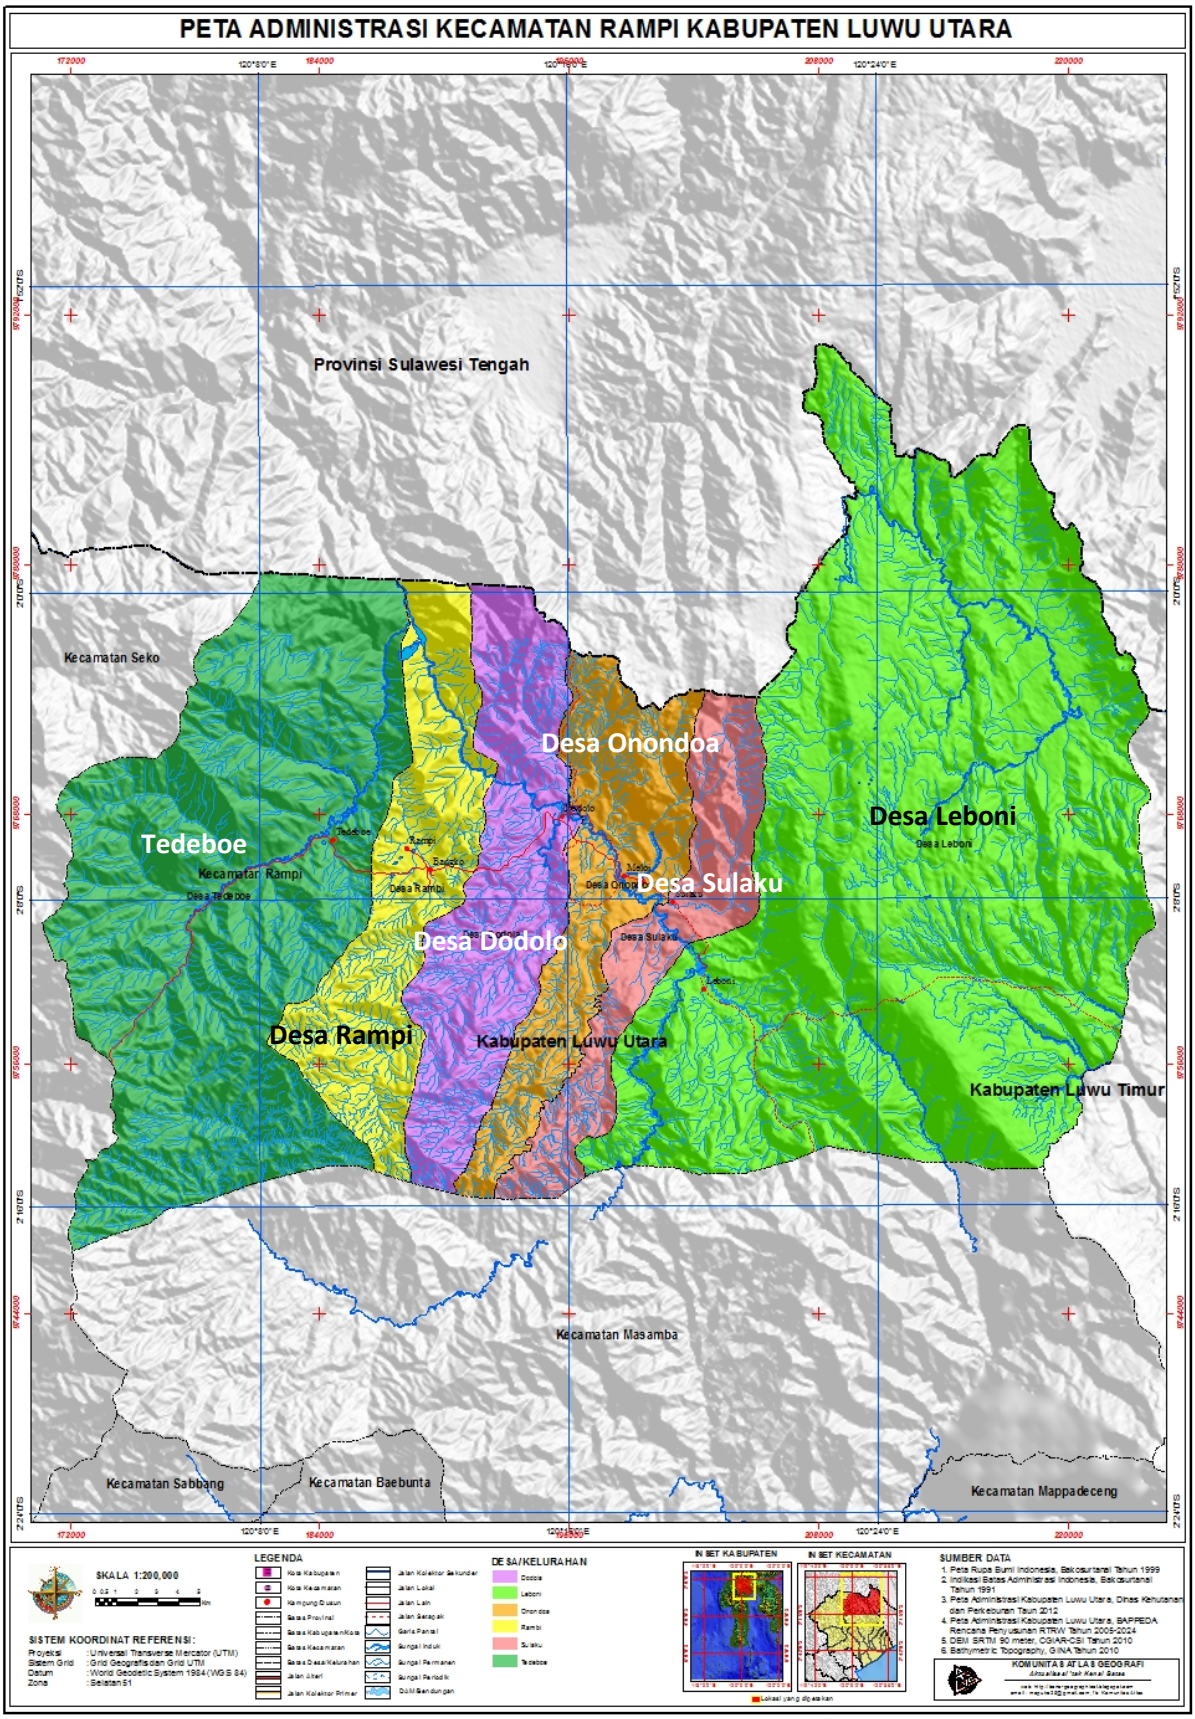
Dodolo has in total 277 inhabitants (BPS, 2012). Most villagers have completed elementary school. The majority of these villagers work in the agricultural sector, either when cultivating crops (rice) or with cattle. There are small numbers of villagers who hold grocery shops.

Some of the residents have no access to clean water service from the government (PDAM) due to the difficult and insufficient access by road. Electricity is present, but only on certain specified times. There is a church and an elementary school in the village. Health facilities are not well equipped. For media information some villagers have television, but the use of them is limited as it depends on the electricity hours. No telecommunication provider can be accessed in the village due to the remoteness of the area. Though, the majority of the youth in this village have cell phones, which is only used for listening to music.

### *Desa Bangko/Rampi*

This village is an old village. In daily activity, people in sub district Rampi know Desa Rampi as Desa Bangko (Bangau). Geographically the village is at the edge of the mountain. The village has border with several neighbouring villages; in the north with Desa Tedeboe, at the south with Desa Dodolo, at the west with a protected forest under the province Central Sulawesi, and at the east with a protected forest of Regency Luwu Utara. Access to the village takes about 13 hours from the city Masamba, but takes longer if the rain has made the road slippery and muddy. Most villagers are farmers, others have cattle. The majority of the people of this village have an education level of elementary school.

The infrastructure is quite the same for this village as for desa Dodolo; difficult and insufficient road access, no electricity, 1 church, almost no health facilities, no access of any telecommunication providers, and no clean water from PDAM. The village has an elementary school, Kindergarten and PAUD (Post ECED), but when the team was conducting the interviews no learning activity took place.



### *Desa Onondowa*

Desa Onondowa is a village in the area which has good prospect for the future. The border of the village at the north is desa Dodolo, at the south it is desa Sulaku. Geographically the village is at the edge of the mountain. The village can be reached from city Masamba can be reached in only twelve hours. The main road access is through jungle. The total numbers of villagers is 902 living in 223 families. Most villagers are farmers, others have cattle. In addition, some are panning for gold or have become a merchant. The average education level is junior high school.

Part of the villagers hasn't got service from PDAM. It is because the difficult road access. Electricity can be enjoyed in the afternoon and night. There is one church, an elementary school, a junior high school, a senior high school, kindergarten and PAUD (Post ECED) in the village. However, there is no teacher from outside (PNS) teaching in this village, only local workers are (honorary). The available health facilities are Posyandu, Puskesmas, and a (part time) midwife but no doctors have their office in the village. There is an airport close by, but because of some problems it is not running. The media information comes from the television owned by some villagers, but the telecommunication has the same problems as mentioned by the other villages. Again the youth have some cell phones, but can only use it for music.

Further information about the project area can be found in section 2 of Annex VII.

# Annex VII. Qualitative Report on the HuMa project in Rampi

## 1. INTRODUCTION

### 1.1. Context of the project

Rampi sub-district is an isolated area in South Sulawesi province, surrounded by hills and mountains. It has luscious and abundant forests which are vibrant with many different types of flora and fauna. Rampi's inhabitants are highly dependent on the forests' natural resources for their livelihoods, as nearly all of them are rice farmers, hunters, or collectors of honey and palm water. Rampi sub-district is also an important ecological buffer zone that contains the sources of clean water for three provinces: West Sulawesi, Central Sulawesi, and South Sulawesi. In Rampi society traditional culture is still well preserved. Its inhabitants still actively practice their old traditions and live by their customary laws.

Rampi's remote location and difficult access have long protected its forests and communities against the threats of modern development and industrialization. However, over the recent years more and more companies are discovering Rampi's bountiful forests and are trying to gain access into the territory to undertake (gold) mining activities.

As a result of the increasing mining activities and their polluting waste some natural resources are already growing scarcer and some water sources are affected. Any further damage of Rampi's forest could have disastrous consequences for its eco-system, as well as the indigenous peoples' ability to survive. This is not only the case for Rampi sub-district itself, but also for the surrounding regions that depend on Rampi sub-district for their water supply. The situation in Rampi sub-district is pressing, as its habitants are constantly on the verge of conflict with mining companies that want to take over their forests, as well as the government that has plans to develop and expand mining activities in the area. The recent opening of the Masamba Rampi airport may also worsen the situation as it provides wider opportunities for investors to enter Rampi territory.

HuMa, the Association for Community and Ecologic-Based Law Reform, is an organisation that seeks to empower indigenous communities to defend and strengthen their rights to land and its natural resources. Together with Wallacea[29], a local NGO that aims to achieve indigenous peoples' sovereignty over their natural resources, HuMa implemented workshops in the framework of the "Security of Strengthening Communities Rights & Justice Program" in all 7 villages of Rampi sub-district: Sulaku, Leboni, Onondowa, Dodolo, Rampi, Mohale, and Tedeboe.

The programme has 2 main activities. The first is community law facilitation (PHR[30]) training, which is provided to influential people within communities, such as community leaders, religious leaders, lawyers, etc. The training covers different topics including constitutional rights, revitalization of indigenous/customary law, gender issues, critical legal study, and legal pluralism, and aims to increase people's knowledge and awareness about their land rights, and their ability to make informed decisions about the use of their lands and natural resources. The idea behind the PHR trainings is to train people to become 'community law facilitators' that will pass on their knowledge throughout the rest of their communities. The second activity is participatory mapping, which should result in a map that shows the

[29] Wallacea is an abbreviation of *Wahana Lestari Lingkungan Celebes Area,* translated: 'Forum for the Sustainable Environment of South Sulawesi'.

[30] PHR is an abbreviation of *Pendamping Hukum Rakyat,* translated: 'Community law facilitator'.

borders of the communities' villages and forests and the location of their natural resources and important natural and cultural landmarks, and can be used as a tool to prove and secure indigenous land rights.

The final objective of the HuMa programme is to influence law and policy with regard to indigenous land rights, by building a social movement that pushes for law reform based on social and ecological justice. The idea is to make the indigenous communities the main actors in the law reform process. Both the participatory mapping and the PHR activities form an integral part of this approach.

### 1.2. Evaluation questions and report structure

Firstly, to provide a more detailed description of the context of the project villages, the following research questions were asked: What do the research communities look like? How are they governed? How do the communities use, manage and monitor their natural and cultural resources? What land right conflicts are there in the communities and how are they handled? Secondly, to determine the success of HuMa's programme, the following research questions are discussed: How was the project implemented in the 3 villages? What was the project's impact on the lives of the community members and their ability to manage their natural resources in a sustainable way?

This report will be structured broadly along the lines of these research questions: Chapter 2 contains a description of the research villages. Chapter 3 provides more in-depth information about how the communities manage and monitor their natural and cultural resources, and Chapter 4 investigates land right conflicts, both within and among the communities, and between the communities and outsiders. Turning to HuMa's programme, Chapter 5 discusses the project implementation. Finally, in Chapter 6 we reflect on the practicalities and limitations of the project implementation and the project's impacts on the lives of the community members. Additionally, chapter 7 and 8 are added as an appendix to provide more background information on how the villages and the lives of the community members are governed, and the position that women hold within those communities.

### 1.3. Evaluation methods

For our qualitative evaluation we have chosen to study 3 of the 7 project villages in Rampi sub-district: Rampi, Dodolo, and Onondowa. In each village 2 focus group discussions were held; 1 with men that were part of a farmer group and 1 with women working in the farming trade. All of these informants had taken part in HuMa's project activities. Furthermore, in each village in-depth interviews were held with a number of village representatives: the *Tokey Bola* (customary leader), the village head, the *Topebeloi* (agriculture and forest expert), and the *Pobeloi* (land reclaimer). In Onondowa village the position of *Topebeloi* and *Pobeloi* were occupied by the same person.

## 2. DESCRIPTION OF STUDY LOCATIONS

Rampi sub-district lies within the Luwu Utara District, and can be reached from the District's capital Masamba, which is 95 km away, on motorcycle (*ojek*) or by airplane. A plane ride only takes 20 minutes, but tickets are difficult to get and have to be booked at least one week before departure. There is one alternative road to Rampi which leads from Palopo to Poso. It takes one day to drive from Palopo to Bada. The remaining 37 km through mountains, forests, and footpaths to Rampi have to be travelled by motorcycle, which costs around Rp. 500.000 per person. A map of Rampi sub-district can be found in

Annex III.

## 2.1. Onondowa village

Onondowa is the capital of Rampi sub-district. This village shares borders with Mount Onondowa in the north, Dodolo in the west, Onondowa Forest in the south, and Sulaku in the east. The government office of Rampi sub-district is only 1 km away from the village. Ondonowa village is approximately 40 Ha wide, and has a population of +/- 860 people belonging to 248 families. They have an additional +/- 50 Ha of agricultural land, and a forest area of +/- 150 Ha. There is a church in Onondowa, and most of the residents are Christians.

Residents of Onondowa mostly work as farmers in the field and plantations, while some others work as gold miners. Some residents also work as motorcycle drivers. Residents of Onondowa rely on the forest for the fulfilment of their daily needs. Onondowa's forest still harbours plenty of natural resources, such as hazelnut, coffee, cocoa, eaglewood, wood rosin, and rattan. Just like the other villages in Rampi sub-district, Onondowa village uses spring water and distributes it to the houses through pipes.

Unlike the other villages Onondowa had good communication facilities. There is signal service within 100 meters from the sub-district office and a callers quota of 20 callers. Residents have had mobile phones since 2007. Before, they only used them to play music, but now they can also be used as a means of communication.

Most residents of Onondowa have graduated Elementary, Junior, and High School, and a few have finished studies at the University. Onondowa village has educational facilities, including a Kindergarten, an Elementary School, a Junior School, and a High School. These facilities are attended by many students that are motivated to come to school and study diligently, despite the fact that they are taught by temporary teachers. Onondowa also has health facilities and staff in the village, such a *POLINDES (Poliklinik Desa),* and midwives. However, these facilities are of minimal quality. Because it is so difficult to find medical staff and teachers from outside the area that want to work in Rampi's remote villages, the residents of Rampi-district hope that the government will hire local people to become medical staff and teachers and appoint them as civil servants.

The electricity facilities in Onondowa are not working properly since their Microhydro Electricity system has recently been struck by lightning, causing a black out. At the moment the residents of Onondowa are using generators for lighting.

The road into the village is slippery and of poor quality but can still be travelled by vehicles. Onondowa also has an airport, which serves the Massamba-Rampi and Rampi-Palu routes. The residents of Rampi sub-district expected that the construction of this airport would lead to easy access from Rampi to Masamba and Palu, but in reality it is very hard for the average villager to get a flight ticket, as the airline staff gives priority to rich residents such as gold mine owners and officials.

## 2.2. Dodolo village

Dodolo village is located in the centre of Rampi sub-district. It shares land borders with Onondowa in the south, Rampi village in the north, Morawa Forest in the east, and Rampi Forest in the west. Dodolo village covers an area of approximately +/- 30 Ha inhabited land, +/- 30 Ha of agricultural land/fields, and +/- 2000 Ha of forest. The population of Dodolo village counts around 315 people, belonging to 75 families.

Most residents of Dodolo are farmers. Some of them are also working in the plantations, and some others work as gold miners or motorcycle drivers that transport daily supplies from Bada to Rampi. The average adult inhabitant of Dodolo village has graduated from Elementary, Junior, and High School. Some of the villagers have a University degree.

Residents of Dodolo village strongly rely on the forest as their source of livelihood. For now, there are plenty of natural resources in the village, such as coffee, cocoa, and hazelnut. Dodolo's residents take water from the natural springs, which is delivered to their houses through pipes. The water is used to bath, wash, and cook. The quality of the water is good, but can become turbid after heavy rains and floods. Some residents still wash their laundry in the rivers, but the custom board has recently advised the villagers not to use the water from the river as it is contaminated by gold mining waste from Onondowa. Dodolo village has the facilities to generate Microhydro Electricity from spring water. The cables have been installed to the houses, but due to money laundering by the staff, the system has not been working properly and electricity has not been distributed as it should. Up till now the villagers have been using candles to light up their houses in the evenings. Some of them use batteries or generators to power lamps and other electronic devices.

Road access into the village is poor and the only way to enter the village is by motorcycle or by foot. Due to bad signal service there are no good communication facilities in the village. Some of the residents have got mobile phones, but they mainly use them to play music. When they want to use the mobile phones for communication, they need to travel to Onondowa.

There is only one Elementary School in Dodolo. The school is accessible for all village residents but only a few students attend this school as there are no permanent teachers employed. Dodolo, like all other villages in Rampi-District, has a hard time finding and employing permanent teachers because of its remote location and lack of facilities. The teachers that were mandated to teach in Dodolo decided to live in Masamba (the district's capital) instead and only come to Dodola once a month.

Dodolo doesn't have any health facilities. They have no health centres (*Puskesmas-Pusat Kesehatan Masyarakat*) and no midwife. Sick residents have to be brought to the city for treatment and medication. They are prioritized to use airplanes, but will still have to make the one hour trip from Dodolo to the airport in Onondowa.

### 2.3. Rampi village

Rampi village is located about 9 kilometres north of Dodolo village. Rampi shares borders with Onondowa in the north, Tedeboe in the south, Bangko forest in the east, and Seko sub-district in the west. There are 307 people from 67 families living in Rampi. Rampi village covers a total of +/- 272 Ha, including +/- 45 Ha of agriculture land and +/- 200 Ha of forest.

Like the residents of Dodolo, most of Rampi village's residents are farmers and/or work on plantations and in gold mines. Some of them own fishing ponds that they use for business or private consumption. Rampi has a substantial amount of land which is suitable to plant rice on.

Most residents of Rampi have graduated Elementary, Junior, and Senior High School, and some have graduated University. There is one Elementary School and one Kindergarten in this village, but students rarely attend these facilities because the permanent teachers are absent most of the time. If the students are taught at all, this is mostly by temporary teachers. If students want to attend Junior and Senior High School (*SMP* and *SMA*) they have to travel to the sub-district capital on foot, just like the

students from Dodolo village. There is one church in Rampi village. Most of the residents are Christians. On Sundays, residents of Rampi join a mass prayer, children at 7 a.m. and adults at 9 a.m. At noon, residents gather in groups in the houses of the indigenous leaders to pray and to discuss their problems and village issues. There are no health care facilities in Rampi village, because the medical staff doesn't want to live in Rampi because of its remote location.

The road that accesses the village is slippery and damaged, but can with great effort be traversed by motorcycles and other vehicles. There is no mobile phone service in Rampi village. To use their mobile phones the villagers have to travel to Onondowa.

Rampi village is one step ahead of the other villages with regard to electricity facilities. Their Microhydro Electricity system is running, so the residents of Rampi don't have to rely on generators, which they now only use in case of power failures.

# 3. MANAGEMENT OF NATURAL RESOURCES

## 3.1. Natural resources

Situated on a plateau and surrounded by green hills, Rampi sub-district has abundant natural resources such as forests, water, gold, rice, corn, eagle wood, wood rosin, rattan, honey, dwarf buffalo (*anoa)*, various types of birds, livestock (cows, horses, pigs), and many other forest animals. Some residents of Rampi sub-district still use cows to plough the field and horses to transport goods. The land in Rampi is used as a place for living, fields, plantations, fishing ponds, and livestock farming. The fields are planted with rice, corn, yam, etc. Some of the forest land has been converted to coffee-, hazelnut-, and cocoa plantations. The main water source for Rampi residents is the rivers. This water is also used for irrigation. Nowadays, clean water is being distributed to houses and some villages have Microhydro Electricity Systems (*Pembangkit Listrik Tenaga Mikrohydro-PLTMH*).

However, nowadays, it is getting more and more difficult to find natural resources such as rattan and wood in the forests of Rampi. Not only have they become scarcer, but villagers also have to travel further to find them. This is partly due to an increased usage by the residents themselves, who use these natural resources to build houses, etc. Livestock raising is still done in the conventional way, which means that the animals are free to roam around the villages. This is problematic because the animals leave dirt throughout the villages, and sometimes wander through the farmer fields and damage the crops.

## 3.2. Livelihood activities based on natural resources

Most of the residents of Rampi sub-district are farmers. They start working in the field or plantation in the early morning and finish in the afternoon. The way of farming has recently changed due to an increased need of space for agricultural practices. Before, farmers used to regularly change location and leave fields lie fallow. Now, farmers choose one place as their field and continue to plant coffee, cocoa, or hazelnut throughout the year. The lands that lay fallow before have now been planted with yam, corn, and other plants, or are used as fishing ponds. Rampi's residents want to improve the way they manage their natural resources, but a lack of funds, technology, knowledge, and skilled people makes it difficult for them to develop their farms and other businesses. Poor road access and transportation facilities worsen the condition, as products cannot easily be exported outside the region.

### 3.3. Natural resource management

The management and use of natural resources in Rampi sub-district still heavily relies on the customary laws. Examples of these customary laws are: 'Residents may not damage others' plants, may not burn their forests and fields, may not use chemical fertilizers when planting rice, and may not cut too many trees'. Since the emergence of gold mining sites in Onondowa, parts of the forests have been converted into mines. In response the customary board has made new rules related to gold mining activities, one of which is the prohibition of the use of chemicals in mining activities.[31]

The village government has also shown its support of these rules by publishing a government rule that appoints mining as a form of Native Village Income (*Penghasilan Asli Desa*: PAD). One of the sources of income is the fines that are charged to people that violate the forest regulations and laws. The management of PAD is done by the customary board. They are the ones that decide on the penalties for perpetrators, which is usually a fine in the form of money or livestock. If livestock is paid as a penalty, it is distributed among the residents of the village and a party will be held as a symbol of peace making between the two parties involved in the conflict.

> There will be a fine paid to the custom board if one party burns out a forest. Each of the violation has its own fine. For example: one will have to pay Rp. 1.500.000 for doing bomb fishing in the river (Focus group discussion with men in Onondowa).

Even though new regulation have been made, the residents of Rampi are still worried about the potential damaging effect gold mining may have on Rampi's ecosystem. When our informants were asked how they thought their forests and villages would look like within 5 years times, they mentioned that they feared that the wall of the Tomonongka river and other rivers, some agricultural lands (for example Kompe and Timo Oni in Onondowa village), some animal species, and the conditions of the road would (further) deteriorate as a result of illegal gold mining activities. On the other hand, the people had good hope for the future of their rice fields and some parts of the forests where they said a lot of trees were seen to be growing.

## 4. MANAGEMENT OF CULTURAL RESOURCES

### 4.1. Cultural resources

The residents of Rampi-district have a rich local culture, and still adhere to a lot of their traditional customs such as rituals for planting and harvesting crops (for example a welcoming ceremony for rice, praying in the field and feasting after harvest), traditional dances, playing music on their traditional instruments, and making traditional clothing from 'wooden leather' which can be found in the forests. Rampi's forests also harbour various sites that are of cultural and historical importance, such as the old villages, the old fields, sites that display ancestral sculptures, and Kalibamba Mountain which is the place of human creation according to Rampi mythology.

[31] According to our informants HuMa and Wallacea did not play any role in the making of these rules.

### 4.2. Cultural resource management

Rampi sub-district manages its cultural resources by continuing to follow its customs and traditions. Nowadays, Rampi has a special women's group that is concerned with the preservation of Rampi culture. It does so by taking care of issues regarding customary activities, marriage customs, and women's rights, by making traditional clothing made of wood crust, and by participating in culture exhibitions to promote Rampi culture.

> Residents are very committed to preserve their cultural customs such as the traditional wedding ceremony, so the next generation will not forget the traditions and culture. There are groups of women who try to preserve the culture by showing traditional costumes in an exhibition (Focus group discussion with women in Onondowa).

Another important thing to notice is the effort made by the customary board to preserve Rampi's cultural customs and traditions by documenting them in the form of written reports, pictures, and videos. The events and activities that are undertaken by the customary board, have also received the approval and support of the village- and district government within the last 2 years.

Even though HuMa and Wallacea did not play any role in the documentation of Rampi's culture or the founding of the women's group (which already existed before the project was implemented), their mapping activities did have an effect on the attitudes of the villagers towards the preservation of their traditional culture. Some informants, for example, said that the mapping had made them realize even more how great their traditional culture was and how important it was to preserve it.

## 5. CONFLICTS

### 5.1. Conflicts within and between villages

According to our informants, including the village heads of Dodolo and Rampi village, there have never been any serious issues with regard to land rights within the villages. However, a conflict about village boundaries has occurred between Onondowa village and Dodolo village. According to the *Tokey Bola* of Onondowa this conflict was solved through discussions and mediation by the customary board. Wallacea also played a part in solving this conflict by organising discussions with farmers, (re)measuring borders, and acting as mediator between the customary leaders of the 2 villages.

The fact that serious conflicts between villagers and neighbouring villages in Rampi only rarely happen can be explained by the fact that all residents in Rampi have their own land and know the boundaries of their land. Secondly, the escalation of conflicts is prevented by the existence of – and strong adherence to - customary laws about land management, such as the rule that people are not allowed to sell their land to 'outsiders' (people who are not Rampi residents). According to the *Tokey Bola* (customary leader) of Dodolo village, land conflict settlement is now better handled than in the past. While before only the customary leaders were involved in conflict settlement, nowadays conflicts about land rights are solved by the customary board and the village government together, often also involving the religious leaders. Usually, the 2 conflicting parties are made to sit down together and discuss their issues under mediation of the customary board.

## 5.2. Conflicts with outsiders

Even though no serious land-related conflicts have yet occurred between Rampi's villagers and outsiders, the potential for conflicts with mining companies and the government is very much present. According to some of our informants the community is worried about the process of peg mounting on the lands owned by residents that is being done by the Department of Forestry. The process is already taking up to 5 years, and the government officials have still not given any explanation about why it is being done. Meanwhile, the villagers continue to work on the land, but live in fear that the pegs are put there to indicate the borders of what will become protected forest instead of community land. In an attempt to subvert the problem, the customary board received assistance from AMAN[32] to organise a meeting with the government. In this meeting the customary leaders told the government that the community was unhappy about the peg mounting and asked them to remove the pegs from their lands. However, no action has yet been taken by the government to do so.

Another conflict that might potentially happen in the future is with the Aribama mining company that is planning to run its business in Rampi. The company claims it has received a land acquisition license from the government, and is therefore allowed to use residents' land for their business activities. However, the residents of Rampi refuse to let the company in, as the following statement of the *Topebeloi* (agriculture and forest expert) of Dodolo shows:

> To counter the effort of indigenous land grabbing, we agreed not to give the company a chance. We are now brave to fight. A long time ago, residents were afraid to violate the border, but because the capacity of the community has now improved, they are motivated to fight for their rights over their land.

When we asked the *Topebeloi* if he could clarify his statement about the capacity of the community being improved, he said that he meant that "…the community members had gained new awareness and insights about protecting their natural resources, as a result of Wallacea's socialization about village boundaries, forest conversion, and environmental damages".

Recently, an Australian mining company has also tried to set foot in Rampi. The community's attitudes towards this company have been different than those towards the Aribama company because the Australian mining company has promised to undertake their mining activities with eco-friendly machinery and without the use of chemicals, and has pledged to invest in community development. The customary boards of all villages in Rampi sub-district have already agreed to let the company operate in Rampi, except for the customary board of Onondowa village, who are still contemplating the pros and cons for the society. Because the company would be located in Onondowa the final right to decide lies with the customary board of Onondowa.

Rampi sub-district is no stranger to land conflicts with mining companies. For example, in the past another land right conflict occurred when a mining company attempted to seize mining spots in

[32] Aliansi Masyarakat Adat Nusantara (AMAN) translated as Indigenous Peoples Alliance of Archipelago is an independent social organisation comprised of Indigenous communities from various parts of the Indonesia Archipelago. AMAN is a forum for the struggle of Indigenous Peoples in matters relating to upholding the Rights of Indigenous Peoples in politics, social, economic, cultural and natural resources through just and sustainable ways (source: http://ccmin.aippnet.org/index.php/aman-indonesia, viewed 02-12-2014).

Onondowa territory.

The people of Rampi have shown that they are willing to fight for their natural resources, and have already taken actions against mining companies. For example: members of the customary board together with some community members have visited the leaders of a mining company to warn them about the threats of mining waste contaminating the river water the residents use for their daily needs and the maintenance of their livestock. They also threatened the company leaders that, if they wouldn't change their ways, the villagers would sue them and ask the government to withdraw the company's license to mine in the area. In the past years the customary board has also often held discussions about how to deal with the gold mining issues, and has taken steps in developing new customary regulations related to mining activities.

According to our informants the residents of Rampi sub-district have a positive outlook on the future and believe that, with the new knowledge they acquired through the mapping activities, they are able to handle any conflicts over land use and land rights that will occur between the community and companies or government.

# 6. PROJECT IMPLEMENTATION

## 6.1. Participatory mapping

As discussed earlier, the HuMa/Wallacea project has two main activities: participatory mapping and PHR trainings. In this paragraph the implementation of the participatory mapping activities will be discussed. The different stages of the participatory mapping process in the 3 villages of study are described below.

Wallacea started off the mapping project by holding a socialization workshop in each of the villages to explain the details of the project, and discuss with the communities how, when, and where the mapping activities could best be implemented. The socialization workshops were joined by village leaders, village officials, members of the customary board, religious leaders, as well as the community members. Youth and women were present during the workshop, but the role of the women was mostly limited to providing food.

After the socialization workshops, the village apparatus (village leaders and officials, religious leaders, and members of the customary board) and community members (men and youth) decided together on who among themselves should become the members of the pioneering teams: the people that would collect the GPS points in the forest. No women were chosen as members of the pioneering teams.

> I do not know what the training was like as I was not involved in the training. Only selected men joined it. Those were representatives of youth, the custom board, as well as village officials (Female focus group participant from Onondowa).

The people that were assigned to the pioneering team then received training on how to use GPS devices to take coordinate points in the field. This training was facilitated by Wallacea, and was done in one day.

After the training the pioneering teams (2 teams for Rampi, 1 for Onondowa, and 1 for Dodolo) and the facilitators from Wallacea went into the forests to collect the coordinate points. The full process

of the GPS data collection took them approximately one week. The activity involved measuring the boundaries between villages, sub-districts, and provinces. The pioneering teams also made notes of the important natural and cultural landmarks and sites in those areas, such as sculptures, old villages, old fields, and mountains.

When the pioneering teams were finished with their field activities, they brought their data back to the villages, and organised a discussion with the village leaders, customary leaders, religious leaders, and the community members. The objective of this discussion was to check the validity and accuracy of the data that was found in the field. All participants of the discussion could ask questions and had the right to make corrections. After an agreement about the data was reached, it was handed in for the final stage: the making of the map.

The processing of the GPS data - transferring all the data to the computer and making it into a map - is complicated work. Therefore, the task was fully being done by Wallacea staff, and no community leaders or community members were involved during this stage.

The ultimate aim of the mapping project is to create a 3D map which depicts the whole of Rampi sub-district area with all its borders and important sites, and then submit the map to local government in order to get the communities' rights over their lands officially recognized. However, at the moment of our study the map was not yet completely finished, though a simplified version of the map was already on display in the village office in Onondowa.

## 6.2. PHR activities

Wallacea also organised PHR activities in villages in Rampi. Generally, the aim of PHR activities is to train influential people in the villages to become 'community law facilitators' that know how to successfully manage and maintain their forests, know how to fight for the rights over their lands, and will pass on their knowledge to their communities.

However, for its implementation in the villages in Rampi sub-district, Wallacea has chosen a slightly different strategy whereby they not only targeted the influential people in the villages, but also directly involved the general population in their activities. Wallacea for example organised non-formal discussions among small groups of residents that were gathered in the fields, farms, churches, houses, *baruga*, and other public places. In each village various topics were discussed such as farming and agriculture, natural resources management, forest conservation, the destruction of nature, and mapping. In Onondowa, a movie about the environment was shown and people from other villages were also invited to watch it. The participants of these PHR activities varied from group to group, but included farmers, women, youth, as well as local leaders. According to our informants, these discussions have strongly benefitted the society by increasing the people's knowledge about the importance of preserving the environment.

Apart from organising these community discussions, Wallacea also invited some local leaders (from the village government, customary council, and church) to attend workshops about environmental damage and the preservation of natural resources. These trainings coincided with the socialization stage of the participatory mapping. Some of the customary leaders we interviewed said they had also attended a seminar on 'indigenous maintaining' at the time of the socialization workshop, and had tried to pass the knowledge they obtained during this seminar on to their community members.

Wallacea chose to refrain from using the limiting term 'PHR' in relation to the discussions and workshops organised by them, so that they could adapt a more informal approach for the project activities' implementation. As a result, none of our informants recognized the term 'PHR' when we asked them about it. However, the informants confirmed the activities had taken place by reciting stories about the discussions and workshops, and their relevance and benefits to the community.

# 7. Reflections on the project's implementation and its impacts on the lives of the community members

## 7.1. Reflection on the participatory mapping activities

Our first consideration about the project is that (at the time of our research) the process of participatory mapping was not yet finished, as no final map had yet been published and therefore no efforts had yet been done to legitimize the map and to get the government to acknowledge Rampi's indigenous people's rights over their forests. The slow pace of the project seems to be caused by at least 2 obstacles: the limited number of skilled community members, and the remote location of the villages which makes it difficult and expensive for HuMa's and Wallacea's staff to visit the communities. In the original HuMa project planning only one visit from Wallacea to Rampi had been budgeted. However, since 2012, Wallacea has visited Rampi 3 times together with AMAN. Sainal Abidin, the executive director of Wallacea, mentioned that Wallacea feels a moral responsibility to finish the mapping project in Rampi, because the government is planning to develop and expand mining activities in the area which will be disastrous for the sustainability of Rampi's forests and its riches. Wallacea has therefore tried to search for additional sources of funding, which they eventually found through one of Sainal Abidin's friends who worked for JKPP (*Jaringan Kerja Pemetaan Partisipatif* or 'the Participatory Network'). The funding is coming from Oxfam, but is distributed to Wallacea's mapping project through JPKK. Even though Wallacea has been able to continue their project activities, they have not yet been able to deliver many results. Because the final area map of Rampi sub-district is not yet finished, we cannot determine if it will contain all the relevant and detailed information (for example about the location of borders, houses, rivers, caves and roads, flora and fauna distribution, rainfall patterns, wealth distributions, etc.) the communities need to manage their resources and convince the government of their rights to the lands. However, Rampi's forests are under immediate threat from land grab attempts and the damaging effects of existing mining companies, and it is therefore of immense importance that Wallacea finishes the map as soon as possible.

Our second consideration about the mapping process is that it has not sufficiently empowered the local communities to undertake the mapping activities on their own. Firstly, the mapping team mainly consisted of village leaders and members of the customary council, and as a result only a few local residents (mostly youth) learned how to undertake map sketching and how to use GPS technology to take coordinate points in the forests. Secondly, nobody from the villages, not even the village leaders, received training on how to process the GPS data and make it into a map. This means that the communities are still dependent on outside parties, such as Wallacea, to be able to undertake a complete mapping exercise and produce, update and maintain their maps.

Furthermore, it seems that the female residents have benefitted less from the mapping

activities compared to the male residents. Women were only included in the socialization stage of the mapping process, and even then were often too busy with providing food to the other participants to actively partake in the discussions. No women took part in the pioneering activities. However, some informants mentioned that participating in the project activities had made them more knowledgeable about gender issues and women emancipation.

Even though the map has not yet been finished, it has already proven beneficial to the local communities. The mapping of the boundaries between the villages has for example cleared up some uncertainties about the exact location of the borders between Onondowa and Dodolo village. The exact location of the borders could now be established amicably, but could otherwise have led to a serious conflict in the future. However, only when the map is fully completed will the local communities be able to use the map to prevent or win land right conflict with outsiders such as mining companies or the government. The map could then serve as a tool for the communities to claim their rights over their ancestral lands and their ways of managing those lands according to Rampi's customary rules.

## 7.2. Reflection on the PHR activities

Our data shows that HuMa/Wallacea have combined their PHR activities with the implementation of the mapping process. The reason for this is that HuMa/Wallacea only had a limited budget to spend on staff trips to and from Rampi, which are expensive and arduous due to Rampi's remote location. Nevertheless, the fact remains that HuMa/Wallacea have not executed their PHR activities with as much attention and as thoroughly as they should have to reach maximum results. Our data shows that the participants not always fully understood the materials that were presented during the workshops and discussions. By putting greater effort and more time in the implementation of the discussions and workshops and by covering a larger variety of topics, Wallacea should be able to instil in Rampi's residents a deeper understanding of the issues and solutions at hand.

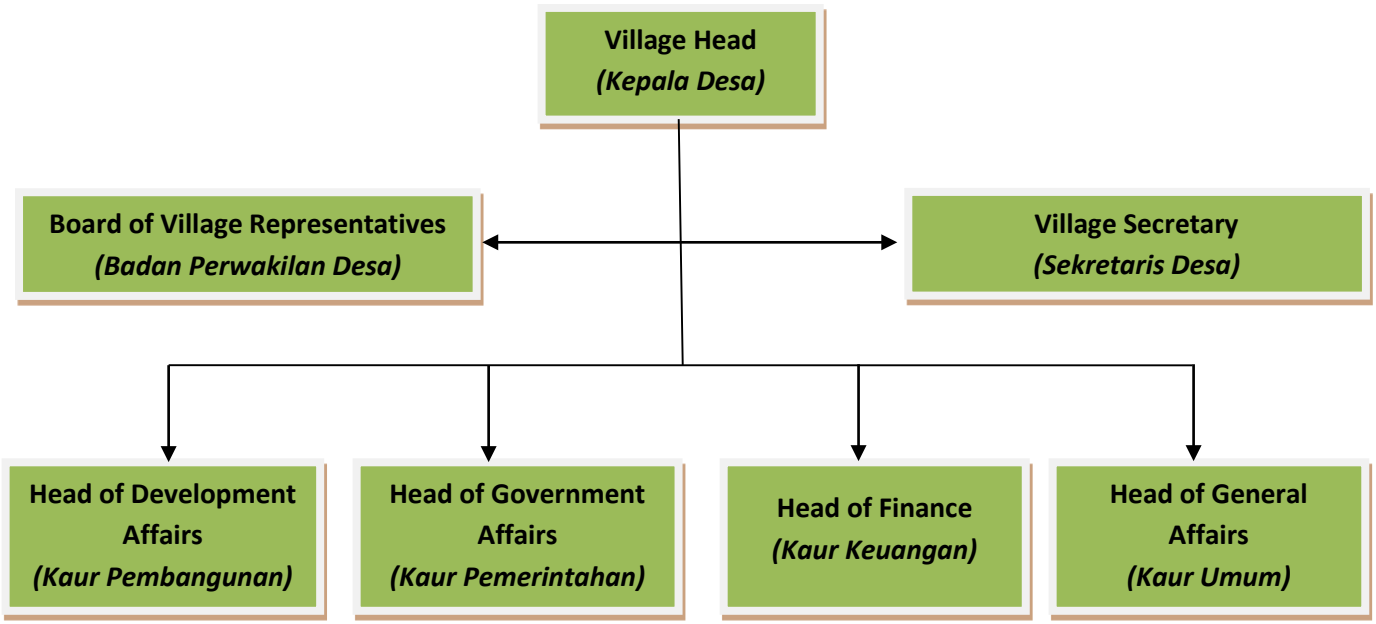
For now, it is difficult to determine to what extent the PHR discussions and workshops in Rampi have had an effect on people's awareness and behaviour with regard to land conversion and sustainable natural resource management. On the one hand, our informants clearly stated that the project had given people new awareness and insights about the value and worth of their forests, as well as their traditional culture, and making them realize how important it was to protect and preserve their natural resources and cultural customs. Some of the respondents also mentioned that they felt confident that, with the knowledge they acquired through the mapping activities, they would be able to handle any future conflicts over land use and land rights between the community and companies or government. Furthermore, the village apparatus' concern about the negative effect of the gold mining activities is shown by the fact that the customary board often held discussions about the issue, and has taken steps in developing new regulations with regard to gold mining. There is also a visible willingness among Rampi's communities to fight for their forests, as can for example be seen from the visit representatives of the villages made to leaders of one of the mining companies operating in their district to complain about the damage done to their environment and threaten the company leaders with a law suit, as well as the villagers' persistent refusal to let the new Aribama mining company enter their territory.

On the other hand, at the same time, a contradictory increase in gold mining activities -and damage of natural resources- is occurring in Onondowa. This increase is facilitated by both the companies and the local residents themselves. The residents' reason for allowing the mining companies

to keep operating has much to do with the fact that many residents make money from the mining activities. Conflicts over who should be allowed to work on the mining sites have even occurred between Rampi's residents and people from outside Rampi that had especially come to Rampi to work on the mining sites. The fact that these newcomers brought along their own values and customs – sometimes incompatible with Rampi's culture and customary rules-, thereby affecting the social life of Rampi, also played a part in the emergence of these conflicts. In addition, some influential people in Rampi administration keep setting a bad example for the community members by being involved in the mining industry themselves. Among them is the *Tokey Bola* of Onondowa who currently holds a high position in a gold mining business. When confronted, these village officials say that the mining activities they are supporting don't make use of destructive machinery, and that they did not realize 'their' type of mining activities could cause damage to Rampi's nature, even though these activities are forbidden by the customary law they themselves exert.

In short, Rampi's communities do not yet seem to consistently apply the knowledge they were taught during the socialization stage of the mapping and the PHR discussions and workshops. The extent to which the project has managed to improve people's awareness and behaviour towards sustainable natural resource management can thus not be unilaterally measured.

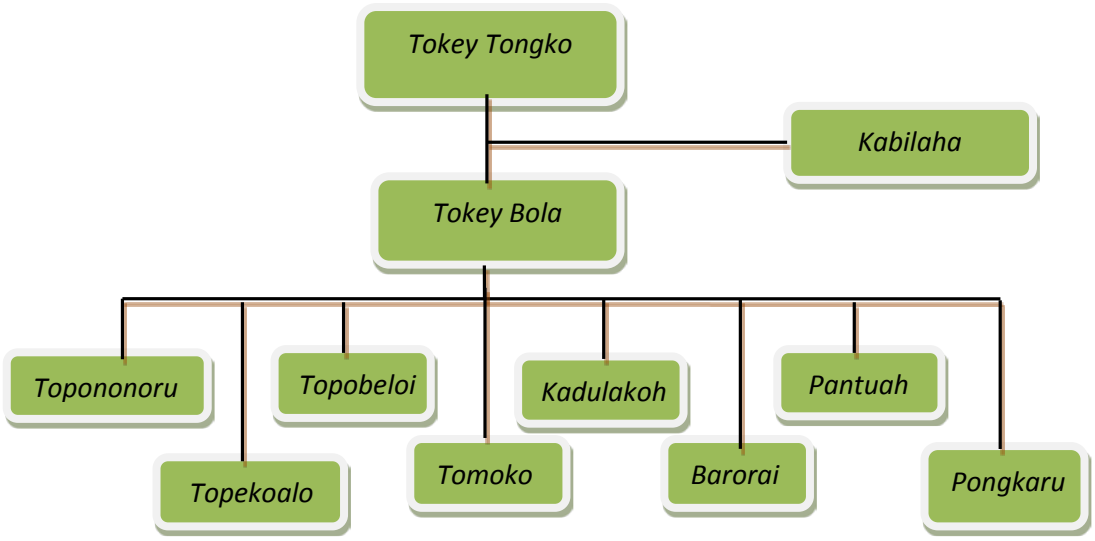
## 7.3. Final considerations



If HuMa and/or Wallacea were to continue the programme or implement it elsewhere in the world, we think it would be of paramount importance that they would improve its activities by more strongly aiming them towards achieving community empowerment, i.e.: increasing residents' knowledge, collective awareness, willingness, and capacity to make smart choices and independently manage their natural and cultural resources, and secure the rights to their lands so that they can protect it against damage and threats by outsiders in the future. Active participation of the community members is key in these endeavours, and for the project to be effective Wallacea should facilitate and push the community members to be actively involved in all the stages of the project, as well as putting a stronger focus on proper and effective knowledge transfer to the communities.

# APPENDIX

## 8. GOVERNMENT STRUCTURE OF RAMPI



The structure of the government in Rampi sub-district's village is similar to that of other villages in Indonesia. Rampi is led by the village head, who is assisted by the village secretary, as well as four 'heads of village affairs' (development, administration, finance, and general issues). There is also a Board of Village Representatives (*Badan Perwakilan Desa-BPD*), assigned to represent and fight for residents' rights and wishes. Rampi is an integral part of Luwuk Utara District and South Sulawesi Province, so they abide to the same law. Below the structure of village government in Rampi is displayed.

**Figure 5: The structure of the village government**

In the villages in Rampi the village government doesn't exist on its own. There is also a customary board that helps the village government take care of social problems and regulates affairs relating to custom, community life, and village development. Its structure can be described as follows:

**Figure 6: The structure of the customary board**

As can be seen in the figure above, the customary board counts 11 positions:

- *Tokey Tongko* : Customary leader of Rampi sub-district / all Rampi villages
- *Tokey Bola* : Customary leader of a village
- *Kabilaha* : Judge
- *Barorai* : Security guard
- *Kadulakoh* : General
- *Topekoalo* : Spokesman
- *Tobrolia* : Customary doctor
- *Toponoroo* : Customary singer
- *Pantuah* : Customary treasurer
- *Topobeloi* : Head of farmer groups / Agriculture and forest expert
- *Tomoko* : Farming expert

The *Tokey Tongko* is the highest leader of Rampi's indigenous society, and operates at the same level as the sub-district government head. The *Tokey Tongko* is the head of 7 *Tokey Bola*, the indigenous leaders of the 7 villages of Rampi sub-district. Both the *Tokey Tongko* and the *Tokey Bola* play important roles in maintaining and preserving Rampi's culture and customs, its norms and values, the social order, the sovereignty of the society, and the spirituality of Rampi's residents.

The customary board rules society according to Rampi's customary laws that have been applied in the villages throughout many generations, as well as new rules that can be made by the customary board if the necessity arises. The customary rules have been written down for documentation, independently from the HuMa/Wallacea project.

The customary law applies to all residents of Rampi, regardless age, social- and economic status, religion, and position, and all residents are obedient to the rules. To illustrate this, one of our informants told us a story about a *Tokey Tongko* (the highest customary leader within Rampi sub-district) that got

into a fight with a miner. The *Tokey Tongko* was called before the customary board, was declared guilty, and was charged with the fine of one cow which he had to give to the miner as compensation.

The village government supports the customary board's implementation of the customary law in the villages, and overall the village government and customary board work closely together in regulating village affairs. This can, for example, be seen reflected in the villages' security management:

> There is only one police officer in this village, and there are only two soldiers here. It is the customary board that's solving all the problems that occur in this village (Focus group discussion for men in Onondowa).

The role of the customary board is very strong in Rampi sub-district. Not only because the board and the customary law are well respected by the villagers, but also because some heads of villages often spend time away from the village for long periods of time in which case the leadership role will be entirely fulfilled by the *Tokey Bola* (the customary leader of the village). Overall our informants seemed to think more highly of the customary leader than the village leader, as can be seen from the statement of one of the male focus group participants in Dodolo:

> The role of the village government is quite a lot, but they do not do their jobs well. On the other hand, the role of Tokey Bola is really good. He really pays attention to the society. Meanwhile, the village government does not really affect the society. The condition of our village is its reflection.

The village government and customary board often also collaborate with the church in regulating society's life, especially with regard to village empowerment. This collective leadership between the 3 different parties gives Rampi sub-district a special and unique character compared to other sub-districts in Luwu Utara District and Indonesia.

## 9. THE POSITION OF WOMEN IN RAMPI SOCIETY

Most of the women in Rampi sub-district are housewives. Their main tasks are cooking, cleaning, providing clean water to the household, taking care of their children and husband and reminding them to pray. Men are regarded as the head of the household and are expected to provide for their families, even though in reality women often also contribute to the family income.

Within community life women are bound by some restrictions dictated by customary law. Women can't, for example, become *ojek* drivers and can't pick up wood. They are also prohibited to go to the forest in the evenings, and are not allowed to visit other houses if there is only one man inside. Furthermore, women have to adhere to customary dress-regulations, as illustrated by the statement of one of the male focus group participants in Dodoma:

> Women are not allowed to wear trousers when they go to the church, but they can wear them when doing chores.

With regard to village politics and decision making, women have the freedom to participate in any activity or programme that is available in the village, and have the right to speak during discussions.

However, in reality their role usually only consists of catering food. Women in Rampi do have their own organisations: women groups that are for example active in government programmes such as PNPM (National Programme to Empower the Community).

Over the past few years, women's role in community life and village politics has increased. Some women have, for example, become religious leaders. It is also getting more and more common that women with leadership skills nominate themselves for leadership positions, such as that of village head. Some informants mentioned that the HuMa project has increased their knowledge about gender issues and women emancipation, but the discourse about women as leaders had already started to change before the start of the project, at least partly due to people's increased exposure to other cultures and ideas via electronic media (such as television). It is therefore hard to determine how much the project has really contributed to this change in the people's mentality.

For now, no women are yet assigned to the customary board, but women are often involved in the process of problem solving. When there is an issue, such as an extra-marital love affair between villagers, a conflict over land ownership, or even disagreements between members of the customary board itself, women are asked to discuss the problem and to help decide who's to blame and what a suitable punishment is. The role of women as mediators was confirmed by some of the male participant of the focus group discussion in Dodolo, who stated that: "Women play important roles. They are mediators of conflict".

Women also play a role in the management of natural resources. They are, for example, involved in the regulation of water in the fields and the use of manure for fertilizing crops. They also have a role in instilling awareness and concern for the preservation of natural resources in their husbands and children.

# Annex VIII. Literature review on participatory mapping[33]

## *Introduction*

Even though the existence of participatory mapping activities is very important in a country like Indonesia where an estimated 48 million indigenous people still depend on the forest for their livelihood, but where mining, logging and oil palm industry are destroying more than 1 million hectares of rainforest territory each year[34] (Telapak & Gekko Studio 2011), the academic literature on participatory mapping within specific Indonesian context is quite limited. This may, at least in part, have to do with the political sensitivities involved in mapping, that can be especially critical for Indonesian indigenous peoples that have since long had a particularly uneasy relation with government and, until very recently, had to cope with a severe lack of legal protection. Luckily, a lot of additional information can be found in manuals, project evaluations, working papers, and online blogs, tutorial videos, etc. which are most often published in more recent years by the international organisations that implement the mapping projects in Indonesia. This literature review therefore draws on academic literature on participatory mapping both within and without Indonesian context, as well as other (mostly online) sources that are more specifically focused on mapping projects undertaken in Indonesia or Southeast Asia. It will cover the following topics: What is participatory mapping, what tools and methods are used, history and development of participatory mapping, reported impacts, and considerations about "good practice".

## *What is participatory mapping?*

Participatory mapping is a general term[35] used to define a set of approaches and techniques that combine the tools of modern cartography with participatory methods to create a map of a local community's habitat that represents this community's spatial knowledge (Rainforest Foundation UK 2014). "NGO's, from small local ones to large international ones, often play a crucial role as interlocutors, trainers, advocates and facilitators in these mapping activities" (IFAD 2009: 5).

Participatory mapping is used over the whole world, and the maps that are produced can take on many forms, and can be used to achieve various different purposes. Looking at the available literature and documentation on participatory mapping initiatives the most common aim of participatory mapping appears to be to help marginalized groups, in particular indigenous, pastoralist and forest dwellers, to claim and/or defend their (access to) ancestral lands and its resources, typically by working towards legal recognition of their land rights, using the maps as evidence of their continued residency. The maps can also serve as a tool for community land use planning and natural resource management, and can be used to bring resource-related problems, such as the impacts of logging, mining, and 'land grab' activities, to the attention of governmental authorities and decision makers

[33] Please note beforehand that part of this text has been taken over into the main text of the report. In addition, this annex is also included as annex in MDG projects E2, E3 and E8.

[34] Making Indonesia the fastest forest clearing nation in the world since 2012, and also the world's third largest emitter of carbon dioxide emissions, behind China and the United States (Telapak & Gekko Studio 2011).

[35] The numerous initiatives throughout the world aren't always referred to with the words 'participatory mapping', but can go by many different terms, including: "indigenous mapping" (IFAD 2009: 6) , "…"participatory land use mapping," "participatory resource mapping" (Mbile *et al*. 2003), "community mapping" (Bennagen & Royo 2000, Eghenter 2000, Fox 2002), "community-based mapping" (Flavelle 2002), "ethnocartography" (Chapin & Threlkeld 2001, Gonzalez *et al*. 1995), and "counter-mapping" (Peluso 1995, Kosek 1998, Hodgson & Schroeder 2002)…" (as cited in Chapin *et al*. 2005: 622-623).

(Chapin *et al*. 2005: 620; Di Gessa 2008; Rainforest Foundation UK 2014; Literat 2013: 200; IFAD 2009: 9-12, 39). Some indigenous groups are now using mapping to monitor and defend lands against deforestation, illegal timber extraction, prospecting, and colonization (Teague c. 2010: 10). Other purposes of participatory mapping activities include the strengthening of indigenous political organisation, economic development planning, the documentation of history and customs for culture preservation, education of indigenous youths and/or the general public (Chapin *et al*. 2005: 620), and support for conflict resolution in territory-related disputes (Di Gessa 2008).

Participatory mapping processes in general don't follow usual cartographic conventions. The maps that are produced often represent a socially or culturally distinct understanding of landscape and include information that is excluded from mainstream or official maps. The aim is to create a map that depicts local knowledge about the environment, and represents and serves the agenda of the community (IFAD 2009: 7). Participatory maps can present spatial information at various scales, from detailed information of village layout and infrastructure, to a more general depiction of large areas. Elements that can be included in a map are for instance: territorial land boundaries, land-use occupancy, hunting- fishing- and gathering grounds, the location/distribution of flora and fauna, important landmarks such as rivers, caves, roads, and location of houses, but also information on rainfall patterns, health patterns, wealth distributions, etc. Furthermore, the maps can depict places of social, cultural and/or historical significance, such as ancestral burial grounds, sacred areas, cultural sites and trails, and information on cultural customs, traditions, and mythology (IFAD 2009: 6-7).

What further distinguishes participatory mapping from traditional cartography and map-making is the process by which the maps are made (IFAD 2009: 4): Community members are involved (preferably) throughout the whole mapping process and recognized as capable research collaborators and experts on their own local surroundings and needs (IFAD 2009: 4; Pathways Through Participation 2010: 1). According to Fox *et al*. (2003, as cited in Wright *et al*. 2009: 261) the reasons for choosing a participatory mapping approach are usually not only practical (i.e. the actual production of the map and using it as evidence for land claims, or as community advocacy tools), but also intrinsic, as the communal aspect of the mapping process can enhance group awareness and cultural identity, facilitate the passing down of historical knowledge through generations, and build trust and communication between people.

### *Tools and methods*

Participatory mapping uses a range of tools and methods, of which some of the principles ones are:

**"hands on mapping"**, which is a basic method in which the community draws a map from memory on the ground (also called "ground mapping") or on paper (also called "sketch mapping");

**"Participatory mapping using scale maps and images"**, where local knowledge and information is added to a pre-existing image (such as an aerial or satellite image);

**"Participatory 3-D modelling (P3DM)"**, which is used for hilly or mountainous areas. Layers of elevation are cut out of cardboard in the shape and contours of the landscape and placed on top of each other, after which paint, pins and strings are used to show surface information and to indicate boundaries and conflict areas. Data depicted on such a 3-D model can also be extracted, digitized and incorporated into a Geographical Information System (GIS);

**"GPS based field mapping"**, in which geographical reference points of boundaries, landmarks, etc. are collected and are put on top of a map, often using GIS to store, retrieve and analyse the GPS data;

**"Computer based map making"**, where graphic software (such as Adobe Illustrator) and GIS are used to make geographically accurate maps, and;
**"Multimedia and internet-based mapping"**, which draws on Web 2.0 technology to create interactive, computer based maps that contain links to digital video, pictures, audio and written text (Pathways Through Participation 2010: 4). This increasingly popular method, makes it better possible to document the complexities and the oral and visual aspects of local knowledge (Di Gessa 2008: 6-9; IFAD 2009: 13-19; Rainforest Foundation UK 2011).[36]

The choice of methods to be used in a participatory mapping project is determined by many factors, such as the problems the community is facing and wants to resolve, the available resources (financial, and in terms of staff and equipment), and the community's physical context (is it hilly or plain) (IFAD 2009: 13) as well as its cultural context (norms, values, customs) (Rainforest Foundation UK 2011).

### *History and development*

#### Over the world

Local people have been drawing maps of their territories to develop a sense of place and identity for centuries (Pathways Through Participation 2010: 2). However, mapping of indigenous lands as a participatory exercise and a means for "securing tenure, managing natural resources, and strengthening cultures", often facilitated by outsiders, is a more recent phenomenon (Chapin *et al*. 2005: 619).

According to Chapin *et al.* the first participatory mapping exercises started in Canada and Alaska in the 1960's (2005: 619). The rest of the world only followed much later, approximately 25-30 years ago, when participatory mapping projects started to rapidly proliferate from Southeast Asia through Central Asia, Africa, Europe, North-, South- and Central America to Australasia (IFAD 2009: 7).

"In the development literature, mapping is identified as having many different sources – from social anthropology to participatory action research and popular education" (Pathways Through Participation 2010: 2). Throughout the years, mapping has become increasingly popular and prominent (Ibid: 13), which "many commentators ascribe to the developments in Participatory Rural Appraisal (PRA) which emerged in the late 1980s in South Asia and combined insights from agro-ecosystem analysis with Rapid Rural Appraisal (RRA)" (Ibid: 2).

"The more technically oriented participatory mapping work began filling the field in the mid- and late 1990s, when computerized mapping technology became more widely available" (Chapin *et al*. 2005: 623). "Those engaged in participatory mapping are increasingly taking advantage of new, digital and web-based Technologies" (Teague c. 2010: 13), which are being developed and improved by large corporations such as Google (Google Maps and Google Earth), ESRI (developers of the principal GIS used word-wide) and Garmin (producer of GPS hardware and software) especially for this purpose (Teague c. 2010: 13).

[36] More information on the different methodologies and their advantages, disadvantages, ways of implementation, suitable contexts, etc. can be found in the manuals of IFAD (2009) and Di Gessa (2008). For additional information on participatory 3-D modelling in specific also see Vandergeest (1996), Rubiano *et al.* (1997), Rambaldi & Callosa-Tarr (2000), Flavelle (2002), Hoare *et al.* (2002), De Vera *et al*. (2003), and Rhoades & Moates (2003) (as cited in Chapin *et al.* 2005: 623)

### In Indonesia

According to Peluso early forms of participatory mapping entered Indonesia in the 1980s via conventional (eco) conservation projects by international organisations such as the World Wildlife Fund (WWF), after which Indonesian activists took the opportunity to "… reinterpret this kind of mapping as a sort of resistance and counter-movement to state mapping, which did not consider people's rights but instead was a basis for exploitive development projects under the Suharto regime" (1995: 398-400, as cited in Hartjati Sanmukri 2013: 123).

Over the past 1.5 decade, communities from nearly every region in Indonesia have been trained in the technical and facilitation skills required to undertake participatory mapping, and by 2009 1.5 million hectares of land had already been mapped by local communities (IFAD 2009: 22). The Indonesian community mapping network (Jaringan Kerja Pemetaan Partisipatif or JKPP), established by the mapping activists in 1996 in Bogor, West Java, has been instrumental in achieving these goals (IFAD 2009: 22). I.a. by forming an alliance with AMAN and the Forest Watch Indonesia to advocate for the customary maps to become officially recognized and fed into the "Ancestral Domain Registration Agency" (Badan Registrasi Wilayah Adat): The government's official national database of forest cover. In 2011 AMAN signed an MoU with the National Land Agency (Badan Pertanahan Nasional), which officially stated that "indigenous" maps would be integrated into governmental data (Hartjati Sanmukri 2013: 123).

On May 16'th 2013 another important milestone for the recognition of indigenous peoples' ancestral land rights was reached, when – in response to a petition of AMAN - the constitutional court in Jakarta ruled that the customary forests of indigenous peoples should no longer be classed as falling in "State Forest Areas"[37] (Forest Peoples Programme 2013), officially giving customary forest its own status and position in the Forestry Law, and - at least in theory - returning the rights over the customary forests (seized by the state through UUK[38]) to its indigenous inhabitants (REDD-Monitor 2013). This development could greatly enhance the success rate of indigenous people's endeavours to lay claims to their lands and thereby protect their sources of livelihood in the future.

#### *Reported impacts of participatory mapping*

Over the years, many researchers have noted the positive impacts that participatory mapping can have on a community:

> *Participation in mapping seems to have encouraged some indigenous communities to demand title to lands (Toledo Maya Cultural Council, 1997; Leake, 2000; Herlihy, 2003; Herlihy and Knapp, 2003), to defend and claim their rights to control natural resources (Smith, 2003; Brown, 2006), and to design conservation and resource management plans that are compatible with local practices (Mohamed and Ventura, 2000; McCall and Minang, 2005; Brown, 2006; Bauer, 2009). Researchers have argued that, in addition to producing maps, when implemented with a stress on participation and with facilitation of discussions within communities, indigenous mapping empowers indigenous peoples in land and resource use*

[37] The petition of AMAN (*Aliansi Masyarakat Adat Nusantara*), which was filed with the court some 14 months before the ruling, objected to the way the 1999 Forestry Act treats indigenous peoples' 'customary forests' as providing only weak use-rights within State Forest Areas" (Forest Peoples Programme 2013)

[38] UUK is the abbreviation for Undang-Undang Kehutanan: Act No. 41/1999 on Forestry, saying: "customary forest is STATE FOREST in indigenous territory" (IWGIA 2013). The new ruling has replaced this law.

*rights against potential encroachers (Poole, 2003; Smith, 2003; Brown, 2006; Finley-Brook, 2007) (Reyes-Garcia et al. ca. 2012a: 2-3).*

In addition to these positive effects, researchers have also observed negative consequences resulting from participatory mapping. For instance, Authors such as Mwangi, Hodgson & Schroeder, Fox, Bryant, and Roth have noted issues such as increased privatization of land, loss of indigenous conceptions of space, greater exposure of valuable natural resources, increased taxation by the state, and increase or intensification of conflicts, either within the village, with neighbouring villages, or with other external actors such as companies or governmental authorities (Reyes-Garcia *et al*. 2012b: 651). Increase of conflicts due to participatory mapping, is one of the most frequently reported drawbacks of participatory mapping. Researchers such as Offen, Peluso, Hale, and Vandergeest have argued that: "Participatory mapping might intensify internal conflicts because it might bring to light overlapping uses of land and resources or erode traditional ways of dealing with internal conflicts…" (Ibid). Furthermore, it has been reasoned by i.a. Peluso and Rundstrom that "…participatory mapping might increase the number of conflicts with external actors, as the maps produced might challenge the maps made by state and corporate authorities" (Ibid).

Reyes-Garcia *et al*. have attempted to validate the theory that participatory mapping systematically increases the number of conflicts, using an experimental research design whereby 32 native Amazonian villages with and without conflicts with outsiders were randomly assigned to a treatment group (those where a participatory mapping project would be implemented by them) and a control group (those where a participatory mapping project would not (yet) be implemented by them[39]).[40] Contrary to others' previous findings, the results of their research show no statistically significant differences in the measured variables (i.e. number of conflicts, negative opinion, neutral attitude, and negative attitudes towards outsiders) between treatment and control villages (2012b: 656).

Reyes-Garcia *et al*. explain their deviating results by arguing that previous studies, which were based on direct observations rather than a randomized experimental design, might have been subject to selection bias, because the villages participating in participatory mapping projects are generally the ones that are chosen or volunteering to participate in participatory mapping due to the fact that they are expected to experience – or are already experiencing – conflicts over land rights and resources (2012b: 651, 656). Their results support the argument that mapping projects do not bring about conflicts per se, rather "…the process and the results of participatory mapping can help in conflict resolution or contribute to conflict generation or exacerbation depending on the political and socio-economic context in which they are conducted" (Ibid: 657).

[39] For the sake of fairness, participatory mapping projects were also implemented in the control villages, but only after all research data for the post-intervention study had been collected (Reyes-Garcia *et al.* 2012b: 653).

[40] All these villages were located in Tsimane' territory. The Tsimane' are a native Amazonian society of foragers and farmers in Bolivia.

*Good practice*

### How to organise a mapping process

Considerations on how to successfully undertake a participatory mapping programme, in part focus on the question of "what constitutes as an ideal way to organise a mapping process". There are many philosophical and technical differences in implementing participatory mapping initiatives, and the fact that they are carried out in many different settings, makes it impossible to distinguish a single definitive blueprint process that proves successful regardless of context (Di Gessa 2008: 2; IFAD 2009: 30). It is, however, generally agreed upon that a structured approach to the mapping process is necessary for it to succeed.

In this regard, the International Fund for Agricultural Development (IFAD 2009) identified some broad steps that are typically adopted in the deployment of participatory mapping initiatives, i.e.: Preparing the community for the mapping activity; Determining the purpose(s) of making a map; Collecting information; Creating the map and determining the legend; Analysing and evaluating the information, and; Using and communicating the community's spatial information (IFAD 2009: 32-38). These steps correspond with Chapin & Threlkeld's "ethnocartography model": a coherent and structured methodology that provides a 6 step approach to the process of mapping indigenous lands. According to the IFAD (2009: 32) most mapping projects loosely follow the steps of this approach, which entail: 1. "**ground preparation**: before the project starts project leaders and indigenous leaders explain the objectives and importance of the mapping work to the community, the technical team is recruited and collaboration with NGO's and government agencies is sought; 2. **First workshop – orientation and training**: Project staff and indigenous leaders explain the objectives and methodology to the surveyors and technical team and data collection tools are developed; 3. **First fieldwork – gathering data and sketch mapping**; 4. **Second workshop – transcription of data onto new maps**; 5. **Second fieldwork – verification of collected data by the community**, and; 6. **Third workshop – correcting and completing final maps**: Surveyors reunite with the cartographers to incorporate information that has been verified in the field and put the draft maps in final form (Chapin & Threlkeld 2001; IFAD 2009: 30).

### Ethical considerations

In one of his later works, Chapin points out that in the past guidebooks about participatory mapping that have grown out of work in Southeast Asia, have focused mostly on the technical aspects of mapping, avoiding the more politically sensitive aspects and ethical considerations brought along by the mapping.[41] The first manual to actually focus on these matters within Indonesian context was "Mapping people's forests: the role of mapping in planning community-based management of conservation areas in Indonesia" by C. Eghenter in 2000 (Chapin *et al*. 2005: 627). Over the years the focus on ethical considerations about potential negative consequences of mapping and the moral responsibilities of the project instigators towards the communities that partake in the mapping projects has become more pronounced. More and more authors broach these kinds of issues in their articles, books and manuals, even if only in afterthought.

[41] Examples of these "technical" guidebooks on participatory mapping are: Drawing on Local Knowledge: A Community Mapping Training Manual (Momberg *et al*. 1995); Mapping Our Land (Flavelle 2002); and Manual on Participatory 3-Dimensional Modelling (Rambaldi & Callosa-Tarr 2000) (as cited in Chapin *et al*. 2005: 627).

In the literature, a prominent topic with regard to "ethical practice" is that of "empowerment". Projects should be dedicated to achieving community empowerment, meaning that cartographers should focus on teaching the indigenous people how to read, interpret, produce and use maps, and should let them take as much control and responsibility over the mapping process as possible, thereby ensuring that the community will also be able to update their map and develop their own map-use strategies after the project has finished (Chapin & Threlkeld 2001: 128; Di Gessa 2008: 15; IFAD 2009: 25). Good practice, in this regard, also (perversely) means that mappers sometimes have to deliberately disregard or simplify available technologies to make sure the community will be able to access, understand and use them in the future without outside help (Chapin *et al.* 2005: 259; Di Gessa 2008: 5). Ownership rights should also belong to the community itself, enabling them to protect their own interests by deciding for themselves which data they want to publicly disclose, and which (potentially sensitive) data they want to keep private (Chapin & Threlkeld 2001: 134; IFAD 2009: 27-28).

According to i.a. Chapin & Threlkeld (2001) and Teague c. (2010), good practice in participatory mapping exercises also requires a culturally sensitive approach on the part of the international project instigators (NGO's, CBO's, etc.) and staff involved in the mapping process. They should make an effort to view the world from the eyes of the indigenous community, respecting and prioritizing the community's needs, and "carefully considering the challenges inherent in translating indigenous knowledge (which is often based on different epistemologies and conceptions of space and time than their own) into Western Cartesian cartographic formats" (Teague c. 2010: 15). For instance, knowledge about boundaries can easily be misrepresented as indigenous peoples often have a "fluid sense" of their borders, which can be overlapping, incomplete, shifting and/or dependent on seasonal variations (Chapin & Threlkeld 2001: 133)

Another topic that is quite extensively covered in the literature is the project initiators' (perceived) ethical responsibility to ensure that the benefits of the participatory mapping exercise are evenly felt throughout the community. It is deemed important that the map should represent the views and wishes of all the different groups within the community, and consequently many authors highlight the fact that special effort should be put into making sure that the map reflects the perceptions and needs of (potentially) marginalized groups, such as women, the elderly, youth, or immigrants (Chapin & Threlkeld 2001: 127; IFAD 2009: 27-28). Furthermore, it is thought important that members of all groups (and not only the village elite) are encouraged to participate in the actual mapping process, among other things to make sure that pre-existing power structures favouring certain groups' access to land are not reinforced (Teague c. 2010: 14), and to prevent new power imbalances between the people that know how to use the advanced technology, and those who don't (Wright *et al*. 2009: 260). Conversely, authors such as Mei-Po Kwan and Diane Rocheleau, who write from a feminist perspective, note the importance of taking into consideration and addressing the disrupting effect that mapping can have on existing gender relations (Teague c. 2010: 14).

An interesting development is that, over the past years, a special interest seems to be taken in the issue of "who controls GIS and with what power" (Spiegel *et al*. 2012: 345). Authors such as Chapin *et al.* (2005), Di Gessa (2008), Spiegel *et al*. (2012), Teague (c. 2010), and Wright *et al*. (2009) raise concerns on how skill levels needed for the handling of GIS are often gendered and age based (Teague c. 2010: 13), and on how a lack of electricity and internet access in remote communities and the cost of the equipment, causes the knowledge and handling of the GIS technology and/or the processing of the

GPS data to remain outside of the community, in the hands of a small - already privileged - elite of experts, thus enhancing existing power structures (Chapin *et al.* 2005: 629; Di Gessa 2008: 14-15).

Other topics on "good practice" in participatory mapping that are less pronounced but still present in the literature are: The importance of ensuring the long term commitment and support to initiatives of external parties (NGO's, CBO's, universities, development partners, etc.) (IFAD 2009: 25); A good selection of the mapping team. For instance: Chapin & Threlkeld have provided a list of desirable characteristics for facilitators (2001: 127), and lastly; The responsibility to make the local community aware of potential risks of mapping (such as boundary conflicts, risks of documenting sensitive information) before the start of the activities, and to put an effort into mitigating negative impacts that occur in the wake of the process (Di Gessa 2008: 1,3; IFAD 2009: 28-29).

# 1. Introduction

## 1.1. Project context

The archipelago of Nusa Tenggara Timur (NTT) province, of which the Flores is one of the islands, is one of the poorest provinces of Indonesia. Indonesia's most recent (March 2014) poverty statistics[1] estimate that 20% of the population in NTT province lives in poverty, while the national percentage is 11%. Many of the poor are small-holder farmers producing cash crops like coconut, cashew nut or cocoa. Therefore, they are not only vulnerable to local weather conditions but also to international market prices, and they depend on the trading conditions offered by local traders.

In East Flores, cashew nut is one of the main cash crops, and around 80% of the farmers grow cashews. Most of these cashew farmers deliver the unprocessed cashew nuts to traders that export it to Java. From there the cashews are shipped to countries like India and Vietnam for further processing. The processed cashews are then sold to Western markets.

Cashew nut farming is seasonal activity, providing a stream of income only for 3-6 months per year. Farmers, who are not able to save enough during this period, often have to rely on borrowing at high interest rates to overcome the lean periods. Therefore, it is greatly beneficial for the farming households if they can increase their share of profits in the cashew value chain, for example by getting involved in cashew nut processing or in the organic cashew market. By responding to the increasing demand for organic foods in developed countries,[2] farmers following organic farming practices can obtain a premium price, increasing their profits. For example, in a public consultation, FairTrade proposed a 15% premium for organic cashew nut, which was widely accepted by the consulted stakeholders[3].

Entering the organic food market requires high quality products and that farmers have not used chemical farming inputs for a sustained period. Both of these conditions are satisfied for the cashew sector in East Flores.

SwissContact also realized the potential for producing high quality organic cashews in East Flores, which became part of their Local Economic Development in NTT (LED-NTT) project starting in 2004 [4] The project focused on promoting organic farming practices, supporting the implementation of national and international organic certification for the project villages and supporting the development of local processing. The main objective of the project was to increase income and create jobs by improving the competitiveness of farmers and processing enterprises. The project started out as a local economic development project in the first phase (2005-2009). However, in the second phase (2010-2012), value chain development became the focus of the project aimed at the development of alternative market channels. In addition, in the cashew sector, the project stared cooperating with the local government at

[4] For more information about SwissContact and the LED-NTT project, see Annex I.

the district (East Flores) and sub-district level. As a result, organic farming practices have become part of the government's extension services for cashew, and the government has also contributed financially to the certification process of cashew.

In addition to cashews, the LED-NTT project (2004-2012) focused also on the cocoa and seaweed sector in different parts of NTT. After the end of the project, Cordaid continued funding the cashew nut sector activities through the Flores Specialty Products Promotion (FSPP) project which was running in 2013-2014. The project activities in the seaweed sector have been phased out, and the cocoa sector is funded by another donor after 2012. Hence, the *Medefinancieringsstelsel* (MFS) II evaluation focuses on the cashew nut sector activities for the 2010-2014 period.

## 1.2. Evaluation objectives

This report evaluates the cashew nut sector activities of the LED-NTT (2010-2012) and FSPP (2013-2014) projects of SwissContact[5] funded by Cordaid as part of as part of the MFS II evaluation for Indonesia under the Achievement of Millennium Development Goals (MDG) component. The project has been selected under the goals on poverty alleviation (MDG 1). In particular, the current evaluation focuses on the following research questions: Have the trainings on good farming practices lead to sustained increased productivity? Did the livelihood of farmers increase? Has certification of cashew nuts led to increased prices and revenues for the farmer? How did the share of cashew nuts sold at regional/national markets change? How did the farmers access to finance and use of financial services change?

We investigate whether the project had a favourable effect on the above mentioned outcomes using difference-in-difference methodology: we compare the changes in the outcome variables between the baseline and endline periods for the project beneficiaries to the changes in outcomes for a comparison group. In addition, because the project was already running for several years before the baseline with the same beneficiaries, we also estimate the effects of the project prior to the baseline survey by comparing the outcomes of the beneficiaries to the comparison group while controlling for pre-intervention household characteristics. We surveyed 6 out of 9 project villages and 4 comparison villages in East Flores.

In the 10 surveyed villages, we conducted a total of 150 household surveys. For the endline surveys, the same respondents were re-interviewed in 2014 whenever it was possible. The survey households were selected randomly from the project cashew farming groups in the treatment villages, and from cashew farmers who were members of randomly selected farming groups in the comparison villages. In addition, we interviewed the project farming groups in the sampled project villages both at the baseline and at the endline. We have also interviewed SwissContact to obtain information about the project implementation and project costs.

As specified in the Terms of Reference for this evaluation, the report addresses five evaluation questions to assess the project outcomes:

[5] The project is described in more detail in section 3.

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?
2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern partner organisations efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

## 1.3. Summary of findings

The LED-NTT project of SwissContact ran between 2010 and 2012. This project was followed up by the FSPP project between 2013 and 2014. The projects focused on different sectors. However, both of them included a focus on the cashew sector in East Flores that is the focus of this evaluation report. Both project had the objective to increase the profits of cashew farmers through four channels: increasing productivity, obtaining premium prices on organic certified cashews, obtaining higher price for processed products and linking farming groups to national and international buyers.

The fact that the project already started years before the baseline period of this evaluation and it worked with the same nine project villages all through the project period complicated the impact analysis. To be able to assess the early effects of the project before the baseline and the impacts during the evaluation period, we use both pooled regressions with location fixed effects and difference-in-difference regressions. The total effect of the two projects is the sum of the early effect and the effect found during the evaluation period, or it can also be inferred from the pooled regression coefficient.

In the data analysis, we found that the as the result of the projects treatment households conducted about 50 percent of their cashew trade at (inter)national markets (both at baseline and endline), and they increased the share of processed cashew nuts (with brown or white skin) in the total volume of cashew sold to 24% (at the endline). These developments contributed to increasing the average selling price of cashews by 22% compared to the comparison group at the endline but the result is not significant.

Regarding the promotion of sustainable farming practices, less than 50% of the treatment households practiced sustainable farming practices at the endline compared to around 30% at baseline. However, the comparison group was quickly catching up in the use of sustainable farming practices during the evaluation period.

Unfortunately, the yield, production and revenue of cashew nuts have decreased during the evaluation period in both groups but treatment households suffered more. The total household income still increased on average but comparison households were better at diversifying their incomes and as a result their income increased more. This development contrasts the baseline findings of around 100% higher revenues from cashews than the comparison group at the baseline, and highlights the importance of income diversification as cashew production is seasonal and volatile.

### 1.4. Structure of report

The rest of this report proceeds as follows: section 2 describes the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1 till 4 in turn. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. Information about the Southern Partner Organisation (SPO), the project and its implementation is provided in Annex I. Regarding the survey data, the construction of the outcome indicators and indices is summarized in Annex II, and Annex III presents summary statistics of the variables used in the analysis. Annex IV in turn describes the study locations, and Annex V reports detailed descriptive statistics of the sample. Finally, Annex VI provides additional information that is used to explain the findings.

## 2. Literature overview

The demand for organic products has been continuously growing over the last decade driven. According to Mheen-Sluijer and Innocenti (2011) the turnover of the global organic markets grew from some 20 billion USD in 2000 to 54.9 billion USD in 2009. The Research Institute of Organic Agriculture found that the European organic market grew by approximately 6% to a value of almost 23 billion EUR in 2012.[6] As a response, Non-Governmental Organisations (NGOs) and farming groups are increasingly adopting organic farming practices world-wide. Organic farming is an interesting option for farmers in developing countries because it combines low external inputs, environmental conservation and a premium price through labelling (Mheen-Sluijer and Innocenti, 2011). However, the socio-economic benefits of organic farming is debated as organic farming practices are more labour intensive and provide lower yields compared to using chemical inputs. In a comprehensive meta-analysis, Seufert et al. (2012) indeed found that organic yields are typically lower than conventional yields. However, they added that the difference is system and site specific: it ranged from 5% lower organic yields for rain-fed legumes and perennials on weak-acidic to weak-alkaline soils; 13% lower yields when best organic practices are used; to 34% lower yields when the conventional and organic systems are most comparable.

In the case of cashew nuts, the yield difference is likely to be small as cashew trees are usually grown on (sandy) soils that are generally unsuitable for other fruit trees.[7] In addition, when the yield difference is calculated based on the yield before introducing organic farming practices, organic farming can actually increases yields if the farmers used 'organic by default' farming practices, implying no agro-chemicals but also no organic best practices.

Leijdens (2007) reported the effects of an organic cashew nut certification project in Mkuranga, Tanzania. The project was implemented between September 2002 and January 2006 as part of the project Export Promotion of Organic Products from Africa (EPOPA), which is financed by the Swedish International Development Cooperation Agency (Sida). The project was linked to the exporting company

[6] Source: http://www.fibl.org/en/media/media-archive/media-archive14/media-release14/article/european-organic-market-continued-to-grow-in-2012.html
[7] Source: http://www.nda.agric.za/docs/Infopaks/cashew.htm

Premier Cashew Industries Ltd., and EPOPA supported the project by setting up the field organisation and the internal control system, training the farmers, and providing technical assistance in production, certification and marketing.

Due to the high prices of pesticides in Tanzania, farmers did not use agro-chemical inputs for years before the certification (Forss & Lundstrom, 2004). Cashew fields were also old and fairly neglected, trees had not been pruned for years. The project's field officers had been teaching pruning, mulching, stamping and how to apply manure, for which one demonstration farm in each of the three villages was established. The farmers all started to improve their cashew-trees, increasing yields in the following years. Additionally, some farmers invested in new land and processing equipment (Agro Eco/Grolink, 2008). This, together with the increase in productivity as a response to the increased demand, resulted in a production of almost twice as much on the same trees, from 5.2 to 10.1 kg per tree. It should be mentioned that the exporter provided sulphur to control the Powdery Mildew Disease.[8]

The farmers received an organic premium on their sales of raw nuts between 10% and 20% (Leijdens, 2007). At the same time, the price increased by over 200% from around 300 TSH (0.27 USD) per kilo to 700 TSH (0.62 USD) per kilo (Agro Eco/Grolink, 2008). Consequently, the income of the farmers has increased significantly, also when higher production costs were taken into account (Leijdens, 2007).[9] Unfortunately, no data is available for comparison households to control for the positive development on the international cashew market. Therefore, it is not possible to estimate the impact of the project on incomes. Among the interviewed project participants, 54% of the farmers reported that organic farming had improved their lives. Forss and Lundstrom (2004) noted that the sustainability of the project depended on the development of the world market and on government interference in the cashew trade in Tanzania. They concluded that as long as farming and trade are profitable, the impacts of the project would be sustainable.

Evidence for the sustainability of organic farming projects can be found in another EPOPA project in the cacao production in Tanzania, which ended before 2000. Incomes of the farmers kept increasing and the exporter did not need support anymore. It was too early to analyse the impact of the second phase, but Forss and Lundstrom (2004) stated that the use of demand and market mechanisms as driving forces in combination with local certification would indicate a sustainable impact at village level.

Bolwig, Gibbon and Jones (2009) assessed the revenue effects of certified organic coffee contract farming for smallholders coupled with trainings on organic agricultural farming methods in Uganda. They analysed Kawacom[10] Ltd.'s Sipi organic coffee contract farming scheme, which was also part of the EPOPA. Hence, the implementation was similar to the cashew project in Tanzania. The non-use of synthetic inputs was a condition for qualifying for organic certification. Certification in 2000 and 2001 was paid by Kawacom and conducted using a group system, based on an internal control system. Locally recruited company field officers performed annual or semi-annual farm inspections. They were trained in organic farming methods, ran demonstration farms and conducted occasional training. Kawacom

[8] Part of the results could also be driven by weather conditions as no comparison group is available to control for such effects.

[9] In the first two years of the project, the farmers earned an additional income of 603 USD per farmer compared to a total income per farmer of 2,198 USD (Leijdens, 2007).

[10] Kawacom is the largest organic coffee exporter from Uganda.

bought all the coffee that the organic farmers offer during the main buying season, paying an organic premium of unspecified size if the coffee is 'of suitable quality'. Surpluses were sold as conventional coffee. By analysing survey data on participants in the contract farming scheme as well as data on a control group of non-organic coffee smallholders in the same area, Bolwig et al. (2009) found an increase in net coffee revenue of around 75%, which is equivalent to 12.5% of mean household revenue. This is explained by the price premiums and higher yields per tree, which are contributed by the authors to the organic production system. After the EPOPA support stopped, Kawacom kept training field officers and running demonstration plots (Tulip, 2005).

Beuchelt and Zeller (2011) conducted a quantitative analysis of an organic certification project without emphasis on adoption of best organic farming practices. The analysed the effects of organic certified coffee cooperatives on income and poverty in Nicaragua. The cooperatives had to be certified for 5 years and have an internal control system. In addition, the certified farmers sell over 85% of their produce in certified market channels. By applying random sampling techniques, complemented by over a hundred qualitative in-depth interviews, the authors found a negative effect on the net coffee incomes for the whole organic certified coffee area as well as on per capita incomes, even though organic coffee farmers in Nicaragua received 8% higher prices in comparison to conventional farmers. Due to the higher prices and the high yield, organic certified farmers had significantly higher revenues. Nonetheless, neither input costs nor production costs were significantly lower for the certified farmers, while labour costs were likely to rise. The authors find that over a period of 10 years, organic certified farmers became relatively poorer.

The reported EPOPA projects all showed positive effects of organic farming on both yield and revenues, while the organic coffee project in Nicaragua showed a negative effect on the livelihood of the organic coffee farmers. The success of the EPOPA projects may be explained by the fact that the projects' farmers used 'organic by default' farming practices prior to the project. Hence, their productivity was below the levels using conventional farming. The training and adoption of best organic farming practices have resulted in increased yields under these circumstances.

However, organic farming practices are labour intensive, and adoption rates of best practices may be dependent on the farming households' willingness to increase their labour inputs. Agro Eco/Grolink (2008) reported that most smallholder farmers have complained about the heavy work load resulting from the organic farming practices. In addition, Mheen-Sluijer and Innocenti (2011) notes that smallholder farmers often have multiple, including off-farm sources of income and do not always have sufficient labour for agriculture. Hence, the profitability of organic farming also depends on the availability of cheap labour.

Overall, we can conclude that organic certification projects have a positive impact on the yield and revenue of farming households if the projects are coupled with trainings on best organic farming practices and the projects target farmers that have not used agro-chemical inputs prior to the project. For example, in Tanzania the EPOPA project increased the yield of cashew nuts from 5.2 kg to 10.1 kg per tree.

However, the high costs of organic certification have to be supported either by the exporter (under contract farming) or other funding agencies at the start of the project. Barrett et al (2001) recommend

that farmers form a producer group or cooperative to share costs. However, they note that there is a risk that the whole cooperative will lose its organic certification if one farmer fails the inspection. As a solution, they suggest that internal control and record keeping are needed.

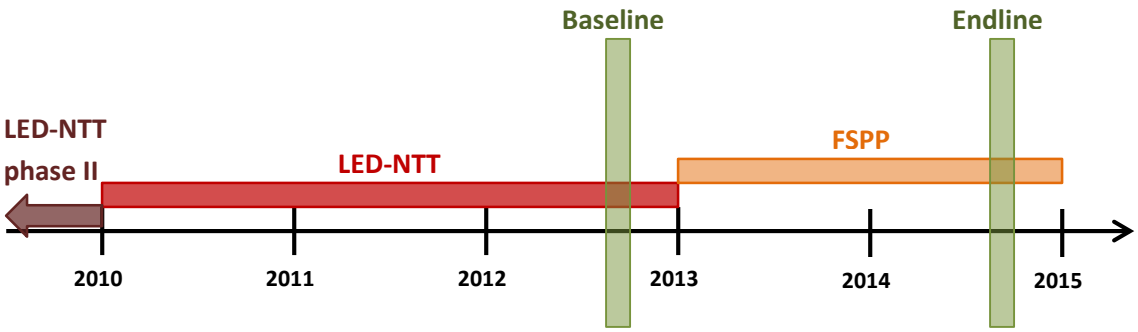
# 3. The project

## 3.1. Project description

The Local Economic Development in Nusa Tenggara Timur (LED-NTT) project of SwissContact has started in 2004. Cordaid provides funding for the project since 2005. Since then, three phases of the project have been implemented. The last phase, which ran between 1 January 2010 and 31 December 2012, was selected for the MDG component of the MFS II evaluation in Indonesia. The LED-NTT focused on three sectors: cashew nut, cocoa and seaweed. As a follow-up on the project in the cashew sector and a new component on wild honey, the Flores Specialty Products Promotion (FSPP) project of SwissContact and Cordaid ran between 1 January 2013 and 31 December 2014.[11]

Due to the continuity in the cashew sector activities, we decided to focus the evaluation only on the cashew nut sector, and evaluate the joint effect of the LED-NTT and FSPP projects on participating cashew nut farmers. As a consequence, the remainder of this report addresses only the cashew nut sector activities of LED-NTT and FSPP.

LED-NTT chose cashew nuts as one of the focus crops because the quality of cashew nuts is very good in East Flores and many farmers do not use chemical inputs as they are costly. The project expected that by labelling cashew nuts as organic can increase the selling price by approximately 30%.



The objectives of LED-NTT were to increase the profit of cashew nut farmers by (1) increasing productivity (yield of cashew nuts) by providing trainings on sustainable farming, (2) increasing selling prices of products by organising national and international organic certification, (3) increasing the profit share of local communities from the value chain of cashew nuts by setting-up local processing units of cashew nuts (creates jobs for locals and allows for higher selling price through value added), and (4) linking farmers to organic and non-organic markets. This last objective is supported by establishing cooperatives for contracting buyers and linking the buyers to the farmers. These objectives remained the same also in the FSPP project.

## 3.2. Project implementation

Figure 1 shows the timing of the LED-NTT and FSPP projects and the evaluation periods.

[11] The cocoa activities continued with funding from other donors, while the seaweed activities were phased out in the last LED-NTT project.

**Figure 1: Timing of the intervention and evaluation periods**

At the start of the project, SwissContact selected the project sites for the cashew nut activities based on the following criteria:

- Only districts with the best quality of cashew nuts, tested on size and the taste, were eligible.
- Only communities where the main income source is from cashew nuts qualified (SwissContact conducted a livelihood study to determine whether this is the case).
- Farmers had to organise themselves into a village level (*gapoktan*) farming group as certification is based on the village level.
- Only when a credible group leader is present within the farmer group, the community becomes eligible for the certification assessment

The implementation of the project was done at the village level in a total of nine villages/farming groups. Farmers in villages with organic certification have to sell their cashew harvest through the farming group in order to get the premium price. However, the members are also allowed to sell outside of the farming group. As usual practice, only the best quality cashews are sold as organic at the national and international market. The rest are sold at local markets. To apply for certification, the farming groups had to set up an internal control system (ICS) for the quality control of the cashews labelled as organic. In addition, a saving fund has been set up to save from sales for the costs of certification. However, only four of the nine farming groups/villages participated in certification by 2012.

LED-NTT implemented the following activities between 2010 and 2012:

- Identifying measures for productivity increase
- Training facilitators in Good Farming Practices
- Coaching facilitators in conducting training
- Facilitating potential investors
- Supporting organic certification
- Identifying provider and coaching delivery of services related to quality assurance and access to markets

In addition, FSPP planned to conduct the following activities between 2013 and 2014:

- Facilitating production, processing and marketing of organic cashew

- Facilitating technical services and marketing services
- Facilitating service delivery through farmer cooperatives

FSPP focused on the strategies on access to market through support on financial access and increase of quality and quantity of processed cashew products, as these were identified as the bottleneck issues of the LED-NTT project. Efforts have been made to organise organic certification for processing units as well, in order to be able to sell processed cashews at the organic market.

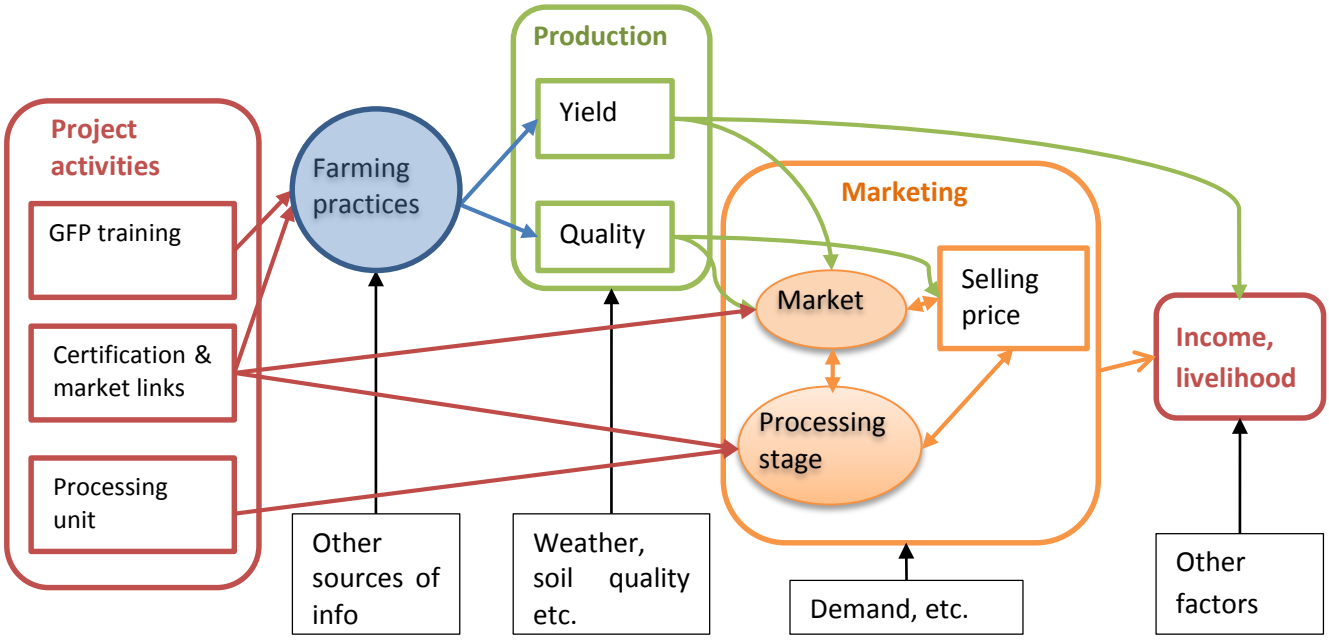
Annex I provides further information about the outputs of the LED-NTT project.

## 3.3. Result chain

The overall objective of the LED-NTT and FSPP projects is to increase the income of farming households. Figure 2 displays a schematic project logic to reach this objective from the perspective of the beneficiary farming households.[12]

On the left side of the figure, the main project activities are displayed: training on sustainable or good farming practices (GFP), facilitating certification and assisting in setting-up processing units. These project components influence the decision nodes of the farming households:

- **Farming practices**: what type of inputs and farming practices to use for the cultivation of cashews? The project trains and encourages farmers to use more labour intensive but low input sustainable farming practices, which include sustainable soil management through weeding, *rorak* making (drainage channels supported by composting and water catchment in a hole); distancing between cashew trees and pruning to select productive branches; the use of organic pesticides and herbicides; and the abandonment of chemical inputs.
- **Market**: farmers have to decide how much of their harvest to sell at the local, national and international markets (given the demand at each market). In general, only the best quality products are sold at the national/international markets, while second grade cashews are sold to the local market. The project facilitates the establishment of linkages between the farming groups and national or international buyers both for certified and non-certified cashews in different processing stages.
- **Processing stage**: farmers have to decide whether they want to sell the cashews in shell and let the buyer process it, or they want to benefit from higher prices by selling processed cashews. The project assists the establishment of local processing units.



The decisions of the farmers affect their production (yield and quality) and the selling price of cashews (depending on the market sold), which will finally affect the livelihood of the farmers. While the LED-NTT project focused a lot of attention on the use of sustainable farming practices and setting up an ICS, FSPP focused more on the marketing of the cashews.

It is important to note that organic certification is implemented at the village level, and it requires the commitment of the community to follow the quality control regulations. Therefore, it is a collective decision of the cashew farmers in the village. In addition, certification is only worthwhile if the products

[12] The results chain in Figure 2 is the interpretation of the evaluation team.

can be sold to buyers who are willing to pay for the additional value of certification. Linking the villages to such buyers was a continuous activity of both the LED-NTT and FSPP projects.

**Figure 2: Result chain**

Finally, as the figure indicates, there are also numerous other factors that affect the decisions of the farmers and the final outcomes of both production and marketing. To mention the most important ones: the weather conditions and diseases can hugely influence cashew production; the international cashew market drives the prices for cashew; and local government policies and extension workers can encourage farmers to use chemical farming inputs.[13]

# 4. Evaluation questions and outcome variables

## 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. In the baseline report specific evaluations questions were specified. Table 1 shows these five questions and what it implies for this project.

[13] To control for the effects of such outside factors (from the perspective of the project), it is important to use a comparison group when evaluating the impacts of project like the LED-NTT or FSPP.

**Table 1: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| 1 | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | • Have the trainings on good farming practices lead to sustained increased productivity?<br>• Did the livelihood of farmers increase?<br>• Has certification of cashew nuts led to increased prices and revenues for the farmer?<br>• How did the share of cashew nuts sold at regional/national markets change?<br>• How did the farmers access to finance and use of financial services change? |
| 2 | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Are the observed changes above attributable to the intervention? |
| 3 | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>• Does the project address an important issue for the beneficiaries? |
| 4 | Efficiency: Were the development interventions of the Southern partner organisations efficient? | Was the intervention cost effective? |
| 5 | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

The first 4 questions directly link to the project logic presented in Figure 2, while the last question refers to a general activity of the LED-NTT project: facilitating access to credit. This is not included in Figure 2 as it is not indicated as one of the outputs of the project.

In addition, 2 questions have been proposed in the baseline report that cannot be answered using the data collected as they relate to higher level outcomes. These are: Did the programme improve the business environment for the farmers? Did the programme contribute to creating new jobs in the cashew nut or related sectors?

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators split up into 7 groups: households using organic farming practices; yield of cashew nuts; volume of cashew nuts sold; percentage of cashew nuts sold to (inter)national markets; selling price of cashew nuts; household income and livelihood; and food security and vulnerability. These outcome variables are closely linked to the evaluation questions presented in the previous section, and also to the uniform indicators identified by the Synthesis team.

Table 2 displays the outcome indicators of the main analysis, the scale of these variables and whether the indicator is a uniform indicator, while Annex II provides a detailed explanation of the content and

construction of the indicators. The uniform indicators are specified by the synthesis team for the goal on poverty alleviation (MDG 1).

**Table 2: Overview outcome indicators**

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| **Panel A. Households using organic farming practices** | | | |
| Percentage of households practicing organic farming | | | |
| - Self-reported | (0-100%) | Household survey | |
| - Based on responses to questions (not using any chemical input) | (0-100%) | Household survey | |
| Percentage of households using chemical inputs | | | |
| - Using chemical fertilizer | (0-100%) | Household survey | |
| - Using chemical pesticides/insecticides | (0-100%) | Household survey | |
| Percentage of households using organic inputs | | | |
| - Using organic fertilizers | (0-100%) | Household survey | |
| - Using organic pesticides/insecticides | (0-100%) | Household survey | |
| Percentage of households have distance larger than 9x9m | (0-100%) | Household survey | |
| **Panel B. Yield of cashew nuts** | | | X |
| Yield per hectare | (0;NM) | Household survey | |
| Yield per tree | (0;NM) | Household survey | |
| **Panel C. Volume of cashew nuts sold (kg)** | (0;NM) | Household survey | X |
| **Panel D. Percentage of cashew nuts sold to (inter)national markets (compared to local markets)** | | | X |
| Using aggregate data in treatment and comparison groups (cumulated over the 2 treatment groups) | (0-100%) | Household survey | |
| Household average (based on kg sold to markets) | (0-100%) | Household survey | |
| **Panel E. Selling price of cashew nuts** | (0;NM) | Household survey | |
| **Panel F. Household income and livelihood** | | | X |
| Household income | | | |
| - Household revenue from sale of cashew nuts (1000 Rp) | (0;NM) | Household survey | |
| - Total income per month (1000 Rp) | (0;NM) | Household survey | |
| - Total income per capita per month (1000 Rp) | (0;NM) | Household survey | |
| Per capita expenditures of households | | | |
| - Non-food consumption per capita per month | (0;NM) | Household survey | |
| Asset holdings of households | | | |
| - Predicted expenditure based on housing facilities using IFLS (compatible with all MFS) | (NM;NM) | Household survey | |
| - Asset index using weights from DHS | (NM;NM) | Household survey | |

| Outcome indicator | Scale (minimum; maximum) | Source | Uniform indicator |
|---|---|---|---|
| Investment into business or farm equipment | | | |
| - Percentage of household invested in business | (0-100%) | Household survey | |
| - Percentage of household invested in new farming tools | (0-100%) | Household survey | |
| Self-reported well-being | | | |
| - Happiness | (1;4) | Household survey | |
| - Current wealth status | (1;6) | Household survey | |
| **Panel G. Food security and vulnerability (uniform indicator)** | | | X |
| Percentage of households not able to cover their living costs | (0-100%) | Household survey | |
| Percentage of households have not enough to eat | (0-100%) | Household survey | |
| Number of months households not able to cover their living costs | (0;12) | Household survey | |
| Number of months households have not enough to eat | (0;12) | Household survey | |
| Current standard of living: daily needs covered | (1;3) | Household survey | |
| Current standard of living: food consumption covered | (1;3) | Household survey | |
| Notes: NM stands for no minimum/maximum | | | |

# 5. Data collection

This section describes the survey instruments and the sampling design and outcome in turn.

## 5.1. Survey instruments

We collected two types of data: quantitative and financial. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

To analyse the impact of the programmes, two surveys have been conducted to collect quantitative data:

- Household survey: was designed to collect information about socio-economic characteristics, involvement in financial institutions, farming practices and production focusing on cashews, and the households' livelihoods.
- Farming group survey: a short survey was administered to the project farming group leaders regarding the activities of the farming group.

The baseline data have been collected from mid-September to the beginning of October in 2012; while the endline data was collected in the first two weeks of September 2014.

### *Financial data collection*

To collect information about the costs of the LED-NTT and FSPP projects, we conducted a project cost survey with the field coordinator of LED-NTT and the project manager of FSPP on 9 September 2013. The cost data has been verified with Cordaid in November 2014.

## 5.2. Sampling outcome

The evaluation focuses on the impact of the LED-NTT and FSPP projects on the beneficiary cashew nut farmers in 6 out of 9 project villages.

The following sub-sections discuss the selection procedure for the survey respondents (sampling design) and the results of its implementation (sampling outcome).

### *Sampling design*

At the time of the baseline survey, the treatment intensity differed among the 9 project villages: some have already obtained certification at the baseline (4), some were planning to obtain it (2), while the rest of the villages were not yet ready for certification. Also, some but not all project villages had a processing unit in the village. We stratified the sampling of villages by certification status: we randomly sampled 3 villages with certification, 2 that planned certification and 1 village that did not plan on certification. Please note that the selection of the project location is based on self-selection: only committed and well-organised villages participate in the project.

Comparison villages were selected based on information from SwissContact field officers: we selected 4 villages out of 10 listed villages. We have chosen one village in the same sub-district as some of the treatment villages; one village was chosen from the largest cashew producing sub-district in the area; and 2 villages had international certification in the past but the local NGO left the area and the intervention stopped.

In the 10 sampled villages, we interviewed 15 randomly selected households that were members of a selected farming group and produced cashew nuts. In the treatment villages we sampled from the project farming groups focusing only on cashew, while in the comparison villages the farming groups were often focusing on several crops.

At the endline survey, we aimed to re-interview all respondents and households participating in the baseline survey. However, if it was not possible to interview the same household or the household moved out of the village, we replaced the household with a randomly selected household following the sampling design from the baseline survey. As some of the questions in the survey relate to the subjective perception of the respondent, we aimed to interview the same respondent as for the baseline survey. If this was not possible, we interviewed another household member knowledgeable about household income and farming practices.

### *Sampling outcome*

Table 3 reports on the sampling outcome. The sampling at the baseline almost followed the sampling plan. However, one interviewed treatment household had to be discarded as they reported not to have produced any crops during the past 12 months (column 2). At the endline, we interviewed the same number of households as at the baseline (column 3). However, 4 treatment (4%) and 7 comparison (12%)

households were replaced. Replacement in the treatment villages occurred most often because the household moved out of the village (3) or the household was not at home at the time of the field work (1). In the comparison villages, the reasons were that the household moved out of the village (5), the household could not be found (1) or the household head died (1). Column 4 of Table 3 shows the households that have been interviewed in both survey rounds (panel households). The data on the households is used when assessing the change in the outcome variables between the baseline and endline (evaluation question 1 and the difference-in-difference estimators for equation question 2).

We also aimed to interview the same respondent at the endline as at the baseline. In the treatment villages this happened in 82% of the cases, while in the comparison villages only in 68% of the cases (column 5). Replacement of the respondent most often happened due to the baseline respondent not being at home (75% of all cases). The sample of panel respondents is used in the analysis for some of the outcome variables that depend on the subjective valuation of the respondent, like the subjective well-being of the household.

**Table 3: Sampling outcome**

| Assignment group | Planned | Baseline | Endline | Panel HHs | Panel respondent |
|---|---|---|---|---|---|
| Treatment | 90 | 89 | 89 | 85 | 73 |
| Comparison | 60 | 60 | 60 | 53 | 41 |
| **Total** | **150** | **149** | **149** | **138** | **114** |

# 6. Descriptive statistics

This section summarizes the characteristics of the sample by treatment group. The household characteristics are discussed below, while the village characteristics are described in Annex IV. In addition, the exposure of villages and households to the LED-NTT and FSPP projects activities is explored.

## 6.1. Household characteristics

To provide a better insight into the general characteristics of the households in our sample, Table 4 displays the most important socio-economic characteristics including age, gender, education level of the household head, economic activities of the household, and membership of the household in farming groups. The data are reported separately for the comparison and treatment villages. The variables are described at the baseline survey (Base) and the endline survey (End) for all households that have been interviewed in both survey rounds (panel sample). We also report on the significance of the change in the variables (p-value)[14]: column 3 (and 7) compares the characteristics of the comparison (and treatment) groups over time, while column 5 compares the characteristics of the treatment and

[14] P-values are calculated using standard errors corrected for heteroskedasticity and clustering at the village level. This means that the standard errors are allowed to have an arbitrary correlation for comparison or treatment respondents in the same village. In other words, we allow respondents in the same village in the same treatment group (comparison or treatment) to be more similar to each other than they are to a different randomly selected respondent in another village from the other treatment group.

comparison groups at the baseline. If the p-value is small (say smaller than 5%), it indicates that the change is significantly different from zero (at 5% significance level). The sample size for all variables is reported in Annex III.

The data show that the treatment and comparison households are fairly similar in terms of household size (4.7 vs 4.6 members), gender of the household head (10.1% vs 11.7% female), age of the household head (45.7 vs 43.7 years) and religion (100% catholic).

However, the household heads in the comparison groups are somewhat more educated (6% vs 0% with no education, and 23% vs 37% with secondary education). In addition, less of the comparison group's households report to have crop farming as the main income source (93% vs 85%), however, this difference is not significant. These households earn the most of their living from salary/wage or non-farm business. Further, the treatment households cultivate a somewhat larger size of land (2.1 vs 1.9 hectares) but the difference is again not significant.

The most important difference between the treatment and comparison households is their membership in farming groups. While almost all households have a membership in a farming group, at the baseline it was more often a cashew specialised farming group (*poktan*) (100% vs 38%) or a cashew farming group at the village level (*gapoktan*) (69% vs 13%) in the treatment group compared to the comparison group. Most farmers in the comparison group were members of a general farming group not specialized on cashew (0% vs 57%). However, by the endline the membership of treatment households in specialized cashew farming groups have dropped: only 55% of them still had membership in small cashew farming groups (*poktan*) and 46% had membership in a village level cashew farming group. At the same time, the membership in general farming groups in the treatment villages have increased: 38% of households were members of such a farming group. The same pattern, although more muted, can be also found among the comparison villages: membership in general farming groups increased at the expanse of cashew farming groups between 2012 and 2014.

Finally, membership in a savings and credit group is also higher in the treatment villages (40% vs 18% at baseline), and membership has increased in both types of villages between the baseline and endline (61% vs 40% at endline).

**Table 4: General characteristics of the sample**

| Column | (1) | (2) | (3) | (4) | (5) | (6) | (7) |
|---|---|---|---|---|---|---|---|

Notes: Robust standard errors corrected for clustering at the village level are used to calculate p-values.
P-values are not defined for variables where there was no change.

## 6.2. Treatment exposure

### *Treatment exposure in treatment villages*

In the farming group survey in the project villages we have asked a number of questions related to activities related to the LED-NTT and FSPP projects. The result of these questions is summarized in Table 5 and in Table 16 and Table 17 in Annex VI reported for the baseline (Base) and endline (End) periods.

**Table 5: Services of treatment farming groups supported by the project**

| Survey period | Base | End |
|---|---|---|
| **Sample size** | n=6 | n=6 |
| Number of farming groups that […] | | |
| *Had last meeting/training on GFP in 2012 Base/2013 End* | 4 | 4 |
| *Has an Internal Control System (ICS)* | 6 | 5 |
| *Has national organic certification (Biocet)* | 1 | 5 |
| *In 2012* | 2 | 4[1] |
| *In 2013* | - | 3 |
| *In 2014* | - | 1 |
| *Has international organic certification (IMO)* | 2 | 4 |

| *Is involved in the marketing of cashew nuts* | 3 | 6 |

Source: Farming group survey E10; MFS II Evaluation Indonesia

Notes:

1. Two additional farming groups indicated at the endline to have had national certification in 2012. However, the validity of this information is questionable.

The data shows that at the time of the baseline 4 of the 6 farming groups had the last training on good farming practices in 2012, while the remaining 2 villages had it in previous years. At the endline, also 4 farming groups reported to have had the last training in 2013, while one organised the last training in 2014 and another in 2012. The groups reported that the trainings were mostly organised by SwissContact (4 at baseline and 5 at endline) or by the district education centre or agricultural extension centre (4) (Table 17).

Table 5 also indicates that almost all farming groups have an internal control system that is used for quality control for certification or gathering data for applying for certification. One farming group has given up on managing an internal control system.

Turning to certification, Table 5 shows that 3 farming groups reported to have had international organic certification in 2012 (IMO)[15], while only one of the villages reported to have it in 2013 and 2014 (not the same villages). However, 3 villages reported to have national certification (Biocet) in 2013, and only 1 in 2014.[16] The 3 villages with international certification in 2012 and national certification in 2013 are the

[15] International certification (IMO) is awarded for 3 years. The villages had to reapply in 2012.

[16] National certification (Biocet) is valid for 1 year, and it has to be reapplied each year.

same. Table 19 indicates that SwissContact has (co-)financed the costs of certification for all farming groups.

The number of farming groups with a processing unit has increased between the baseline and endline from 2 to 5, while the number of farming groups involved in the marketing of cashews has also increased from 3 to 6. Most farming groups also provided storage for cashews at the endline (5) (Table 16). These are the largest improvements among the treatment indicators.

Unfortunately, we do not have information about comparison farming groups.

### *Treatment exposure of households*

Turning to the household data, we are able to report on the participation of both treatment and comparison households in project related activities. Table 6 and Table 18 in Annex VI show that, in general, not too many households reported to participate in trainings on good farming practices at the baseline (33% and 10%), while the percentage of participating households have somewhat increased by the endline despite the shorter recall period (3 vs 2 years) to 39% and 20% in the treatment and comparison groups, respectively. Hence, more treatment than comparison households participated in such trainings in prior to both survey rounds. Nonetheless, the treatment exposure to trainings on good farming practices is not universal among the treatment households. It is possible that some households do not recall to have attended such trainings or do not consider a discussion about farming practices a training. However, this is true for both treatment and comparison villages.

In addition, due to the extension service workers adopting the good farming practices advocated by SwissContact, it is quite possible that the comparison households indirectly also benefitted from the projects of SwissContact.

However, only the treatment households benefitted from organic certification. While only 27% of the households reported to participate in organic certification (at the national level), at the endline 58% of the households reported to have patriated in some type of organic certification. Based on the data from the farming groups, 3 of 6 farming groups had international certification in 2013, which implies a response rate of 50% at the household level if all households participated, while we observe that 56% of the treatment households reported to have international organic certification at the endline. However, this discrepancy could be due to the one village that had national certification at the endline (17% of the sample): only 2% reported to have only national organic certification, while 12% reported to have both international and national certification.

The final verdict regarding certification is whether household actually report to sell their cashews at the national and international markets, which we will investigate among other outcome variables in the next section.

**Table 6: Household participation in organic certification**

| Assignment group | Comparison | | Treatment | |
|---|---|---|---|---|
| **Survey period** | Base | End | Base | End |
| Percentage of households that participated in good farming practices training in the past 3 years (baseline) / 2 years (endline) | 10.0 | 20.0 | 32.6 | 39.3 |
| Percentage of households that have […] certification | | | | |
| *No* | 100.0 | 98.3 | 73.3 | 41.6 |

# 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured between the base- and endline survey (2012-2014) are 7 groups: households using organic farming practices; yield of cashew nuts; volume of cashew nuts sold; percentage of cashew nuts sold to (inter)national markets; selling price of cashew nuts; household income and livelihood; and food security and vulnerability.

Table 7 displays the results for all outcome indicators in a similar manner as the household characteristics were presented in Table 4. However, Table 7 only reports on the significance of changes within group between the baseline and endline (p-values). Comparison of the changes between the treatment and comparison groups is left for the attribution section (evaluation question 2). In Table 7, the standard error[17] of the outcome variables is displayed in brackets below the mean. The sample size for the outcome variables can be inferred from Annex III.

The results of Table 7 are discussed below by outcome indicator group.

### *Use of organic farming practices*

Households were asked directly whether they were practicing organic farming. At the baseline, almost all households reported to do so in both treatment groups. At the endline, the percentage of households that reported to practice organic farming has dropped sharply in the comparison group (from 92% to 30%) and also in the treatment group (from 88% to 62%). However, this decrease hints more at the popularity of the expression 'organic farming' in 2012 than the actual practice itself because when asking about the type of farming practices used in detail, we observed that 95% of comparison households and 76% of the treatment households did not use chemical inputs to farming at the endline, hence qualifying for organic farming.

[17] Standard errors are corrected for heteroskedasticity and clustering at the location level. See footnote 14 on page 21.

The data show that 16% of the sampled treatment households use chemical fertilizers at the endline, compared to the 8% reported by the treatment farming groups in Table 20. This could be an issue for the farming groups that have organic certification. Therefore, Table 20 also reports separately on the three farming groups that have organic certification: these farming groups report that no households use chemical inputs for soil management or against insects and diseases. However, according to Table 21, which contains the self-reported farming practices of the households, 9% of the households report to use chemical fertilizers. No change is found in this value between the baseline and endline.

Organic farming does not imply the absence of chemicals in farming but also the use of sustainable farming practices that were also promoted by the LED-NTT project. Table 7 shows that the use of organic practices have significantly increased over the evaluation period: among the treatment households 49% are using organic soil management practices (16% use manure, 19% *rorak*[18] and 29% use other methods including compost, see Table 21) and 38% use organic methods against insects and diseases, mostly fumigation/smoking (34%, see Table 21).

Surprisingly, less of the households in the organic certified farming groups use organic farming practices (Table 21). Especially the use of *rorak* for soil management has reduced in this group between the baseline and endline from 23% to 5%, while the farming group survey indicates that the use of *rorak* has increased from 33% to 92%. Hence, the data from the households contradicts the data from farming group leaders for the certified farming groups.

The use of organic practices has increased the most in the comparison villages: at the endline 30% used organic soil management practices (12% used *rorak*, 3% manure and 20% other methods including compost) and 42% used organic methods (fumigation/smoking) against insects and diseases. This last percentage is higher than in the treatment groups.

Overall, the data on the comparison villages show that SwissContact was successful in mainstreaming organic farming methods into the extension services and trainings held by other field workers (for example through peer education) on farming practices.

However, this finding has also a drawback from the perspective of the evaluation: since the changes in organic farming methods are the largest in the comparison group, it makes it difficult to identify the projects' effects on cashew nut yield.

### *Yield of cashew*

As farmers switch from letting cashews grow naturally to using sustainable soil and pest management, it is expected that their yield should increase. However, Table 7 shows that the both the yield per hectare and per tree has generally decreased between the baseline and endline periods.[19] However, yields are still higher in the treatment group compared to the comparison group. The reduction in yields is likely to

[18] *Rorak* involves the making of drainage channels supported by composting and water catchment in a hole.

[19] For 47% of the comparison households and 62% of the treatment households we calculated a reduction in the cashew nut yield per tree (not reported).

driven by other factors (like weather conditions) than the project. In the treatment group, the average yield per tree has dropped from 4.51 kg to 2.8 kg.[20]

Table 22 and Table 23 investigate some potential factors affecting the yield of cashews. Table 23 shows that the percentage of cashew trees in full production did not change significantly: 52-67% of the cashew trees are in full production, while this percentage it at the higher end in the treatment group. The table also highlights that the stock of cashew trees have a worse age structure in the treatment villages, meaning that there are more trees that are too old for production (20% vs 15% at endline), and less young trees (14% vs 32%). Between baseline and endline, we also observe a small reduction in the number of cashew trees used for production in both the treatment and control groups (not significant).

Table 22 investigates the variables used to calculate the cashew nut yield per hectare: cashew harvest and the cultivated land size. Cashew harvest in the past 12 months has decreased on average by 25% in the comparison group and by 43% in the treatment group. There has been a reduction also in the land used to cultivate cashews but this is only 13% in the comparison group and 20% in the treatment group on average. Only households in villages with organic certification have increased the land used for cashew production, however, their production suffered the largest loss at 49% on average.

### *Volume of cashew nuts sold*

Due to the substantial drop in cashew harvest in the past 12 months, also the volume of cashew nuts sold has significantly diminished in both the comparison and treatment villages. The households sold most of the harvested cashews.

### *Percentage of cashew nuts sold to (inter)national markets*

There has been no change in the percentage of cashews sold at national or international markets compared to the local market: about 50% of the cashew nuts are sold to national or international market in the treatment villages, while almost all cashew nuts are sold at the local market in the comparison villages.

In addition, Table 8 disaggregates the percentage sold to (inter)national markets by the processing stage of the cashew nuts. At the endline, almost all processed (brown or white skin) and almost half of the unprocessed (in shell) cashew nuts were sold at (inter)national markets in the treatment villages. Table 24 further investigates at which markets households sold cashews both in terms of processing stage and locality of the market. Focusing on treatment households, we observe that only 18% of the household sold any cashews with brown skin and 14% sold with white skin. Hence, the benefit selling processed cashew nuts are only limited to less than 20% of the treatment households.

Table 25 shows that most treatment households either sell all their cashews at the (inter)national market or they sell all it at the local market.[21] There are very few households that sell to both markets. Looking at the data from the farming groups, Table 26 shows that while at the baseline farming groups were still selling cashew nuts to the local market (especially in shell), by the endline farming groups were

[20] For reference, the yield per trees has increased from 5.2 kg/tree to 10.1 kg/tree in a similar project in Tanzania (Agro Eco/Grolink, 2008).

[21] Please note the inconsistency between selling at the national and international markets based on the household and farming group data. It is most likely that household made a mistake when specifying whether they sold at international or national markets.

mostly specialized on marketing the cashew nuts at the (inter)national market. In addition, the share of processed cashews has increased in the volume of cashews marketed by the farming groups: from 1% to 20% for cashew nuts with brown skin and from 0.2% to 3.6% for cashew nuts with white skin.

### *Selling price of cashew nuts*

The average selling price of cashew nuts (averaged over markets and processing stage) has increased in both treatment (16%) and comparison groups (10%) in real terms. [22] However, the change is not significant due to the large variation of reported selling prices by the households. For more detailed information on average cashew nut prices the reader is referred to Table 27 and Table 28, which contain the disaggregated price data for cashew nuts sold in different processing stage and at different markets from the project farming groups and all surveyed households, respectively.

Overall, the increase in the average selling price of cashews is driven both by households selling a larger share of cashews as processed products, and by a general increase in prices of cashew nuts.

### *Household income and livelihood*

Revenues from cashew nut production have decreased in real terms by 41% (p=0.01) in the treatment group and 21% (p=0.14) in the comparison group, as the increase in prices could not compensate the significant reduction the amount of cashews harvested.

Nonetheless, the total household income per capita has increased by 70% in real terms in the comparison group (p=0.05) and by 9% in the treatment group (p=0.47). Hence, especially in the comparison group the reduction in cashew revenues was compensated by an increase in income from non-farm businesses (14.4 percentage point increase in the share of total income) and from livestock (8 percentage point increase).

In the treatment villages, the reliance on cashew nuts remained high: 53.2% in the share of total income compared to 36% in the comparison group. Households in treatment villages compensated the reduction in cashew income through and increase in income from transfers (7 percentage point increase in the share of total income) and from non-farm businesses (6 percentage point increase). However, not only cashew revenues but the contribution of other crops to the household income has decreased.

Hence, the increase in total household income per capita cannot be attributed to the LED-NTT and FSPP projects as it did not arise through increases in cashew nut income.

The increase in total household income (per capita) is verified by increases is non-food expenditure,[23] the asset indices and the subjective valuation of the current wealth status (for panel respondents only). However, only the last one of these increased significantly over the evaluation period.

Finally, looking at the investments made by households, a shift is visible: a smaller percentage of households invested into new farming tools (37% and 30% at endline) and a larger percentage invested into business (24% and 27% at endline). These figures suggest that non-farm business opportunities are more profitable than crop farming.

[22] Income and consumption variables at the endline are reported in real terms (2012 prices) adjusted for inflation between 2012 and 2014. The CPI was 4.3% in 2012 and 8.38% in 2013, resulting in a 13.04% increase of consumer prices between the baseline and endline periods.

[23] For details about the components of non-food expenditure see Table 30.

### *Food security and vulnerability*

Despite the increase in per capita household income, the percentage of households reporting that they were not able to cover their living cost and they had not enough to eat at least in one month during the last 12 months has increased in both treatment groups. In fact, almost 80% of the households in both groups report to have had an episode when they did not have enough to eat. This suggests that households still rely on seasonal income, and mechanisms to save household income for later consumption are not well developed.

# 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

## 8.1. Methodology

We analyse the effects of the LED-NTT and FSPP projects on beneficiaries using regression analysis. The primary analysis uses difference-in-difference methodology: we compare the changes in outcome indicators between the treatment and comparison groups. We assume that in the absence of the LED-NTT and FSPP projects, on average, we would observe the same magnitude of changes in the treatment villages as in the comparison group.

However, because the LED-NTT project was running already before the baseline survey (since 2010), we also analyse the results of the project using a pooled regression combining the baseline and endline data without taking first differences. In effect, this analysis compares the outcomes of the treatment and comparison group at a point in time. The results tell us the early effects (at the baseline) of the LED-NTT project and also the total effects of the LED-NTT and FSPP projects (at the endline).

The total impact of the LED-NTT and FSPP projects can also be calculated as the sum of the early effects (at the baseline) and the effects found between the baseline and endline survey period (diff-in-diff). The two calculations of the total project impact should yield similar results. If the estimated total impacts are significantly different, it suggests that the results of the pooled estimator are invalid.

Below we discuss the model used for the regression analysis in detail.

### *Treatment effect on the treated*

As discussed in section 3.3, the project has three components: trainings on good farming practices, organic certification and processing units. These components affect the outcomes to a different extent depending on the outcome variables. Therefore, it would be reasonable to assume the following regression equation for outcome variable $Y$:

$$Y_{it} = \alpha_t + \beta GFP_{it} + \gamma Cert_{it} + \delta Proc_{it} + \zeta X_{it} + \eta_i + e_{it} \quad (1)$$

Where $GFP_{it}$ signifies if household $i$ is a member of a farming group that received trainings on good farming practices at time $t$;[24] $Cert_{it}$ shows whether household $i$'s farming group has been certified to produce organic cashew nuts at time $t$; and $Proc_{it}$ indicates whether the same farming group (village) had a processing unit at time $t$.

In general, because the treatment and comparison groups were not randomly selected, there could be differences in the characteristics of the treatment and comparison villages and of the households sampled in these villages. If some of these characteristics also affect the outcome of $Y_{it}$ and we do not control for these characteristics, we could mistakenly interpret the effect of these characteristics on the outcome variable as an effect of the project. Therefore, in (1) we include $X_{it}$, a set of observable control variables that affect the project outcome but they are not affected by the outcome itself (predetermined). In addition, we also include household fixed effects ($\eta_i$) that pick up unobservable time invariant household specific characteristics; and a time varying trend ($\alpha_t$) in the outcome variable. The remaining residuals ($u_{it}$) are clustered at the village level.

However, due to the limited number of observations (of farming groups) per intervention type, we are not able to report on the project components separately for most outcome variables. Instead, we only report on the overall impact of the intervention. Hence, instead of regressing the outcome variable on the components of the intervention, we will only use an indicator whether the household is a member of a project farming group ($Treat$). This way we can estimate the mean effect of the programme on the participating farming groups and households.

In addition, since the project has already started before the baseline at the farming groups and there have been continued project activities since the baseline, we split the intervention coefficient into before baseline ($TreatBefore_{it} = 1$ in both rounds if the household is member of a project farming group, and 0 otherwise) and after baseline ($TreatAfter_{it} = 1$ at the endline survey if the household is member of a project farming group, and 0 otherwise). Therefore, $TreatAfter$ only contains the additional improvement after the baseline. The resulting regression equation is:

$$\mathrm{Y_{it}} = \alpha_t + \theta_1 \mathrm{TreatBefore_{it}} + \theta_2 \mathrm{TreatAfter_{it}} + \zeta \mathrm{X_{it}} + \eta_i + \mathrm{e_{it}} \quad (2)$$

[24] Regarding the time index $t$, $t = 1$ for the baseline period and $t = 2$ for the endline period.

We are interested in the estimates of $\theta_1$ and $\theta_2$, the coefficient of the treatment effects before and after the baseline, respectively.

### *Treatment effect on the treated between baseline and endline*

We use difference-in-differences methodology to estimate the treatment effect of the LED-NTT and FSPP projects between the baseline and the endline survey. We take the first difference of (2):[25]

$$\Delta Y_{i2} = \alpha + \theta_2 \text{TreatAfter}_{i2} + \zeta \Delta W_{i2} + \Delta u_{i2} \quad (3)$$

The time-invariant household fixed effect disappears in (3) due to the differencing, along with some of the control variables in $X$ with $\Delta W_{i2}$ containing the change in the remaining control variables. Only variables where the change is significantly different between the treatment and comparison groups are included in W. In addition, we denote the average change of the outcome variable in the comparison group by $\alpha$.

Note that the early treatment variable, $TreatBefore$, has been omitted from (3) as its value did not change between the baseline and endline periods. In addition, we omitted the change sign (Δ) from $\text{TreatAfter}_{i2}$ as its value at the baseline was zero, and hence, the change in this treatment variable is equal to its value at the endline. We report the regression results for the treatment effect, $\theta_2$, with and without control variables (W). Note that only the panel sample is used for this regression.

### *Treatment effect on the treated before and after the baseline*

In order to estimate the treatment effect of the LED-NTT project before the baseline survey, we combine or pool the baseline and endline data,[26] and estimate the following pooled regression:

$$Y_{it} = \alpha_t + \theta_1 \text{TreatBefore}_{it} + \theta_2 \text{TreatAfter}_{it} + \zeta X_{it} + \mu_{f(i)} + u_{it} \quad (4)$$

where the household fixed effect ($\eta_i$) is replaced by a farming group fixed effect ($\mu_{f(i)}$) in the pooled regression. This model assumes that there are no unobserved household-specific effects that correlate with the treatment. Given that the intervention is at the farming group level, self-selection of individuals is less of a problem. Only the overall organisation of the farming group and the quality of the cashew nuts played a role in the placement of the intervention, which can be controlled by farming group fixed effects.

Regarding the control variables, $X_{it}$ includes household characteristics that are significantly different between the treatment and comparison households either at the baseline or the endline period. We use observations on all sampled households for estimating regression (4).

Most importantly, the coefficient of $TreatAfter$ in regression (4) not only shows the impact of the interventions after the baseline (as in regression (3)) but, in fact, it combines the treatment effect both before and after the baseline survey. Hence, it estimates the total treatment effect on the treated.[27]

---

[25] Hence, $\Delta Y_{i2} = Y_{i2} - Y_{i1}$ and so forth.

[26] In principle, we could also just have estimated the early project results using a cross-sectional analysis of the baseline data. However, combining the baseline and endline data may improve the precision of the estimates.

[27] If the total impact estimated by $\theta_2$ in regression (4) significantly differs from the total impact estimated by the sum of $\theta_1$ from (4) and $\theta_2$ from (3), it signals that unobserved household characteristics are also an important determinants of the outcome variables. Hence, the results from (4) are biased.

## 8.2. Results

Table 9 reports the regression results for the outcome indicators in the same order as in section 7. The first column of the table contains the mean value of the variable in the comparison group at the baseline. This serves as a reference point for assessing the size of the project impact on the variables. The next two columns report on the pooled regression results of regression (4): column 2 reports on the treatment effect before the baseline, while column 3 reports on the total treatment effect until the endline. Next, column 4 reports the difference-in-difference (DD) regression results of regression (3) without the controls, and column 5 shows the regression results including controls. As mentioned above, the overall effect of the project on the beneficiaries should be assessed as the sum of the baseline effect (column 2) and the DD effect (column 5), which can be compared to the total effect calculated in using the pooled regression (column 3). If the two results are significantly different, it suggests that the results of regression (4) in columns 2 and 3 are biased.

In the pooled regression (columns 2 and 3), the education, age and gender of the household head, the household size, the size and slope of land owned and cultivated, the gender of the main respondent, and the subjective well-being 5 years ago are used to control for differences between the households. In addition, village fixed effects are also included as indicated in regression (4). In the diff-in-diff regression (column 5), the same household level variables are included.

The standard error of the coefficient estimates are calculated correcting for heteroskedasticity and clustering at the village level, and they are reported below the coefficients estimates in brackets (columns 2-5). The significance of the coefficient estimates is denoted by stars next to the coefficient estimates.[28] As before, the sample size for the regressions is not reported but can be inferred from Annex III.

The regression results are discussed by outcome variable groups.

### *Use of organic farming practices*

The regression results show that the LED-NTT and FSPP projects did not significantly affect the farming practices used by the households between the baseline and endline periods except for a small reduction in using chemicals to protect from insects and diseases (significant at 10%). No positive impact is observed on using organic soil management and protection methods against insects and diseases as the comparison group was also catching up in terms of organic farming practices between the baseline and endline.

However, if the improvements in the comparison villages are due to spillover effects of the LED-NTT project as argued above, the increase in organic farming practices in both the treatment and comparison groups can be at least partially attributed to the projects. Unfortunately, we are not able to quantify what percentage of the effect can be attributed to LED-NTT.

[28] The probability that the coefficient estimates are not significantly different from zero is indicated by stars: * denotes that this probability is smaller than 10%, ** is used if this probability is less than 5% and *** if it is less than 1%. Hence, the more stars indicate a higher probability that the effects are significantly different from zero.

### *Yield of cashew*

Between the baseline and endline the yield of cashew nuts in the project villages decreased, which is captured by the negative albeit insignificant coefficient estimate of the intervention. Nonetheless, the overall effect of the project on the cashew nut yields appears to be substantial and significant (42% higher per tree and 46% higher per hectare compared to the comparison group at baseline).

However, given the selection procedure of the LED-NTT project for the project sites, it is possible that at least some part of this effect is due to unobserved site characteristics (like soil quality). This view is supported by the fact that treatment households did not use more intensive sustainable farming practices compared to the comparison households at the endline.

### *Volume of cashew nuts sold*

The regression results do not support the hypothesis that the project contributes to increasing the amount of cashews sold.

### *Percentage of cashew nuts sold to (inter)national markets*

The results show that the LED-NTT and FSPP projects were successful in linking the project farming groups to (inter)national markets. The total effect of the projects was a 38.4 percentage point increase in the percent of cashew nuts marketed at (inter)national markets.

### *Selling price of cashew nuts*

Due to the LED-NTT and FSPP projects, the average selling price of cashew nuts increased in the treatment group. The overall effect is 28% higher prices compared to the prices reported by the comparison group at the baseline (or 22% at endline). As discussed before, both the processing stage of cashew nuts and the locality of market contributed to this outcome. Both of these factors are influenced by the project. However, the estimated project impact is very imprecise, and it cannot be excluded that the project did not have any beneficial effect on the selling price of cashew nuts.

### *Household income and livelihood*

Before the baseline period, the project had a positive impact on households' revenue from cashews (exp(0.7)-1=101% increase compared to the comparison group). However, during the evaluation period the project had a negative (exp(-0.2)-1=-18%) but insignificant effect. The overall effect of the project is insignificant (exp(0.3)-1=35%).

However, the impact of the project on the total household income per capita is negative both during the evaluation period (exp(-0.3)-1=-26%) and overall (exp(-0.6)-1=-45%). This is due to the fact that the comparison households were able to improve their livelihood with activities other than cashew nut cultivation, while the treatment households lost out on focusing on cashews and suffering a bad harvest.

Due to the project, treatment households invested less into their own business and relatively more into farming tools than the comparison households.

Finally, despite being poorer in terms of total income and expenditure, at the baseline treatment households judged their current wealth status to be higher than in the comparison group by 29%. However, during the evaluation period the subjective wealth status of treatment households grew less than in the comparison group.

Hence, overall, the LED-NTT and FSPP projects did not contribute to improving the livelihoods of the treatment households. Treatment households may have been better off by focusing on a different livelihood activity.

### *Food security and vulnerability*

The regression results on the food security indicators are mixed, and do not yield conclusive findings on the effect of the project on the food security and vulnerability of households.

# 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular we look at the size of the impact and whether the project addresses an important issue for the beneficiaries.

## 9.1. The size of the impact

The LED-NTT and FSPP projects had a positively impact on the share of cashew nuts sold at (inter)national markets, the revenue from cashew sales and the selling price of cashew nuts compared to the comparison group. However, it failed to increase the total income of the project beneficiaries during the evaluation period. In fact, households in treatment villages are worse of compared to the comparison group that manage to better diversify its income sources and increase its income through investing more into non-farm business and livestock.

Hence, the achieved positive results of the project are counterweighted by the unfortunate reduction in cashew harvests, which led to the relative decrease of household income in the treatment group. The findings highlight the importance of income diversification of the project beneficiaries, as cashew nut cultivation not only provides seasonal income but it also appears to be a risky income source subject to weather and other factors outside the control of the households. In that respect, it is not a surprise that households are not willing to exert the extra effort to fully adopt the sustainable farming practices promoted by the project.

## 9.2. Does the project address an important issue for the beneficiaries?

The project addresses an in important issue for the beneficiaries: their livelihood. Given that most household in the project area are cashew farmers that produce good quality cashews without using chemical inputs, the project's focus on organic certification and (inter)national marketing of cashew nuts is well chosen.

However, the project focuses on a seasonal and risky livelihood activity as can be seen from the findings of this evaluation, which may not be the optimal strategy for the economic development of the treatment households.

As we observed in Table 4, the membership of treatment households decreased over the evaluation period in cashew focused farming groups in favour of more general farming groups. This suggests that farmers have realized that they have to diversify also in their crop production and not focus solely on cashews. Recalling the findings of Table 24 and Table 25, the projects of SwissContact are certainly beneficial for the treatment households that engage in processing of cashews (18-32%) and selling at the (inter)national market (53%). However, other farmers are better off by pursuing other livelihood activities.

# 10. Evaluation question 4: Efficiency of project

This subsection will answer evaluation question 4: Were the development interventions of the Southern partner organisations efficient? To answer this question we will describe the cost effectiveness of the programme. First, the calculation of cost per beneficiary is discussed. Second, these costs are compared to the project effects per beneficiary. Finally, the findings on cost effectiveness are compared to achievements of similar projects.

## 10.1. Costs per beneficiary

A first step to estimate the cost effectiveness of the programme is to calculate the project cost per beneficiary. We conducted a structured interview with the field coordinator[29] of LED-NTT and the project manager of FSPP at SwissContact on 9 September 2013 using the 'budget survey' as described in section 5.1. In addition, we consulted relevant reports of the LED-NTT such as their financial statements and annual narrative reports. [30]

The cost data is based on the actual costs made by LED-NTT. However, a number of currency exchanges had to be calculated for the project as SwissContact Indonesia reported costs in Indonesian Rupiahs (IDR) and Swiss francs (CHF), while the audit reports were usually in CHF and EUR. We tried to consistently use the IDR and EUR amounts whenever possible. However, project management costs and fees at SwissContact headquarters in Switzerland had to be converted to IDR in order to report the total projects in IDR.[31]

The total costs of the LED-NTT project amount to 9,543,375,490 IDR or 847,748 EUR[32,33] for the 2010-2012 period covering the four sectors of the project (cashew nut, cocoa, seaweed and enabling environment) and overall project management. This is 94% of the overall project budget of 897,794 EUR.

[29] The interview was conducted with Hanna Keraf, Programme Manager of FSPP, Etih Suryatin, Field Coordinator of LED-NTT, and Elvy Setheono, Head of Operations of Swisscontact Indonesia until end 2013.

[30] For the costs we relied on the LED NTT Cordaid (Total Expenditure-Profit Loss) reports for years 2010, 2011 and 2012, and the annual audit reports for years 2010, 2011, 2012 and 2013. Information about the beneficiaries is obtained from half-yearly project reports between 2010-2012, Progress Report 2013 and Wildhoney Baseline Report.

[31] The project costs for 2012 differ between the profit/loss statements obtained from SwissContact Indonesia, the financial statement sent by SwissContact Switzerland to Cordaid, and the annual audited financial report. Data reported in the tables are based on the financial statement specifying costs in EUR and CHF.

[32] Using implicit exchange rates based on the financial reports, we arrive at the following IDR/EUR exchange rates: 10,490 IDR/EUR in 2010, 11,916 IDR/EUR in 2011, 11,899 IDR/EUR in 2012 and 14,106 IDR/EUR in 2012. Note, however, that costs have been recorded in IDR and CHF at the time of occurrence. Therefore, there is no fixed exchange rate for the costs. The exchange rates reported above are average exchange rates calculated based on the annual total project costs.

[33] Prices in IDR and EUR are reported in nominal values. No adjustment for inflation has been made. Hence, adding the costs over the years is technically incorrect. To overcome this problem when calculating the costs per beneficiaries, we converted the annual costs to International dollars (Int$) in 2011 prices. Hence, values reported in Int$ are real values adjusted for purchasing power parity.

Cordaid funded 36% of the actual costs (305,000 EUR) of the LED-NTT project.[34] Overall, 52% of the costs cover direct project costs (18% for cashew nut sector, 13% for cocoa sector, 12% for seaweed sector and 9% for enabling environment), and the remaining 48% are the costs of project management (24% local project management, 16% project management at SwissContact headquarters and 8% overhead).

Based on the financial statement for 2010, Cordaid covered 100% of the direct costs in the cashew sector, 75% in the cashew sector, 9% of the seaweed sector and 74% of the project activities on enabling environment. In addition, Cordaid funded 6% of the local project management costs and 32% of the project management costs at SwissContact headquarters and project management fees (overhead costs). The overall contribution of Cordaid to the LED-NTT project was 39% in 2010. Unfortunately, we do not have information about the cost items covered by Cordaid in 2011 and 2012.

Turning to the FSPP project, the total cost for the 2013-2014 period was planned at 379,365 EUR with 73% contribution from Cordaid. In 2013, the total costs of the FSPP project were 2,035,315,560 IDR or 144,289.76 EUR funded 100% by Cordaid.[35] In the first half of 2014, the project costs amounted to 47,990 EUR financed fully by Cordaid.[36] Hence, 49% of the planned budget was still available for the second half of 2014. In 2013, 29% of the overall costs were used for the cashew sector component, 21% were used for the honey sector, 41% were the costs of project management, and the remaining 9% were the project management fee (overhead). Unfortunately, the actual costs of activities in 2014 were not yet available at the time of writing this report.

Table 10 summarizes the overall costs of the LED-NTT and FSPP projects in Indonesian rupiahs (column 1) and in euros (column 2) per year. The percentage of total costs covered by Cordaid (Co-financing Agency or CFA) through MFS II funding is shown in column 3 also per year.

The remaining columns of Table 10 contain information regarding the calculation of annual project costs per beneficiary household. Column 4 reports on the percentage of project costs attributed to the cashew sector (direct and indirect costs) in Indonesian rupiahs. The indirect costs of overall project management are split among the sub-projects according to their share from all direct costs.[37]

We report on the cashew nut project costs in Indonesian rupiahs because we want to calculate the annual cost per beneficiary household (HH) in Indonesian rupiahs and International dollars (Int$). International dollars at 2011 prices[38] are used for the final values of the cost per beneficiary household

[34] According to SwissContact Budget to LED-NTT Contract, the total budget of the LED-NTT project for the period 2010-2012 was 897,794 EUR, of which Cordaid financed 305,250 EUR.

[35] Cordaid have transferred 151,434 EUR to SwissContact. However, due to changes in the exchange rate over the year, only 144,289.76 EUR (95% of funds) have been used. The project closed the year with a net asset balance of 100,774,836 IDR according to the project's audit report.

[36] Information for 2014 received from Cordaid.

[37] The share of indirect costs attributed to the cashew nut sub-project is 29.2% in 2010, 28.1% in 2011, 42.4% in 2012 and 57.6% in 2013.

[38] The following exchange rates are used based on PPP conversion factor using the World Development Indicators: 3,469.52 IDR/Int$ in 2010, 3606.57 IDR/Int$ in 2011, 3,636.38 IDR/Int$ in 2012, 3,682.25 IDR/Int$ in 2013 and 4,530.90 IDR/Int$ in 2014. Source: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#

calculation because it takes both purchasing power parity and inflation into account. Hence, the final result can easily be compared across time and countries.

Turning to the direct beneficiaries, column 5 shows the number of farm households directly benefiting from the cashew nut intervention as reported in the progress reports of the project. Column 6 reports the cost per farming household per year in IDR and column 8 reports the same value in constant price international dollars (Int$ 2011).

The table shows that the number of beneficiaries is rather stable over the years, indicating that the same households have benefitted from the project over the three year project period. As discussed in section 3, the intervention is a continued capacity development of the cashew nut farmers and processors. Therefore, in order to obtain a realistic picture of the overall costs per beneficiary, we need to sum the costs per beneficiary per year for the 2010-2014 period. The total costs are 589.45 Int$ per farming household for the 2010-2012 LED-NTT period, and 172.98 Int$ for 2013 in the FSPP period. Hence, for the period of 2010-2013, the total costs per cashew farming household were 762.43 Int$.

**Table 10: Overview of the costs and number of beneficiaries**

| Period | Total costs [IDR] | Total costs [EUR][1] | Percentage of costs funded by CFA [MFS II] | Cashew costs[2] [IDR] | Number of direct beneficiaries [Farm HHs] | Cost per farm HH per year [IDR] | Cost per farm HH per year [Int$ 2011][3] |

Source: Budget Survey 2013; LED-NTT financial statements and annual narrative reports for the years 2010-2013.
Notes:

1. EUR amounts are included as reported in the annual audit reports as the amount transferred by Cordaid to SwissContact. No adjustment has been made for inflation.
2. Direct costs include the direct costs of the cashew nut sub-project and indirect costs of overall management. The share of the cashew nut sub-project from all direct project costs (for 4 sub-projects) is used to calculate the share of the cashew nut sub-project from the total indirect costs.
3. PPP conversion factor to 2011 international dollars is calculated using the World Development Indicators: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#
4. Costs in 2010 are funded by MFS I.
5. Costs are included only from 1 January 2014 until 30 June 2014 (6 months).
6. N.K. = not known
7. Planned number of beneficiaries.

The financial report assigns sector costs to categories of production/productivity, organic certification, market channel, processing unit/product development, coordination and staff, and monitoring and

evaluation. Table 11 reports on the cost per beneficiary household for specific project activities in International dollars (2011). The staff costs are not included in the table, only direct project activity costs. In addition, costs contributed by the beneficiaries or the local government are not taken into account. This especially applies for the organic certification, where the local government also contributes. The establishment of processing units is also partly driven by private initiatives that complement the project.

**Table 11: Contribution of project activities to cost per beneficiary household (2010-2013) in Int$ (2011)**

| Year | 2010 | 2011 | 2012 | 2013 | Total |
|---|---|---|---|---|---|
| **Productivity (GFP)** | 17.08 | 4.25 | 6.34 | 22.79 | **50.46** |
| **Organic certification** | 9.18 | 11.65 | - | 18.11 | **38.93** |
| **Product development, market channel and processing units** | 15.72 | 7.32 | 43.23 | 29.62 | **95.89** |
| Source: LED-NTT financial statements and annual narrative reports for the years 2010-2013. | | | | | |

Table 11 shows that the costs of production/productivity contribute 7% of the total cost per beneficiary, while this percentage is 5% for organic certification and 13% for market channel and processing unit/product development.

## 10.2. Cost-benefit

On the one hand, the total costs of the LED-NTT and FSPP project were estimated at 762.43 Int$ per cashew farming household. However, only considering only the direct project costs on the three project components: productivity increase, organic certification and marketing, the cost of direct project activities was only 185.28 Int$ (2011).

On the other hand, it is difficult to quantify the benefit of the project. The final outcome of the project is the increase in households' livelihood, which may be best quantified by increases in total household income. However, the regression results in Table 9 indicate that while the project had a positive impact on revenue from cashew production, it had a negative overall impact on the total household income.

The results may be driven by unfortunate weather or other circumstances, and in another year or over the long run we might have found a positive overall benefit for the project in terms of household income.

However, judging the project based on the findings during the evaluation period, we have to conclude that the net benefit of the project is negative accounting for the project costs.

## 10.3. Cost effectiveness

Comparing the costs of the LED-NTT and FSPP projects to the costs of other similar projects, Barett et al (2002) report that the costs of organic cashew nut certification were 1,037 Int$ per farming group (100 farmers) per year, or 10.37 Int$ per farmer per year. Considering only the costs of certification, these costs are similar to the ones found for the projects of SwissContact (9.18-18.11 Int$ per farmer).

Quizon et al (2001) report on the costs of trainings on organic farming practices per farming group using the farmer field school approach, which are 37.30-49.20 Int$ per farming group, which are considerably

lower than the costs of the productivity component of the LED-NTT project (4.25-22.79 Int$ per farmer per year).

Summarizing, already the direct costs of trainings on organic farming practices are higher than the benchmark suggested by the Synthesis team (Quizon et al, 2001), while most of the SwissContact unit project costs (762.43 Int$ per farmer) cover indirect project costs like project management. Hence, compared to the benchmark costs sited above, the projects of SwissContact are not cost effective.

# 11. Contribution of Capacity Development and Civil Society

SwissContact was not selected for the evaluation of capacity development of the SPO and civil society strengthening.

# 12. Conclusion

SwissContact's LED-NTT and FSPP projects aimed to increase the profit of cashew nut farmers through four channels: increasing productivity, obtaining premium prices on organic certified cashews, obtaining higher price for processed products and linking farming groups to national and international buyers. Below we discuss to what extent the projects were successful in delivering the desired outcomes in terms of the four project components for the sampled beneficiary households.

Firstly, we consider the productivity channel: almost all treatment farming groups indicated that SwissContact has conducted meetings or trainings at the farming group on good farming practices, while only 33% of the treatment households at the baseline and 39% at the endline recalled to have participated at such meetings. However, this does not in itself imply that households are not using sustainable farming practices. Indeed, during the evaluation period the percentage of households using sustainable soil management methods increased from 31% to 49%, and for insect and disease protection methods it increased from 13% to 38%. However, at the same time households in comparison villages also caught up on using sustainable farming practices. This could be an indirect effect of LED-NTT. Unfortunately, households in organic certified villages showed the lowest use of organic farming practices at the endline, while some of them even admitted to using chemical fertilisers (9%). Turning to cashew yields, we find that the cashew yields are significantly higher among the project beneficiaries compared to the control group. However, during the evaluation period the advantage has decreased. In general, cashew yields have dropped from 2011/2012 to 2013/2014 by 24-37% in the treatment and 11-21% in the comparison group.

Secondly, half of the sampled project farming groups had organic certification. As a result of organic certification and linking farming groups to (inter)national markets, around 50% of the cashews sold have been marketed on (inter)national markets. Table 27 and Table 28 show that cashews were generally sold more expensive at (inter)national markets.

Thirdly, almost all project farming groups had a processing unit at the endline. Table 24 shows that the share of processed cashew nuts sold increased to 24% in the treatment group at the endline. As processed cashews are sold at a higher price, the SwissContact projects have contributed to the increase

in cashew selling price. In fact, the project contributed to a 22% increase in the overall average cashew nut selling prices but the impact is not significant due to the large variation of reported selling prices. Hence, the LED-NTT and FSPP project were the most successful in linking farmers to the (inter)national market (including certification) and setting up processing units.

Turning to the profits and income of farmers, we found that despite the positive impact on prices, the projects were not able to increase the revenues of project beneficiaries from 2011/2012 to 2013/2014 even when controlling for the reduction in revenues in the comparison villages. However, at the baseline (2011/2012), treatment households had twice as high revenues from cashews compared to the comparison households. Unfortunately, treatment households were not able to adapt to the poor harvest of the 2013/2014 period as total household income of the treatment households decreased in relative terms during the evaluation period.

The data show signs that households started moving away from cashew nut production, diversifying their income sources, which could be a result of the unfavourable cashew cultivation conditions in the 2013/2014 period. We observe that the membership of treatment households in cashew farming groups has decreased by 38%, while membership in general farming groups increased by 44%. In addition, households stared investing more in off-farm businesses at the expenses of new farming tools. This is a necessary development as cashew harvest can be volatile due to environmental conditions. However, the last bad harvest may explain why households are less keen on exerting extra effort into organic farming practices.

The above findings are partly compatible with the findings in the literature. The literature shows that organic certification projects can have a positive impact on the yield, prices and revenue of farming households. However, there are no indications that these effects translate into higher income. The LED-NTT project indeed increased price (the reported increase in price for the LED-NTT project falls into the range of reported price increases in the literature[39]) and indeed, though unfortunate, has no effect on total household income. However, where the literature shows positive effects on yield and revenue as well, the LED-NTT project was not able to increase the yield of cashew nuts or the revenues of project beneficiaries during the evaluation period due to regional unfavourable conditions for cashew nut cultivation. Nonetheless, we observed higher yields and revenues of beneficiary households at the baseline compared to comparison location.

Finally, the MFS synthesis team asked to score each project along a few indicators. Table 12 displays the indicators and the scores we deemed valid for the project.

[39] Though, the reported increases in yield, price and revenue vary widely between studies.

**Table 12: Overall project scoring**

| Statement | Score | Comment |
|---|---|---|
| **1. The project was well designed** | 8 | The project aimed to improve the livelihood of farmers by increasing the value added of the commodity already produced by the farmers. In addition, it cooperated with the local government and farmer peer educators on promoting sustainable farming practices. |
| **2. The project was implemented as designed** | 9 | We are not aware of deviations in the project implementation. |
| **3. The project reached all its objectives** | 7 | While most project objectives have been reached, the project was not successful in increasing the revenue from cashews and total household income of beneficiary households during the evaluation period.<br>A positive effect of the project is that also farmers in the comparison villages started using some of the sustainable farming practices promoted by SwissContact. |
| **4. The observed results are attributable to the project interventions** | 6 | The score is both positive and negative.<br>Positive: the unsuccessfulness of the project in term of household income during the evaluation period is driven by factors outside of the control of SwissContact of the farmers (like whether).<br>Negative: The positive effects on yield cannot be explained by the use of sustainable farming practices. Therefore, it is possible that they are due to the selection effect of the project (site characteristics). |
| **5. The observed results are relevant to the project beneficiaries** | 6 | Given the negative outcome on income, the beneficiaries may be better off by diversifying their income sources to other livelihood activities. |
| **6. The project was implemented in the most efficient way** | 5 | Comparing the project costs to other projects, the SwissContact projects seem to be on the expensive side partially due to the high project management costs. |
| Notes: Scores are on a scale of 1 to 10, with 1 being “no agreement at all” and 10 being “completely agree with statement”. | | |

# Annex I. SPO and project description

### *SwissContact*

SwissContact is an international development organisation with its head office in Switzerland. SwissContact focuses on the development of small enterprises in developing countries. In the 1960s, SwissContact built up the first vocational training projects in Africa, Asia and Latin America. Later, in the 1980s, it developed the first small and medium-sized enterprises (SMEs) support concepts, as there was a great need in this domain, especially for graduates from vocational schools. SMEs find it very difficult to get inexpensive operational and investment loans, which is why programmes were developed to help overcome these problems. As regards environmental protection, SwissContact has mainly been involved in developing methods to combat air pollution. SwissContact specialises in project management, focusing now on Vocational Education and Training, SME Promotion, Financial Services and Resource Efficiency. SwissContact has been working in Indonesia for over 30 years. SwissContact has its country office in Jakarta, and a field office in NTT. As of 2007, SwissContact has two offices on the island of Flores and a permanent staff of 5 people. [40]

### *Project description: LED-NTT (2004-2012)*

The Local Economic Development in Nusa Tenggara Timur (LED NTT) project is one of the projects supported by Cordaid and SwissContact. There are two phases of the LED NTT programme: the first phase is in 2004-2008, and the second phase is 2009-2012. In the first phase, Cordaid and SwissContact support LED NTT by providing an integrated approach for economic development, particularly in rural areas in Eastern parts of Indonesia. Focus of the activity in the first phase was improving and enabling environment by promoting green or organic production among farmers in rural areas, linking the product of cashew, cocoa, and seaweed to the market, and promoting the access of information and access to finance for farmers of cashew, cocoa, and seaweed.

Based on the internal assessment of the project in 2008, it is concluded that it would be more efficient for the project to focus on the selected activities which sound feasible. Therefore, LED NTT project move to the second phase, 2009-2012. There are three selected sectors that get funded, including: cashew production in East Flores, cocoa production in district of Ende, and seaweed production in Alor.

Focusing on Farmers who produce cashew nut in East Flores, the projects' aim are: (i) strengthening farmers by organising farmers work in groups to apply for organic cashew certification; (ii) improving farmers' productivity through training; (iii) linking farmers to market for selling organic cashew nuts. Organic cashew able to gain premium price; being labelled as organic the cashew value added improve approximately 30%. (iv) cashew nut sector is expected able to create job approximately 130 employees, mainly in the processing unit. The majority of the workers are female.

Cocoa is the second sector to be focused by LED NTT in the second phase. Like the cashew, cocoa is already planted by the local farmers in Ende. Cocoa production started in 2007. However, due to vulnerable for disease, cocoa production decreased significantly in the subsequent year, 2008. The key intervention of the project in cocoa production involving: (i) strengthening farmers groups by forming

[40] See also: http://www.swisscontact.org/english/pages/AR/AR.php?navanchor=2110011

farmers into 21 groups, with approximately 432 members. Within these groups, farmers could sharing their experience how to maintain good quality of cocoa seed instead of bad impact of the diseases. (ii) Through the training for Good Farming Practices (GFP) cocoa farmers are expected gaining productivity. They plant good seeds which are available in the local nursery, and applying organic fertilizer. Using demonstration in 3 different plots, it is reported that organic fertilizer could improving cocoa production almost 300%. In collaboration with PT MARS, the cocoa from farmers in Ende can be improved by guaranteeing its dry level.

The third sector of the LED NTT second phase project is seaweed production. Seaweed production is started in 2006 as parts of earth quake recovery project. In 2007, only 600 farmers engage in seaweed production, however the number double into 1282 farmers by the year 2009. Like in other sectors, forming farmers into groups, assigning training how to produce seaweed could increase the number of farmers involved in the seaweed sector. SwissContact has phased out its activities in the seaweed sector in 2010.

### *Achievements of LED-NTT in the cashew nut sector (2010-2012)*

Based on the progress reports of the LED-NTT project between 2010 and 2012, this subsection describes the planned project outputs and their accomplishments.

***Output targets***

*Organisational strengthening*

1.1 As from 2012 the Cashew Coordinating body acts as driver for future sector development.

*Productivity*

1.2 In 2012 at least 2 productivity enhancement measures applied by 1100 producers.

*Value added*

1.3 In 2012, 5 cashew farmers groups continuously obtained organic certification for 3 consecutive years.

1.4 In 2012, at least 70% of certified organic cashew shell sold through the organic channel.

1.5 At least 3 service providers provide services related to access to finance, access to markets and quality improvement until end of 2010 for cashews and until 2012 for palm/coconut sugar

***Achievements in 1st semester of 2010***

*Organisational strengthening (50% achieved)*

- Balai Penyuluhan Pertanian – BPP able to act as Cashew Coordinating Body – CCB for capacity building, increasing productivity and strengthening farmer groups.

- Several inter-group meetings resulted in strategy and planning for certification process 2010, they discussed budget for preparation certification cost, strategy for GFP training, strategy for selling cashew market.

- Almost all farmer groups are very active in conducting working groups on applying GFP (sanitation) facilitated by field facilitator in each villages.

*Increasing productivity (50% achieved)*

- 12 package role out training on on-farm GFP (Conservation and Sanitation, Pruning, pest and disease, and fertilizer) and on off-farm (post harvesting), facilitated by CCB with 24 field facilitator (7 field extension government employees and 17 farmers). Attended by 234 HH of which 155 HH very actively apply GFP.

- 9 Demo plots as media for learning have been introducing part of GFP treatment.

*Value added (60% achieved)*

- 3 farmer groups conducted preparation for organic certification process for certification 2010

- 4 Service Providers provided service relate to access to market, access to finance, and quality improvement

- 22 HH have additional income from processing 190 kg cashew equivalent to IDR 16.150.000 or IDR 241.818 per HH per month

- 5 organic channel linkages: PT. PMA, PT. Big Tree Farm Bali, PT. Aliet Green, Manik Organic Shop (producer Chocolate "Monggo"), Carrefour. One of buyer (PT. Alit green) have been promoting "Flores Branding"

***Achievements in 2nd semester of 2010***

*Organisational strengthening (70% achieved)*

- Balai Penyuluhan Pertanian – BPP act as Cashew Coordinating Body – CCB for very active conduct capacity building on increasing productivity and strengthening farmer groups through formalize farmer group organisation become cooperative, coordinates working groups on applying GFP (sanitation) facilitated by field facilitator in each villages.

- Several inter-group meetings resulted in strategy and planning for certification process 2010, they discussed budget for preparation certification cost, strategy for GFP training, strategy for selling cashew market.

*Increasing productivity (60% achieved)*

- Coordinated by CCB of 24 field facilitator (7 field extension government employees and 17 farmers) were conducted technical assistance to 857 farmers trained on farm GFP and on off-farm (post harvesting). Of 221 HH very actively apply full GFP (Conservation and Sanitation, Pruning, pest and disease, and fertilizer).

- 6 of 9 demo plots as media for learning maintained and showing positive impact on increasing productivity

*Value Added (65% achieved)*

- 5 farmer groups participate in organic certification process for certification 2010.

- Only 7% of 260 ton sold to organic cashew channel this year (decrease 18% in 2008). Of 15 ton will processed during first semester 2011 in level processing unit.

- 27 HH have increase additional income of 28% from processing 3.436 kg cashew become brown skin quality equivalent to IDR 194.416.000 or IDR 1.524.000 per HH per 2 month.

- 4 organic channel linkages: PT. Big Tree Farm Bali, PT. Aliet Green (producer Chocolate "Monggo"), Carrefour and Olam ltd. "Flores Branding" have been promoted.

- 1 potential investor for Processing unit and 1 market channel identify and facilitated business linkages.

***Achievements in 1st semester of 2011***

*Organisational strengthening (75% achieved)*

- Balai Penyuluhan Pertanian – BPP acts as Cashew Coordinating Body. Continuation of capacity building on increasing productivity and strengthening farmer groups through formalizing farmer group organisation to become cooperatives. Coordination of working groups on applying GFP (sanitation) facilitated by field facilitator in each villages.

- Several inter-group meetings resulted in strategy for selling cashew market and increasing productivity.

*Increasing productivity (70% achieved)*

- Cashew: 12 of 24 field facilitators (field extension government employees and lead farmers) have now good capacity and knowledge on GFP and become trainers. Coordinated by CCB, training to 460 farmers was conducted and technical assistance was provided to 1519 farmers on-farm GFP and off-farm (post harvesting) practice.

- The total number of farmers increased 32% or 693 HH (398 direct and 30 indirect) compared to data first second semester 2010. They are applying full GFP (Conservation and Sanitation, Pruning, pest and disease, and fertilizer). 50 farmers apply and integrated cocoa system with cattle.

- 14 demo plots as media for learning maintained are showing positive impact on increasing productivity.

*Value Added (65% achieved)*

- 5 farmer groups participate in organic certification process for certification 2011.

- 2 HH of 51 HH have increase additional income of 28% from processing. 180 kg cashew become brown skin quality for BTF Bali and white kernel for local market, equivalent to IDR 10.980.000 or margin IDR 1.098.000 per HH per 2 month.

- 6 identified, 4 organic and 2 conventional market channels have been identified: PT. Big Tree Farm Bali, PT. Aliet Green), Carrefour, UD Nusa Permai, Comextra and Eka Prima

- 1 potential investor for Processing identified and facilitated business linkages with existing processing unit.

***Achievements 2nd semester of 2011***

*Organisational strengthening (75% achieved)*

- Balai Penyuluhan Pertanian – BPP acts as Cashew Coordinating Body. Continuation of capacity building on increasing productivity & disseminate the lesson learn.

- 1 group formalized as cooperative, offer the business services such as buying and selling organic cashew, received micro-credit IDR 110 Mio for working capital and successfully create income IDR 5.600.000,- .
- Several inter-group implemented for selling brown skin cashew to market and increasing productivity.

*Increasing productivity (70% achieved)*

- 25 field facilitators (field extension government employees and lead farmers, 3 women) active provided technical assistance to 1519 farmer on-farm GFP and off-farm (post harvesting) practice.
- 408 farmers are applying full GFP (Conservation and Sanitation, Pruning, pest and disease, and fertilizer). 50 farmers apply and integrated cocoa system with cattle.
- 14 demo plots as media for learning maintained.

*Value Added (65% achieved)*

- 4 farmer groups participate in international and national organic certification process for certification 2011.
- 128 HH have increase additional income of 42% from processing. 4.880 kg cashew become brown skin quality for BTF Bali and UD Nusa Permai, equivalent to IDR 333.500.000 or income IDR 2.605.469 per HH per 4 month.
- 6 identified, 2 organic market channels have been signed contract: PT. Big Tree Farm Bali, PT. Aliet Green, Carrefour, UD Nusa Permai, and Javara
- 1 potential market channel a Service Provider identified

### *Achievements in 1st semester of 2012*

*Organisational strengthening (80% achieved)*

- Cashew Coordinating Body was successful promote their services, the results are: 1) the cashew module on GFP and Processing include as a curriculum and 2 facilitator became a teacher in SMK Teluk Hading. 2) Local government and other NGO have plan to on job training in village on processing unit and training on ICS implementation
- 2 cooperative offers the business services such as buying and selling organic and conventional cashew, 1 cooperative in Lewobele village received micro-credit IDR 686 Mio for working capital from government programme and successfully create income IDR 5.035.325 from buying selling cashew and as micro finance services.

*Increasing productivity (85% achieved)*

- 27 field facilitators are active provided technical assistance to 1519 farmer on-farm GFP and off-farm (post harvesting) practice. Of 395 farmers trained during this period.
- 489 farmers or 32% from total beneficiaries (increased 20% compare data 2011 of 208 farmers) are applying full GFP accept re-planting (Conservation and Sanitation, Pruning, pest and disease, and fertilizer).
- Of 14 from 15 demo plot shows positive result: growing more flowers and healthy

*Value Added (75% achieved)*

- 4 farmer groups received international and national organic certificate with prediction harvest of 271.426 tons, 2 new villages identified. 140 household processing units certified.
- 1 pilot local processing unit for white kernel in village level is still under construction.
- 7 identified: Carrefour, PT. Larise, BTF Bali, Berry Beach and PT. Indo Agroforestry, PT. PMA and UD Nusa Permai. The total demand of 470 tons, of 58% processed in Flores

***Achievements in 2nd semester of 2012***

*Organisational strengthening*

- Cashew Coordinating Body was active provides technical assistance to farmer group on processing, productivity and dissemination base practices to other farmers. Lobbying to local government for rehabilitation.
- 1 cooperative have created profit reaching US$ 5'600, increased of 1112% profit compared data 2012 semester- 2 of US$ 503 from buying selling organic cashew and as micro finance services.

*Increasing productivity*

- 28 field facilitators are active provided technical assistance to 1541 farmer on-farm GFP and off-farm (post harvesting) practice. Almost 603 farmers applying full GFP accept re-planting (Conservation and Sanitation, Pruning, pest and disease, and fertilizer), of 56 trained during this period.
- Of 9 from 15 demo plot shows positive result: increased productivity until 79% compared base line data 2008.

*Value Added*

- 624 Farmer HH from 6 farmer groups participates in international and national organic certification process for certification 2012.
- 1 pilot organic local processing unit for white kernel in village level tested, of 1980,5 kg sold to national market – PT. Indo Agroforestry with price US$ 12 per-kg FOB Village. During 3 month (October – December) were successfully created income of US$ 2.065
- 8 buyer identified, of 4 buyers (PT. PMA, BTF Bali, PT. Indo Agroforestry and JAVARA) were providing contract and purchases order for harvest 2012.
- JAVARA was committing to make a long-term relation with the farmer groups, developing financing scheme for working capital, product development and access to national and international market.

***Achievement of outputs***

Achieved:

*Organisational strengthening*

Output 1.1: Done

*Increasing productivity*

Output 1.2: Almost all farmers applying GAP, of 603 applying full GFP (Achievement 55% from phase target of 1100 measured)

*Value added*

Output 1.3: Achievement 70%Output 1.4: In 2012 Achievement only 22% lower than achievement in 2009 of 47%.
Output 1.5: Achievement 50%
Not achieved:
*Organisational strengthening*
Output 1.1: Currently, The CCB only focused for productivity. Only 1 cashew cooperative established and only focused for buying and selling cashew in shell and brown skin.
*Value added*

Output 1.3: only 3 farmers groups received certificate since 2005 and 2007. 1 groups certified since 2011 and 1 group have join in 2012.
Output 1.4: 1 company PMA withdraw from Flores and close their processing unit. Other issues such as lack of working capital and capacity of the processing unit.
Output 1.5: only 1 legalized and only 1 buyer provider down payment

# Annex II. Overview outcome indicators and indices

This annex provides a detailed description about the used outcome indicators. In addition, it discusses the variables which were used to construct the outcome indicator indices. Please note that some of the indicators are constructed as indices from multiple questions. In the main text of the report, only the indices are reported for such indicators. However, this Annex reports on the outcomes of the components of the indices.

Outcome variables for the project were collected at household and farming group level. The outcomes are reported for treatment villages and comparison villages for the baseline and the endline surveys. The treatment and control group consist in total of 6 farming groups. For the household data, the sample size can differ between tables because the answer 'don't know' is changed to a missing value or because a respondent could skip a question if he/she had no knowledge about what was asked (answered 'no' to a previous question). This was the case if a respondent answered 'don't know' to a question with a scale, so it did not make sense to incorporate the answer in the scale. However, for questions where we were interested in the percentage of the sample that answered 'yes' to a question, it made sense to change the 'don't know' answers to 'no' so that we could use all data when reporting on the question.

### *Households using organic farming practices*

- Percentage of households practicing organic farming (this indicator is measured from self-reported information as well as based on responses to questions on chemical inputs for farming)
    - Self-reported: This variable is measured based on responses to the question whether a household practices organic farming. We assume that if the answer is 'Don't know', this household does not practice organic farming, hence answers are recoded with 0.
    - Based on responses to questions (not using chemical inputs): Based on three questions on farming practices, it is assessed whether a household practices organic farming, i.e. does not use chemical inputs. The first question asks about the household's soil management for cashew trees. If the household does not use any chemical fertilizer, it is classified as organic soil management. The second question asks about how the household protects its cashew trees from insects and diseases. If the household does not use any pesticide or chemical herbicides, it is classified as organic farming. The third question asks whether the household used among others any chemical fertiliser or chemical pesticides for growing cashews in the past year. If the answer is yes to either of these two questions, the household does not exclusively use organic farming practices. Hence, the answers to the three questions are collected into one indicator which indicates whether the household used any chemical input at all.
- Percentage of households using chemical inputs
    - Percentage of households using chemical fertilizers: This indicator is again based on the first question mentioned above whether the household uses any chemical fertilizer to keep the soil for cashew nuts fertile.

  - Percentage of households using chemical pesticides/insecticides: This indicator is again based on the second question mentioned above whether the household uses any pesticides or chemical herbicides to protect its cashew trees from insects and diseases.
- Percentage of households using organic inputs
  - Percentage of households using organic fertilizers: This indicator is again based on the first question mentioned above whether the household uses 'manure' or 'rorak (composting and water catchment in hole)' to keep the soil for cashew nuts fertile.
  - Percentage of households using organic pesticides/insecticides: This indicator is again based on the second question mentioned above whether the household uses bait to attract insects, plants special plants (eg. Nimba tree) or uses organic/herbal pesticides/herbicides to protect its cashew trees from insects and diseases.
- Percentage of households that have distancing larger than 9x9 m: This indicator gives information about the distance between the cashew trees which the household grows. This dummy is 1 if the distance is larger or equal to nine square meters.

### *Yield of cashew nuts (uniform indicator)*

This indicator is measured by a) the yield per hectare and b) the yield per tree.

- Yield per hectare: This indicator looks at the total amount of cashew nuts in shell harvested in the past year. Since the questionnaire asks for the harvest in four different time periods (of each 3 months) separately, these values need to be added up to get the total amount of cashew nuts harvested. To receive the yield per hectare, this amount is divided by the area used for growing cashew nuts (in ha) per household.
- Yield per tree: Here the same amount of cashew nuts harvested is used. However, now we divide this amount by the total number of cashew trees cultivated by the household. For the total number of cashew trees, we add up the number of trees per household that are a) too young to produce (i.e. still no or few fruits), b) in full production (i.e. all branches bear fruit) and c) no longer in full production (i.e. production is less than 60% of full production).

### *Volume of cashew nuts sold (kg) uniform indicator*

This value represents the total amount of cashew nuts sold on local, national and international markets. It does not distinguish between the processing stages but rather includes all cashew nuts sold in shell, brown skinned cashew nuts and white skinned cashew nuts. The household questionnaire asks all information on the production of cashew nuts for four different time periods of each 3 months. It is important to know that all amounts for these four periods are generally added up to receive the yearly measure. Furthermore the questionnaire asks the information for cashew nuts sold in the three processing stages separately. For each processing stage, it further differentiates between non-certified cashew nuts (local markets), national certified cashew nuts and international certified cashew nuts. To receive the total amount of all cashew nuts on all markets, first the amounts for all three markets are added up, before then adding up these amounts for all cashew nut types.

### *Percentage of cashew nuts sold to (inter)national markets (compared to local markets) (uniform indicator)*

This indicator is measured in two different ways, aggregated in the treatment and comparison group, as well as the household average based on the kg sold to the markets. We report on the percentage going to national and international markets together.

- Using aggregate data: First, we calculate the total amount (per household) of cashew nuts sold either on national or international markets. This is done separately for every processing stage (cashew nuts in shell, brown skinned cashew nuts and white skinned cashew nuts). Second, we aggregate the total amount sold to (inter)national markets for the Treatment and the Control group. This is again done separately for all three processing stages. In total, this leaves us with six different amounts, three for each treatment group (one for each processing stage). For the percentage of cashew nuts going to (inter)national markets compared to local markets, we divide each of the six values by the total amount sold of the particular processing stage in either the treatment or control group and multiply each of them with 100. We end up with three percentages for the treatment group, and three percentages for the control group.
- Household average: For this indicator the total amount of cashew nuts in all processing stages (in shell, brown skinned and white skinned) sold to national and international markets is calculated. To receive the percentage sold to (inter)national markets compared to local markets, this total amount is then divided by the total amount of cashew nuts to sold to all markets (including local) and multiplied with 100.

### *Selling price of cashew nuts (average per household)*

This indicator gives the price of cashew nuts weighted by the quantity sold. Since there are three different types of markets (local, national and international) and three processing stages of cashew nuts (in shell, brown skinned and white skinned), we have in total 9 prices for 9 markets. By multiplying each price (per kg) with the quantity sold in the corresponding market, we receive the value sold for each of the 9 markets. Next we sum up all 9 values to get the total value of cashew nuts (of all processing stages) sold per household (on all markets). Dividing by the total quantity sold (on all markets) we finally receive the weighted price of cashew nuts as an average per household

### *Household income and livelihood (uniform indicator)*

For this indicator, data was collected on the (per capita) consumption and asset holdings of households as well as the self-reported well-being.

- Household income is calculated from a) household revenue from sale of cashew nuts, b) total income per months and c) total income per capita per month (all three in 1000 Rp.).
    - Household revenue from sale of cashew nuts (1000 Rp): This indicator is measured from the amount of cashew nuts sold (kg) multiplied by the price received per kilo (in Rp.). The volume of sold cashew nuts as well as the price is recorded separately for three types of cashew nuts (in shell, brown skinned and white skinned). These types represent the different stages of production, where white skinned cashew nuts represent the final stage. Additionally, for every type of cashew nut, we further differentiate between nuts sold on local markets (non-certified), sold on national markets (national certified) and

sold on international markets (international certified). Hence, this gives 3 markets and 3 production stages. Furthermore, these amounts and prices are recorded for three different time periods throughout the year (each 3 months). We simply add these 4 periods up to receive the yearly figures. For the total revenue per household, first the revenues per market and cashew type are calculated. Second, the total revenue for every production stage is calculated, leaving us with 3 revenues. Finally, these values are summed up to receive the total for all three cashew nut types (shell, brown and white skinned). For the monthly revenue in 1000 Rp., total revenue is divided by 12 and by 1000.

- Total income per month (1000 Rp): The questionnaire includes separate sub-sections for income generated from: a. Crops, b. Livestock (net profit), c. Non-Farm activities (net profit) and d. Money transfers (net income). The total income variable is created by the sum of income generated by the different income sources mentioned above. In particular, we sum the 'total income per month from livestock per household' (based on self-reported price), the net profit per month from non-farm business per household, the income per month from crop other than cashew nuts per household, household revenue per month from sale of cashew nuts and the total amount of transfers (includes different types of assistance, i.e. in cash or in-kind) received per month per household.
- Total per capita income per month (1000 Rp): For the monthly per capita income, total income is divided by the household size.

- Per capita expenditures of households (
  - Non-food consumption per capita per month (1000 Rp): The total non-food consumption of a household is calculated from a number of questions on household expenses. To get the monthly non-food consumption per household, yearly expenses are converted into monthly figures. For the per capita *non-food* consumption we divide non-food consumption per month by household size. Non-food expenses consist of the following:
    - Yearly expenses on items like clothing, household supplies, medical costs and taxes. Again, also the yearly value of these items that were consumed but self-produced or received from another source is taken into account.
    - Expenses on schooling for family members (schooling needs, transportation, registrations etc.) were asked separately for members outside and inside the household. Only expenses for family members inside the household are included in the calculation of non-food consumption.

- Asset holdings of households
  - Housing facilities index: In order, that the housing facilities index in the MFS II projects have a meaningful interpretation, we calculate weights for the index components based on their predictive power for household expenditure. The weights are calculated using a population representative survey for Indonesia using regression analysis. We use the IFLS 2007 survey as a population representative sample. From the IFLS 2007 dataset we

use aggregate expenditure data, asset ownership and sampling weights. As the aggregate expenditure variable the data analysis uses the logarithm of the monthly per capita expenditure (*lnpce*). The sampling weight used is the cross-sectional sampling weight adjusted for attrition. This weight should be representative of all households living in the IFLS provinces in Indonesia in 2007. Based on the KR section of the IFLS survey, we construct the housing variables that are the same in IFLS and the MFS II surveys. The variables used from the KR section of the MFS II surveys which are also the found in IFLS are: a. *kr01*, b. *kr02*, c. *kr04*, d. *kr07*, e. *kr10* and h. *kr13*. The corresponding variables in IFLS are: a. *kr03,* b. *kr13*, c. *kr16*, d. *kr20*, e. *kr11* and h. *kr24.* There are more variables which are the same between E6 and IFLS, however we wanted to construct a housing facilities asset variable which can be used by all MFS II surveys, thus the variables mentioned above are selected as they are common in most MFS II surveys. The first step is to recode the variables of MFS II surveys in order to have matching answer categories with the variables of IFLS; the same procedure is also followed for the IFLS variables. In addition, as the variable names are not the same among the two datasets, in the IFLS dataset we renamed the common variables as to have the same name with the MFS II variables. After, the aforementioned preparation the two datasets are combined into one dataset. Furthermore, dummy variables are created based on the answer categories of the chosen common variables. The reason behind the construction of the categorical dummy variables is to include them in the regression of the logarithm of the monthly per capita expenditure on the housing dummies. Nevertheless, not all of the categorical dummies are used in the regression model. The regression does not include dummy variables whose variation is higher than 97% of the sample or lower than 3% of the sample. Moreover, after we performed the regression the next step was to calculate the fitted values by predicting the expenditure based on housing facilities for both the IFLS and MFS II sample. Finally, the last step was to rescale the predicted variable in order to have a zero mean for the IFLS sample by subtracting the mean of the fitted value from the fitted value itself.

Hence, we will be able to infer the livelihood of our survey participants compared to the Indonesian average in 2007: for example, if the value of the index is 0.10 (-0.10), on average, it implies that the sample is approximately 10% better off (worse off) than the average Indonesian household in 2007 based on the predictive power of housing facilities (like drinking water source) on household expenditure.

- Asset index: The construction of the asset index follows a similar procedure with the creation of the housing index, however in this case instead of the IFLS dataset the DHS 2012 dataset was used, as DHS includes more common asset variables with the MFS II surveys than the IFLS. Moreover, asset variables were chosen from the KR section of the MFS II surveys which are common with DHS variables. From MFS II dataset questions a. kr11 and b. kr12 were chosen while from the DHS dataset questions a. *hv207*, b. *hv208*, c. *hv209*, d. *hv243a*, e.*hv210*, f. *hv211*, g. *hv212*, h. *sh118c*, i. *hv243d* and j. *hv243c* were selected. The next step was to combine the two datasets and perform a factor analysis of the common variables in order to calculate the asset index. In addition, as mentioned

above the 3% rule was also applied for the asset index, excluding from the factor analysis variables with small variation. Finally, the predicted asset index was normalized for the DHS sample (mean 0 and variance 1).

- Investment into business or farm equipment
    - Percentage of households invested in business: This indicator is based on the question whether a household expanded its family business, purchased new equipment or started a new business in the past 12 months. From this we created a dummy which is 1 if the answer to this question is 'Yes', and 0 if the answer is 'No'.
    - Percentage of households invested in new farming tools: This indicator is based on the question whether a household purchased new farming tools in the past 12 months. From this we again created a dummy which is 1 if the answer to this question is 'Yes', and 0 if the answer is 'No'.

- For self-reported well-being is measured by two scales on a) happiness and b) current wealth status. Respondents were asked the following:
    - Taken all things together how would you say things are these days? The question was answered on a 4-point Likert scale from 1 (very happy) to 4 (absolutely not happy).
    - Please imagine a six-step ladder where on the bottom (the first step), stand the poorest people, and on the highest step (the sixth step), stand the richest people. On which step are you today? Here, all 'don't know' answers are replaced with missing values.

  These questions relate to the subjective judgement of the respondent. Therefore, we only report on the change in these indicators if the (main) respondent was the same during the baseline and the endline surveys.

### *Household income and livelihood (uniform indicator)*

For this index four measures are taken into account.

- Percentage of households not able to cover their living costs/ have not enough to eat: It was asked whether it happened to the household in the past 12 months that the income did not cover the living costs.
- Number of months households were not able to cover their living months/have not enough to ear.
- Current standard of living (daily needs covered): Possible answers were 1 (not enough to fulfil my daily needs), 2 (only enough to fulfil my daily needs), 3 (more than enough to fulfil my daily needs). Again, all that answered 'don't know' where replaced with a missing value.
- Current standard of living (food consumption covered): Possible answers were 1 (not enough to fulfil my daily needs), 2 (only enough to fulfil my daily needs), 3 (more than enough to fulfil my daily needs). Again, all that answered 'don't know' where replaced with a missing value.

All of these four indicators above, besides the second one on the number of months, relate again to the subjective judgement of the respondent. Hence, we only report on the change in these indicators if the (main) respondent was the same during the baseline and the endline surveys.

# Annex III. Summary statistics of variables

**Table 13: Summary Statistics**

| Survey period | Baseline | | Endline | | Change (EL-BL) | |
|---|---|---|---|---|---|---|
| | Sample Size | Mean | Sample Size | Mean | Sample Size | Mean |
| Average size of household | 149 | 4.68 | 149 | 4.67 | 138 | -0.09 |
| Percentage female hh-head | 149 | 10.74 | 149 | 9.40 | 138 | -0.72 |
| Average age of hh-head | 149 | 44.88 | 149 | 46.64 | 138 | 1.86 |
| Education level of hh-head (%) | | | | | | |
| *No education* | 149 | 3.36 | 149 | 3.36 | 138 | 0.00 |
| *Primary education* | 149 | 68.46 | 149 | 66.44 | 138 | -4.35 |
| *Secondary education* | 149 | 28.19 | 149 | 30.20 | 138 | 4.35 |
| Religion of hh-head (%) | | | | | | |
| *Catholic* | 149 | 100.00 | 0 | | 0 | |
| Main source of income (%) | | | | | | |
| *Crop farming* | 149 | 89.93 | 149 | 85.91 | 138 | -3.62 |
| *Fishing* | 149 | 0.67 | 149 | 2.68 | 138 | 2.17 |
| *Livestock* | 149 | 0.00 | 149 | 0.67 | 138 | 0.72 |

| **Lewomada** | Talibura | Comparison | | |
| **Wailamung** | Talibura | Comparison | | |

### *Treatment villages*

**DESA PAINAPANG**

Painapang is located in Kecamatan Lewolema Kabupaten Flores Timur. This village is divided into areas split by a hill. The distance between the main village Painapang and dusun Welo is quite far, which is about 20 km if taking forest route. But forest route is impossible to access at night and we have to take another route through Larantuka city which is about 40 km away to travel. With this distance issue, Dusun Welo people have proposed themselves to be a village. Village area is hilly and the asphalt of the roads is severely damaged, yet the access to this road is quite easy. While the electricity power is available 24 hours in this village, yet many times they have blackout.

Most villagers' livelihood is cashew nuts farmers. Yet some villagers are producer of coconuts and cocoa. The cashew nuts products have been managed well by the farmer group in this village (Gapoktan). They sell the cashew nuts in shell to this Gapoktan and there are working unit who will do the skinning in order to produce white cashew nuts and ready to market. This working unit of Gapoktan has a tool to preserve the white cashew nuts to last longer. Gapoktan's white cashew nuts have been distributed to many areas throughout Indonesia with average price ranged from Rp65.000 to Rp 95.000, depending on the quality. Villagers do not made use of the cashew fruit. Meanwhile, the other farming products produced in this village are dried cocoa or copra, and cocoa. The price of copra is around Rp 2.500 – Rp 3.500 per kilo. People are also growing other farming products mentioned above, but they are grown to fulfil villagers' daily needs.

**DESA BALUK HERING**

Baluk Hering village belongs to Kecamatan Lewolema Kabupaten Flores Timur. The location is about 25 km away from Larantuka. Most of the area consists of hills but some part of it lies on the seashore. The road to access this village is damaged severely. Electricity power is available for 12 hours which is at 6 pm to 6 am.

Most of Desa Baluk Hering's villagers are cashew nuts farmers. Cashew nuts plantation in this village is considered the biggest one through Flores Timur. The trees are grown in the hilly areas of this village, while the sloped areas are used as people's dwelling. But some of villagers built houses at the top of the mountain lies in this village and no transportation mean can reach them. There is no other way than walking to get there and it would take one or two hours. Although the number of cashew nuts production in this village is the biggest in Flores Timur, there is no proper product processing system in order to produce good quality cashew nuts available in this village that farmers could not get the optimum income from cashew nuts selling. The farmers sell the nuts in their shell to the collectors who come to their village every day. Therefore, farmers could not improve their household economic condition with cashew nuts. Some villagers earn their living from selling copra. Meanwhile, those living on the shore are fishing to earn a living.

**DESA SINAR HADING**

Sinar Hading village is located in Kecamatan Lewolema Kabupaten Flores Timur. It is about 15 km from Kabupaten Flores Timur, Larantuka. All of village's areas consist of hills on the border of the sea. The access to this village from Larantuka is pretty easy with relatively good road condition. Electricity power is available for 24 hours but clean water is difficult to attain since they only have a small spring water source that is insufficient for all villagers. Therefore, people have to get water which is derived from wells nearby the shore to fulfil their daily needs for water.

The majority of the people in Sinar Hading are cashew nut farmers. The plantation is not only located on the hilly areas but it is also at the top of the mountain. A system to produce high quality products is not available in this village and they simply sell cashew nuts in their shell. However, an experiment on cashew to be processed into syrup has been conducted in this village. Since the syrup is still in testing process, it is not marketed yet. Like any other villages, copra is produced in this village. As the location is nearby the sea, some people were cultivating seaweed. However, the price of seaweed nowadays is not too good that many of them have abandoned it.

**DESA LEWOBELE**

Desa Lewobele belongs to Kecamatan Lewolema Kabupaten Flores Timur. The distance between village and Larantuka is about 30 km. Half of this village is located on the hill and the other half is on the shore. The road to access this village is poor because the asphalt is damaged. However, electricity is working 24 hours and water availability in this village is abundant because it comes from the flowing spring of the mountain and directly distributed to villagers' houses with pipes.

Just like the other villages in this district, the majority of villagers' livelihood is cashew nut farmers. In 2011, Gapoktan of this village started to process cashew nuts by skinning the shells. However, they found difficulty in marketing these white cashew nuts and faced problem in storing them that they no longer sell cashew nuts to Gapoktan since 2012. Some people are producing copra as their livelihood and some other are raising animals such as pigs, goats, and chicken. In addition, there are some industries in this village that producing fermented palm wine (tuak).

**DESA SERINUHO**

Serinuho is located in Kecamatan Lewolema Kabupaten Flores Timur. This village is 40 km away from Larantuka. Community's dwelling is located in lower ground, while plantation is on the hills. The access to get this village is actually easy, only the condition of the asphalt road is severely damaged. There is no electricity power in this village. People have their own generator or oil lamp. Clean water is difficult to attain because spring water debit is small that is insufficient for the whole villagers.

Most of the villagers are cashew nuts farmers. They sell the nuts with the shells and the cashew fruit is given to the pigs or just thrown away in the yard. Coconut trees are available along the shore area and people pick the fruits to be processed into copra. Those who own farming land usually grow rice, corn, and bananas just to fulfil their daily needs.

**DESA DULI JAYA**

Desa Duli Jaya is a new village as a result of extension village of Serinuho village in 2010. The distance between Serinuho and Duli Jaya villages is only 3 km away. The village area is similar to Serinuho village. Community dwelling is located on the lower ground while plantation is on the higher ground. Although the asphalt on the road is damaged, the access to get this village is considered easy. They have no electricity power but each household has their own generator or oil lamp.

Most of villagers' livelihood is cashew nut farmers. And those who possess coconut plantation are copra producer. Cashew nut farmers sell their nuts in shell and no further process of the cashew. They just throw away the cashew or give them to their livestock. Just like farmers in other villages, they grow rice or vegetables in their farm just to fulfil their daily needs.

### *Comparison villages*

**SINAMALAKA VILLAGE**

Sinamalaka village is located in Kecamatan Tanjung Bunga, Kabupaten Flores Timur. This village is located about 50 km away from Larantuka, kabupaten Flores Timur. It is about 35 km away from Gewayantana airport. The access to get this village is pretty easy; the only problem is the poor condition of the road as the asphalt is severely damaged. Only the road which is heading to the Tanjung Bunga sub-district is in good condition. This village lies on lower ground and it is not too far from the sea. Electricity power in this village is available already, yet it works only at 6 pm to 6 am.

The majority of villager's livelihood is farmers. They grow cashew nuts, coconut, cocoa and other farming products for their own daily consumption. They usually harvest cashew nuts on August through January depends on the condition of the trees. In good condition, the trees can yield plenty of nuts and longer harvest time. Otherwise, cashew trees can only be harvested during September through December. Cashew nuts farmers usually sell cashew nuts with the shell, though few of them sell without the shell (white nuts). The price of cashew nuts in shell is around Rp 9.000-Rp 13.000. Meanwhile, the cashew fruit is given away to the pigs or just thrown away. They do nothing to make use of the cashew fruit. Other than cashew nuts, villagers are growing coconut and dried them to make copra. And some industries buy coconuts from villagers to produce coconut oil. One bottle of coconut oil small size cost Rp 25.000. They have distributed coconut oil to other provinces, even to Surabaya.

**DESA ADABANG**

Adabang village is the furthest village of Laruntaka. It is located about 60 km away from Kabupaten Flores Timur, Larantuka. To get Larantuka we need to go through the damaged asphalt road. Most of villagers of Adabang usually access Maumere city, the capital of Kabupeten Sikka which has good road condition although the distance is further. This village lies on the border of kabupaten Flores Timur and Kabupaten Sikka. Community dwelling lies on the lower ground while plantation is on the higher ground. There is no electricity power in this city and people generally have generator or oil lamp for lighting.

The majority of people in Adabang village are cashew nut farmers. Just like the other products in other villages, cashew nuts are not well processed. They merely sell the nuts with the shell to the collectors who have already given them money in advance. This system is called ijon system. Other than cashew nuts, people in this village also produce copra from their coconut plantation. Meanwhile, fishermen of this village are able to market their fishing product to other villages.

**DESA LEWOMADA**

Lewomada is located in Kecamatan Talibura Kabupaten Sikka. This village is about 80 km away from Maumere capital city of Kabupaten Sikka. Lewobele village lies on the border of Kabupaten Flores Timur (Desa Adabang). The access to get this village is from Kecamatan Talibura for about 20 km. The condition of the asphalt is very poor; even some spot is almost cut off due to the abrasion of the sea. Repair has never been conducted and government never paid attention to it. Some part of Lewomada village lies on the hills and some other part lies on the shore. Since electricity is not available in this village, people have their own generator and oil lamp.

The main livelihood of the villagers is cashew nut farmers. Almost each household has their own cashew nut trees on their back yard. But some of them grow cashew nuts on the hills. They sell the nuts with their shells and no further process is conducted. The other income source of the villagers is making copra and also fishing for those dwelling around the shore.

**DESA WAILAMUN**

Wailamun village used to be called Wailamung. It changed into Wailamun since 2012. This village is located about 10 km away from Kecamatan Talibura. The distance between village and sub-district is actually not too far, but the condition of the road is very poor. Community's dwelling is mostly located on the hilly areas, while plantation is on the mountain. Electricity power is not available yet in this village that people use their own generator and oil lamp for lighting. Even some of them have solar energy. Electricity from PLN s planned to reach this village in 2013 and the poles have been installed since 2012.

The majority livelihood in Wailamun is cashew nuts farmers. They sell their harvest to the collectors along with their shells. Other than cashew nuts, people have coconut plantation which is to produce copra. Cows ranch house is available is this village.

# Annex V. Descriptive statistics

# 1. Introduction

## 1.1. Project context

Gender based violence (GBV) is a human rights violation and the social and economic costs are high. GBV is usually the result of unequal power relationships between men and women in families, communities and nations. GBV can result in "physical, mental, sexual, reproductive health and other health problems" for survivors and/or their children (WHO [1]), constituting a major public health problem. In addition, GBV also "impacts on, and impedes, progress in many areas, including poverty eradication, combating HIV/AIDS, and peace and security" (UN[2]). Several actions to combat GBV have been taken. The UN Declaration on the Elimination of Violence against Women (1993), the first international human rights instrument to deal exclusively with gender-based violence (GBV), offered the first official definition of the term gender based violence (GBV), defining it as "any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or suffering to women, including threats of such acts, coercion or arbitrary deprivations of liberty, whether occurring in public or in private life.[3] Millennium Development Goal 3 calls for the promotion of gender equality and women's empowerment.[4]

In Indonesia, law no. 23/2004 (the PKDRT law) on the Elimination of Domestic Violence was the first regulation that finally legally entitled female victims of domestic violence to report any violence they experienced at the hands of their husband. In addition, as a result of the implementation of this law, institutions providing services to female and child victims of GBV started to be established. In Central Java Province,[5] the government issued by-law no. 3/2009 to assure better enforcement of the PKDRT law. This by-law governs, among others, the rights of female victims and the obligations of the local government with respect to prevention, protection and reintegration of victims. As a result, local governments are authorized to form integrated services centres (PPTKs) and commissions for the protection of female and child victims of domestic and/or gender based violence.

However, despite these efforts, the actual implementation and enforcement of the legislation, especially by local governments, is slow. In Indonesia's multicultural society, GBV is often tolerated and permitted due to patriarchy that manifests in cultural and religious beliefs and practices.

Domestic violence is by far the largest reported subcategory of GBV[6], which the PKDRT law defines as 'any act toward somebody in the household, especially women, that results in any psychological,

[4] Source: http://www.un.org/millenniumgoals/gender.shtml
[5] The location of the project.
[6] According to the National Commission on Violence against Women (Komnas Perempuan) 119.107 cases of violence against women had been reported in Indonesia in 2011. Almost 97% of the reports (110.468 cases) have been filed as 'domestic violence' cases. From the different types of violence against women in the domestic domain, psychological violence ranked the highest with 103.691 cases, followed by economic violence (3.222 cases), physical violence (2.700 cases), and sexual violence (1.398 cases) (Komnas Perempuan, 2012a & 2012b).

physical and/or sexual suffering, and/or abandonment, including threat, force, or deprivation of liberty as defined by law, that happened within the domestic sphere' (Article 1). The roots of domestic violence in Indonesia can -at least in part- be found in gender inequality, particularly within marital relations. For example, the husband's culturally-instilled superior position as head and provider [7] has grave implications for women's willingness and ability to report domestic violence and/or file for divorce. Another example involves the marital practice where the father of the bride is taking on the role of his daughter's representative during the wedding ceremony. The husband thus swears the marital oath to the father of the bride, instead of to his bride herself. Many victims attest that, consequently, their husbands tell them during fights that "he is not bound by his oath to treat her well or stay faithful, because he hasn't sworn the marital oath directly to her". Worries about how to support herself and her children after a separation or divorce, can inhibit women from taking action to stop the abuse. Thought divorce is common in Indonesia, it is rarely instigated by the wife since she needs the income of her husband to take care of the children (Venning, 2010). Moreover, women that report their husband to the police face the threat of being stigmatized by her family and environment.

Data on GBV cases is gathered mostly by Non-Governmental Organisations (NGOs) working on violence against women. During the period of 2000 to 2011, there was an increasing trend of the number of female victims in Indonesia. Particularly, between 2009 and 2011, there were more than 100,000 reported cases per year. The National Commission for Women found that 95% of the divorce cases approved by the Religious High Court in 2011 were due to domestic violence against the wife. According to Komnas Perempuan (2012a; 2012b) the most vulnerable age group is 25-40 years. The most common reported form of violence in Indonesia is psychological violence.

Though, the actual number of GBV cases is expected to be higher than the official data (Komnas Perempuan, 2012a; Komnas Perempuan, 2012b; Hayati, 2011). For example, based on the outcomes of the Violence Against Women Survey 2006, UN Women estimates that nearly 2.09 million women in Indonesia experienced at some point in their life a form of domestic violence (Utami, 2013). In November 2000, the prevalence of domestic violence in Central Java was investigated by Hakimi et al. (2001) in accordance with a questionnaire developed by a WHO Multi-Country Study on Women's Health and Domestic Violence Against Women. They found that 41% of women from Central Java had suffered physical or sexual violence at least once in their lives, mostly from their husbands. In addition, 20% of the women experienced sexual assault from someone other than their husband.

In general, the lack of autonomy and assertiveness among many Indonesian women, particularly of those who live in rural areas, hinders them to report the case to state apparatuses or bringing the case into public.[8] Women also often experience difficulties in accessing the legal system, for example due to the prohibitive cost and distance. Moreover, domestic violence is often regarded as a private matter, not belonging in the public domain. The taboo and stigma on domestic violence prohibits not only

[7] Within Indonesian law and culture, the husband is always regarded as the head of the household and expected to be the breadwinner. The notion of the husband as the head of household is also stated in the marriage law no. 1, dating from 1974.

[8] ACNielsen (2005) finds that only 27% of victims would report domestic violence to the police.

collecting accurate data (Utami, 2013), but more importantly hinders women to become aware of the problem and possible solutions. Therefore, the rising trend of GBV prevalence should be regarded as a positive sign of an increasing number of women having the courage to report their cases, hence breaking the taboo on domestic violence.

Several institutions in Indonesia provide services to female and child victims of violence. In 2011, Komnas Perempuan (2012a; 2012b) recorded a total of 395 of these institutions (both government and non-government initiatives) across 33 provinces in Indonesia, providing for example counsellors, gender-sensitive judges/district attorneys and database officers. Rifka Annisa is one of the institutions. Rifka Annisa provides counselling and legal assistance to victims of Sexual and Gender Based Violence. The aim of Rifka Annisa is to empower female survivors and in doing that contribute to the development or creation of a gender-just society.

## 1.2. Evaluation objectives

This report evaluates the Rifka Annisa project[9] as part of as part of the *Medefinancieringsstelsel* (MFS) II evaluation for Indonesia under the Achievement of Millennium Development Goals (MDG) component.[10] The project has been selected under the goals on gender (MDG 3) and health (MDG 4, 5, 6). In particular, the current evaluation focuses on the following research questions: how did the programme change the mental (and physical) health conditions of women victims? Did the programme empower women victims of GBV?

We investigate whether the project had a favourable effect on the above mentioned outcomes by looking at the changes in the outcome variables between the baseline and endline periods for the project beneficiaries.

Data was collected using structured surveys from October to the beginning of December 2012. Survey respondents were selected from the client base of Rifka Annisa. In total 18 women (out of the 168 counselled female victims of GBV visiting Rifka Annisa between July 2011 and June 2012) were interviewed. These respondents were re-interviewed in April 2014 in order to assess the change in outcome variables. The attribution of these changes is addressed using qualitative information regarding the life events of the respondents during the evaluation period.

In addition, a self-administered client survey was designed to obtain additional information regarding the effectiveness of Rifka Annisa's services on the beneficiaries. This client survey was carried out between September 2013 and February 2014 with 51 participants.

As specified in the Terms of Reference for this evaluation, the report addresses five evaluation questions to assess the project outcomes:

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?

[9] The project is described in more detail in section 3.

[10] Please note that this project has been also evaluated under the Capacity Development of Partner Organisations component of the MFS II Evaluation.

2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern partner organisations efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

## 1.3. Summary of findings

Rifka Annisa provides counselling and legal aid services to victims of SGBV. For the evaluation, we interviewed 18 women who used the counselling, legal aid and support group services of Rifka Annisa and were victims of domestic violence. At the time of the baseline survey, most of the respondents have already visited Rifka Annisa multiple times, with their first visit more than 6 months before the baseline except for one respondent. In addition, many (11) respondents were already divorced at the time of the survey. As a consequence, only 6 respondents have still visited Rifka Annisa during the evaluation period.

These facts pose limitations for measuring the effectiveness of the project. However, we were restricted in the sampling by the Rifka Annisa's policy that only allowed us access to their clients if a counsellor of Rifka Annisa contacts the client and she is also present during parts of the interview.

For the endline survey, the same respondents were re-interviewed in April 2014. By that time, only 3 respondents were still married to their husband, and two divorced women had remarried. The data show that most women had taken a positive attitude towards their future due to their ambition to provide a better future for their children.[11] Almost all respondents were employed (17), and many of them found a better job. Often they were supported by their family morally and financially and by taking care of the children. Women who had no such support were struggling to make ends meet as they had to take care of the children and work at the same time.

In addition, friends provided emotional support and encouragement to take action to break free of the cycle of abuse. Often they have also referred the respondents to Rifka Annisa. At Rifka Annisa, all respondents received counselling, 11 of them received legal advice, and 6 of them were assisted in the litigation procedure. However, some respondents turned for help elsewhere (3) or handled their case on their own (4). The respondents indicate that Rifka Annisa was the most helpful in the litigation procedure that helped them settle their issues with their husband (divorce). They were in general satisfied with all the help received from Rifka Annisa.

Turning to the findings for the outcome indicators, we observe little change during the evaluation period. The most notable changes are observed as less dependency on husband, less exposure to abuse, better relationship with husband and improvements in the psychological well-being and social functioning of respondents. But there are signs that the physical health of the respondents got somewhat worse. Respondents were also still struggling to cope with the emotional burden of the past experiences, and their new responsibilities as the breadwinner.

[11] All respondents had at least one child.

### 1.4. Structure of report

The rest of this report proceeds as follows: section 2 describes the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1) till 4) in turn. Section 11 describes the relationship between the Capacity Development and Civil Society component to the MDG component. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. The project implementation and the SPO is described in Annex I. Regarding the survey data, the construction of the outcome indicators and indices is summarized in Annex II, while Annex III till Annex V present detailed figures on the change in outcome indicators for evaluation questions 1 till 3. Annex VI provides the survey outcomes by marital status and finally, the results of the Rifka Annisa client survey are presented in

Annex VII.

## 2. Literature overview

In order to better position the Rifka Annisa project, this section summarizes relevant findings in the literature with respect to combating domestic and intimate partner violence (IPV)[12]. First, we discuss policy level recommendations and risk factors, and then report the results of specific interventions aimed at reducing the incidence of domestic violence and IPV, and/or supporting victims of domestic violence and IPV.

#### *Policy level recommendations for fighting domestic and intimate partner violence*

The state is an important actor when fighting domestic and intimate partner violence. It can adopt or improve domestic violence legislation to provide a framework to prevent and respond to domestic violence (UN, 2010). For example, it can alter the legal framework (e.g. criminal and civil remedies), start programmes to prevent violence (e.g. reduce alcohol abuse), or provide services for victims (e.g. protection services, legal aid services) (UN Women, 2011).

The movement aimed at changing domestic violence legislation have been partly successful. On the one hand, women's organisations' and human rights group's campaigns to reform criminal and civil laws related to domestic violence - often broadening the legal definition of domestic violence[13] - have achieved great progress (Heise, 2011). For example, the number of countries that have specific legal

[12] Both domestic violence and IPV can take place in the domestic environment. However, IPV can also take place outside the domestic domain, for example dating violence. Domestic violence does not necessarily take place between partners like IPV, for example the violence can also be directed to children.

[13] With respect to the definition of domestic violence in the law, the UN Women (2011) recommends to have a detailed definition in the law which "captures women's experiences of violence in all its manifestations". Furthermore, the UN Women recommends to "domesticate the definitions by outlawing specific cultural manifestations of violence" (p. 17).

provisions on domestic violence has grown from 89 in 2006 to 125 in 2011.[14] On the other hand, however, implementation of these laws is yet quite insufficient (Heise, 2011).

Studies documenting the impact of reforming laws on changing behaviour in low income countries are scarce (Heise, 2011). However, it is generally recognized that resolving domestic violence through the state system can work, but if, for example, women and men do not regard themselves as equals in society, these laws and regulations lack the right effect (Venning, 2010). Then, implementing domestic violence legislation alone will not eliminate the violence. It is crucial to include provisions in domestic violence legislation to ensure efficient implementation of the domestic violence legislation, for example by training public officials. Moreover, laws on domestic violence should include public awareness raising programmes and education provisions to create an environment of zero tolerance for violence (UN Women, 2011).

### *Risk factors affecting the prevalence of domestic violence*

Efforts aimed at preventing domestic violence are very important, as the ultimate goal of both government and the NGO-sphere is to create a zero-tolerance to domestic violence. It is generally recognized that the roots of violence against women lie in gender inequality and discrimination.[15] The likelihood of a woman experiencing violence in a particular situation depends on a variety of (risk) factors at the individual, relationship, community and society (including the institutional/state) levels, together known as 'ecological model' (Heise, 2011). For example, the current stock of literature provides relatively strong evidence that gender-related norms, exposure to violence during childhood and male alcohol abuse are risk factors of IPV, at least in the developed world. However, the research on risk factors of domestic violence specifically on Indonesian women is scarce (Hayati et al., 2011).

Hayati et al. (2011) investigated the risk factors of rural Javanese women for physical and sexual violence. 765 women were interviewed by female field workers using the WHO Multi-Country study instrument on domestic violence. The lifetime exposure to sexual and physical violence was 22% and respectively 11%. The results displayed that women's risk of physical and sexual violence is related to traditional gender norms. These unequal gender relationships, measured with women's attitudes and norms, show that these relationships are more common among women living in the highlands and those being married to poorly educated men. Hence, the traditional gender roles, especially in marriage, should gain particular attention in preventive interventions in Indonesia.

Besides women's experiences, men's views on domestic violence are important to investigate to gain knowledge on the determinants of domestic violence (Hayati et al., 2014). Hayati et al. (2014) conducted six focus group discussions with, in total, 44 local male community leaders in Purworejo, rural Java. Three different positions of masculinity with certain beliefs on the gender order and acceptance of violence within marriage among the sample were identified, ranging from high acceptance of violence (traditionalist), pragmatic acceptance if needed to correct the wife's behaviour (pragmatist), to no acceptance (egalitarian). A very important determinant of the beliefs of all three positions is religion. The study concludes by recommending that religion should be included in every type of preventive intervention for this population.

[15] For example, see http://www.endvawnow.org/en/articles/300-causes-protective-and-risk-factors-.html

### *Effectiveness of preventive programmes*

The evidence about the effectiveness of preventive programmes is highly skewed towards high-income countries (especially the United States). Based on the available evidence, Heise (2011) provide us with an overview of the current research-based literature on the effectiveness of preventing IPV interventions in low- and middle income countries for five different varieties of programmes: law and justice system reforms (see above), harmful alcohol use, women's economic empowerment, childhood exposure to violence, gender-related norms and beliefs. The current evidence stock on harmful alcohol use and the economic empowerment was inadequate to draw general conclusions, but results from the other two programme varieties are promising.

Interventions aimed at reducing childhood exposure to violence show that parenting programmes can improve parent-child interactions and reduce harsh punishment, but more research is needed on a number of other programmes, e.g. positive child discipline or gender socialization interventions (Heise, 2011).

With respect to changing gender norms interventions, both small group and larger-scale campaigns seem to be effective to change norms, attitudes and beliefs related to gender. In addition, some studies show a decrease in reported IPV cases. Successful programmes seem to have engaged the community and locally respected leaders, have involved awareness raising and deliberation on values, rights and gender based discrimination, have built on local traditions, songs and values; and have addressed the drawback of non-compliance with social norms. However, many evaluation studies are methodologically weak (Heise, 2011).

One study in particular that does give evidence on the impact of a preventive intervention in a developing world context, is the SASA! Activist Kit for Preventing Violence against Women an HIV in Uganda. The programme seeks to change community attitudes, norms and behaviours that result in gender inequality, violence and increased HIV vulnerability. Community activists interested in issues of violence, power and rights were trained, along with staff from selected institutions, who worked through the Awareness, Support and Action phases. The programme introduced new concepts of power and encouraged an analysis of the imbalance of power through local activism, media and advocacy, communication materials and training. The activities in each community were developed in response to the community's needs. Abramsky et al. (2014) report that after almost 3 years of the programme, social acceptance of a man's use of violence against his partner was significantly lower among women (adjusted risk ratio[16] 0.54, CI[17] 0.38 to 0.79) and lower among men (0.13, CI 0.01 to 1.15) in intervention communities compared to control communities. Similarly, more people in intervention communities reported attitudes supporting the acceptability of a woman refusing sex, statistically significant for both women (1.28, CI 1.07 to 1.52) and men (1.31, CI 1.00 to 1.70). Past year experience of physical intimate partner violence (IPV) was substantially lower among intervention women compared to control women (0.48, CI 0.16 to 1.39). For sexual IPV, the difference between intervention and control communities was

[16] Adjusted risk ratios generated on the basis of expected number of events from a logistic regression model on individual data with independent variables including age, marital status and EA-level summary baseline measure of outcome indicator (Abramsky et al., 2014, p. 12)

[17] The 95% confidence interval (CI) of the estimates is reported.

somewhat smaller and statistically non-significant (0.76, CI 0.33 to 1.72). These results should be interpreted as the short-term community-wide effects.

### *Effectiveness of post-violence services*

In addition to interventions aimed at preventing and resolving domestic violence, there are services aimed at the rehabilitation of survivors of violence, like facilitating access to justice or counselling.

One of the most popular responses by the government to fight domestic violence is to set up facilities which offer post-violence services, i.e. women's police stations facilitating access to justice for women (Heise, 2011). The effectiveness of domestic violence agencies in Illinois, U.S., is investigated by Bennett et al. (2004). Though the results are preliminary due to the study limitations (e.g. self-reported data, no control group), in all four programme areas, crisis hotline, counselling, advocacy, and emergency shelter, the outcomes were positive. Victims of domestic violence have gained important information due to their participation in the hotline, counselling and advocacy. Counselling and advocacy participation improved victims' decision-making ability. Furthermore, counselling alone increased the self-efficacy and coping skills of victims.

Studies on the effectiveness of women's police stations in the developing world show mixed results. On the positive side, the policy stations seem to make the domestic violence problem visible and offer women new opportunities to defend their rights. However, the stations do not necessarily contribute to the elimination of violence or guarantee access to justice since stations were not designed to fulfil *all* women's needs like emergency shelter, guidance, support and legal advice (Heise, 2011).

With respect to counselling, the literature suggests that counselling for battered women can improve a number of skills and characteristics, like self-esteem, assertiveness and coping abilities (Bennett et al., 2004). Based on international standards and good practices, the United Nations Women (2011) concludes that it is important for the long-term rehabilitation of survivors that counselling aims to empower them, be provided free of charge and should not be mandatory. Counselling for perpetrators must be mandated as supplementary to the criminal justice sanction (United Nations Women, 2011).

Other post-violence services are support groups. The results of the two available studies on their effectiveness is summarised below. Tutty, Bidgood, and Rothery (1993) evaluated the impact of 12 closed support groups (i.e. not open to new members after the start) on 76 women within a time span of 6 months. Women showed improvements in the areas of self-esteem, sense of belonging, locus of control, traditional attitudes towards marriage and the family, marital functioning and perceived stress. Women living with their husbands showed significant decreases in both physical and non-physical and controlling abuse. Thought the results should be interpreted with caution due to the high level of attrition (n=32 at the endline) and the lack of a comparison group.

Constantino et al. (2005) evaluated 24 women in a domestic violence shelter (Western Pennsylvania, U.S.) using a randomized control design. The women were randomly designed to either the control group or the treatment group. Both the control and treatment groups received the standard shelter services provided to all women in the residence: meals, shelter, and necessary transportation. In addition, the treatment group received the social support intervention: once a week a 90-minute meeting led by a trained nurse for eight weeks. The meetings focussed on their social support networks and access to community resources. After the programme the treatment group showed greater

improvement in psychological distress symptoms, reported higher feelings of social support, and showed less health care utilization than the control group.

However, the above findings may not be directly translated to Indonesian women due to differences in culture and context. As research in the U.S., U.K. and Australia has shown: "women's perceptions of appropriate and inappropriate responses [by professionals] partly depended on the context of the consultation, their own readiness to address the issue, and the nature of the relationship between the woman and the health care professional."(Feder et al., 2006, p.22).

***Summary***

Summarizing, it is found that in order to eliminate domestic violence both legal interventions and interventions to change social norms building on local traditions are important. In the context of Indonesia the traditional role of men and women in marriage deserves particular attention. Evidence on the effectiveness of programmes that aim to prevent domestic and IPV violence is scarce. The SASA! Programme was successful in changing beliefs about violence, but did not find significant results for a decrease in actual violence. For rehabilitation of survivors of domestic violence, counselling can help to emotionally strengthen survivors, but it is not clear whether it actually results in changing the abusive situation. More evidence is needed to pinpoint the key factors driving successful programmes aimed at eliminating domestic violence and the rehabilitation of survivors.

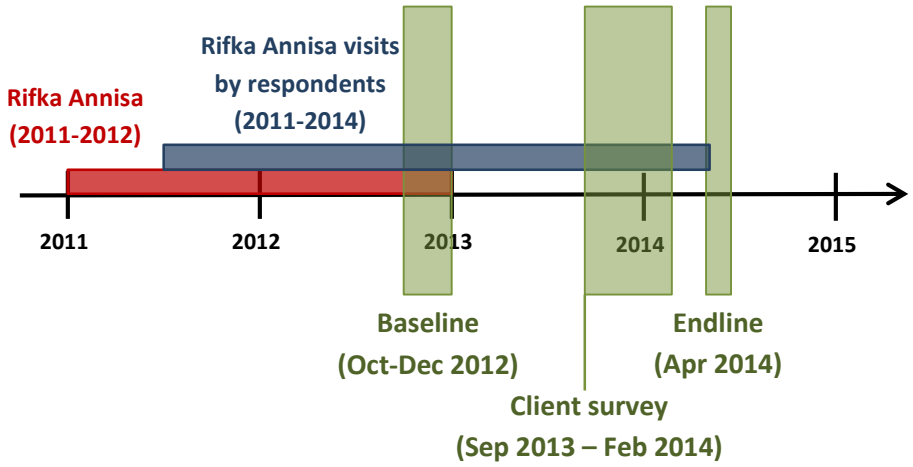
# 3. The project

## 3.1. Project description

Rutgers WPF provides funds for pre-specified activities of Rifka Annisa, an NGO providing free counselling and legal aid services to victims of Sexual and Gender Based Violence (SGBV) in Yogyakarta and its surroundings (Central Java province). However, Rifka Annisa is also involved in several other activities that help achieve its mission to organise women and community in eliminating violence against women, to create a gender-just society through the empowerment of violence survivor, and to increase community's awareness and participation through critical education and strengthening network. Accordingly, the final objective of the project is to reduce SGBV.

The funding from Rutgers WPF is directed towards the following activities:

- Organising training session on paralegal counselling.
- Providing Sexual and Reproductive Health (SRH) counselling and legal aid services to female victims of SGBV.
- Providing shelter to female victims of SGBV.
- Providing counselling service for changing behaviour of men perpetrators
- Promoting national networking of the New Men Alliance
- Developing M&E tools for quality services for victims and perpetrators of SGBV.
- Organising case conferences.
- Organising activities to link partner organisations to relevant networks.



- Developing and implementing advocacy strategy and advocacy work plans on Sexual and Reproductive Health and Rights (SRHR) for partner organisations.
- Arranging contact moments between alliance members and policy makers at the national level.

## 3.2. Project implementation

The contract for the Rifka Annisa project started 1 January 2011 and was planned to run until the end of 2015. However, the MFS II funding of Rifka Annisa stopped at the end of 2012, due to an additional funding possibility from the MenCare+ and UFBR (Unite for Body Rights) programme[18] of Rutgers WPF. Hence, starting 2013, the project was moved under a different funding framework but the content of the project was not affected. However, Rifka Annisa still benefits from MFS II funding through the capacity building activities of Aliansi Satu Visi.[19]

These changes did not affect the evaluation, which focused on the counselling and legal assistances provided to victims of domestic violence, as this group is the most represented among the clients of Rifka Annisa. In 2012, among the 270 cases handled by Rifka Annisa, 200 were cases of domestic violence. Figure 1 summarizes the project periods and the evaluation activities.

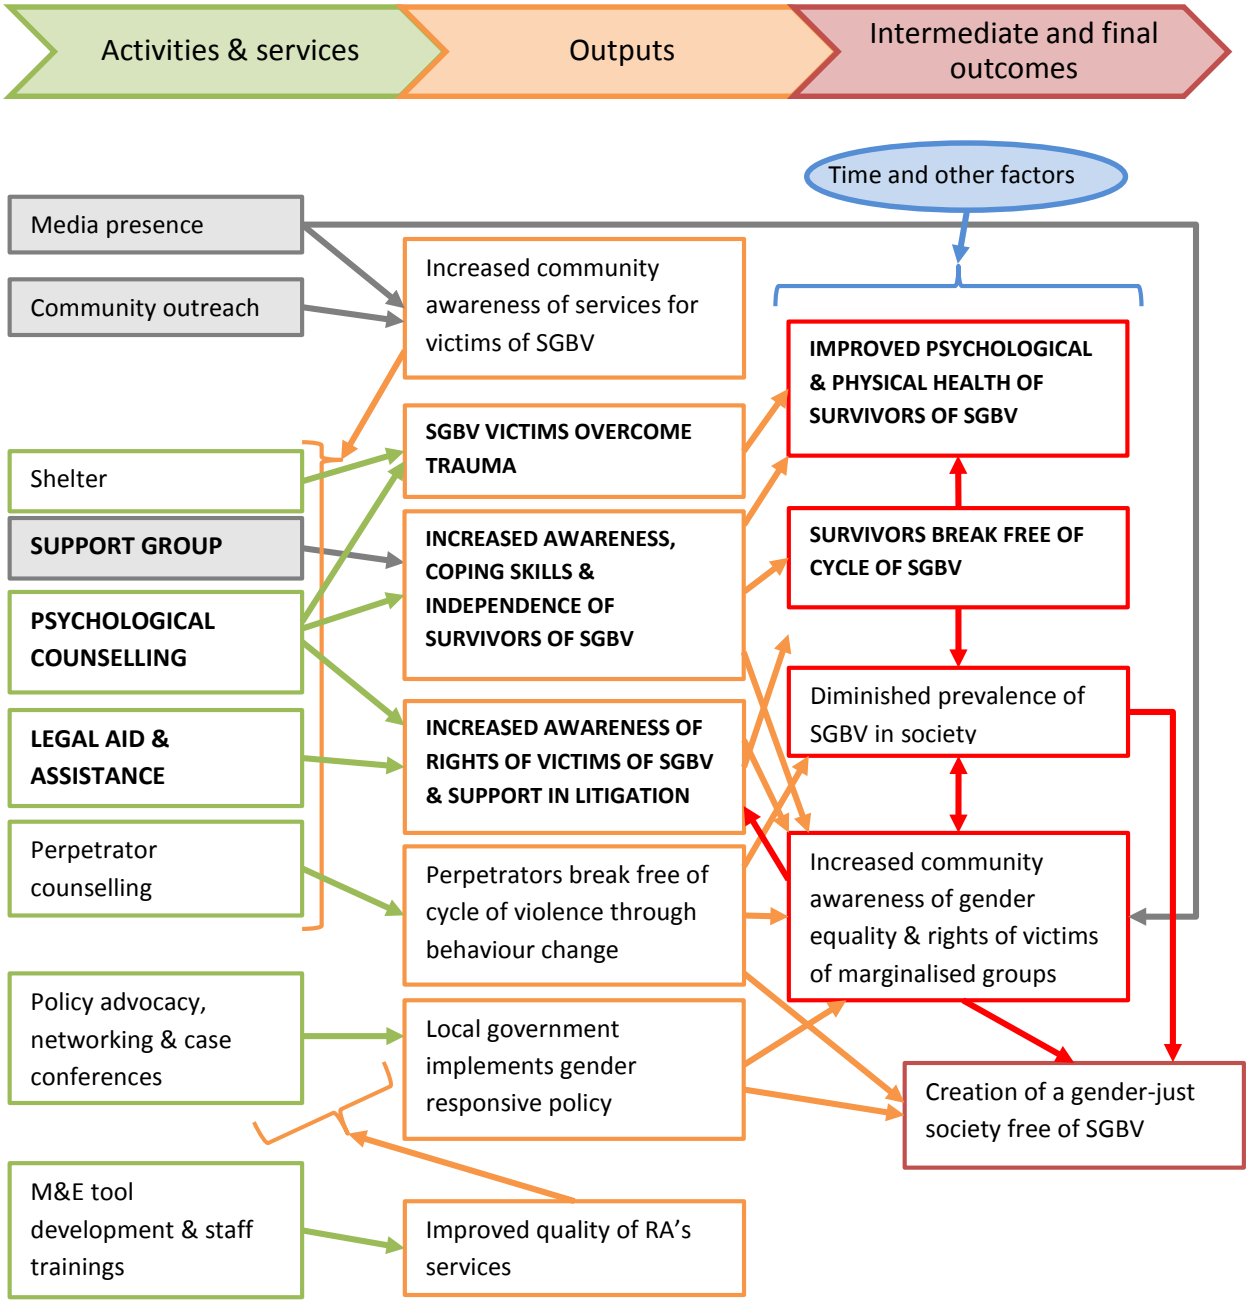
**Figure 1: Timing of intervention**

## 3.3. Result chain

The result chain of the project is shown in Figure 2. It is based on both project documents and the interpretation of the evaluators. It is a rather complex project logic which incorporates both activities and their desired effects at the beneficiary and at the community and policy level.

[18] Both MenCare+ and UFBR are funded by the Ministry of Foreign Affairs of the Netherlands.
[19] The counselling activities are funded by UFBR which is not funded by MFS II. However, the capacity building activities also contribute to the quality of counselling.

The evaluation focuses on the components of the result chain that are printed in bold and with capital letters. Regarding the activities of Rifka Annisa, these are psychological counselling; legal advice, aid and assistance; and support group. These activities were used by the respondents during the evaluation period. The hypothesised effects of these activities are discussed below in further detail, while we leave the interpretation of the other components to the readers as the evaluation does not directly address these.



The aim of counselling is to overcome the trauma and to improve the awareness, independency, and honour of (female) victims. However, it usually takes time to empower the victims of domestic violence to break free of the cycle of abuse and become survivors. First, victims have to become aware that they are being abused, which is followed by becoming aware that they are able to change their situation and becoming open for outside help. As a result, women are able to make a decision either to divorce their husband or learn to control the household situation. Based information from Rifka Annisa, counselling for women who decide to stay with their husband takes about 1 year on average. However, also in case of a divorce, women need counselling to overcome the emotional burden of the abuse. Support groups can also provide comfort for the women by sharing their experiences and providing support for each other.

Rifka Annisa also provides legal advice for abused women regarding their rights and the procedure of divorce or other legal cases. If they are ready to take legal action (divorce), Rifka Annisa offers assistance in handling the litigation procedure.

It is important to keep in mind that there are also other factors that affect the empowerment and psychological well-being of the survivors of domestic violence. These could be support from the family and friends of the respondents or new life experiences such as a new job.

Finally, it is of interest of the evaluation how the project beneficiaries got in contact with Rifka Annisa. Most clients voluntarily visit Rifka Annisa. They have heard about Rifka Annisa through friends, family or media, for example Rifka Annisa hosts a weekly TV-show in Yogyakarta and is frequently present on the radio. Rifka Annisa works with outreach communities where they make themselves more actively known and organise discussion groups. Within these outreach communities, Rifka Annisa is informed about victims of SGBV. Rifka Annisa could be notified by a representative from the neighbourhood or a Health Centre in their network. In such a case, Rifka Annisa could decide to do a home-visit. Victims of SGBV can thus be referred to Rifka Annisa; Rifka Annisa collaborates for example with a special unit in the police department, hospitals, health centres, clinics, etc. Victims can also reach Rifka Annisa through email and telephone.

**Figure 2: Result chain**

Notes:

1. MFS II evaluation focuses on result chain items in bold (e.g. psychological counselling).
2. Activities highlighted in grey do not receive funding from Rutgers WPF (e.g. community outreach).
3. Oval factor is independent of the activities of Rifka Annisa.

# 4. Evaluation questions and outcome variables

## 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. In the baseline report specific evaluation questions were specified. Table 1 shows these five questions and what it implies for this project.

**Table 1: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| 1 | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | • How did the programme change the mental (and physical) health conditions of women victims?<br>• Did the programme empower women victims of GBV? |
| 2 | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Are the observed changes above attributable to the intervention? |
| 3 | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>• Representativeness of the sample<br>• Does the project address an important issue for the beneficiaries?<br>• Satisfaction of beneficiaries (self-reported impact) |
| 4 | Efficiency: Were the development interventions of the Southern partner organisations efficient? | Was the intervention cost effective? |
| 5 | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

In addition, the baseline report identified one other evaluation questions: did the programme lead to a change in the behaviour and empowerment of men's perpetrators? However, this question proved to be too ambitious.[20]

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators following the result chain of the project discussed in section 3.3. The outcome indicators are split up into 4 sub-groups: women's empowerment/attitude towards themselves; attitude/empowerment in marriage; number of women free of domestic violence; and (psychological) health of women. Since there are many possible and interesting outcome indicators, variables are grouped into indices for the main analysis.

[20] At time of the baseline, we were only able to interview three males regarding these issues.

Table 2 displays the outcome indicators of the main analysis, the scale of these variables and whether the indicator is a uniform indicator, while Annex II describes the outcome indicators in more detail and highlights the components per index. The uniform indicators are specified by the synthesis team for the goal on health (MDG 4, 5 and 6) and gender equality (MDG 3). However, none of the uniform indicators on health were related to the project outcomes. Therefore, these have not been measured.

**Table 2: Overview outcome indicators**

| Outcome indicator | Scale (minimum; maximum) | Uniform indicator |
|---|---|---|
| **Panel A. Women's empowerment/attitude towards themselves** | | |
| Locus of Control/Happiness Index | | |
| *Self-efficacy index* | (-2;2) | |
| *Self-esteem index* | (-2;2) | |
| *Control index* | (-2;2) | |
| *Dependency* | (-2;2) | |
| *Support* | (-2;2) | |
| Survivor Coping Index | (1-5) | |
| *Support* | (1-5) | |
| *Self-efficacy* | (1-5) | |
| *Decision making* | (1-5) | |
| *Control* | (1-5) | |
| *Coping skills* | (1-5) | |
| **Panel B. Attitude/empowerment in marriage** | | |
| Rights of wife index | (0-9) | |
| Any good reason for a husband to hit his wife | (0;n) | MDG 3 |
| Number of good reasons for a husband to hit his wife | (0-6) | MDG 3 |
| Any occasions a wife can refuse to have sex | (0;n) | MDG 3 |
| Number of occasions a wife can refuse to have sex | (0-3) | MDG 3 |
| **Panel C. Number of women free of domestic violence** | | |
| Abused by husband/partner in the past 3 months | (0;n) | |
| Number of types of abuse by husband/partner | (0-3) | |
| Nr. of negative traits | (0-6) | |
| Nr. of positive traits | (0-4) | |
| **Panel D. Physical and mental (psychological) health of women** | | |
| Psychological distress index | (0-12) | |
| *Social dysfunction index* | (0-6) | |
| *Anxiety index* | (0-4) | |
| *Losing confidence index* | (0-2) | |

| Outcome indicator | Scale (minimum; maximum) | Uniform indicator |
|---|---|---|
| *Components of physical health* | | |
| *Often had headaches* | (0;n) | |
| *Poor appetite* | (0;n) | |
| *Easily frightened* | (0;n) | |
| *Hands were shaking* | (0;n) | |
| *Felt nervous, tense or worried* | (0;n) | |
| *Cried more than usual* | (0;n) | |
| *Felt tired all the time* | (0;n) | |
| *Had uncomfortable feelings in stomach* | (0;n) | |
| Notes: n is the number of women in the sample | | |

# 5. Data collection

This section describes the survey instruments and the sampling design and outcome in turn.

## 5.1. Survey instruments

We collected two types of data: quantitative and financial data. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

To analyse the impact of the programmes, two surveys have been conducted to collect quantitative data:

- Respondent survey: data was collected using a structured survey for clients of Rifka Annisa. The baseline data have been collected at October-December 2012; the endline data in April 2014.

Client survey: a short self-administered survey with clients of Rifka Annisa was carried out after their first counselling session, which was followed up by an extended survey after the third counselling session during the period September 2013 – February 2014. The result of this survey is reported in

- Annex VII.

### *Financial data collection*

To collect information about the costs of the project, we conducted a project cost survey with the programme manager and financial coordinator of Rifka Annisa on 10 December 2013.

## 5.2. Sampling outcome

### *Sampling design*

The evaluation strategy was based on interviews with clients of Rifka Annisa. To evaluate the impact of counselling on victims of domestic violence and perpetrators, we distinguished several sub-treatment

groups based on the starting date of counselling and whether their husband was involved in the men's programme. Table 3 summaries the planned sample size for the treatment types.

**Table 3: Planned sample size by treatment group**

| Possible treatment exposure (bin) | Female victims (1) | Men's programme: wife (2) | Men's programme: males (3) |
|---|---|---|---|
| 0-3 months | 10 | 5 | 5 |
| 3-6 months | 10 | 5 | 5 |
| 6-9 months | 10 | 5 | 5 |
| 9-12 months | 10 | 5 | 5 |
| **Total** | **40** | **20** | **20** |

In the first group (1), victims of domestic violence are sampled whose (last) husband is not involved in counselling. The total desired sample size for this group is 40 respondents stratified by the starting date of counselling irrespective of current counselling status. In the second group (2), victims of domestic violence are interviewed whose husband also follows the men's programme at Rifka Annisa. The total desired sample size for this group is 20, stratified by the date of their husband's first visit at Rifka Annisa. Finally, the third group (3) contains the men who are following the men's programme, and whose wife is sampled in group (2).

### *Sampling outcome*

The final baseline sample substantially deviated from the sampling strategy described above. At the baseline, from the 168 counselled female victims of SGBV visiting Rifka Annisa between July 2011 and June 2012 for the first time, only 18 victims could be interviewed; and from 18 male clients only 3 were available for interview. All interviews had to be arranged by Rifka Annisa and conducted at the facilities of Rifka Annisa to protect their clients. This constrained the number of respondents we were able to reach because respondents had to invest time and energy for travel to participate in the survey.[21]

Due to the low sample size in the male survey, we decided to only focus on the evaluation of female victims in the follow-up survey at endline period. All 18 female respondents were successfully re-interviewed in April 2014, while the male respondents were excluded from the evaluation. Note that due to the small sample size, the results reported should not be taken as precise estimates.

In addition, to gain more insights into the impact of Rifka Annisa on the female clients, we developed a new client-based survey. All women with cases of domestic abuse who turned to Rifka Annisa between September 2013 and February 2014 were invited to take part in a self-administered short survey after their first counselling session and an extended self-administered survey after the third and sixth visit to Rifka Annisa. During the survey period, 51 women filled out the first survey, and only 3 of them returned for a third visit and filled out the second survey. Due to the rather low latter outcome, it is not possible

[21] Hence, the selection of the sample is non-random due to the limited number of the beneficiaries. Therefore, the results of the study cannot be generalised.

to evaluate the change in women's empowerment, psychological health and self-reported impact of Rifka Annisa's services. The results of the survey are nonetheless summarized in

Annex VII focusing on the profiling of Rifka Annisa's clients by the type of assistance they seek (legal or psychological).

The following sections focus on the outcomes of the 18 female survey respondents who were interviewed in 2012 and 2014.

# 6. Descriptive statistics

This section summarizes the main characteristics of the respondents focusing first on their interaction with Rifka Annisa, and then on their socio-economic characteristics.

## 6.1. Treatment exposure

Table 4 reports on how often and for what purpose the respondents used the services offered by Rifka Annisa. The table shows that most respondents visited Rifka Annisa more than 9 months ago for the first time (8 of 11 respondents). Hence, the respondents at the time of the baseline were not anymore in a situation where they need acute help. All 18 respondents reported that they have received (psychological) counselling before the baseline survey, and 11 of them received legal advice. Three respondents reported that Rifka Annisa directly assisted them in litigation before the baseline. Almost all (15) respondents visited Rifka Annisa more than once.[22]

We assume that the more often respondents used the services of Rifka Annisa, the more they benefitted from them. Before the baseline survey, respondents visited Rifka Annisa 3.7 times on average with 3 respondents visiting Rifka Annisa only once.[23]

During the evaluation period, 6 respondents had contact with Rifka Annisa: 2 were only visiting support group sessions, 4 received counselling, from which 3 also received legal advice, and 2 out of these 3 received legal aid and were member of the support group as well.[24] However, none of them used counselling or legal assistance anymore at the time of the endline survey. At the endline, 4 respondents were members of the support group compared to only 2 at the baseline (3 members joined and one left). Among the 4 support group members 2 visited only 1-3 times, but 2 visited over 10 times, while the other 2 respondents visited 1-2 times.

We are specifically interested in these respondents who have used the services of Rifka Annisa during the evaluation period because we assume that due to directly being exposed to the services of Rifka Annisa, the changes in the life of these respondents are the most influenced by the services of Rifka

[22] For the representativeness of this sample, see section 9.2.

[23] 8 respondents visited Rifka Annisa 2-3 times, 5 of them 4-5 times, 1 respondent 8 times and 1 respondent 16 times (member of support group).

[24] Different respondents reported to have received legal aid before and after baseline. Hence, Rifka Annisa provided direct assistance in a total of 5 litigation cases in the sample.

Annisa during the evaluation period. Therefore, we also report the changes in the outcome indicators separately for this group.[25]

**Table 4: Number and type of visits to Rifka Annisa**

| Survey<br>Sample size | 2012<br>(n=18) | 2014<br>(n=18) |
|---|---|---|
| Time ago first visit[1] | | |
| *0-3 months (Bin 1)* | 0 | - |
| *3-6 months (Bin 2)* | 1 | - |
| *6-9 months (Bin 3)* | 2 | - |
| *9-12 months ago (Bin 4)* | 3 | - |
| *12-15 months ago* | 4 | - |
| *More than 15 months ago* | 1 | - |
| Services used | | |
| *Counselling* | 18 | 4 |
| *Legal advice* | 11 | 3 |
| *Legal aid for civil law litigation* | 3 | 2 |
| *Legal aid for criminal law litigation* | 0 | 0 |
| *Men's programme* | 1 | 0 |
| *Support group (membership)* | 2 | 4 |
| *Shelter* | 1 | 0 |
| Visited Rifka Annisa more than once | 15 | 15 |
| Used counselling services of Rifka Annisa since baseline | - | 6 |
| Still uses services | 5 | 0 |
| Number of sessions (including support group) | 3.7 | 6.0 |

Source: E11 surveys, MFS II Evaluation Indonesia
Notes: 1. Sample size deviates: n=11

Finally, it is interesting to observe the reasons respondents stopped using the services of Rifka Annisa. For the 5 cases where Rifka Annisa assisted in litigation, the most common reason to stop was that the case (divorce) was finalized. Only one respondent returned for additional counselling sessions, and finally stopped because of lack of time and distance to Rifka Annisa. Among the other 13 cases, 3 looked for help elsewhere (e.g. lawyer), 2 said that the counsellor was not always available, 4 said that the case/problem was finished and 2 that the situation improved. In addition, 4 respondents had no time for counselling and 2 complained about the distance to Rifka Annisa.

[25] Note that respondents who only used the support group during the evaluation period are not included this group.

## 6.2. Respondent characteristics

To provide a better insight into the general characteristics of our sample, Table 5 displays a number of socio-economic characteristics of the respondent and her husband at the baseline. For variables where the sample mean is displayed, the standard deviation of the variable is reported in parentheses below the mean (for example, for age or number of children). For categorical indicators, the number of respondents that belong in each category is reported.

The table shows that the average age of respondent is 35 years. The youngest respondent is 25, while the oldest is 53. This shows that most of respondents belong to productive age, both productive as worker and as mother. Most respondents have more than one children and in school age. Almost all respondents are Muslim.

Looking at the education level, both respondents and their husband have senior high school and bachelor degrees, and the education level between the spouses is similar. Respondents' households are also better off than the average Indonesian household based on the asset and housing facilities indices.[26] In terms of the asset index, they were almost one standard deviation wealthier than an average Indonesian household in 2012.

The table also shows that most respondents are working in order to have their own income (13 respondents at baseline and 17 at endline, Table 28 in Annex IV). As stated by one of the respondents "*women who got married should never stop working, just in case if anything bad happens they can handle it on their own"*. This is proved by the fact that most respondents work and are able to fulfil their and their children's needs, even though it is only enough to fulfil their basic needs. As stated by one respondent *"I work for the children and I can also do good things for my parents and I also asked my parents to take care of my children while I am working."* Respondents conveyed that employed women can be more independent and they can take care of themselves in case they have to leave their husband. Another respondent agreed "*Working is a must for women, if our husband is cheating on us and they did not provide us allowance we can still move on and take care of the children*".

[26] The asset and housing facilities indices are standardized at zero (mean) for the average Indonesian household based on the DHS 2012 and IFLS 2007 surveys, respectively. The asset index is also standardized to have 1 standard deviation.

**Table 5: General characteristics of the sample**

| Sample | Total sample | Used Rifka Annisa since baseline |

Source: Household survey E11; MFS II Evaluation Indonesia
Notes: Standard deviations given in parentheses

At the time of the baseline, 11 respondents were already divorced and only 6 of them were still married. We assume that a divorce can solve marital problems. Hence, for respondents that were already divorced at the time of the baseline survey, their marital problems have been solved already. These women were at a different stage of their life at the time of the baseline compared to women who were

in the process or preparing for divorce or who did not want to divorce. We expect to find an impact on the last group of women since Rifka Annisa helped these women with their divorce and/or with solving their marital disputes.

For women who were already divorced at the baseline, changes in their lives after the baseline can still be attributed to the services of Rifka Annisa in some cases. For example, if they are a member of the support group. Moreover, it takes time to heal and adjust your personal habits. The effect of the counselling sessions can have a short term impact when learning how to cope with the marital disputes, but can also have a long term impact on the women. Even after a divorce and when not attending Rifka Annisa anymore, respondents can still improve on their wellbeing due to the lessons learned in the counselling sessions with Rifka Annisa.

Hence, Rifka Annisa's services could affect both women who were already divorced at baseline and those who were not. Since we expect the impact to be different, we are interested in both subsamples. The results on the outcome indicators for the two subgroups are reported in Annex VI.

# 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured between the base- and endline survey (2012-2014) are grouped into 4 categories: women's empowerment/attitude towards themselves; attitude/empowerment in marriage; number of women free of domestic violence; and (psychological) health of women. Annex II describes the contents and construction of the indices and Annex III reports the results for the components of outcome indices.

Table 6 to Table 12 display the results for these outcome indicators. In the tables, we report the results for the total sample and the subsample of respondents who have used the services of Rifka Annisa since the baseline separately. For both groups, the tables show the baseline (2012) and endline (2014) values and the change (2014-2012) in the outcome indicators. The standard deviation of the indicators is displayed below the means in parentheses. The significance of the change from zero is denoted by stars, with '*' denoting that the change is significant at 10% significance level, '**' for 5% significance level and '***' for 1% significance level.

The following subsections discuss the levels and changes in the outcome indicators.

### *Women's empowerment/attitude towards themselves*

Women's empowerment with respect to their self-image is measured by three indices and two indicators between the baseline and the endline, as shown in Table 6. The indices range from -2 to +2, where -2 indicates a negative outcome and +2 indicates a positive outcome. Hence, the higher the value of the index/indicator, the more empowered the women feel. The impact on the components of the indices is provided in Annex III.

The table shows that women feel significantly less dependent on their husbands at the endline (change of 0.88 on a scale of -2 to +2), which is especially true for women who used Rifka Annisa's services during the evaluation period (change of 1.60).

However, we do not observe any significant changes in the respondent's self-efficacy, self-esteem, control (or influence on life) and having support. In general the self-efficacy and support indicators were reported at a quite high level at the baseline but have deteriorated somewhat by the time of the endline. This could be the result of new challenges in the lives of the women, for example the increased burden to provide for themselves and their children. In addition, some of the respondents are also faced with negative judgement in their communities due to their divorced status.

Table 7 reports the Survivor Coping Index and the sub-components based on Bennett et al (2004). The scaling of each indicator is from 1 to 5, with 5 indicating the best possible outcome. This indicator was only asked at the endline, however, the client survey also asked first time visitors to Rifka Annisa the same questions. The outcomes of the respondents are similar for this reference group (after first time counselling session, n=51), indicating that respondents were neither doing too good nor too bad in terms of confidence in their coping abilities.

Notes: Standard deviations given in parentheses

### *Attitude/empowerment in marriage*

Table 8 reports on respondents' attitude towards their rights in marriage. The rights if wife index indicates respondents' (assumed) autonomy in the marriage and it is measured by the average number of traits indicating autonomy that the respondents agree with (see Annex II for further details). The table also reports on the number of women who agree with any reason for a husband to hit his wife and the number of women who agree with any occasion for a wife to refuse sex. Annex III reports on the components of the indicators.

Overall, women feel quite some autonomy towards matters participating in social matters after their housework is done (100%) and not obeying their husbands when they disagree with him (72%). However, only 61% of them thought that a wife has the right to work (part-time) without the approval of her husband. In addition, more than 80% of them thought that the husband has the right to know where his wife is at all times, and that family problems should be discussed only within the family (Table 20 in Annex III). The last finding is interesting since all women have reported their case to Rifka Annisa and often confessed their marital problems to their friends.

The overall score of 4.8 at the endline indicates that women believe that they have some autonomy but they still report patriarchal values, which sometimes may be only normative as the case of discussing family issues with outsiders shows. However, we do not observe much change in this indicator during the evaluation period.

Respondents confessed that it is justified for women to refuse to obey their husband, like refusing to have sex, as long as they have acceptable reasons. A Muslim respondent mentioned that "*disobedience toward husband is forbidden in religion.*" However, most women agree that women are allowed to refuse to have sex either when they have (17 at endline) or have no reason at all (only 1 respondent).

Most respondents also agree that a husband never has the right to hit his wife. However, despite having experienced domestic abuse, 7 women at the baseline still believed that a husband is justified to physically abuse his wife if she neglected her children. However, at the endline the number of respondents who agreed with this statement has decreased by 2.

Hence, we observe some increased empowerment of at least two of the respondents with respect to their rights as wives.

1. The higher value indicate more rights.

### *Number of women free of abuse/domestic violence*

Being free of domestic violence means that the respondents have experienced violence in the past but they are not being abused anymore. Of course, the psychological impact of the abuse may affect the respondents longer.

The hypothesis in the Theory of Change is that legal assistance and the psychological counselling empower the clients of Rifka Annisa to take action towards breaking the cycle of violence. This can happen through legal action/divorce, but also women who are aware of their rights may be less likely to be submissive to abuse. Therefore, we expect that due to the services of Rifka Annisa the exposure of

respondents to abuse will decrease. However, there are also other reasons that result in a reduction in the number of respondents reporting experiences of abuse. A qualitative analysis of the interviews is needed to disentangle the determinants of change.

Table 9 reports the exposure of respondents to GBV for the 3 or 12 months period prior to the baseline (2012) and prior to the endline (2014) surveys. GBV is categorised into domestic violence and abuse by others. Domestic violence is further categorised into psychological, physical and sexual abuse. Abuse by others is categorised into physical and sexual abuse.[27] Since there are women who experience more than one type of abuse, the mean number of types of abuse by the husband or partner is provided in the table together with the change in this indicator between the indicated periods.

The results in Table 9 show that, at baseline, half of the 18 respondents were still experiencing psychological (9) and sexual (1) violence from their (ex-)husband/partner within the past 3 months. This number is quite high given that 12 respondents at the endline were already divorced or separated, and they have started counselling at Rifka Annisa more than 6 months ago in almost all cases (17). At some point in their married life, 15 respondents experienced some type of domestic abuse, from which psychological abuse was experienced by 14 respondents, physical abuse by 12 and sexual abuse by 10, while 8 respondents were subjected to all three forms of abuses at one point in their married life (Table 22 in Annex III). These unforgettable and bitter experiences of physical and sexual violence prior to the baseline 'forced' women to seek help and protection, as one of the respondents confessed *"I'm trying not to tell anyone about his abusive behaviour, but it's too painful to hold* by myself".

During the evaluation period, 12 respondents reported to have experienced some form of domestic abuse. All of these respondents confessed that they were psychologically abused, but 5 of them were also physically and 2 of them sexually abused (Table 22). Based on this table, 4 women became free of domestic violence; while an additional 5 women became free of physical or sexual abuse but not of psychological abuse. Unfortunately, the situation did not improve for 4 women and actually deteriorated for 2 women who experienced multiple types of abuse during the evaluation period.

At the time of the endline study, the situation seemed somewhat better: while 5 respondents were still experiencing psychological abuse, and two of them also reported sexual abuse during the past 3 months, 13 of the 18 respondents were free of domestic violence compared to only 9 at the baseline.

Regarding the forms of psychological abuse, they can take the form of word, SMS or public embarrassment. For example, one of the respondents mentioned that her husband *"sent me SMS regarding properties in the house*", and she also added that her husband "*forced me to have sexual intercourse but I always refuse by saying that I'm tired*".

[27] Please note that if the respondent has a new partner at the endline, the domestic violence indicators are reported for the new partner. In this case, abuse by the ex-husband should be reported in the abuse by others section of the table. In the discussion of the tables on abuse by others, it should be indicated who were the perpetrators of the abuse.

Reporting on domestic abuse assumes that women are always aware that they are being abused by their husband. However, the first step to break the cycle of domestic abuse is the realisation that one is being abused. Therefore, it is of interest to report on how the respondents were being treated by their husband/partner. Six abusive traits[28] and four supportive traits are reported in Table 23, where the number of respondents who reported a certain trait about their husband is reported.

In Table 10 the domestic life of the respondents is summarized by the mean number of negative (out of 6) and positive (out of 4) traits.[29] The results in the table indicate that the number of negative traits of their (ex-)husband, such as ignoring and distrusting, significantly decreased during the evaluation period (by -2.3 traits out of 7). This is the result of the divorce, as it increases the autonomy of the respondents.

[28] The last negative question was taken out of the indicator.
[29] Please note that at the endline survey the questions were asked for respondents that keep in touch at least once per month with their (ex)husband, and if the respondent has a new partner the questions refer to the new partner.

Some of the respondents confessed an improvement in their relation to their (formerly) abusive (ex)husband after the divorce (3) or in the marriage (1). For a positive example, he pays attention showing that he still cares about the respondent, as one respondent confessed: *"my husband buy me a new car, he still give money for monthly necessities, accompany my children to the doctor, and never angry with me."* However, overall, we only observe a small insignificant increase in the number of positive traits (ex)husbands show towards the respondents.

### *Psychological and physical health of women*

Table 11 reports on the psychological health of women measured with the psychological distress index based on the GHQ-12. The psychological distress index is composed of three sub-indices: social dysfunction, anxiety and lack of confidence in oneself. The more psychological distress a woman had experienced in the past one month, the more components of an index were applicable to a woman, and hence, the higher the value of an index. The outcomes of the components included in the indices are provided in Table 24.

The data show that most respondents experience anxiety (2.2 out of 4) and loss of confidence (0.72 out of 2) and that these problems have not improved much during the evaluation period. In particular, at the endline 14 respondents still indicate that they have trouble overcoming emotional problems, which is likely to be a lingering effect of the abuse endured. One of the respondents described that "*sometimes I can't hold back my feelings, my husband accused me of cheating on him."* Another respondent confessed that she sometimes cries when she remembers her husband's terrible treatment of her. As a woman, she tried to be strong although she has suffered a lot. She sometimes hides her feelings and even forgives her husband. As stated by one of respondent *"I felt sorry for my children's father (ex-husband)".*

In addition, 11 reported that they feel constantly under strain and 9 lost much sleep over worry during the past month despite reporting feeling relieved after the divorce procedure is over. However, respondents are now the sole responsible for providing for themselves and their (young) children, which certainly increases their burden. One of the respondents confessed that *"my children are still young and I can't leave them, so I stopped working"*, hence this respondent struggles to provide for her family.

At the same time, we also observe some improvement in these indices. The number of respondents who felt depressed and did not feel reasonably happy in general reduced by 4 from 10 and 7 at the baseline, respectively.

However, respondents are generally able to enjoy their life and carry out their daily activities without significant obstacles (social dysfunction 0.6 out of 6 at endline), and we also observe a significant improvement (-0.5) in the social dysfunction indicator during the evaluation period, which is mainly explained by the decrease in the index for women who were divorced at the baseline (Table 44 in Annex VI).

All respondents confessed that they 'played a useful part in things,' as they have an important role in many aspects of life, such as taking care of the children, working to provide for the children and taking care of household chores. As stated by one of the respondents who wanted her children to be successful persons "*I have to work so that I can provide them with high level of education*". Most respondents confessed that their children are the main motivation for them to look positively into the future, as one respondents stated "*I would not be overshadowed by the past anymore, I want to take care of the children in order they have a bright future.*"

Compared to the small improvements observed in the indices on psychological distress, the physical symptoms reported in Table 12 seem to suggest that the respondents' health is not all that well. However, not all physical symptoms may be related to the distress caused by (past) experiences marital abuse. For example, tiredness may arise from working long hours, and 'uncomfortable feelings in the stomach' may be due to the menstrual cycle.

Nonetheless, 7 (8) women suffered from feeling nervous, tense and worried. In addition, the number of women who cried more than usual and who have bad appetite has increased for 3 respondents (from 2 and 4 before the baseline, respectively, to 5 and 7 at the endline). Most of these negative developments (2 out of 3) are observed among women who have used the services of Rifka Annisa after the baseline,

indicating that they are freshly divorced and are still struggling with the after-effects of the divorce, which may have put additional pressures on them as breadwinners.

# 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

## 8.1. Methodology

The evaluation of the Rifka Annisa project relies on a before-after comparison methodology. This means that we interviewed respondents at certain periods and evaluate how their situation changes over time. The difficulty of this approach is that we cannot be sure whether these changes occurred as a consequence of the project or due to other factors. Therefore, we have to use a Theory of Change (ToC) for the project and investigate whether the changes can be explained by this ToC or by alternative pathways. Qualitative analysis helps to disentangle the pathways.

The ToC or result chain for the Rifka Annisa project was discussed in detail in section 3.3. Here, we summarize the ToC for the counselling and legal assistance services of Rifka Annisa. It is hypothesised that providing psychological counselling and legal assistance will empower marginalised women by providing information about their rights. This will improve their psychological health condition and enables them to change their behaviour. In addition, it might enable abused women to take legal action against their abusers (in this case their husband), and break the cycle of abuse (by a divorce). All clients of Rifka Annisa are also invited to join a support group, where survivors of abuse come together for

learning and supporting cases of other abused women. This empowers women to become survivors of gender-based and/or domestic violence.

Hence, the outcome indicators of the project are related to women being free from abuse, female empowerment, psychological well-being (psychological health) and the behaviour of abused women. However, it is important to keep in mind that a number of alternative pathways or ToCs could also lead to improvement in these outcomes. For example,

- Women may have sought help elsewhere. If the client already knew about her right to divorce her husband and got divorced with a help of a lawyer, the change in the outcome indicators is not driven by the services of Rifka Annisa
- She may have moved out of the house of her husband and she is not interacting with the husband anymore.
- Change in the outcome indicator on psychological well-being and empowerment can be originated in other aspects of the women's life than her relationship to her (last) husband. For example, she may have better living or working conditions; or she might suffer from the loss of a close family member.
- Change in the outcome indicator on psychological well-being and empowerment can also be explained by time. If she is not abused anymore, her psychological condition might improve due to new life experiences.

There are numerous other possible explanations for the change in the outcome indicators. In order to find out what share of the change in the outcome indicators can be attributed to the proposed ToC or Rifka Annisa's services, at the end of the follow-up interview with the respondents, we allowed for open-ended discussion regarding the factors that influenced their lives since the baseline interview.[30] The following section summarizes our findings.

## 8.2. Results

In order to address the attribution of changes to different factors, we first discuss the most important changes in the lives of the respondents categorised by marital status, children and employment, which constitute the majority of the most important life events. Then we turn to discussing the sources of help respondents turned to during their difficult times. These are categorized by social network and governmental and non-governmental institution. We also discuss Rifka Annisa's role separately. In turn, we look at factors affecting the lives of respondents after the divorce, and the overall changes in their lives. We conclude this section by providing an ex-post Theory of Change based on the findings.

[30] The qualitative discussion focused on the following groups of questions: 1. Do you think you have changed since last interview? How? What are the sources/causes that made you change?; 2. We have discussed a lot of things. What were the most important sources of help for you to overcome the abuse in your marriage? Who helped you the most? And in what way? (These could be psychological, legal, economic, social etc. aspects or just time); 3. ONLY IF DIVORCED: How did your situation change after the divorce? (Emotional, family, social, economic aspects. The developments could both be positive or negative.) Why? Did you change? In what ways?

### *Life events*

Every couple and individual experiences ups and downs in their relationships and changes in their life. As expressed by one respondent *"life is like a roller coaster, today we may be on the bottom and tomorrow may be on the top of the wheel."* Table 25 in Annex IV summarizes these ups and downs in life events that happened to the respondents since the baseline interview. The table shows that most of the changes in the lives of respondents are centred around family life and children (11 positive, 2 negative), employment (10 positive, 3 negative) and their (marital) relationships (6 positive, 5 negative). While most changes in family life and employment are positive, the picture is less clear for marital relationships.

The positive reported changes are for example better relationships with ex-husband/ex-husband's (4) and children have accepted the condition (2). However, for most respondents, first their job improved, which enabled respondents to fulfil their own daily needs, as well as to develop their businesses (2). Meanwhile, the negative changes experienced by respondents were in the sickness suffered by respondents and the family (5). The negative changes level is high on the relationship between respondent and husband which cannot be fixed and also in process of divorce.

The negative as well as positive changes that respondents had were influenced by several factors. Respondents who have experienced domestic violence were trying to get out of the abusive situation. They were brave to make decisions in their life, including to divorce. They just hoped to have positive changes in their life after becoming free from abuse.

In the following these life events are discussed in more detail.

#### Marital status

Therefore, in Table 26 we take a closer look at the changes in marital status. Two women who used the services of Rifka Annisa after the baseline got divorced during the evaluation period, while 2 other women got remarried. One of respondent described her new husband as *"my current husband is more patient, understanding, and love my two children"*, meanwhile the other respondent confessed that "*I got married because there was a man who wanted to help my economic condition*."

At the endline, only 3 women were still married to their (formerly) abusive husbands, while one women became a widow.

#### Children

Table 27 reports on the housing situation of the women. At the baseline, all women lived with their children, and 3 women lived also with her husband. At the endline, one women was living away from her children, while 4 women lived with both her children and husband.

Children can be one of the agents of change on the lifestyle and social structure. As described by one of respondent *"I have to fight for my children although I have to work hard",* another respondent stated that *"I want to be with my children until they can finally live on their own."* Children can be great companions, as described by respondent "*I live with my children and they can cheer me up whenever I*

*feel sad*". Respondents who are still living in the house with their husband and children indicate that they are trying to maintain their marital status and trying to fix the relationship.

However, some respondents expressed that their children have suffered from the husband's abusive behaviour towards the respondents (3), as one respondent described that her two children are imitating the abusive behaviour of their father: they like to scream and snap, and even dare to hit.

**Employment**

Table 25 reports 10 positive and 3 negative changes in job. Table 28 shows that of the 17 respondents who were employed at the baseline, 6 (33% of total sample) changed their jobs. Most women got a better position, with only one woman reporting a worse employment condition. Half of the women who changed their jobs (3) are among respondents who returned to Rifka Annisa during the evaluation period, which indicates that there has been more change in the lives of these respondents with 50% of them changing their job, and one respondent ending in a worse job.

As described by one respondent who experienced a positive change in her occupation "*the online business is running smoothly and I have many customers. Now I have my own activity and it is fun and I gain a lot of profit*." The situation is different for respondents who still have to take care of their children themselves, which has a negative impact on their jobs. As stated by one respondent "*Since the father has gone, the children had no one to take care of them, the first child has started the kindergarten and they need to be monitored, we can't leave them as we like."*

### *Sources of help*

**Social network**

Many respondents have more a stable emotional condition thanks to the help of their friends and family (Table 29). Respondents realized that they need friends to count on in order to overcome their marital problems (15). Friends became a useful source of help because many respondents found that they feel comfortable the most when talking about their bad experiences. They can keep the respondent's secret well and they can reveal whatever the respondent feels concerning the domestic violence she is experiencing. One respondent expressed that "*friends can entertain and give advice when I'm sad and confused*". Friends are seen as the first place to ask for help when hard times hit.

Another source of help is family, like parents and siblings. They can provide not only a shoulder to cry on but also financial assistance (6) and help in taking care of the children (6) in order to get through the hard times.

The support and motivation they received from family and friends encouraged respondents as well as empowered them to attain their freedom.

**Governmental and non-governmental organisations**

Table 30 reports on the organisations where the respondents sought help regarding the abuse they experienced. The police is the first organisation to report if respondents experience physical abuse or threats from her husband or partner. 6 respondents reported her husband to the police before the

baseline survey and 3 of them sought help at a hospital or health centre. A respondent said that *"my husband threats that he will hurt me, so I run to the police station to seek for help. I filed a report and then they summoned my husband. He received conditional sentence"*. Another respondent stated *"he accused me for having an affair and forced me to admit it, but I never did that. I went to file a report in a police station where he works"*.

Apart from that, community leaders rank the second (5 women reported her situation there before the baseline). Community leaders such as the Neighbourhood Association (*RT*) and Community Association (*RW*) have an essential role in the community. But they can only act as a mediator if marital dispute occurs.

During the evaluation period, we observe a decrease in the number of respondents reporting to officials such as police, community leaders, hospitals and religious leaders, which indicates that most respondents' situation improved during the evaluation period, while at least one respondent's condition worsened.

**Rifka Annisa**

Table 31 and Table 32 show that Rifka Annisa provided assistance during the trial in the court for divorce in 6 cases, from which 4 were finalized during the evaluation period. Rifka Annisa helped respondents in the preparation for the court trial (for example, in gathering the necessary documents). However, none of the respondents received assistance from Rifka Annisa in their mediation process with their spouse despite 8 of them having been involved in mediation.

In total, 13 women have been involved in litigation, from which 4 of them handled the case without additional support, 6 received assistance from Rifka Annisa and 3 of them received help from other organisations. Hence, most respondents who sought assistance for litigation actually used the help of Rifka Annisa and only 33% turned to other sources of help.

Interestingly, Rifka Annisa's support is most often mentioned in relation to assistance in the divorce process, and very few respondents explicitly mention the importance of the counselling sessions. One exception is the respondent, who reported that even though the divorce is finished she still wanted to continue with the counselling. In fact, she has also joined the support group during the evaluation period and visited regularly along with one other respondent.

Two other respondents dropped out of the support group due to time and distance considerations, even though they found the sharing of experiences helpful. However, one respondent left the support group because remembering her past only makes her cry and she is not able to forget. The other respondents (13) did not know about the support group.

### *Changes after divorce*

After the divorce, many respondents feel "*relieve", "no more pressure", "less psychological burden*". Although they are no longer burdened with psychological stress, they have to face another burden which is to fulfil their daily needs for the children. Besides that, they have to face the negative view in the community of being divorced.

Each era has its own culture and value which are influenced by characteristics of the origin community. Their culture and values often differ from other communities. Javanese patriarchal culture, for instance, views women without a husband negatively. They tend to have a negative attitude toward divorced women, who have a lower social status compared to divorced men. Some of the respondents expressed that they were negatively judged by community members, which translated into a psychological burden and resulted in insecurity in their life. As described by one respondent *"My neighbour often averts his/her face when I greets him/her. Once, I did that when my male friend sent me home".* Other divorced respondents think and act positively in their community, as described by another respondent *"I stay away from those who dislike me, I have to be careful with the men who approach me, I only work for my children."*

However, despite prejudices towards divorced women in the community, divorced women are able to find a new partner or husband as shown by the example of the two respondents who have remarried shortly after their divorce from their first husband.

Nonetheless, after the divorce, working becomes the norm for women to support their children. Respondents hardly received financial support from their husband/partner or ex-husband/partner. One respondent said "*He never give me spending money.*" No financial support and divorce do not make them give up. Respondents are working hard to provide for their children. Hence, the advice of one respondent is indeed to the point: "*women who got married should never stop working, just in case if anything bad happens they can handle it on their own."*

### *Overall changes*

In general, respondents needed some time to finally decide to get out of the abusive behaviour of their husband. This decision was often supported by friends and family. During the evaluation period, divorced respondents started to move on and start a new life. They got their spirit back and they are optimistic that their lives will change for the better not only in terms of their economic condition but also for their children's future.

Children are the most important factor for respondents to move on and get out of the abusive behaviour. As described by one of respondent "*I won't give up and be drowning in the past, because I have to take care of my children for their better future".* Another respondent described *"I can't regret everything, because all of them can be a valuable lesson for my life".*

Working has become the main activity for respondents because it is important to support the children in order to have better future. They would take any job in order to be able to fulfil their daily needs. As stated by one of respondent *"My child started to attend a school and I can't leave my child to work outside, so I'm running online business in order to help me earn money to give allowance money to my child. I also received help from my brother".*

### *Attribution*

Most respondents first confessed their marital problems to their friends after they could not endure anymore. Friends motivated and encouraged them to seek help. Support from family also played an important role in the resolution of respondents to divorce their husbands.

Friends and relatives were the most important sources to refer respondents to Rifka Annisa. Rifka Annisa provided psychological counselling to all respondents, and legal advice to most of them. From the 12 women who decided to divorce their husband, Rifka Annisa supported half in the litigation procedure. In fact, this is the most often mentioned impact of Rifka Annisa on the lives of the respondents. It is difficult to assess to what extent Rifka Annisa played a role in empowering respondents and taking the decision for the divorce.

Based on the respondents' testimonies, most changes in the outcome indicators (less dependency on husband, less exposure to abuse, better relationship with husband and improvements in the psychological well-being and social functioning of respondents) can be attributed to the fact that women divorced and broke free from their abuse husbands.

In addition, the data show that respondents' main motivation to look positively into the future is their children and to be able to provide for them. Most respondents confess that after the divorce they feel relieved, their mind is more at ease and they look positively towards the future due to their children.

Family support is also an important factor in realizing these changes. Respondents who have parents and siblings that can help them financially and by looking after the children managed to have a good grip on their lives after the divorce, and to find a better job or finish their studies; while some respondents who have no such support still struggle to make ends meet while staying at home with their young children.

However, all women are working hard to provide for their children, which also had an impact on their physical health. But women are also still struggling to manage their emotions especially related to the traumatic experiences in their marriage. In this respect, respondents found consolation in their friends and family, while some of them joined the support group of Rifka Annisa.

# 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular we look at the size of the impact, the representativeness of the sample, if the project addresses an important issue for the beneficiaries, and the satisfaction and self-reported impact of beneficiaries.

## 9.1. The size of the impact

We observe limited changes in the outcome variables. On the one hand, we could think that this is due to the fact that respondents have been actively seeking help to resolve their marital problems already for some time before the baseline survey (for example, empowerment). On the other hand, the results often show smaller effects for respondents who have been assisted by Rifka Annisa during the evaluation period, suggesting that it takes longer for respondents to recover (for example, psychological distress).

## 9.2. Representativeness of the sample

In the client survey, we find that only 3 of 35 clients with cases of domestic abuse who filled out the survey after the first counselling session between September and November 2013 have visited Rifka Annisa at least three times in a period covering more than three months (from September 2013 to February 2014). This suggests that the respondents analysed in this report are not necessarily representative of the clients of Rifka Annisa, as most respondents have visited Rifka Annisa multiple times. However, regarding the type of assistance respondents look for, the sample seems to be representative of Rifka Annisa's clients (compare Table 33 in Annex V and Table 46 in

Annex VII).

## 9.3. Does the project address an important issue for the beneficiaries?

The services of Rifka Annisa address a pressing problem of the beneficiaries, namely how to improve their marital situation when they cannot endure the abuse of their husband anymore. Respondents visit Rifka Annisa voluntarily, hence, their continued use of Rifka Annisa's services signals the value to the respondents (see section 6.1).

However, as section 1.1 regarding the project context and the literature overview in section 2 indicates, the existence of organisations that provide free counselling and legal aid services to victims of SGBV is essential for creating a society that is free of SGBV. They not only provide services but stand as proof for the rights of women, children and other marginalised groups. The more these organisations are known, for example through media coverage or through information from friends, police and health care providers, the more likely it is that abused women will break their silence and seek help to improve their situation either through mediation or divorce.

Of course, not only NGOs but also governmental organisations provide free services for victims of SGBV. However, the quality of services is often lower in governmental institutions due to lack of funding and counsellors are also more likely to advice women to be patient and go back to their husband, rather than providing counselling and support for abused women.

## 9.4. Satisfaction and self-reported impact of beneficiaries

An important indicator of the success of the services of Rifka Annisa is the satisfaction of clients. The valuation of the respondents is reported for the total sample, respondents who have visited Rifka Annisa only once, and those that have used the services of Rifka Annisa after the first visit (visited more than once) and the respondents who are members of the support group. These subcategories are selective since it is the respondent's decision whether to use the services of Rifka Annisa or not. It is expected that respondents who benefit more from the services would use them more extensively.

### *Reasons to seek help at Rifka Annisa*

The reasons for visiting Rifka Annisa for the first time are reported in Table 33 in Annex V. This information was gathered at the endline (2014). Respondents were also asked if they have received the kind of help they were looking for.

All respondents came to Rifka Annisa due to their marital problems. As described by one respondent "*I asked for help to Rifka Annisa because I couldn't take it anymore. I was so broken-hearted and I always come to Rifka Annisa whenever I feel down.*" Most respondents (16) were looking for psychological counselling. A respondent confessed that "*I feel calmer after I spill out all the feelings I have inside.*" However, most of them also sought legal assistance (11) during the divorce procedure, and one respondent wanted to claim rights over the property acquired jointly with her ex-husband. However, not all respondents finally used the assistance offered by Rifka Annisa. For example, one respondent noted that "*I visited Rifka Annisa only once, and my parents got the attorney for me.*" Nonetheless, most respondents (12) who visited Rifka Annisa generally received assistance as expected and have visited Rifka Annisa multiple times, while others were only partially satisfied with the assistance received.

### *Self-reported impact*

All respondents were asked how the services received at Rifka Annisa have changed them. The responses were given on a scale of 1 'Strongly disagree', 2 'Disagree', 3 'Undecided', 4 'Agree' and 5 'Strongly agree'. The number of respondents who answered 4 or 5 for the questions is reported in Table 35 and Table 36 in Annex V. Note that the information was collected at the endline (2014). The results are overly positive, and may represent the general change in the respondents' attitude rather than factors attributable to Rifka Annisa.

The satisfaction of the respondents with Rifka Annisa's services is reported in Table 13. The response categories range from 1 'not satisfied at all' to 5 'very satisfied'. The mean of the responses minus 3 is reported in the table along with the standard deviation. Due to the rescaling, dissatisfaction will have a negative sign and satisfaction will have a positive sign.

Respondents in general were satisfied with the services of Rifka Annisa. They were the most satisfied with the legal aid services and the support group at the baseline. Respondents who used the services of Rifka Annisa during the evaluation period were also positive but to a lesser extent.

**Table 13: Rifka Annisa services used and service satisfaction**

| Variable | Used services of Rifka Annisa before baseline | Service satisfaction | Used services of Rifka Annisa since baseline | Service satisfaction |
|---|---|---|---|---|
| **Period** | 2012 | 2012 | 2014 | 2014 |
| **Sample size** | 18 | - | 6 | - |
| Psychological counselling | 18 | 0.83<br>(0.86) | 4 | 0.75<br>(0.50) |
| Legal advice, information and/or consultation | 11 | 0.82<br>(0.87) | 3 | 1.00<br>(0.00) |
| Legal aid for civil law litigation | 3 | 1.67<br>(0.58) | 2 | 1.00<br>(0.00) |
| Support group | 2 | 1.50<br>(0.71) | 4 | 0.75<br>(0.50) |

Source: Household survey E11; MFS II Evaluation Indonesia
Notes: Standard deviations given in parentheses. Response range is from -2 to +2.

Finally, respondents were asked whether the services of Rifka Annisa made them feel more emotionally stable and less stressed. Respondents also generally agreed with this statement. However, less so at the endline, which is probably because other factors played a larger role in their lives.

**Table 14: Rifka Annisa services used and service satisfaction**

| Variable | Total sample | |
|---|---|---|
| Period | 2012 | 2014 |
| Sample size | 18 | 18 |
| Feel more emotionally stable and less stressed due to services of Rifka Annisa (scale from -2 to +2) | 1.00 (0.69) | 0.78 (0.43) |

Notes: Standard deviations given in parentheses.

# 10. Evaluation question 4: Efficiency of project

This subsection addresses evaluation question 4: Were the development interventions of the Southern partner organisations efficient?

Unfortunately, we are not able to evaluate neither the efficiency nor the effectiveness of the project. Therefore, in this section we put forward our arguments for failing to evaluate the question on efficiency. However, first, the available cost information for the Rifka Annisa project is discussed below.

## 10.1. Project costs

To collect information on the costs of the project, we conducted a structured interview with the programme manager and the financial coordinator[31] of Rifka Annisa on 10 December 2013 using the 'budget survey' as described in section 5.1. In addition, we consulted the 2011 and 2012 expenditure report of Rifka Annisa to Rutgers WPF. Hence, the cost figures are based on actual expenditure data.

As discussed in section 3, the project was terminated at the end of 2012 before the planned end date of the project because Rutgers WPF had decided to allocate funding from a different source for the project (but leaving the project objectives unchanged). This was possible because Rutgers WPF signs yearly contracts with its partners despite agreeing to a multi-annual commitment with the SPOs. Every year the projects are evaluated and new objectives are set for the following year.

Table 15 summarizes the costs of the Rifka Annisa project for 2011 and 2012. We have included information on 2011 for two reasons: firstly, funding in 2011 was already from MFS II funds; and secondly, the project costs can be compared between 2011 and 2012 to see whether the costs in 2012 were typical.

The second column of Table 15 reports the total expenditure of Rifka Annisa covered by all funding sources for the indicated year. The third column presents the funding from Rutgers WPF, for the given

[31] The interview was conducted with Rina Eko Widarsih, programme manager, and Siti Amaroh, financial coordinator.

period, in Indonesian rupiahs and the forth in euros. In turn, the fifth column shows the share of funding from the MFS II project to the total expenditure of Rifka Annisa. The sixth column reports on the number of beneficiaries in the given period. However, in the seventh column the cost per beneficiary is not reported, as it is not sensible to calculate this indicator using the available data as will be argued in the next section.

The table shows that less than 5% of the total expenditures of Rifka Annisa is funded by Rutgers WPF (MFS II).

**Table 15: Overview of the costs and number of beneficiaries**

| Year | Total costs of SPO [IDR][1] | Total costs funded by CFA [IDR] | Total costs funded by CFA [EUR, current prices][2] | Percentage of costs funded by CFA (through MFS II) | Number of beneficiaries[3] | Cost per beneficiary per year [Int$ 2011][4] |
|---|---|---|---|---|---|---|
| 2011 | 3,706,776,254 | 162,599,985 | 13,258.32 | 4.4% | 347 | N.A. |
| 2012 | 6,389,176,000 | 143,800,000 | 11,896.88 | 2.3% | 270 | N.A. |

Sources: Expenditure report of Rifka Annisa to Rutgers WPF (if not stated otherwise).
Notes:
1. Source: Budget Survey 2013.
2. Annual average exchange rate is used. Data is obtained from http://www.oanda.com/currency/historical-rates/
3. Source: Annual Report of Rifka Annisa.
4. N.A. = not applicable

In addition, Table 16 investigates the composition of the project budget funded by Rutgers WPF. We observe that in 2011 33% of the Rutgers WPF budget was allocated to cover costs of counselling services (excluding an additional 9.2% spent on shelter facilities), and an additional 10.8% was allocated towards the development of counselling tools and paralegal training. Hence, a substantial part of the budget was allocated to covering the costs of counselling and improving the quality of counselling services, while the remaining funds were used for covering staff and office costs.

Compared to 2011, the structure of the Rutgers WPF budget changed in 2012: the funds allocated to covering the costs of counselling decreased to 15%, however, the amount dedicated to improving the quality of counselling services (database of cases, formulation of counselling manual and tools for quality services) increased to 44%. Hence, the focus of the project has shifted from supporting the costs of counselling to capacity building of Rifka Annisa in order to improve service quality.

**Table 16: Share of counselling and paralegal training in the project budget**

| Year | Provision for counselling of SGBV victims and perpetrators | | Counselling tool development for victims and perpetrators of SGBV | | Paralegal training [IDR] | |
|---|---|---|---|---|---|---|
| | Int$ (2011)[1] | %[2] | Int$ (2011)[1] | %[2] | Int$ (2011)[1] | %[2] |
| 2011 | 14,873.09 | 33.0% | 3,382.72 | 7.5% | 1,508.36 | 3.3% |
| 2012 | 5,926.23 | 15.0% | 17,393.69 | 44.0% | - | 0.0% |

Source: Expenditure report of Rifka Annisa to Rutgers WPF

Notes:

1. PPP conversion factor to 2011 international dollars is calculated using the World Development Indicators: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#
2. Percent of total expenditure funded by Rutgers WPF.

However, we are unable to relate these expenditure components to the overall budget of Rifka Annisa because we lack information on the expenditure structure of the total expenditures of Rifka Annisa. Therefore, we also do not know the share of Rutgers WPF funding in the overall expenditures on these project items.

## 10.2. Assessment

There are a number of factors that complicate the calculation of cost per beneficiary. Firstly, the majority of costs of Rifka Annisa related to counselling of victims and perpetrators of SGBV are fixed – at least in the medium term (like staff costs). As a consequence, if in a given period more clients turn for support to Rifka Annisa, the cost per beneficiary decreases. However, as the nature of service provision, the number of clients (to some extent) is an external factor to Rifka Annisa. In addition, the availability of the counselling service is valuable in itself.

Secondly, a high number of beneficiaries may show a large turn-over of clients. In fact, the results of the Before-After survey showed us that the majority of the clients did not return to Rifka Annisa within the 6 months of the survey period. Hence, it would be more informative to look at the cost per counselling hour. However, unfortunately, we do not have information about the number of counselling hours at Rifka Annisa in a given year.[32]

Thirdly, we lack information about the total costs associated with counselling. We can only calculate the counselling cost per beneficiary funded by Rutgers WPF, which amounts to 42.86 Int$ in 2011 and 21.95 Int$ in 2012 at 2011 prices (taking only the provision for counselling services into account and excluding general office costs). However, this may not be the total amount spent on counselling.

[32] Assuming no idle time, it would be possible to calculate the cost per hour based on the wages to the counsellors and the costs associated with the space used for counselling and communication costs. However, we do not attempt to do such a calculation.

Fourthly, expenditure spent on improving the quality of counselling services is a capacity building of Rifka Annisa, from which future clients benefit. Therefore, it is difficult to take this item into account when calculating the costs per beneficiary.

Taking the above concerns into account, providing a reliable (and sensible) estimate of the cost per beneficiary for the Rifka Annisa project goes beyond the scope of this evaluation. Therefore, we refrain from going further in answering evaluation question 4 than the information on project costs provided in section 10.1.

## 11. Contribution of Capacity Development and Civil Society

The Rifka Annisa project has also been selected for the Capacity Development component of the MFS II Evaluation. Regarding the contribution of the capacity development of Rutgers WPF and One Vision Alliance to Rifka Annisa during the implementation of the project, MFS II funding was used to develop monitoring and evaluation tools of Rifka Annisa in 2012. As reported in the capacity development endline report, this contributed to a small improvement in Rifka Annisa's capacity to adapt and self-renew. During the evaluation period, several other factors contributed to improving Rifka Annisa's capability to act and commit and other capabilities. The most important internal factors are a more responsive leadership and greater motivation and skills of staff, while an important external factor is the stronger partnership with local authorities.

However, these developments did not affect the MDG evaluation, as the surveyed project beneficiaries have mostly used the services of Rifka Annisa prior to the evaluation period. In addition, during the before-after client surveys (Sept 2013 – February 2014) we found that the monitoring and evaluation tools of Rifka Annisa were not yet always working sufficiently.[33]

## 12. Conclusion

Rifka Annisa provides counselling and legal aid services to victims of SGBV. Despite finding limited measureable impact for the project, the lives of the respondents have improved as they feel free and relieved from their abusive husband after the divorce. Only three of the respondents try to normalize their lives with their husband.

Many respondents find support in their family and friends. However, their main motivation to remain positive is due to the fact that they want to provide a bright future for the children. Respondents with small children and without additional family support to take care of the children find it hard to manage to work and take care of the children at the same time. One respondent found a solution by starting an online business. However, more women would benefit from trainings on entrepreneurship and economic activities that they can do from home (an example would be the *kanzashi* brooches made by beneficiaries of the GREEN project (E5 in this evaluation)).

In addition, when asking respondents why they stopped visiting Rifka Annisa, many respondents indicated that they did not have the time and Rifka Annisa was far away from their home. There was

[33] Counsellors often forgot to administer the survey with the clients.

only one respondent that wanted to attend counselling after the divorced was finalized. Many respondents (13) were also not aware of the support group. Given the busy schedule of the respondents and the fact that many of them still struggle to overcome the emotional burden of the experiences of abuse, we encourage Rifka Annisa to develop and extend counselling tools that can be used remotely, such as counselling by phone, message based counselling (SMS or chat) and booklets.

The reviewed literature showed that counselling and support group activities can help to emotionally strengthen survivors and improve a number of skills and characteristics, like self-esteem, assertiveness and coping abilities. As opposed to the literature, most of the observed impact for Rifka Annisa was attributed to a woman's divorce instead of Rifka Annisa's counselling or support group activities. However, the reported findings for Rifka Annisa are difficult to compare with the findings in the literature review since these are based on women who joined the activities, while in our study only 6 out of 18 respondents had contact with Rifka Annisa during the study period and only 4 women joined the support group activities. In addition, the literature is not conclusive on whether counselling and support group activities actually result in changing the abusive situation; for Rifka Annisa we observe a decrease in exposure to abuse, but again this impact is attributed mostly to divorce.

Finally, the MFS synthesis team asked to score each project along a few indicators. Table 17 displays the indicators and the scores we deemed valid for the project.

**Table 17: Overall project scoring**

| Statement | Score | Remarks |
|---|---|---|
| **1. The project was well designed** | 8 | Rifka Annisa has a complex and well-designed strategy to achieve its objectives. The funding from the CFA provides continuous support to implement activities of the SPO. |
| **2. The project was implemented as designed** | 8 | The project budget was used for the pre-specified activities. |
| **3. The project reached all its objectives** | 8 | Objectives were set as the number of served clients. These outcomes depend on the demand for services. Rifka Annisa assisted all clients that turned her for help. |
| **4. The observed results are attributable to the project interventions** | 4 | Other factors such as family, friends and work play a more important role in the outcomes. However, this is not the shortcoming of Rifka Annisa's activities but the nature of the service. |
| **5. The observed results are relevant to the project beneficiaries** | 10 | Women want to be free of abuse. |
| **6. The project was implemented in the most efficient way** | N.A. | We did not evaluate efficiency of the project due to reasons mentioned in section 10.2. |

Notes: Scores are on a scale of 1 to 10, with 1 being "no agreement at all" and 10 being "completely agree with statement".

# Annex I. SPO and project description

Rifka Annisa, meaning "Friends of Women", was founded in 1993 and is based in Yogyakarta. Rifka Annisa was initiated by Suwarni Angesti Rahayu, Sri Kusyuniati, Latifah Iskandar, Desti Murdijana and Sitoresmi Prabuningrat. Initially Rifka Annisa operated solely as a crisis and counselling centre. [34] In 1995, Rifka Annisa started to broaden her activities and increasing their influence in the community by for example writing for a column in a local newspaper. Rifka Annisa also developed the unique perspective that man should be included in their programmes, which was very uncommon practice at that time in Indonesia. In 1997, to decrease the gap between government institution and NGOs working in the field of SGBV, Rifka Annisa started to collaborate with regional police (women's and children protection division) and hospitals (victim services). The collaboration aimed to detect earlier and provide adequate services on different levels (medical care, legal aid and counselling). In the same year, Rifka Annisa developed a family approach for their counselling services whereby the husband and possibly the children are included in the counselling sessions. In the following years, Rifka Annisa continued to develop their network with community and governmental organisations which leads to the implementation of an integrated service mechanism for female victims of SGBV by the local government in the Yogyakarta region in 2005. Because of their effective programmes and community influence it becomes easier for Rifka Annisa to attract funds and thus the organisation and their activities can expand.

**Vision:**
The vision of Rifka Annisa is "to realise a gender just society that does not tolerate violence against women through the principles of social justice, consciousness and awareness, independence, integrity and preserve local wisdom."

**Mission:**
The mission of Rifka Annisa is "to organise women in particular and society in general to eliminate violence against women and creating gender equitable society through the empowerment of women victims of violence, including children, elderly, Lesbians, Gays, Bisexuals, Transgender and other, and increase public awareness and involvement through education and strengthening critical network."

**Strategies:**
Rifka Annisa provides services to victims of GBV through (initiation of community-based) crisis centres, counselling to both victims and perpetrators (male groups) legal assistance and women support groups. In addition, Rifka Annisa aims to develop a strong network of health care providers, police and legal aid organisations and to improve the capacity of their partners by providing for example training programmes. At the same time Rifka Annisa is strongly advocating against violence and especially violence against women through the media (film production, photo exhibition etc.). They also aim to influence local government to implement gender responsive policies. [35]

# Annex II. Overview outcome indicators and indices

This annex provides a detailed description about the used outcome indicators. In addition, it shows the variables which were used to construct the outcome indicator indices.

Outcomes are reported for the total sample (n=18), for women who had used the services of Rifka Annisa since the baseline (n=6) and for women who were not divorced at the baseline (n=7). Panel A, B, C and D provide the outcomes for the baseline (2012) and the endline (2014) with the changes between the endline and the baseline. These changes show the absolute difference in the outcomes. The outcomes for the rights of wife index were only available for the baseline and the endline.

### *Women's empowerment (attitude towards themselves)*

The following indices are constructed with statements for which the women reported their level of agreement on a scale from -2 to +2, where -2 means 'strongly disagree', -1 means 'disagree', 0 means 'neither agree nor disagree', 1 means 'agree' and 2 means 'strongly agree'. The indices show the average level of agreement over the included statements. A higher value of the index shows more positive feelings. Sometimes agreement with a statement indicates negative feelings. Therefore, the scale for these statements were reversed, so that -2 means 'strongly agree' and +2 means 'strongly disagree'. That way, those statements can be used in the average. They are indicated by '(negative)'.

- *Self-efficacy index*: the following statements are included:
  - On the whole, I'm able to take charge of my life
  - I make commitments not to think of myself as worthless
- *Self-esteem index:* the following statements are included:
  - I feel I do not have much to be proud of (negative)
  - I take a positive attitude towards myself
  - I wish I could have more respect for myself (negative)
  - On the whole, I am satisfied with myself
- *Control index:* the following statement are included:
  - It is not always wise to plan far ahead because many things are a matter of good or bad fortune (negative)
  - Often I feel that I have little influence over the things that happen to me (negative)
- *Dependency:* level of agreement on a scale from -2 to +2 with 'my dependence on my partner makes me feel disappointed in myself' (negative)
- *Support:* level of agreement on a scale from -2 to +2 with 'I have someone who listens when I need to talk about my problems'

In addition, the Survivor Coping Index based on Bennett et al (2004) was measured at the endline. It consists of 8 questions that can be divided into sub-components:

- *Support*
  - I have someone I can turn to for helpful advice about my problem
  - I have someone who would help me in critical situation
- *Self-efficacy*
  - I trust my ability to solve difficult problems

- *Decision making*
    - I am confident about the decisions that I make
- *Control*
    - I feel like I'm in control of my own life
- *Coping skills*
    - I have ways to help myself when I feel troubled
    - I know the abuse was not my fault
    - I am able to talk about my thoughts and feelings about the assault/abuse

All the questions are phrased in a positive way, and the scoring goes from 1 'Never' to 5 'Always'. The responses to the questions should be added up and divided by 8. Then, the score for the Survivor Coping Index is in the range of (1-5).[36] The indicators and indices for the sub-components the average of the questions in reported for each group.[37] Hence, the scaling is from 1 to 5 in each case. The reporting format is the same as for the indices of psychological distress.

### *Empowerment in marriage*

- *Rights of wife index*: this index is constructed with 9 statements for which the women had to indicate whether they agreed or disagreed. If the statement indicates that the woman has little rights (indicated with '(negative)'), disagreement is given the value 1 and agreement the value 0. This is the other way around if the statement indicates many rights for the woman. The rights of wife index gives the mean number of statements per woman with which the women agreed. So, a higher value of the index indicates that the women think they have more rights. The following statements are included in the index:
    - A good wife obeys her husband even if she disagrees (negative)
    - A woman should be able to choose her own friends even if her husband disapproves
    - Family problems should only be discussed with people in the family (negative)
    - If a man mistreats his wife, others outside of the family should intervene
    - It is important for a man to show his wife who is the boss (negative)
    - A woman should be allowed to have a full or part-time job outside the household even if her husband disapproves
    - A husband has the right to know where his wife is at all times (negative)
    - After finishing her housework, a wife should be allowed to participate in social activities in the community
    - It's a wife's obligation to have sex with her husband even if she doesn't feel like it (negative)
- *Any good reason for a husband to hit his wife*: reports on the number of women who indicated that at least one of the following reasons authorizes the husband to hit his wife:
    - She goes out without telling him
    - She neglects the children
    - She argues with him
    - She burns the food

[36] In the USA Bennett et al (2004) finds a mean of 3.89 with standard deviation 0.75.
[37] The index for Support is divided by 2 and the index for Coping skills is divided by 3.

  - She disobeys him
  - She refuses to have sexual intercourse with him
- *Number of good reasons for a husband to hit his wife*: shows the mean number of the above mentioned reasons that the women agreed with
- *Any occasion a wife can refuse to have sex*: reports on the number of women who indicated that at least one of the following occasions authorizes the wife to refuse to have sex:
  - She feels sick or tired
  - If he slept with another woman
  - She doesn't want to have sex
- *Number of occasions a wife can refuse to have sex:* shows the mean number of the above mentioned occasions that the women agreed with.

### *Number of women free of domestic violence*

- Abused by husband/partner in the past 12 months
  - *Any abuse*: reports on the number of women who had experienced either physical, psychological or sexual abuse in the past 12 months
  - *Physical*: reports on the number of women who had experienced psychological abuse in the past 12 months
  - *Psychological*: reports on the number of women who had experienced physical abuse in the past 12 months
  - *Sexual*: reports on the number of women who had experienced sexual abuse in the past 12 months
- Number of types of abuse by husband/partner: shows the mean number of types of abuse (physical, psychological and sexual) by husband/partner per woman

### *Psychological health of women*

For these tables, the women had to indicate on a scale from 1 to 5, where 1 is not at all and 5 is all the time, how often they felt in the ways described in the tables in the past month. If the described feeling was positive, the woman experienced a negative feeling if she indicated 1 or 2. This was made into a dummy, where 1 indicates negative feelings if the woman indicated 1 or 2 and 0 indicates positive feelings if she indicated 3, 4 or 5. This was the other way around if the described feeling was negative. Then the dummy is 0 if the woman indicated 1 or 2 and 1 if she indicated 3, 4 or 5. This means that a higher value of the indicators shows more negative feelings. The questions that described a positive feeling, for which the scale has been reversed to let a higher value indicate a more negative feeling, are indicated below with '(positive)'.

- *Psychological distress index*: mean of the number of components per woman that were applicable to the women. This is on a scale from 0 to 12, since there are 12 components in this index. The more components applicable to a women, the more psychological distress she had experienced. It also is the sum of the social dysfunction index, the anxiety index and the losing confidence in yourself index.
- *Social dysfunction index*: it is the sum of the 6 components reported below the index, which shows the mean of the number of those components per woman that were applicable to the women. The method described above was applied to the following 6 components, which show the fraction (between 0 and 1) of the women who experienced this feeling:

  - Played a useful part in things (positive)
  - Able to concentrate in everything (positive)
  - Feeling capable of making decisions (positive)
  - Enjoying normal day-to-day activities (positive)
  - Able to face up emotional problems (positive)
  - Feeling reasonably happy in general (positive)
- *Anxiety index*: it is the sum of the 4 components reported below the index, which shows the mean of the number of those components per woman that were applicable to the women. The method described above was applied to the following 4 components, which show the fraction (between 0 and 1) of the women who experienced this feeling:
  - Lost much sleep over worry
  - Felt under strain
  - Could not overcome emotional problems
  - Thought of yourself as a worthless person
- *Losing confidence in yourself index*: it is the sum of the 2 components reported below the index, which shows the mean of the number of those components per woman that were applicable to the women. The method described above was applied to the following 2 components, which show the fraction (between 0 and 1) of the women who experienced this feeling:
  - Felt depressed
  - Losing confidence in yourself

# Annex VII. Report on the results of the Rifka Annisa client survey

## 1. Introduction

This study is a cooperation between Survey Meter/AIID (Amsterdam Institute for International Development) and Rifka Annisa (RA). Survey Meter and AIID are contracted by NWO-WOTRO (Netherlands Organisation for Scientific Research – WOTRO Science for Global Development) to carry out external evaluation of selected organisations that receive MFS II funding. Rifka Annisa benefits from MFS II through its funding from Rutgers WPF (Aliansi Satu Visi). NOW-WOTRO selected Rifka Annisa to be part of the MFS II evaluation at two levels: evaluation of the impact on direct beneficiaries and evaluation of the capacity development of Rifka Annisa by Rutgers WPF.

Rifka Annisa has a focus on victims of Sexual and Gender Based Violence (such as rape, sexual harassment, domestic violence etc.). The organisation is based in Yogyakarta; the area of Yogyakarta is also their target area for the programme. The main objective of Rifka Annisa is providing counselling and legal assistance to victims of Sexual and Gender Based Violence. The aim of counselling is to overcome the trauma and to improve the awareness, independency, and honour of (female) victims.

The motivation for this study was to assess the impact of Rifka Annisa on its clients. Given that the original evaluation design could not be implemented as intended, AIID wanted to develop another survey instrument that could better assess the effectiveness of the services of Rifka Annisa in terms of psychological well-being, coping skills, and empowerment of Rifka Annisa clients. Hence, a new client-based survey was developed that could be self-administered by the clients after their first and third visits to RA. However, due to the small number of clients who returned to Rifka Annisa for a third session, the analysis of the data has been adjusted. Instead of focusing on impacts, we analyse differences in outcomes for women who had different reasons for contacting Rifka Annisa. In addition, self-reported impacts are described.

## 2. Methodology

The client survey focused on women who turned to Rifka Annisa because of domestic abuse. Hence, from the sample we excluded women who were victims of dating violence and rape. Of all the women that visited Rifka Annisa during the time of the study, 90 percent was a victim of domestic violence and only 7 percent was a victim of dating violence. The remaining 3 percent were a rape case and a case of child molestation.

There were two surveys: one for when the women visit Rifka Annisa for the first time (before survey), and one for when they visit for the third time (after survey). Clients visiting Rifka Annisa between September 2013 and March 2014 were asked to participate in the survey. The before survey was kept short, because talking about the abuse might have been too hard for them since it was their first visit to RA. We also wanted to keep the amount of time spend on the questionnaire short. The surveys focused on the following impact areas:

1. Coping/empowerment of victims/survivors
2. Psychological health of victims/survivors

3. Behaviour change from victim to survivor
4. Satisfaction with the services of Rifka Annisa

The coping/empowerment of victims/survivors is measured by the Survivor Coping Index proposed by Bennett et al (2004) and the mental health of victims/survivors is measured by a shortened version of the General Health Questionnaire (GHQ). The method for measuring behaviour change was designed together with RA. Based on ten questions, it is assessed in which stages of behaviour change the women are, which are denial, contemplation, preparation for action, action and maintenance.

In addition to these questions, the after survey also included and extended section on psychological well-being, service satisfaction and background information about the respondents including the type of abuse experienced.

Although the surveys were self-administered, a counsellor could help the respondents with filling out the survey. Still, this was the case for only 12 percent of the respondents. For the satisfaction with the services of Rifka Annisa it is important to get the honest opinion of the respondents, so these questions were filled out by the respondents in private.

Both surveys focused on the situation of the respondent during the past month in terms of general health and their attitude towards themselves. Because the women already benefitted from the services of Rifka Annisa after their third visit, it is expected to see an impact in the outcomes from the after survey.

We show the outcomes for the total sample of women who did before survey and for returning women who did both the before and the after survey.

When assessing the results, it should be taken into account that the women might tend to report the middle or neutral outcomes for reasons such as social norms.

## 2.1. Sampling outcome

In total, 51 women were interviewed right after their first visit. Not all women who came to Rifka Annisa were interviewed after their first visit. At the point where 76 target women had visited RA, only 46 had been interviewed. The main reason for this is the counsellor's negligence (in 6 cases), but clients also refused (3 cases) or had no time (3 cases) or their psychological condition did not allow for it (in 2 cases). However, most of the reasons are unknown (in 16 cases).

Unfortunately, of the women who were interviewed after their first visit, only 3 came back for the third time. This is unexpected, since 50 of the 51 women said that they wished to continue making use of the service of Rifka Annisa. Of the three returning women, one only went for psychological counselling, while the other two received information about the divorce law and help with a court case or legal process. When receiving help with a legal process or court case, legal documents have to be prepared, which takes time. So, coming back to Rifka Annisa a couple of times seems reasonable in that case. However, other women who received legal help only came for one visit. Also psychological counselling would be most effective when repeated several times. To find out why most women did not return to RA, they were called. Of the 30[38] women called in April 2014, 9 women answered the question and one woman refused to talk. The rest could not be contacted because the mobile phone number did not work

[38] We had no contact information for the other women

or no one answered the phone. Of the 9 women, two women were pregnant, but did call with their counsellor a couple of times, two were busy with work, one with school and one with a baby and three answered that they were planning on going in the near future. It seems that most of the women are too busy to come to RA, but whether they gave honest answers is always doubtful. In addition, these women remained with their husbands.

## 3. Characteristics of respondents

The average age of the women is 34 (n=45) and almost all of them attended at least high school (including secondary schools 95.6%). 20 percent has a college degree and 28.9 percent are university graduates (n=45). This information is obtained from RA.

From the surveys we found that the main motives of the women to go to Rifka Annisa were receiving information about the divorce law (56.9%) and psychological counselling (47.1%) (see Table 46). Other motives were receiving counselling on how to improve household conditions/relationship with spouses (35.3%), information about rights (27.5%) and help with a court case/legal process (25.5%).

In order to profile the sample, we split it to see the outcomes separately for women who only came for counselling, women who only came for legal help and for women who came for a combination of those. This grouping is based on the findings in Table 46, where high percentages are seen for counselling and receiving information about rights or the divorce law. The 'only counselling' group consists of 17 women who came for psychological counselling, counselling on how to improve household conditions/relationship with spouse or a combination of those. 15 women who came for information about rights or the divorce law, for help with reporting a case to the police or with a court case/legal process or a combination of these reasons are included in the 'only legal help' group. The other 19 women who came for a combination of counselling and legal help are reported on in the 'mixed' group. We expect the situation of the 'only counselling' group to be better than the situations of the other groups, since they do not have the intention to divorce.

**Table 46: Purpose of visit**

| | **Sample**<br>Purpose of visit | **Total**<br>% Agree | **Returning**<br>% Agree |
|---|---|---|---|
| A | Psychological counselling | 47.1 | 33.3 |
| B | Counselling on how to improve household conditions/relationship with spouse | 35.3 | 0.0 |
| C | Male counselling | 0.0 | 0.0 |
| D | Information about rights | 27.5 | 0.0 |
| E | Information about divorce law | 56.9 | 66.7 |
| F | Help with reporting case to the police | 7.8 | 0.0 |
| G | Help with court case/legal process | 25.5 | 33.3 |
| H | Need a safe place to stay | 0.0 | 0.0 |
| i | Other | 0.0 | 0.0 |
| | Sample size<br>Source: Rifka Annisa client survey | 51.0 | 3.0 |

Unfortunately, we do not what type of abuse (psychological, physical, economical and/or sexual) the women experienced, since this was only asked in the after survey. Information provided by Rifka Annisa does describe the type of abuse for nine women. None of them indicated that they had experienced sexual violence, while most of them had experienced psychological violence (8 out of 9).Only two had experienced physical violence and six had experienced economical abuse. However, these numbers are not generalizable.

It is interesting to look at the sources of referral to Rifka Annisa for the separate subsamples, which are shown in Table 47. We clearly see that most of the women heard from Rifka Annisa through the people around them or through the media. Only women who were looking for legal help alone or in combination with counselling heard from Rifka Annisa through public or private court, which could be expected. Another interesting finding is that none of the women heard from Rifka Annisa through religious leaders or religion affair offices.

**Table 47: Sources of referral to Rifka Annisa**

| Percentage of women referred to Rifka Annisa by […] | Only counselling | Only legal help | Mixed |
|---|---|---|---|
| Friends/neighbours | 41.2 | 40.0 | 63.2 |

## 4. Results

This chapter describes the results for the Survivor Coping Index, general health, behaviour change and self-reported impacts. For these, outcomes are reported for the women who filled out the before survey, which is the total sample, and for the three returning respondents who filled out both the before and the after survey. Due to the small sample size, we are not able to report on the significance of change for the latter group. Additionally, the outcomes are shown in a separate table for the subsamples according to their reasons for visiting Rifka Annisa for the first time.

## 4.1. Survivor Coping Index

The Survivor Coping Index is proposed by Bennett et al (2004) and consists of 8 questions that can be divided into sub-components: support, self-efficacy, decision making, control and coping skills. The Survivor Coping Index is shown in Table 48 together with the questions and sub-components. Questions a and b form the sub-component assessing the support around the respondent. Self-efficacy or the woman's believe in her own ability to complete tasks and reach goals is captured with question c. Question d is meant to assess the belief of the respondent in her decision making ability and question e represents the sub-component of control, meaning to assess the feeling of control the respondent has over her own life. The last three questions are taken together in the coping skills sub-component, assessing the coping skills of the respondent with respect to the domestic violence. All the questions together then form the Survivor Coping Index.

The respondents were asked if they never, rarely, sometimes, often or always feel in the described way. The mean and the percentage of the (sub)sample that at least often feels in that way[39] are reported. Calculating the mean, never is seen as 1 and always as 5. The percentage that at least often feel in the described way is the percentage of the (sub)sample that answered often or always. Since the statements are phrased in a positive way, a higher mean or percentage indicates better outcomes. For the indices, the percentage that at least often feels in the described way shows the percentage of women for whom the average of the statements was 4 or higher.

[39] This percentage is group reported because the average could be misleading if some women do better while others do worse.

**Table 48: Question 1 Survivor coping index**

| *Sample (survey)* | Total (before survey) | | Returning (before survey) | | Returning (after survey) | |
|---|---|---|---|---|---|---|
| *How often were the following statements true for you in the past one month?* | Mean (1-5) | % at least often feels that way | Mean (1-5) | % at least often feels that way | Mean (1-5) | % at least often feels that way |
| a. I have someone I can turn to for helpful advice about my problem | 3.1 | 39.2 | 4.0 | 66.7 | 4.0 | 66.7 |
| b. I have someone who would help me in a critical situation. | 3.0 | 35.3 | 4.0 | 66.7 | 4.0 | 66.7 |
| c. I trust my ability to solve difficult problems | 3.2 | 35.3 | 3.7 | 33.3 | 3.7 | 33.3 |
| d. I am confident about the decisions that I make | 3.8 | 64.7 | 3.7 | 33.3 | 4.0 | 66.7 |
| e. I feel like I'm in control of my own life | 3.7 | 62.7 | 3.7 | 33.3 | 3.3 | 66.7 |
| f. I have ways to help myself when I feel troubled | 3.2 | 33.3 | 3.7 | 33.3 | 3.7 | 33.3 |
| g. I know the abuse was not my fault | 3.5 | 46.0 | 4.3 | 100.0 | 4.3 | 100.0 |
| h. I am able to talk about my thoughts and feelings about the assault/abuse | 3.7 | 56.0 | 3.0 | 33.3 | 4.0 | 66.7 |
| **Support** (average of a, b) | 3.0 | 33.3 | 4.0 | 66.7 | 4.0 | 66.7 |
| **Coping skill** (average of f, g, h) | 3.5 | 33.3 | 3.7 | 33.3 | 4.0 | 66.7 |
| **Survivor coping index** (average of a-h) | 3.4 | 21.6 | 3.8 | 33.3 | 3.9 | 33.3 |
| Sample size | **51.0** | | **3.0** | | **3.0** | |
| Source: Rifka Annisa client survey | | | | | | |

The means of the indices for the returning group (between 3.8 and 4), in both the before survey and the after survey, are higher than that the means of the total sample (between 3 and 3.5). We see increases in feeling confident about decisions and in being able to talk about thoughts and feelings about the assault/abuse, resulting in increases in the coping skill (from 3.7 to 4.0) and in the survivor coping index (from 3.8 to 3.9). While at the after survey there was one more woman who at least often felt that she was in control of her life, the mean decreased from 3.7 to 3.3. This is due to one woman indicating that she never feels in control of her own life, which is the only negative development we see.

Table 49 presents the same outcome indicators for the subsamples according to their reason for visiting. Column 5, 8 and 9 report on p-values to indicate the significance of differences in means between the groups. The columns that are compared are shown between brackets.

**Table 49: Question 1 Survivor coping index (split sample)**

| Column | (1) | (2) | (3) | (4) | (5) | (6) | (7) | (8) | (9) |

Source: Rifka Annisa client survey

When comparing the groups in order to profile the sample we do see differences. The 'only counselling' group feels significantly less confident about decisions compared to the other groups ($p<0.05$) and they know that the abuse was not their fault significantly fewer times than the mixed group. In addition, the 'only legal' group feels significantly more in control of their own lives, reflecting the consideration of divorce. There is an almost significant difference in the means of the coping skill index between the 'only counselling' group and the 'only legal' group. Women who want information and help with a divorce indicate that they cannot handle their relationship anymore, suggesting low coping skills. That those women have a higher coping skill index than women that come for counselling seems counterintuitive.

When looking at the separate indicators in the coping skill index, we see that this difference is mainly driven by knowing that the abuse was not their fault.

Although not significant, women who come for legal help feel less like they have someone they can turn to for helpful advice about their problem, which might be because they want legal advice. People around them are not likely to know about. This also causes the low support index for women who only come for legal help.

## 4.2. General Health

Table 50 shows a shortened version of the General Health Questionnaire (GHQ), which usually consists of 12 components. This method was chosen because some sensitive questions could make the respondent emotional and we wanted to keep the survey as short as possible. The full GHQ is asked in the second survey, but as mentioned before, only three women came for a third visit. The five statements asked were previously validated to have high predictive power for the original survey measuring psychological well-being of respondents. For these five statements, the respondents could answer that they never (1), rarely (2), sometimes (3), often (4) or always (5) feel like that. This way of measuring the GHQ is different from the original, but because we wanted to compare the indicators over time, this method seemed to be more compatible. For each statement, the mean is reported and the percentage of women who answered one of the most desirable 2 or 3 answers. Since losing sleep over excessive worry, feeling constantly under strain and feeling unhappy and depressed are phrased in a negative way, the top 2 responses for these are never and rarely and the top 3 also includes sometimes. Because being able to enjoy normal day to day activities and feeling reasonably happy are phrased positively, the top 2 responses for those are often and always, and the top 3 includes sometimes. For the returning group only the percentage of women that answered one of the three best responses. This is done because almost none of those 3 women answered the top 2 responses. For both the percentage outcomes as the mean, after reversing the scale for negatively phrased statements, a higher value indicates a more desirable outcome. The GHQ-5 index shows the mean number of questions (a to e) that the women answered with the top 2 or 3 responses. This could be between 0 and 5 statements. Also here, a higher outcome is more desirable.

**Table 50: Question 2 General health**

| Sample (survey) | | Total (before survey) | | Returning (before survey) | | Returning (after survey) | |
|---|---|---|---|---|---|---|---|
| *How often have you felt in the following ways in the past one month?* | Mean (1-5) | % Good health outcome (top 2) | % Good health outcome (top 3) | Mean (1-5) | % Good health outcome (top 3) | Mean (1-5) | % Good health outcome (top 3) |
| **a.** Lost much sleep over excessive worry | 2.5 | 7.8 | 43.1 | 2.3 | 33.3 | 3.3 | 66.7 |
| **b.** Felt constantly under strain | 2.1 | 7.8 | 29.4 | 1.7 | 0.0 | 3.0 | 66.7 |
| **c.** Been able to enjoy your normal day to day activities | 3.3 | 32.0 | 76.0 | 3.0 | 100.0 | 4.0 | 100.0 |
| **d.** Been feeling unhappy and depressed | 2.2 | 3.9 | 29.4 | 2.0 | 0.0 | 3.3 | 66.7 |
| **e.** Been feeling reasonably happy, all things considered | 2.6 | 7.8 | 56.9 | 2.7 | 66.7 | 3.0 | 100.0 |
| | | Mean (top 2) | Mean (top 3) | | Mean (top 3) | | Mean (top 3) |
| **GHQ-5 index** (scale 0-5) | | 0.6 | 2.3 | | 2.0 | | 4.0 |
| Sample size | | 51.0 | | | 3.0 | | |
| Source: Rifka Annisa client survey | | | | | | | |

It is seen that few women gave the top 2 responses. The women only indicate that they have been able to enjoy their normal day to day activities (32 percent answered 'often' or 'always'). For this indicator, the mean was also the highest one (3.3, while it was 2.6 or lower for the other indicators). On average, the women answered half of the statements with the top 3 responses (GHP-5 index is 2.3).

When comparing the before and after survey outcomes of the returning group we see that all indicators improved.

Table 51 reports on the same outcome indicators for the three subsamples for the top 2 responses and Table 52 does this for the top 3 responses. The p-values are reported in the same way as in Table 49.

**Table 51: Question 2 General health (split sample; top 2 responses)**

| Column | (1) | (2) | (3) | (4) | (5) | (6) | (7) | (8) | (9) |

| Sample | | 17 | | 15 | 32 | | 19 | 36 | 34 |

Source: Rifka Annisa client survey

The only significant difference found between the groups is in being able to enjoy normal day to day activities ($p<0.05$). A significant larger percentage of the women that only came for counselling said to be able to enjoy their normal day to day activities compared to the women that only came for legal help. Considering the top 3 responses in Table 52, it can be seen that the 'only counselling' group has highest percentages of women answering the top 3 responses in all five statements. They also had the highest means. Especially the mean of being able to enjoy normal day to day activities is higher for the 'only counselling' group, however, this difference is not significant anymore. These women having the highest GHQ-5 index could explain why the women only came for counselling and not for legal help with a divorce. In Table 52, the difference in the GHQ-5 index between the 'only counselling' group and the 'only legal' group even comes close to significance ($p<0.1$).

Overall, the women were feeling unhappy, depressed and constantly under strain.

## 4.3. Behaviour change

In order to assess the level in the stages of behaviour change from victim to survivor, Table 53 shows questions asked for determining this for the total sample as well as for the women who did the second survey. (Dis)agreement with the statements determine in what stage the woman is. It is indicated in the table which statements indicate what stage. There are five stage of behavioural change. The first stage is denial, where the woman denies that she is being abused and/or she blames herself. The second stage is contemplation. In this stage, the woman knows that she is being abused, but she is not yet aware that she could control the situation. She feels like she cannot change her marriage and chooses to endure as a good wife. The third stage is preparation for action. The woman admits that she can play a role in changing her husband's behaviour and is open for help from outside. Fourth is the action stage, in which the woman is actively working on changing her situation by telling her husband how she feels and how he should behave. The last stage is maintenance. The woman is a survivor. She is out of the cycle of abuse and wants to help other women who are abused.[40] The percentages of women in the stages are provided in the table.

Since the women could choose from 'agree', 'disagree' and 'don't know', 'does not disagree' also includes women who answered 'don't know'.

[40] However, these stages do not necessarily follow one-another. The stages could rather be thought of as a cycle, where some event can trigger a relapse into a lower stage.

**Table 53: Question 3 Stages of behaviour change**

| | Sample (survey) | Total (before survey) | Returning (before survey) | Returning (after survey) |
|---|---|---|---|---|
| | Do you agree or disagree that the following statements were true for you in the past one month? | % agree | % agree | % agree |
| a. | My husband and I argue but he is not abusing me. | 46.9 | 66.7 | 33.3 |
| b. | My husband is hurting me because I am not a good wife. | 8.2 | 0.0 | 0.0 |
| c. | My husband is hurting me sometimes but I have to endure as a good wife. | 27.1 | 33.3 | 0.0 |
| d. | There is nothing to change in my marriage. | 18.4 | 0.0 | 66.7 |
| e. | I can play a role in changing my husband's behaviour. | 6.0 | 0.0 | 0.0 |
| f. | I'm open for help in mediation between me and my husband. | 60.4 | 0.0 | 33.3 |
| g. | I tell my husband how he makes me feel. | 78.0 | 66.7 | 66.7 |
| h. | I'm able to tell my husband how he should behave. | 56.0 | 33.3 | 66.7 |
| i. | I want to be involved in activities that help other women who are abused. | 90.0 | 100.0 | 100.0 |
| j. | I can prevent my husband from hurting me. | 34.7 | 33.3 | 33.3 |
| | **STAGES OF BEHAVIOUR** | % in stage | % in stage | % in stage |
| | **Stage 1: Denial** (does not disagree a and/or b) | 57.1 | 66.7 | 66.7 |
| | **Stage 2: Contemplation** (does not disagree c and d, disagrees a and b) | 4.2 | 0.0 | 0.0 |
| | **Stage 3: Preparation for action** (agrees e and f) | 6.3 | 0.0 | 0.0 |
| | **Stage 4: Action** (agrees g and h) | 52.0 | 33.3 | 66.7 |
| | **Stage 5: Maintenance** (agrees i and j) | 28.6 | 33.3 | 33.3 |
| | Sample size<br>Source: Rifka Annisa client survey | 49.0 | 3.0 | 3.0 |

These outcomes show some interesting findings.

An outstanding finding from these tables is that more than half of the sample is in the denial stage, since these women came to Rifka Annisa for help regarding the abuse by their husband. Also in the returning group, 2 out of 3 women are in the denial stage both at the before survey and the after survey. These are the two women that did not come for counselling, but for legal help.

When looking at the preparation stage, almost none of the women are in there. However, when looking at the indicators that determine being in the preparation stage, we see that 60.4 percent of the women are open for help in mediation between her and her husband, even though only 6 percent thinks that

they can play a role in changing their husband's behaviour. Of the women who returned to RA, only one woman was open for mediation at the after survey. Surprisingly, the woman that only came for psychological counselling is not open for mediation with her husband, not even after three counselling sessions.

The maintenance stage includes 28.6 percent of the women, but when looking at determinants of being in this stage we see that a much higher percentage wants to be involved in activities that help other women who are abused (90 percent). While only 34.7 percent thinks that they can prevent their husband from hurting them, there are women who think that they cannot prevent the abuse in their own situation but they are willing to help others.

52 percent of the total sample was in the action stage. However, 39 percent of these women were in the denial stage as well. This overlap in stages is unexpected. When comparing the results from the before survey with the after survey, we see positive as well as negative developments. Therefore, no general conclusion can be made here.

Table 54 reports on the same outcomes for the subsamples, again showing the p-values for differences between the groups with the compared columns between brackets. It is interesting to see that 71.4 percent of the women who came for legal help think that their husband is not abusing them. Also, none of them think that they can change their husband's behaviour and only 7.7 percent thinks that they can prevent their husband from hurting them (significantly lower than the other groups, $p<0.05$), even though quite a large percentage (35.7 percent) says that they can tell their husband how he should behave. This might indicate that the women tried to change the husband's behaviour, but that it did not work. These findings explain why these women want a divorce.

In addition, compared to both other groups, an almost significant ($p<0.1$) lower percentage of the women who came for legal help told her husband how he made her feel. This was also the case for the maintenance stage, which is mainly caused by these women thinking that they are not able to prevent their husbands from hurting them.
As expected, women who came for counselling are significantly more open for mediation between her and her husband ($p<0.05$), since 71 percent of these women came for counselling on how to improve household conditions/relationship with spouse. Although not significant, the group also has the lowest percentage of women who think that there is nothing to change in their marriage.

For looking at relations between outcomes, we regressed the stages of behaviour on the coping index and the coping index and its subcategories on the general health index using Ordinary Least Squares, controlling for the reasons to visit. However, no significant relations were found, so we will not report on this further.

Source: Rifka Annisa client survey
Notes: Because some women answered 'don't know', the sample size deviates. The number of observations are 16, 14, 30, 19, 35 and 33 instead of 17, 15, 32, 19, 36 and 34.

## 4.4. Self-reported impact

In the before survey, 50% of the women indicated that they were somewhat satisfied and the other 50% was very satisfied. In addition, 61 percentage says that they had somewhat more information about their available choices and 29 percent said that they now had a lot more information. 8 percent indicated that they had received a little information or they did not know the answer to the question. The question whether the counselling at Rifka Annisa had answered their questions was answered 'all of them' in 73 percent of the cases and 'some of them' in 25 percent of the cases. The answers to these questions were missing for one of the respondents. Concluding from this we can say that the women were satisfied with the services from RA, but there is room for improvements.

Table 55 shows the self-reported impacts by the women who returned to RA. The respondents had to indicate whether they strongly disagreed, disagreed, undecided, agreed or strongly agreed with the statements described in the table. The outcomes show the mean on a scale from -2 to +2, where -2 indicates strong disagreement and +2 indicates strong agreement.

The outcomes only show positive impacts. However, it should be noted that, due to social norms, the women tend to give positive answers.

**Table 55: Question 6 Self-reported impact**

| Because of the counselling and other services […] (scale from -2 to +2) | Returning (after survey) |
|---|---|
| a. I became more comfortable asking for help | 1.7 |
| b. I became more confident and brave | 1.3 |
| c. I'm more able to make plans for the future | 1.7 |
| d. I'm more able to make decisions for myself | 1.3 |
| e. I feel more independent | 1.3 |
| f. I'm more able to speak up to my partner | 1.3 |
| g. I'm more able to control situations when commotion occurs | 1.0 |
| h. I have more resources to call upon | 1.0 |
| i. I'm better prepared to keep myself safe | 1.7 |
| j. I'm more hopeful about my future | 1.7 |
| k. I'm more able to control my emotions | 1.0 |
| Sample<br>Source: Rifka Annisa client survey | 3 |

## 5. Conclusion

Overall, we cannot say much about the impact of the visits to Rifka Annisa on the women due to a small sample of women who returned to RA. Still, most findings suggest positive developments among the women, which they also indicate when self-reporting on the impact of the programme.

Profiling the women according to their reason for visiting, we saw that women who only came for counselling are the least confident about their decisions. However, they were the most able to enjoy their normal day to day activities. In addition, they had the highest GHQ index, explaining why they did not want a divorce.

A surprising finding is that almost half of the women deny that they are being abused, while they came to Rifka Annisa for help regarding the abuse by their husband. This denial was especially high among the women who only came for legal help. Also, almost none of the women who came for legal help think that they can prevent their husband from hurting them and they felt more in control over their lives compared to the group that only came for counselling. These findings are explanatory for the fact that these women are considering a divorce, since getting a divorce is a crucial decision.

Nevertheless, almost all of the women want to be involved in activities that help other women that are abused.

# 1. Introduction

## 1.1. Project context

Knowledge of Sexual Reproductive Health and Rights (SRHR) among Indonesian youth (15-24 years) is low. For example, only 7.5 percent of never-married women (3.1% for men) know where to obtain HIV counselling and testing services (IYARHS, 2012). At the school level, SRHR education is only included as informal subjects in the school curriculum. The subjects are normative in essence, relying on morality and deemed to bear social stigma related to sexuality, gender and HIV/AIDS issues. Teachers feel uncomfortable and may choose not to address some subjects, reducing the quality of the education.

Two opposite trends influence the attitude and social taboo on SRHR services and education: Islamisation versus liberalisation. On the one hand, due to the greater emphasis on religion in Indonesia, including part of the youth population, the social taboo on SRHR issues has grown in recent years. Public discussions on policies regarding SRHR education have been restricted for a long time. Moreover, state and religious leaders are unsupportive and stigma-laden towards SRHR services and education (Utomo & McDonald, 2008). For example, the Population and Family Development Law (No.52/2009) and the Health Law (No.36/2009) define that access to sexual and reproductive health services may only be given to legally married couples (Amnesty International, 2010, p.23). The Ministry of Education of Indonesia does offer a detailed description of sexuality education in its policy framework and it has specific education sector policies on HIV and health. However, the impact of these policies may be limited at the schools due to conservative socio-cultural norms with respect to sexuality. (Iyer et al., 2014). On the other hand, the liberalisation trend causes many young people in urban regions to become more open and liberal with respect to expressing themselves and their sexual activities. Especially the exposure of the youth to the internet and other Western media contributes to the change in attitude and behaviour towards sex and sexuality (Utomo & McDonald, 2008).

When SRHR knowledge level is low, the perceived risk of sexual activities is low, which may increase risky sexual behaviour[1] that may lead to undesirable outcomes like HIV, unintended pregnancies and illegal abortions (Amnesty International, 2010; Harding, 2008). Though, the figures about actual sexual behaviour are low among unmarried youth (15-24 years) [8.3% of the male and 0.9% of the female youth admit to have had sexual intercourse (IYARHS, 2012)[2]], an increasing number of unmarried youth is believed to have engaged in sexual activities. This is evidenced by, for example, the increasing number of sexually transmitted infections (STIs), HIV/AIDS cases, pregnancies and abortions among unmarried adolescents in Indonesia (Harding, 2008; Mepham, 2001). Moreover, while other countries in the region made progress in addressing the HIV/AIDS epidemic, the HIV/AIDS prevalence rate in Indonesia went up (UNDP, 2011).

[1] Risky sexual behaviour is commonly defined as behaviour that increases one's risk of contracting sexually transmitted infections and experiencing unintended pregnancies. They include having sex at an early age, having multiple sexual partners, having sex while under the influence of alcohol or drugs, and unprotected sexual behaviours (Centres for Disease Control and Prevention, 2010).

[2] These figures might be unreliable due to the high taboo on sexual intercourse, especially before marriage.

These trends suggest an increase in risky sexual behaviour among Indonesian youth, which is most probably caused by their little knowledge of SRHR. This underlines the importance of SRHR education in schools. To tackle the stigmatization of SRHR issues and increase the awareness of youth aged 12-18 years about risky sexual behaviour, the Non-Governmental Organisation (NGO) Yayasan Pelita Ilmu (YPI) carries out two SRHR programmes: DAKU and Dance4Life (D4L). Both programmes aim to increase the capacity of young people to make safe and informed SRHR decisions and are implemented at schools as extracurricular programmes. DAKU ('Dunia remajaku seru' or 'Lively Youth World') is a computer-based [3] Comprehensive Sexual Education (CSE) programme with 15 modules covering SRHR knowledge issues like HIV prevention, sexual abuse and other risky behaviour issues like drug prevention. The target groups are students from 15-19 years old. D4L on the other hand is an international programme. It employs dance, music and performing acts and focuses mainly on HIV/AIDS issues. The target group for D4L is broader than DAKU as it covers students from 12-19 years old.

## 1.2. Evaluation objectives

This report evaluates the two projects as part of the *Medefinancieringsstelsel* (MFS) II evaluation for Indonesia.[4] Both projects have been selected under Millennium Development Goal (MDG) 3. In particular, the current evaluation focusses on the following research questions: did DAKU and D4L enable students to make more informed decisions about their Sexual and Reproductive Health (SRH) activities? In particular, how did the knowledge, attitude and behaviour of students change as a result of the DAKU and D4L programmes?

We investigate for both programmes whether they enabled students to make more informed decisions. Since D4L mainly focused on HIV/AIDS related issues, the hypothesized improvement for students attending D4L in knowledge, attitude and behaviour concerns mainly HIV/AIDS issues.

The evaluation is set up as a panel data set evaluation that follows almost 300 students aged 14-19 years in 10 treatment and 4 control schools in Jakarta. In treatment schools both participants and non-participants in the programmes were selected. We collected quantitative data for these students using a self-assisted computer-based survey. Also, a school survey was administered together with the second data collection round. In addition, qualitative data was collected from 8 participating students after the programme implementation; and we interviewed YPI regarding the activities and costs of the YPI project to gain insight into costs of the programmes.

Five evaluation questions are answered to measure programme impact.

1) Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period?
2) Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

[3] In 2013, also a paper-based version of DAKU has been launched by Rutgers WPF and YPI is one of the implementing organisations of this programme.
[4] It follows the baseline report of this evaluation.

3) Relevance of change: What is the relevance of these changes?
4) Efficiency: Were the development interventions of the Southern partner organizations (SPO) efficient?
5) Explanations: What factors explain the findings drawn from the questions above?

## 1.3. Summary of findings

Our data shows that in the intervention schools the implementation of the DAKU and D4L programmes had already started before the baseline survey. Also, most students participating in these programmes have indicated their involvement already at the baseline phase. DAKU and D4L reached few additional participants between the baseline and endline surveys in our sample. This had implications for the evaluation design as well: it was no longer meaningful to evaluate the YPI project using difference-in-difference methodology as originally planned. Instead, we opted for multiple cross-sectional analysis.

The results of our study show that both DAKU and D4L were able to affect knowledge and attitudes of the participating students. The results are strongest for students who participated in DAKU and for students who participated in both DAKU and D4L. They show a significant increase in their knowledge about HIV/AIDS, STIs, and contraceptive methods, as well as more awareness of their rights to information about SRHR. The students who participated only in D4L showed an increase in their HIV/AIDS knowledge, but – as expected – not in any of the other topics such as STIs and pregnancy prevention. Due to the D4L programme, students showed a more accepting attitude towards people living with HIV/AIDs and homosexuality. Unfortunately, we did not find any spillover effects of the programmes, which is an important aspect of especially the D4L programme. We also did not find a change in student's opinion about premarital sex.

## 1.4. Structure of report

The rest of this report proceeds as follows; section 2 will describe the relevant literature; section 3 describes the project; section 4 describes the evaluation questions and outcome variables; section 5 the data collection. Section 6 provides the descriptive statistics. Sections 7 till 10 discuss evaluation question 1 till 4 in turn. Section 11 describes the relationship between the Capacity Development and Civil Society component to the MDG component. The last section discusses the results and concludes.

Further details about the project results are presented in a number of annexes. A summary of the project context based on the qualitative survey results is presented in Annex I, while the full report on the qualitative study can be found in Annex X. Annex II provides further information about YPI and the project. Regarding the survey data, the construction of the outcome indicators and indices is summarized in Annex III and Annex IV discusses data cleaning issues. Annex V in turn discusses whether project participants have different characteristics than non-participants, and Annex VI reports detailed descriptive statistics and explanatory variables of the sample. Detailed figures on the change in outcome indicators are presented in Annex VII, and detailed regression outcomes in Annex VIII. Finally, the representativeness of the sample is discussed in Annex IX.

## 2. Literature overview

In order to better position the SRHR education programmes of YPI, this section summarizes relevant findings on the effectiveness of SRHR education programmes conducted in the past. Special attention is placed on other DAKU and D4L evaluations.

It is important to note that most studies on SRHR focus on Sub-Saharan Africa and Western countries. Iyer et al. (2014) investigate the barriers to HIV and sexuality education in Asia and identifies four key inter-related factors hampering high-quality school-based HIV and sexuality education: cultural and contextual factors (such as religion), policy factors (the absence of supporting enabling environment), resource constraints and school-level factors (such as lack of teacher training on HIV and sexuality education).

Song et al. (2000) conducted a meta-analysis, including 67 studies, on the effects of school sexuality education programmes on the sexual knowledge of adolescents in the U.S.[5], and found that 97% of the weighted effect sizes reported in the studies were positive, indicating positive impact of the evaluated programmes. They also investigated six subcomponents of sexual knowledge: general sexuality, pregnancy, family life, HIV/AIDS, contraception and sexual transmitted infections (STIs); and found that the effect size in subcomponents was significantly positive. Therefore, the authors conclude that sexuality education programmes in the U.S. positively affect overall SRHR knowledge.

Michielsen et al. (2010) conducted a meta-analysis consisting of 31 studies (28 interventions) on the effectiveness of HIV prevention programmes, such as sexual education and condom promotion activities for youths (between 10 and 25 years old) in Sub-Saharan Africa).[6] The interventions greatly differ in intensity, ranging from reading a book for an hour to a 3-year sexual health education programme (median duration: 1 year). The majority of the included interventions were conducted in a school setting. In general, the treatment groups showed a significant improvement in knowledge and attitudes, but the authors did not find a significant impact on risky sexual behaviour, except for condom use[7], or on sexual activity. These conclusions are confirmed by Paul-Ebhohimhen et al. (2008), who conducted a systematic review of sexual education in Sub-Saharan Africa. The authors included 12 articles, of which 10 overlap with the meta-analysis of Michielsen et al. (2010). Michielsen et al. (2010) ascribe the limited impact to the poor implementation of the interventions due to, for example, resource constraints and disorganization in schools or the reluctance of

[5] The selection of studies was based on six criteria: 1) the study must have been a quantitative analysis of empirical data; 2) the study must have been conducted in a school setting; 3) the study must have been conducted in the United States; 4) the study must have been conducted during the years 1900 to 1997; 5) the sample must have included adolescents between grades five and twelve; 6) statistical data required to estimate weighted effect sizes must have been reported or available.

[6] Criteria for the selection of studies are: 1) the study must include a control group; 2) the study must have been published between January 1990 and December 2008; 3) the study must focus on the general population of young people (10-25 years) in Sub-Saharan Africa; 4) the study must report an evaluation of behavioural interventions aimed at preventing HIV transmission by reducing sexual risk taking. In total, 11 interventions used a randomized design, 5 had a pre-post design to control for exposure level and 12 used a parallel-group design comparing intervention groups with control groups.

[7] The increase in the use of condoms at last sex was found among males. Condom use at last sex was 1.46 times higher for males in the intervention group than in the control group.

teachers and health professionals to discuss the use of condoms with youths. In addition, the authors suggest that the lack of impact on behaviour could be due to the focus on HIV/AIDS prevention thereby forgetting other important issues like STIs and contraception.

Fonner et al. (2014) conducted a systematic review to study the impact of school-based sex education on HIV-related risk behaviours (age 9 to 38) in low- and middle income countries. Interventions ranged from 2 or 3 hours in total to spanning multiple years and involving community-based components. A wide range of study designs were eligible for inclusion in the meta-analysis[8], leading to a total of 69 studies. However, only 6.3% of the eligible studies were implemented in South Asia. Over the whole sample, Fonner et al (2014) find that HIV knowledge of youth that participated in any intervention significantly increased compared to youth who did not participate. Also self-efficacy related to HIV prevention (e.g., confidence in refusing sex or confidence in using condoms during sex) was significantly higher for those who participated. The studies that reported on condom use (3 out of 12) found a significant increase for the intervention groups compared to the comparison groups. Regarding behaviour, participants reported a 34% reduction in sexual activity compared to comparison groups. The authors conclude that school-based sex education is an effective intervention for generating HIV-related knowledge and decreasing sexual risk behaviours.

Rijsdijk et al. (2011) conducted an impact evaluation of the Ugandan SRHR programme: the World Starts With Me (WSWM), on which DAKU is based. Besides a few differences (see Annex II), the programmes have the same aims, methodology and message. The results of the intervention on safe sexual knowledge, attitude, and behaviour were mixed. On the one hand, positive significant impact was found for a number of outcomes, like detecting wrong beliefs on how to prevent pregnancy, intention to use a condom in the future, and intention to delay sexual intercourse. On the other hand, the comparison group significantly increased their knowledge scores relating to identifying misconceptions related to HIV compared to the treatment group. No impact of the intervention was found for schools which implemented only half of the programme. However, schools which indicated to have followed the programme only partially, adapting the material to their environment, revealed a slightly higher impact of the programme compared to schools which followed the implementation manual strictly. Overall, the authors conclude that the effectiveness of the programme could be improved by paying more attention to the context in which the programme is implemented.

The Indonesian DAKU programme has been evaluated by Rutgers WPF herself, the Dutch partner organisation of YPI. A quasi-experimental design with pre- and post-tests in both intervention (treatment) and control schools was employed in this study[9]. In total 2044 students from DAKU schools and 2214 students from control schools (79 schools) in grade 10 and 11 were asked to fill in

[8] Inclusion criteria: provided estimate of effect size and its variance, pre-post or multi-arm results comparing before-after or control group, presented outcome of interest comparable to other studies and presented data in individuals.

[9] The study also included a process evaluation, concluding that the DAKU module was perceived very useful and attractive to the students. In addition, teachers were interviewed to measure their opinion about SRHR issues. The evaluation after the involvement of the teachers as facilitators, several attitudes became more accepted. However, found that most teachers still pushed their personal attitude on the students.

an anonymous questionnaire. The ratio of women-men was about 3-1; the rate of attrition was about 13-21%. Due to the anonymous nature of the questionnaire it could not be evaluated if the attrition was systematic or not. However, the reasons for not filling in the questionnaire seemed to be random (e.g. sick at home, move to other schools). The study did not find any results on the behaviour of students with respect to sexual intercourse, other sexual activities, condom use or the intended delay in sexual intercourse. However, results were found for SRHR knowledge in a number of occasions (e.g. HIV transmission, STI transmission, knowledge on behaviour leading to pregnancy). Though, it must be mentioned that the myths around sexual intercourse were still high after the intervention. In addition, a positive result was found on the attitude towards the right for sexual intercourse. The effect of the intervention on the risk perception and self-efficacy related to sexual intercourse was mixed (Rutgers WPF, 2011).

Another evaluation carried out by Rutgers WPF is the evaluation of the UNITE For BODY RIGTHS Programme (UFBR) in Indonesia. So far only a baseline report has been written. The UFBR aims at "improving sexual reproductive rights in developing countries among women, men, adolescents and marginalized groups regardless of their cultural and religious background, age, gender and sexual orientation through its local partners" (p. 1). In Indonesia several NGOs, including YPI, joint forces to work on this aim: ONE VISION ALLIANCE. To obtain the aim the alliance wants to design several interventions. A quantitative evaluation among 983 students (485 junior high school students aged 12-14 years; 498 senior high school students aged 15-18 years) from 17 high schools (8 junior high schools and 9 senior high schools) was conducted to help designing the interventions. The students are located in 4 provinces and asked to fill in a KAP (Knowledge, Attitude and Practice) survey. Among others, the results displayed that about 3% of the female and 9% of the male senior high school students acknowledge to have had sexual intercourse. Most students have heard about HIV. However knowledge concerning HIV transmission and prevention is low; and pre-marital sex and homosexuality is not acceptable for almost all students (BASELINE REPORT FOR THE UNITE for BODY RIGHTS PROGRAMME IN INDONESIA, n.d.).

The Royal Tropical Institute (KIT) conducted an assessment about D4L in Uganda and Russia to evaluate the effect of the programme on the lives of young people and their community. As far as interviewed participants, the results show that in Uganda all participants reported that D4L had a positive effect on their lives, especially with respect to HIV knowledge and related discriminating and stigmatizing behaviour. In Russia most participants reported a positive effect as well, not only in terms of gained knowledge, but also in terms of self-confidence, tolerance, HIV/SRHR stigmatization and taboos, and in their actual sexual and reproductive behaviour (van der Kwaak & 't Hooft, 2012).

In sum, these evaluations show that SRHR programmes are partially effective. School-based sex education programmes significantly changes SRHR knowledge and attitude, but it only has a minor, if any, effect on sexual behavioural intention and activity. 2 out of the 5 meta-analyses conclude that SRHR interventions significantly change actual sexual behaviour of the youth.

# 3. The project

## 3.1. Project description

Yayasan Pelita Ilmu (YPI) provides SRHR education and services focusing on HIV prevention, voluntary counselling and testing (VCT), health services, and support for PLHIV (people living with HIV-AIDS) in Southern Jakarta. As the ultimate mission YPI wants to develop an independent, productive and healthy community and access to youth-friendly health services. Through two education programmes, DAKU and Dance4Life (D4L), YPI aims to increase the capacity of young people to make safe and informed decisions related to SRHR. In particular, as a result of the sexual education programmes, it is expected that young people increase their demand for SRH services, and they become more empowered to demand good quality services that cater their needs.

DAKU is a national programme, targeting senior high school students (15-19 years). D4L on the other hand is a global SRHR education programme, targeting high school students aged 12-19 years. Both programmes are implemented at schools as an extracurricular programme. DAKU is a computer-based programme consisting of 15 modules covering various aspects, such as HIV prevention, sexuality, and sexual abuse. Albeit comprehensive in nature, DAKU can only reach about 30 students per class due to its reliance of the computer lab. However, in 2013 a paper-based version of DAKU has been started in order to reach more students at schools and offer more flexibility in the form of delivering the lessons.

D4L is a social activity and for reaching her aims it employs dance, music, and performing arts. D4L consists of four stages: inspire, educate, activate, and celebrate (at World AIDS day). The programme applies dance and music as its approach to motivate students to learn about SRHR and share their knowledge with their environment. The educative part of the D4L curriculum consists of a 2.5 hour session on HIV/AIDS issues.

## 3.2. Project implementation

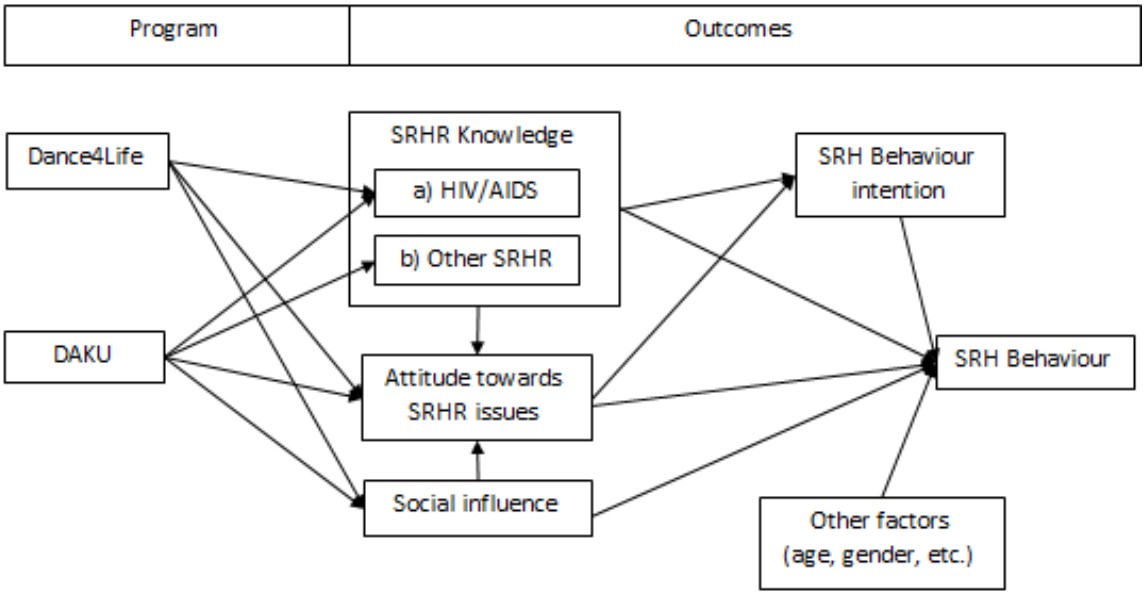
The implementation of DAKU and D4L differ in the schools: while D4L is implemented by YPI, the DAKU modules are facilitated by school teachers trained by YPI. In addition, the education component of D4L is implemented in only one session (about two hours), while DAKU covers 15 sessions if implemented fully.

In 2011 and 2012, YPI worked with 33 and 24 teachers, respectively, on the computer-based DAKU programme. In 2012, 14 teachers (from 9 schools) were trained on DAKU, while in 2011 there were no trainings. In 2013, 19 teachers (from 12 schools) were trained on the paper-based DAKU, while in total 22 teachers where involved in teaching DAKU (on the computer or on paper).

The schools participating in both sexual education programmes are selected annually as a result of consultations between YPI and the schools. YPI has a mandate to engage new schools into the D4L programme every year. However, some schools also drop out from the programmes, for example, due to busy student schedule or lack of interest from the school principal.

Often the schools implementing DAKU and D4L overlap. This can be explained by the fact that it may be easier to engage those schools in the D4L programme that already participated in DAKU (or vice versa) because, in general, these schools have a more open attitude towards sexual education. In

addition, it is easy to imagine, how DAKU could fit in the Educate module of D4L,[10] hence extending this component into a comprehensive sexual education curriculum.



It is also important to note that while the evaluation focuses on the computer-based DAKU and D4L, YPI's mandate for the MFS II period has been to implement the paper-based DAKU and take part in rolling out a comprehensive sexual education programme for junior high school students called SETARA. However, due to delays in the development of these tools, it was not possible for the evaluation to identify and sample students who later took part in these new programmes.

Further information about YPI, DAKU, and D4L as well as a detailed description about the realized activities is provided in Annex II.

## 3.3. Result chain

The result chain of both DAKU and D4L is displayed in Figure 1. As mentioned, the ultimate aim of both programmes is to encourage safe SRHR behaviour. The sexual behaviour of a person depends on several factors; among them are SRHR knowledge, SRHR attitude, SRH behaviour intention, social influence, and other factors like age and gender. As the figure shows, both DAKU and D4L direct aims are to increase the SRHR knowledge and change the attitude towards and the social opinion on SRHR [D4L: HIV/AIDS] issues. Both programmes aim at changing the attitude and social opinion about SRHR issues directly, but also indirectly via a knowledge increase.

**Figure 1: Result chain**

[10] This aspect of combining DAKU and D4L at the same schools has been pointed out by Rutgers WPF. This may work well for the paper-based DAKU.

### 3.4. Possible unintended impacts

Some people, like religious leaders or policy makers, might argue that talking about SRHR increase sexual activity or increased acceptance of premarital sex among the youth. Therefore, it must be explicitly mentioned that both programmes do *not* want to encourage any (premarital) sexual activity. The programmes aim at increasing *safe* SRH behaviour. Safe SRH behaviour includes delayed (intentional) sexual intercourse. We do not expect that the programmes altered the actual sexual behaviour of students. However, seen the general concern in Indonesia about SRHR education (see introduction) it is important to investigate this issue. The outcome variables are grouped under the 'unintended effects', since the programmes do not intent to change these outcomes.

## 4. Evaluation questions and outcome variables

### 4.1. Evaluation questions

The call for proposals outlines 5 general evaluation questions. Table 1 shows these five questions and what it implies for this project.

**Table 1: Overview general and specific evaluation questions**

| Number | General evaluation question | Detail |
|---|---|---|
| 1 | Change: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? | How did the knowledge, attitude and behaviour of students change? |
| 2 | Attribution: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)? | Did the CSE programmes (DAKU and D4L) enable students to make more informed decisions about their sexual activities? In particular, how did the knowledge, attitude and behaviour of students change as a result of the CSE programmes? |
| 3 | Relevance of change: What is the relevance of these changes? | • The size of the impact<br>  • Did the D4L project activate students to inform others about SRHR in their school and/or community?<br>• Representativeness of the sample<br>• Does the project address an important issue for the beneficiaries?<br>• Satisfaction of beneficiaries (self-reported impact) |
| 4 | Efficiency: Were the development interventions of the Southern partner organizations efficient? | Was the intervention cost effective? |
| 5 | Explanations: What factors explain the findings drawn from the questions above? | Why did things work out/not work out?<br>The evaluation question is answered throughout the other evaluation questions and in the end discussion. |

## 4.2. Outcome indicators

To answer the first two evaluation questions (change and attribution) we identified specific outcome indicators. The outcome indicators are split up into three sub-categories: knowledge, attitude, and behaviour. These three factors are sequentially linked (see section 3.3). In addition, we also include the unintended effects variables as identified above (see section 3.4). Since there are many possible and interesting outcome indicators, variables are grouped into indices for the main analysis.

Table 2 displays the outcome indicators of the main analysis, the scale of these variables and whether the indicator is a uniform indicator[11], while Annex III describes the outcome indicators in more detail and highlights the components per index. For all outcome variables (Panel A to C) 'the higher, the better' rule applies.

[11] The uniform outcome indicators as laid out by the synthesis team for MDG 3 could only be collected on one of the uniform indicators: attitude towards gender based violence by women and men (Index on the attitude towards GBV).

**Table 2: Overview outcome indicators**

| Outcome indicator | Scale (minimum; maximum) | Uniform indicator |
|---|---|---|
| **Panel A. Knowledge** | | |
| Index on HIV/AIDS knowledge | (0;17) | |
| Index on knowledge about counselling | (0;2) | |
| Index on other STI knowledge | (0;3) | |
| Index on contraceptive knowledge | (0;2) | |
| Awareness of rights to SRHR information (%) | (0-100%) | |
| **Panel B. Attitude** | | |
| Index on the attitude towards relationships | (0;8) | |
| Index on the attitude towards GBV | (0;5) | X |
| Acceptance of HIV/AIDS rights (%) | (0-100%) | |
| Acceptance of homosexuality (%) | (0-100%) | |
| Acceptance of contraceptive (%) | (0-100%) | |
| Action in case STI is suspected: inform partner (%) | (0-100%) | |
| Action in case STI is suspected: seeing a doctor (%) | (0-100%) | |
| **Panel C. Behaviour** | | |
| Discussion intimate relationship (%) | (0-100%) | |
| Consultation of a clinic for SRHR related matters (%) | (0-100%) | |
| **Panel D. Unintended effects** | | |
| Acceptance of premarital sex (%) | (0-100%) | |
| Index on sexual activity | (0;8) | |

# 5. Data collection

This section describes the survey instruments and the sampling design and outcome at the school level and student level in turn.

## 5.1. Survey instruments

We collected four types of data: quantitative, qualitative, financial, and secondary data. The following paragraphs list the survey instruments used for each type of data.

### *Quantitative data*

To analyse the impact of the programmes, two surveys have been conducted to collect quantitative data:

- Student survey: data was collected using a self-assisted computer-based survey for students, which allowed students to privately answer sensitive questions. We tried to formulate questions to minimize normative responses. The questionnaire had a multiple choice layout, which provides room for leading questions and random guessing. The baseline data have been collected at the end of October and the beginning of November 2012; the endline data in May or September 2013 assisted by the same student.
- School survey: a school survey was administered together with the student endline survey. A responsible staff member of the school was asked about a number of school related items (number of students per grade, participation in sexual reproductive programmes).

### *Qualitative data*

To gain more insight into the impact of the programmes a qualitative analysis was conducted. Eight participating students in DAKU and D4L were individually interviewed on the same topics covered in the quantitative survey. The eight students were selected out of the students from our sample who indicated to have or have had a boy- or girlfriend. The results of this study are summarized in Annex X.

### *Financial data collection*

To collect information about the costs of the project on the targeted beneficiaries (senior high school students participating in SRHR education), we conducted a project cost survey with the project manager, financial manager, and two programme officers of YPI.

### *Secondary data*

Besides our own surveys, we also used other data sources in this report. We have used the young adult subsample of the Demographic and Health Survey (DHS) to compare our sample characteristics with the general youth population characteristics (see Annex IX). Next, we used the annual reports of YPI to collect project information.

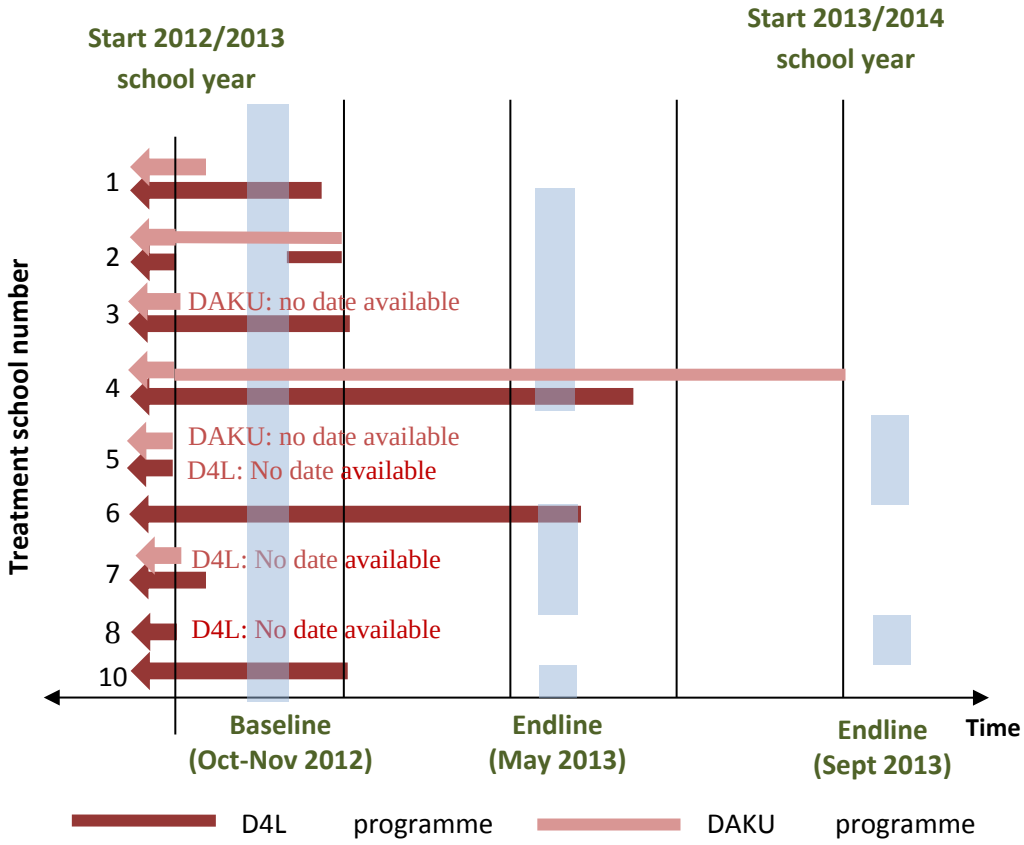
## 5.2. Sampling outcome at the school level

### *Sampling design*

The evaluation focuses on vocational senior high schools. Based on our information at the baseline period, [12] 12 senior high schools implemented either DAKU or D4L in 2012, and 10 of these have been sampled for the evaluation. In addition to the treatment schools, we randomly selected 3 public vocational senior high schools and 2 private Muslim vocational senior high schools in the same area to form the comparison group. Hence, a total of 15 schools were selected for the evaluation. Note that randomized assignment of schools into treatment was not possible as schools participate based on agreement with YPI.

[12] YPI provided us with a list of schools.

### *Sampling outcome*



For the final sample we dropped one treatment school because the programme was implemented with junior instead of senior high school students. Four out of the remaining nine treatment schools had a different treatment status than expected in the baseline report. Based on the YPI listings, we sampled 3 DAKU schools, 4 D4L schools, and 2 DAKU&D4L schools. However, according to the information of the school survey all schools implementing DAKU also implemented D4L. One sampled D4L school did implement DAKU as well. Therefore we focus on the actual treatment status (based on the outcomes of the school survey) in this report: the sample contains five comparison schools, three schools which implemented only D4L, and six schools which implemented both DAKU and D4L.[13]

The school survey also revealed all schools started the intervention already before the first study. In addition, some of the schools participated in the programmes before the 2012-2013 school year, and did not continue their implementation during the evaluation period (3). Hence, the first survey cannot be taken as a true baseline survey. Figure 2 displays the timing issues graphically. The horizontal lines/arrows show the period of implementation of the programmes at each school, while the vertical columns indicate the timing of the surveys. Note that in two schools the endline survey had to be postponed to September due to request of the schools.

The section 8.1 discusses the implications of this finding for the methodology in detail. More information about the data cleaning is given in Annex IV.

[13] 2 out of the 5 comparison schools report to have implemented another CSE programme during the past school year. Unfortunately we do not have information about the participation of the student in our sample in the programmes. It appeared that not many students at the school level participated. Hence, we disregard this issue, based on the expectation that these were fairly small interventions. If anything, our results will be an underestimate of the DKU & D4L programme impact.

**Figure 2: Timing of the intervention and student surveys**

Source: School survey E12, MFS II Evaluation Indonesia.

## 5.3. Sampling outcome at the student level

### *Sampling design*

In each senior high school 20 students were randomly selected among first and second grade students[14], stratified by gender. We obtained the list of participation students from the schools, who were responsible for the selection of students into the programmes. Based on the list, in treatment schools we stratified our sample based on CSE participation: we interviewed 10 participants (treatment group) and 10 non-participants who were expected to indirectly benefit from the programme through social contacts with their participating classmates (spillover group).

### *Sampling outcome*

All students, except for one, were interviewed in both rounds of data collection.[15] Hence, the attrition rate is very low. In the analysis we use data on the 279 students interviewed in both evaluation rounds. They are divided almost equally over the three treatment groups: comparison, treatment and spillover.

[14] Senior high consists of 3 years of schooling. If a student dropped out or graduated between the base- and endline survey, the student was tracked at home to complete the endline survey.
[15] Due to personal reasons the school did not allow us to track this student at home.

The stratification in treatment schools was based on their participation in DAKU or D4L. However, at the endline it appeared that the actual treatment status of students (based on self-reported participation) often differed from the listings provided by the schools. In order to give a better estimate of the impact of the programme, we use the treatment status as indicated by the students at the endline survey to distinguish between different types student.[16]

**Table 3: Recognition and participation in the programme by school treatment status**

| Column number | 2 | 3 | 4 | 5 |
|---|---|---|---|---|
| School | | Comp | D4L-only | DAKU & D4L |
| Participant status | Survey year | Comp | All | All |
| Variable name \ Sample size | | [n=99] | [n=60] | [n=120] |
| Percentage of students who have heard of DAKU (%) | base | 2.8% | 9.1% | 58.3% |
| | end | 5.6% | 18.4% | 75.1% |
| Percentage of students who have heard of D4L (%) | base | 7.6% | 63.0% | 84.6% |
| | end | 14.8% | 82.2% | 86.9% |
| Percentage of students who ever participated in DAKU, never in D4L (%) | base | 0.0% | 0.0% | 11.0% |
| | end | 0.0% | 0.0% | 12.8% |

Notes:
- The treatment status of schools is displayed as actual treatment.
- Observations are weighted proportional to the inverse of the probability of being included in the sample due to stratification.

Table 3 shows the participation rates of students at the school level. The responses of the students are weighted proportionally to the inverse of the probability of the students being included in the sample.[17] Therefore, the results in the table are representative at the school level and the percentages display the average percentage of students who have heard of DAKU at the school level.

[16] Some errors and/or typos appeared in this self-reported treatment status. First, 8 (baseline: 2) students reported to have participated in DAKU, while they are attending a comparison school or a school which only implemented D4L. 2 students (baseline: 1) of the comparison schools report to have participated in D4L. We have set those participation rates to zero for those observations. Secondly, 6 students indicated to have participated in DAKU at the baseline, but reported not to have participated at the endline. For D4L these are 15 students. This is in itself a rather important outcome. Apparently 3.3% of the students attending a treatment school forgot that they participated in DAKU; even 7.8% for D4L. We have not corrected those participation rates at the endline survey. Hence, these students appear in the spillover group in the analysis.

[17] The weights are normalised such that each school has an equal weight in the sample.

Notes:
- The treatment status of schools is displayed as actual treatment.
- Observations are weighted proportional to the inverse of the probability of being included in the sample due to stratification.

Investigating the differences between intended and actual treatment status of the students, Table 4 reports the self-reported participation rates of students in the assigned treatment and spillover groups. In addition to participation, the table also shows the percentage of students who have heard about DAKU and D4L.

The results show that only a small fraction of students in the comparison schools have heard of DAKU and D4L (Table 3). In both D4L-only and DAKU&D4L schools, most students already participated in DAKU and/or D4L at the baseline. Though at the endline, more students participated in both programmes. The increase in participants of both DAKU&D4L at the endline stems from an increase in participants in DAKU. Table 4 shows that in the treatment group in D4L-only schools the percentage of students participating in D4L dropped at the endline compared to the baseline from 73.3% to 66.7%. This drop could be due to several reasons: the student misreported their participation status in either baseline or endline, or the students forgot at the endline that they participated in the programme. Note that especially in the D4L-only schools, a significant number of students from the listed spillover group participated in the programme.

## 6. Descriptive statistics

This section summarizes the main differences between the comparison and treatment schools (D4L only and D4L&DAKU) using baseline data (except if mentioned otherwise). The tables are provided in

Annex VI. All figures in the tables are representative at the school level. In tables using the student survey, the group means (in columns 2, 3 and 5) and significance levels (p-values) have been calculated using sampling weights to correct for stratification by gender and assigned treatment status. The p-values (in columns 4 and 6) indicate significant differences between the particular treatment and comparison school. There is a significant difference between treatment and comparison schools when the p-vale us is below 0.05, meaning that the probability that the means in the two groups are equal is less than 5%. In the calculation of the P-values we corrected for clustering at the school level.[18]

## 6.1. Number of students per school

Looking at the number of students in (grades 1-3) per school among the treatment groups (Table 15 in Annex VI), we observe that the treatment schools are on average somewhat larger than the comparison schools (551 students in D4L and 571 in DAKU&D4L vs. 521 in comparison schools). The percentage of girls is higher in all school types in average: 70% in the treatment schools and 62-64% in the treatment schools. Due to the low sample size (n=13) no statistical inferences on these differences can be drawn.

## 6.2. General student characteristics at baseline

To provide a better insight into the general characteristics of our sample, Table 5 displays age, gender, grade, religion, number of siblings, final grade last school year, and the education level of the father respectively mother. 'Final grades last school year' and the 'education level of both parents' are included as proxies for school quality. [19]

[18] This means that the standard errors are allowed to have an arbitrary correlation for students within the same school. In other words, we allow students in the same school to be more similar to each other than they are to a different randomly selected student in another school.

[19] The baseline report already described most of these time invariant characteristics of the sample between different groups (see table 12 of the baseline report). However, results were displayed by gender and by assigned treatment status of the student. The results displayed here will use the actual treatment status of the student as this will be the division used in the impact analysis.

**Table 5: General characteristics of the sample at baseline**

| School type | Comparison | D4L-only | P-value C. vs. D4L | DAKU&D4L | P-value C. vs. DAKU&D4L |
|---|---|---|---|---|---|
| **Sample size** | n=99 | n=60 | | n=120 | |
| Age | 15.9 | 16.8 | 0.000 | 16.6 | 0.000 |

| *Secondary education* | 38.6% | 37.6% | 0.912 | 39.3% | 0.929 |
| *Vocational school* | 26.6% | 31.2% | 0.591 | 22.6% | 0.537 |
| *University or college* | 7.1% | 4.6% | 0.562 | 15.0% | 0.116 |

Source: Student baseline survey E12, MFS II Evaluation Indonesia
Notes:
- Standard errors are corrected for clustering at the school level.
- Observations are weighted proportional to the inverse of the probability of being included in the sample due to stratification.

The results show that students in both of the treatment schools are significantly older than students in the comparison group. This is due for two reasons: 1) in comparison schools we sampled only first and second graders, while in the treatment schools students from the third grade were sampled as well; 2) in the comparison group most students in the sample attend grade 1, while in treatment

schools most students attend grade 2.[20] Since age[21] is an important determinant of SRHR knowledge, attitude and behaviour, we include age as a covariate when we estimate the impact of the intervention.

The number of females in the comparison and D4L-only schools is comparable, about 31-38% of the sample is female. In DAKU&D4L schools 57% of the students are female, significantly more than in the comparison group. This is due to the fact that in some schools more females than males participated in the programme. As with age, gender can be an important determinant for the outcome variables. Hence, gender is included as a covariate as well when we estimate the impact of the intervention.

Apart from age and gender no statistical significances between the treatment groups are found for any of the reported time invariant characteristics. This indicates that the school quality, proxied by 'final grades last school year' and the 'education level of both parents', is comparable between the schools.

## 6.3. Students out of school activities and exposure to media

The students were asked what their preferred place and separately activity is after school time (endline survey). In addition, questions were asked about their level of exposure to Western media to get an insight into the exposure level of Western influences to these students. Table 17 in Annex VI displays the results.

Most students prefer to be at home when they are free, with visiting friends on the second place. With respect to activities, students prefer to play on the computer, surf the internet, watch TV, listen to music/radio and chat with friends.[22] Almost all students go out to a discotheque occasionally. Some statistical significant differences between treatment types (comparison, D4L and DAKU&D4L) are found, but those are only small in nature.

With respect to the exposure to Western media, television appears to be the most common media source used in the past 6 months. Almost all students listen frequently or occasionally to religious broadcasting. Indonesian popular music and films are slightly more popular than Western popular music and films. Overall, the exposure level to Western influences seems moderate. Again, some significant differences between treatment types are present, but no overall significant differences between groups are found.

[20] Hence, without the third graders in the sample, students in both treatment groups are still significantly older than students in the comparison group (results not displayed).

[21] Grade is an important determinant as well if students receive information about SRHR issues in a particular grade or if students are influenced by their (younger/older) classmates' knowledge, attitude or behaviour. Since grade and age are highly correlated and age is endogenous to other factors influencing the outcome variables, age instead of grade is used as a covariate.

[22] Feedback from Rutgers WPF verifies this finding. Their Operational Research, currently conducted under UFBR's ASK programme, found that home computer is the first option for young people to access knowledge, affirming the importance of parents in strengthening the CSE impacts on their children. In addition, Rutgers WPF noted that this finding is a good example of the importance of the Enabling Environment in UFBR: in order to facilitate the CSE learning, parents need to be involved in the programme. This was also discussed during the process of Outcomes Measurement (OM) Survey for UFBR in 2013.

## 6.4. Relationship and sexual behaviour of students

An important descriptive statistics for the current study is the relationship and sexual behaviour of students (see Table 18 in Annex VI). As it appears, 76-90% of the sampled students ever had a boy- or girlfriend at time of the baseline survey. No significant differences are found between the treatment types.

Despite the high number of students who engaged in a relationship, the rate of sexual activities of students is low: none of the girls reported to ever have had sex, while 2.5-2.7% of the boys in treatment schools and none of the boys in the comparison schools have done so (as reported in the baseline report).[23] Due to the taboo on sexual intercourse before marriage (see introduction) the figures might be underreported.

## 6.5. Information on SRHR at the schools

Table 19 in Annex VI summarizes SRHR related topics that have been discussed in class (for example in biology class) at the schools over the past school year. According to the school management of the 5 schools implementing DAKU (school survey), a range of topics (including SRHR issues, puberty, drugs, etc.) were covered during the classes. As expected, only a subset of those topics was covered in the D4L programme. This subset varies by school, but in all schools D4L covered 'HIV/AIDS' and 'other STIs' issues. 3 treatment and 2 comparison schools indicated to have discussed 'HIV/AIDS', 'other STIs', 'SRHR', and 'drugs and narcotics' issues in another SRHR education programme than DAKU or D4L. Apart from SRHR programmes, only 1 treatment school discussed the human sexual reproduction system in biology class. Hence, in the schools, most information about SRHR issues can only be learned in the framework of specific SRHR programmes implemented at the school.

## 6.6. Correlates of programme participation

As mentioned earlier, we use self-reported actual participation in the DAKU and D4L programmes. It appears that students could decide themselves whether they wanted to participate in the programmes. Therefore, it is important that in the analysis we control for observable student characteristics that is different between participants and non-participants. Annex V investigates which (if any) observable characteristics are correlated with student participation. We find that the gender of the student (being a female) and preferences to go to a concert/cinema are positively correlated to involvement into the programmes; preferences to play sports is negatively correlated with selection into the programme. The last correlation may be partially explained by the fact that both playing sports and attending DAKU or D4L are both extracurricular activities, and the students may not have time to participate in both.

The next sections describe per evaluation question the methodology and the results of the analysis.

[23] For more information on sexual activity of the students see Table 22 reporting on unintended effects of the project in Annex VII.

# 7. Evaluation question 1: Change in outcomes

This section discusses evaluation question 1: What are the changes under each MDG or theme at community/household level during the 2012–2014 period? The changes in the outcome indicators for the period measured between the base- and endline survey (2012-2013 school year) are reported below grouped into four categories: knowledge, attitude, behaviour, and unintended effects.

Table 6 displays the results per school type[24] for all outcome indicators. The indicators are calculated to be representative at the school level. Hence, in treatment schools they include both programme participants and non-participant students expected to indirectly benefit from the programme. Results separately for programme participants and the spillover group[25] are presented in Annex VII.[26] The following subsections discuss the levels and changes in the outcome indicators grouped by indicators for knowledge, attitude, behaviour and unintended effects.

## 7.1. Knowledge indicators

Panel A in Table 6 shows that, on average, knowledge levels are moderate for HIV/AIDS issues (6.7-9.5 out of 17) and also for students awareness about their rights to receive SRHR information (78-85%) and low for the awareness of counselling services (0.1-0.3 out of 2), STI (0.6-1.1 out of 3) and contraceptive knowledge (0.4-0.7 out of 2) at time of the baseline. Looking at changes over time within each type of schools (we are **not yet** comparing treatment with control), we see that knowledge levels at time of base- and endline are comparable for both treatment and control schools. Three exceptions stand out: 1) the students in the comparison schools more than doubled their knowledge about counselling; 2) the comparison schools increased their knowledge on contraceptive knowledge with 30%; and 3) the DAKU&D4L group experienced a 'loss' in their knowledge level on HIV/AIDS issues of almost 1 point. Hence, contrary to the expectations, on average the students in the DAKU&D4L group answered 1 HIV/AIDS related question more incorrect at the endline than at the baseline.

[24] For the school types we use the actual intervention status as self-reported by schools.
[25] We use the self-reported participation of students to define the participant and spillover groups.
[26] Table 23 in Annex VII also shows the number of students that improved or deteriorated on the outcome indicators.

**Table 6: Change in outcome indicators over time**

| Student type | Comp. | | D4L-type | | DAKU&D4L | |
|---|---|---|---|---|---|---|
| Sample size | [n=99] | | [n=60] | | [n=120] | |
| Survey | Base | End | Base | End | Base | End |
| **Panel A. Knowledge** | | | | | | |
| Index on HIV/AIDS knowledge (0-17) | 6.67 | 6.43 | 7.84 | 8.12 | 9.47 | 8.55 |
| Index on counselling knowledge (0-2) | 0.13 | 0.28 | 0.20 | 0.26 | 0.34 | 0.41 |
| Index on STI knowledge (0-3) | 0.58 | 0.64 | 0.65 | 0.67 | 1.07 | 1.09 |
| Index on contraceptive knowledge (0-2) | 0.37 | 0.48 | 0.63 | 0.61 | 0.67 | 0.63 |
| Awareness of rights to SRHR information | 77.9% | 78.2% | 79.8% | 76.1% | 85.0% | 88.7% |
| **Panel B. Attitude** | | | | | | |
| Index on relationship (0-8) | 3.72 | 4.09 | 3.65 | 4.12 | 4.23 | 4.28 |
| Index on attitude towards GBV (0-5) | 4.12 | 3.86 | 3.92 | 4.05 | 4.11 | 4.03 |
| Acceptance of HIV/AIDS rights | 41.0% | 58.1% | 55.2% | 58.3% | 70.0% | 74.2% |
| Acceptance of homosexuality | 7.7% | 7.5% | 17.8% | 6.8% | 21.7% | 12.9% |
| Acceptance of contraceptive | 0.0% | 0.0% | 0.0% | 0.0% | 0.0% | 0.0% |
| Action in case STI is suspected: inform partner | 32.6% [n=33] | 40.2% [n=37] | 43.8% [n=18] | 28.6% [n=22] | 37.7% [n=58] | 40.1% [n=61] |
| Action in case STI is suspected: seeing a doctor | 86.9% [n=33] | 90.4% [n=37] | 71.6% [n=18] | 59.1% [n=22] | 97.1% [n=58] | 92.6% [n=61] |
| **Panel C. Behaviour** | | | | | | |
| Discussion intimate relationship | 25.6% | 29.2% | 35.4% | 30.1% | 38.9% | 41.0% |
| Consultation of a clinic for SRHR related matters | 13.7% | 25.6% | 18.2% | 21.2% | 15.2% | 20.7% |
| **Panel D. Unintended effects** | | | | | | |
| Acceptance of premarital sex | 0.0% | 0.0% | 0.0% | 0.0% | 0.0% | 0.0% |
| Index on sexual activity (0-8) | 1.35 | 1.78 | 2.73 | 3.11 | 1.71 | 2.20 |

Source: Student base- and endline survey E12, MFS II Evaluation Indonesia
Notes:
- If the sample size deviates, the sample size is displayed in brackets.
- Observations are weighted proportional to the inverse of the probability of being included in the sample due to stratification.

## 7.2. Attitude indicators

Panel B of Table 6 indicates that, on average, about half of the statements (3.7-4.2 out of 8) on relationships were correctly indicated as good/bad at the time of the baseline. The scores on attitude towards Gender Based Violence (GBV) are closer to the desired outcome: on average 3.9-4.1 out of 5 statements are agreed upon by students to be an incorrect attitude or behaviour. On average, 41-70% of the students agreed that HIV/AIDS patients have the same rights as other persons. For all mentioned indicators, the scores are comparable between the base- and endline in ally treatment types. The acceptance of homosexuality was significantly lower for both treatment groups (6.8-12.9%) at the endline compared to the baseline.

At both baseline and endline, *none* of the students agreed with the statement 'I think that unmarried boys and girls should use a contraceptive to prevent pregnancy if they have sex with each other.' Therefore, it was not possible to include this variable in our analysis. The low outcome could be due to two reasons:

- The attitude towards premarital sexual intercourse (see unintended effects) is in general negative (see below)
- Inadequate knowledge about the need to use contraceptive methods to prevent pregnancy

About 29-44% of the students would inform their partner in case they suspect to have a STI; 72-97% would visit a doctor at time of the baseline. However, only a low number of students were asked to answer this question (students needed to know what a STI is). Due to the low sample size for these variables we drop these variables from later analysis.

## 7.3. Behaviour indicators

Panel C of Table 6 shows that 26-39% of the students discussed intimate relationships with their friends at time of the baseline. The percentages of the endline survey display similar levels. On average, 14-18% of the students consulted a health centre/clinic for SRHR related matters in the past year at time of the baseline. At the endline more students indicated to have visited a clinic, but this change can be due to age solely. The older a student becomes, the more likely s/he will or has engaged in sexual activities and the higher the 'need' to visit a clinic.

## 7.4. Unintended effects

Looking at Panel D Table 6, we observe that in both at the base- and endline, none of the students agreed with the statement 'I believe there is nothing wrong with unmarried boys and girls having sexual intercourse if they love each other'.[27] Hence, the SRHR interventions do not alter the opinion of students about premarital sex. Since there is no variation in the indicator between the groups, the indicator is dropped in later analysis.

[27] Feedback from Rutgers WPF indicates that the Outcome Measurement Survey in 2013 and also IYARHS (2012) found that the percentage of young people who have had extramarital sex is very small. Rutgers WPF notes that part of the reason could be that the survey was conducted in schools, and among students who mostly live with parents, allowing same values and norms transferred from parents. The situation might be different with out-of-school young people or in community-based research.

With respect to the sexual activity level, on average students indicate to have engaged in 1.4-2.7 out of the 8 listed activities, meaning that the average student has not embraced and caressed (index=2) and kissed (index=3) yet. At the time of the endline survey, this indicator has increased by 0.4-0.5 on average, indicating that more students have engaged in these activities. For a detailed description on the percentage of students engaged in intimate partner activities, see Table 22 in Annex VII.

In general, students from the treatment schools indicated to have engaged in more sexual activities at both base- and endline compared to the comparison group. Though, one should be reminded of the fact that students in the comparison group were significantly younger than students in the treatment groups. Any statistical interference about the impact of the programmes on sexual activity can only be made when the analysis controls for age differences.

With respect to sexual intercourse (see Table 22 in Annex VII), only 3 students indicate to have engaged in sexual intercourse with a boy-/girlfriend; 6 students report to have had sexual intercourse with someone who was not their boy-/girlfriend (either a friend or housemate).[28]

### 7.5. Discussion

We do not observe a lot of changes for the treatment groups between the base- and endline surveys. Therefore, we also do not expect a large impact of the programmes between the baseline and endline periods. However, given that both DAKU and D4L were already running for some time during the baseline survey and treatment after the baseline was limited (see Figure 2), we expect that most of the project impact has already taken place already before the baseline (for example, increase in knowledge). Therefore, it makes little sense to follow the planned evaluation methodology using difference-in-differences analysis. Instead, we compare the outcome indicators between the comparison and treatment groups separately for both base- and endline surveys (cross-sectional analysis). We hypothesise that the programme effect will be higher at the endline survey due to additional project activities between the baseline and endline periods.

## 8. Evaluation question 2: Attribution of changes

This subsection discusses evaluation question 2: To what degree are these changes at target group level attributable to the development interventions of Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

[28] Of the students who indicated to have had sexual intercourse with their boy/girlfriend (n=3 at endline), 2 students say that they used a form of contraception to prevent pregnancy but not always, the other student answered never to use such a method (not in table). From the students who indicated to have had sex with another person (n=6), 2 students indicate to have always used a contraception method, 2 answered never, the other 2 respondents refused to answer (not in table). Though the sample sizes are very low, the numbers are worrisome. Our questions about the use of certain contraception methods suffer from the same low sample size issue, except for the result that 8.2% of the respondents indicate to have ever used abstinence as a contraception method. Interesting as well is the low percentage (34.8%) of students who agree with the following statement: 'Before two people start having sex with each other, they should test for their HIV/AIDS and other STI status if at least one of them had a sexual relationship before'.

## 8.1. Methodology

In the baseline report we described that we want to analyse the impact (attribution) of the YPI project on senior high school students using difference-in-differences methodology. Due to the timing of the survey with respect to the intervention (see Figure 2), we do not expect to be able to identify the impact of the DAKU and D4L programmes between base- and endline (as discussed in the previous section).[29] Therefore, we opt for taking a different approach for measuring the programme effects: we use cross-sectional regressions using data from the base- and endline surveys. Hence, we are not able to use fixed effects to control for observed and unobserved student characteristics that are constant over time (as done in a difference-in-difference analysis). Controlling for student-specific characteristics is important in a cross-sectional analysis, where differences in the distribution of the characteristics of treatment and comparison groups can drive observed differences in the outcome variables. Therefore, we use observable student characteristics (for example, the age of the students at baseline) as control variables in the regression analysis.

Using regression analysis, we first estimate the overall treatment effect on the schools or the Intention to Treat (ITT) effect at the school level. This measure combines the effect of DAKU and D4L on the programme participants (direct effect) and non-participants (indirect effect). To separate the two effects, we also estimate the Average Treatment Effect of the Treated (ATET) at the student level. The ATET is calculated by comparing the outcome variables of students in the comparison schools to the two treatment groups: (1) the students who participated in DAKU and/or D4L (direct effect), and (2) the students in the treatment schools who did not participated in DAKU and D4L (indirect/spillover effect). Note that in both regressions the actual treatment status of both schools and students is used instead of the assigned treatment (see section 5.3).

Regarding the regression outcomes at the baseline and endline, given that not all schools had already finished DAKU and D4L before the baseline survey, we expect that the treatment effect using the endline data will be larger compared to the treatment effect found for the baseline data.

### *Intention to Treat (ITT) at the school level*

Equation (1) estimates the ITT of the intervention at the school level. In other words, equation (1) estimates the impact of the programme for an average student in a treatment school, regardless of the participation of the student in D4L and/or DAKU. Hence, equation (1) estimates the average effect of DAKU and D4L at the school level for a selected outcome variable.

$$(1) \qquad y_{ij}^{t} = \beta_0^t + \beta_1^t D4L_j + \beta_2^t DAKUD4L_j + \boldsymbol{\gamma}^t \boldsymbol{X}_{ij}^t + \varepsilon_{ij}^t,$$

where $t$ indicates either baseline or endline, $i$ is the individual, $j$ is the school, and $\varepsilon_{ij}$ is the error term clustered at the school level. $y_{ij}$ is the outcome variables as discussed in section 4.2. $D4L_j = 1$ if a school implemented the D4L programme, 0 otherwise. $DAKU_D4L_j = 1$ if a school implemented both the DAKU and the D4L programme. $\boldsymbol{X}_{ij}$ is the vector of control variables.

[29] We don't know for sure if the parallel trend assumption holds, meaning that we cannot assume that the 'trend' in the outcome variables between the baseline and the endline are the same for both treatment and comparison groups since the trend in outcome variables were already affected by the programmes at time of the baseline.

In the regression, $\beta_1$ measures the intention to treat effect for D4L and $\beta_2$ for jointly implementing DAKU and D4L. In order to obtain results that are representative at the school level, the coefficients are calculated using weighted least squares method to correct for the effects of stratification. The sampling weights are proportional to the inverse of the probability that the respondents are included in the sample as a result of the stratification procedure at the school level (on gender and assigned treatment status). The sampling weights are normalised so that each school has an equal weight in the sample.

As mentioned above, due to the use of cross sectional data, controlling for confounders in the regression analysis is important. Confounding variables are selected based on three criteria: (1) the distribution of the variable is significantly different between the comparison and treatment students; and (2) the variable is not influenced by factors influencing the outcome (predetermined);[30] and (3) the outcome indicator is influenced by the variable. Using these criteria, we control for age[31] and gender in the regressions. We expect that the outcome indicators differ by age and gender of the student, since both are considered to be important determinants of SRHR issues in the literature. For example, the older someone is, the more likely someone has or is engaged in sexual activities. Also, it is generally assumed that men have a more liberal attitude towards casual sex.

### *Average Treatment Effect on the Treated at the student level*

Equation (2) estimates the ATET on the student level. In other words, equation (2) estimates the effect of the programmes by comparing the outcomes between the three groups – comparison, participants, spillover – using the self-reported participation of students in DAKU and D4L.

(2) $$y_{ij}^t = \alpha_0^t + \alpha_1^t D4L_j * D4L_{spillover_{ij}} + \alpha_2^t D4L_j * D4L_{student_{ij}} + \alpha_3^t DAKUD4L_j * DAKUD4L_{spillover_{ij}} + \alpha_4^t DAKUD4L_j * D4L_{student_{ij}} + \alpha_5^t DAKUD4L_j * DAKU_{student_{ij}} + \alpha_6^t DAKUD4L_j * DAKUD4L_{student_{ij}} + \boldsymbol{\gamma}^t \boldsymbol{X}_{ij}^t + \varepsilon_{ij}^t$$

The sub- and superscripts, abbreviations and X-vector are as in equation (1). In addition to equation (1) the actual treatment status of the students are added on the right-hand side (RHS). $D4L_{spillover_{ij}} = 1$ if a student did attend a D4L treatment school but did not participate in the programme. $DAKUD4L_{spillover_{ij}} = 1$ if a student did attend a DAKU & D4L treatment school but did not participate in any of the programmes. $D4L_{student_{ij}} = 1$ if a student reported at the endline survey to have ever participated in the D4L programme, but not in the DAKU programme. $DAKU_{student_{ij}} = 1$ if a student reported at the endline survey to have ever participated in the DAKU programme, but not in the D4L programme. $DAKUD4L_{student_{ij}} = 1$ if a student reported at the endline survey to have ever participated in both the DAKU and D4L programmes.

[30] The second condition is important for the selection of valid control variables because the intervention has started already before the baseline data was collected.

[31] The distribution of both age and grade is significantly different between the treatment and comparison group. However, these two variables are highly correlated. We chose to use age over grade as control since age is exogenous, while grade is endogenous (depends on age, skill levels, motivation at school, etc.), meaning that both grade and the outcome are influenced by the same unobserved factors (like motivation and skills).

Note that we do not use weights in equation (2) since equation (2) is not meant to provide a representative outcome at the school level, but instead it measures the impact of actual participation and spillover effects of the programme.[32]

## 8.2. Results

Again results are displayed by the three categories: knowledge, attitude and behaviour. As before, unintended effects indicators form the fourth category. Results of both regressions (1) and (2) for both the base- and endline data are displayed in Table 7, and the findings for the two rounds are jointly discussed below the table. Annex VIII displays the results for both regressions of each separate component of the indices for the endline survey. Note that for all regressions the sample size equals 279, the total balanced sample size[33].

[32] We do not use weights in equation (2) because of the discrepancy between the assigned and actual treatment status. If we did use the weight in equation (2) the students who were not supposed to participate but actually report to have participated would have a larger weight in determining the coefficients for participation than the students who were supposed to and actually did participate. This is due to the fact that the weight of participants is smaller; i.e. we sampled to have a 50-50 division between the spillover and participant group but the actual division in schools is in favour of the spillover group.

[33] The sample size by treatment status is as follows: D4L-only n=60; DAKU & D4L: n=120; D4L spill.: n=27; D4L part.: n=33; DAKU & D4L spill.: n=42; DAKU part.: n=15; D4L part.: n=19; DAKU & D4L part.: n=44.

Notes: Standard errors given in brackets. Regressions are estimated with age and gender as covariates. For ITT school level (equation (1)), observations are weighted proportional to the inverse of the probability of being included in the sample due to stratification. Standard errors are corrected for clustering at the school level. * p-value<0.10, ** p-value<0.05, *** p-value <0.01.

## 8.3. Knowledge

This subsection discusses the results for the knowledge indicators as reported in Panel A of Table 7. At the school level (ITT), students from the D4L-only schools have not seen a significant improvement in their SRHR knowledge compared to the comparison school for any knowledge indicator except for their HIV/AIDS knowledge. At the endline students of the D4L-only schools score almost 1.5 points (or 23%) higher than the comparison students (c.p.). At the student level (ATET), participants of D4L show a 2.5 point higher score (or 38%) in their HIV/AIDS knowledge compared to comparison students. We do not find any significant effect for the spillover group. The D4L participants show a higher score in their contraceptive knowledge at the endline of 0.2 points (42%), but show a lower score in their STI knowledge score of 0.46 (79%) compared to the students in the comparison schools. Note that the educate component of D4L is relatively short (2 hours) and it focuses exclusively on HIV/AIDS. Therefore, we do not expect to find any impact of D4L on other indicators than HIV/AIDS knowledge and attitude.

Due to the more comprehensive nature of DAKU and the fact that students can follow both programmes in DAKU&D4L schools, we expect the results on students SRHR knowledge to be bigger for these students and schools. Indeed, almost all knowledge indicators show a significant impact of the intervention. At the school level, HIV/AIDS knowledge scores are 42% at baseline (32% at endline) higher compared to the comparison group; STI knowledge scores are 71% (77%) higher. Looking at the student level, it becomes clear that the impact of the intervention mainly stems from DAKU-only and DAKU&D4L participants: DAKU-only participants know significantly more about STIs and contraceptive methods, and are more aware of their right to be informed about SRHR issues compared to the students in the comparison schools. Participants in both DAKU and D4L show the most impact of the programmes on their knowledge scores, especially on the scores on HIV/AIDS and contraceptive knowledge. As with participants in D4L-only schools, D4L-only participants know significantly more about HIV/AIDS (34% at the baseline) but we do not find a significant impact on other aspects of SRHR knowledge for this group (as expected). Note that students participating only

in D4L did not learn about other SRHR related issues from their classmates participating in DAKU (and potentially also in D4L). Hence, neither D4L nor DAKU succeeded in activating students to inform their peers about SRHR issues.

## 8.4. Attitude

Panel B of Table 7 shows the results on attitude indicators. For the D4L schools, we did not find any significant impact of D4L on any of the attitude indicators.

The effects of the programmes on attitude are larger in schools implementing both DAKU and D4L. At the school level, students in DAKU&D4L schools score significantly higher on both the statement 'HIV/AIDS patients should have the same rights' (26-68%) and 'In my opinion, being attracted to someone of the same sex is ok' (150% at baseline) than the students in the comparison schools. Even so the acceptance of homosexuality is only 20% in the DAKU&D4L schools at the baseline and only 12% at the endline. At the student level, it is participants in either or both programmes who score higher than comparison students. However, the effects are larger at the baseline than at the endline. An explanation for the low rate of acceptance of homosexuality could be that YPI focuses its efforts more on HIV/AIDS with a medical approach (as the founders of YPI are medical doctors), while discussions about gender have received less attention during the programmes.[34]

Regarding the students' attitude towards GBV, we find a significant coefficient at the endline for the participants of both DAKU and D4L. However, this finding is driven by a reduction in the score of the comparison school students rather than by an increase in the score of the programme participants. Hence, we cannot talk about an effect of the programme in this case.

No spillover effects for any of the attitude indicators were found.[35]

## 8.5. Behaviour

With respect to the behaviour indicators reported in Panel C of Table 7, in the D4L only schools, neither school nor participant effect of D4L was found on the two behaviour indicators. We found mixed results for the schools implementing both DAKU and D4L. On the one hand, significant positive effects of the programme are found for DAKU-only participants for 'consultation of a clinic for SRHR related matters'. For D4L-only participants a significant positive effect is found on the statement 'with some of my friends we talk about intimate relationships and sex'. At time of the baseline, spillover students score higher for the discussion indicator, but significantly lower for the consultation indicator compared to comparison students. No impact on behaviour is found for students participating in both programmes.

## 8.6. Attribution of effects

In addition to the regression results, we can utilize the result chain of the project to assess whether the observed effects in SRHR knowledge, attitude and behaviour can be attributed to the YPI project.

[34] This explanation was offered by Rutgers WPF.

[35] Note that for a spillover effect to take place the impact of the programme on the participants also has to be significant because it is argued that the impact of the programme reached the 'spillover' group through the programme participants.

In essence, the output of the project is that the participants of DAKU and D4L are trained on different types of SRHR related issues, for example HIV/AIDS has been discussed at the school. Then the outcomes are that, for example, the students are more knowledgeable about HIV/AIDS. The outcomes of the project were already discussed above.

Turning to the outputs, we measured the exposure to SRHR topics in the endline survey: students were asked whether they have learned anything about a number of SRHR related topics in school related activities during the past school year.[36] In principal, students could have learned about these topics for example in biology class or via another SRHR programme as well. But due to the DAKU and D4L programmes we expect that participants of the programmes indicate higher percentages with the relevant topics.

Table 20 in Annex VI shows the results: students from DAKU and D4L schools indicate to have learned more about each listed topic during the past school year than comparison schools, differences being significant for half of the topics.

However, in schools implementing on D4L, students report significantly higher percentages compared to the comparison group for only 2 out of the 12 topics ('feel part of a group of young people' and 'dance and party for a good cause'). What is surprising is that the percentage of students that indicate to have learned about HIV/AIDS related issues is not significantly different from the comparison group ('know more about (your) sexual and reproductive health and HIV/AIDS issues'; 'how to discuss sensitive issues such as sexuality and HIV/AIDS' and 'not stigmatize/ discriminate people living with HIV/AIDS'). This finding is also in line with data from the qualitative survey, where students indicated to recall little about the 'educate' component that lasted for only about 2 hours. Students mostly remembered D4L for its dancing activities.

In schools implementing both DAKU and D4L, the percentage of students indicating to have learned about HIV/AIDS and sexuality issues (the 3 questions mentioned above) is significantly higher for all three questions compared to the comparison group. In addition, significantly more students in these schools indicated to have learned about topics related to social activities ('feel part of a group of young people' and 'dance and party for a good cause') and learning about rights related to SRHR.

Hence, these findings support the claim that changes in the outcome variables can be attributed to DAKU and D4L in the schools participating in both programmes, but the findings are less favourable for the D4L only schools.

## 8.7. Unintended effects

With respect to the unintended effects of the SRHR programmes, the results indicate that more students in treatment schools engaged in sexual activities (e.g. holding hands, kissing and hugging) compared to students in comparison schools controlling for age and gender of the students. In D4L-only schools, students engaged on average in a one level higher order activity, meaning that while the comparison group was on average at the 'holding hands' and 'embrace and cares level, students in D4L-schools were at the 'embrace and cares and 'kiss' level. In DAKU&D4L schools, the spillover

[36] Given that we look at self-reported indicators, maybe it is better to think about these indicators as intermediate outcomes.

and DAKU-only students were similar in terms of the average level of sexual activity they have experienced. In the same schools, students who participated either only in D4L or both in DAKU and D4L, again experienced a one level higher order of sexual activities than the comparison group (just like the D4L participants in the D4L-only schools).

This is a controversial finding. It is important to emphasize that this finding in itself does not imply that DAKU and D4L encourage sexual activity. There could be a number of other possible explanations for this finding. These are:

- **Selection-effect at school level:** DAKU and D4L are implemented in more liberal schools. The fact that the school leadership is willing to implement DAKU and D4L may be a sign of that. However, we also observe that both public and Muslim private schools are participating in the programmes
- **Selection effect at student level:** Students who have more experience in intimate partner relationships are more interested to participate in DAKU and/or D4L (self-selection), and/or they are more likely to recall that they have participated in these programmes because the content of the programme is more relevant for them.
- **Effect on openness:** Students participating in DAKU and/or D4L are more willing to admit their sexual behaviour as discussing sexual activities become less of a taboo for these students.
- **Nonlinear age effects:** As mentioned before, the students in the comparison schools are on average almost a year younger than the students in the treatment schools. In the regression analysis, we control for age using a linear trend. However, it is possible that around the age of 16-17 years students start to engage in intimate partner activities at a higher order than a linear trend would predict. Hence, the differences between the treatment and control schools may be driven by a non-linear boom in sexual activity around the age of 16-17 years.

Given our data, unfortunately, we are not able to distinguish to what extent these factors drive our findings on the self-reported sexual activity of the students.

## 8.8. Discussion

Our findings are in line with the literature on sexual education programmes (see section 2); we also find that the DAKU and D4L programmes were effective in educating students about SRHR knowledge. Similar to the literature, students participating in DAKU and D4L still did not perform very well on the SRHR knowledge test. For example, in our sample they only answered on average about 9 of 17 (53%) HIV/AIDS related questions correctly. This is nonetheless better than the score in the comparison schools (38-39%). However, we can conclude that DAKU and D4L could improve on the delivery of the SRHR information to students.

Regarding the delivery of the project material, we have to note that YPI only trains the teachers at the participating schools on teaching the DAKU programme. These teachers at the school are responsible for implementing DAKU for the students. Therefore, based on the data, we believe that more effort should be taken by YPI to train teachers on how to effectively deliver the material of the

DAKU programme.[37] With regard to D4L, our data suggest that this programme could also improve on its effectiveness, for example by a longer education component.

# 9. Evaluation question 3: Relevance of changes

This subsection will answer evaluation question 3: What is the relevance of these changes? In particular we look at the size of the impact, the representativeness of the sample, if the project addresses an important issue for the beneficiaries, and the satisfaction of beneficiaries (self-reported impact).

## 9.1. The size of the impact

As expected, the size of the impact is bigger for the DAKU-only and DAKU&D4L participants than for D4L-only participants. No substantial spillover effects are found. In relative terms, the size of the impact on the knowledge level is moderate to high, especially on HIV/AIDS (increase 34 to 52% compared to the comparison group) and STI knowledge (increase of 63 to 130% compared to the comparison group). With respect to attitude, the size of the impact is marginal for students in D4L-only schools, but more substantial for participants of any of the programmes in DAKU&D4L schools. No clear effect of the programmes was found on behavioural indicators. Though the size of the impact (in percentage improvement compared to the comparison group) is substantial for about half of the knowledge and attitude indicators, there is room left for improvements in students SRHR knowledge and attitude; the overall scores at the endline are not yet close to reaching their ceiling score of 100% score as discussed above.

Related to the issue on the magnitude of the project impact, is the question whether the project activates students to inform others about SRHR in their school and/or community. Actively passing on the D4L information and core messages is a particular aspect of the D4L project. For this reason, some specific questions about the activation of students were asked to the participants of DAKU and D4L. Of course, no data from comparison schools could be selected since the questions are programme specific. In particular, the following outcome indicators are used:

- Percentage of students who like to share with other that they are involved in DAKU and/or D4L
- Percentage of students that do tell others that they are involved in DAKU or D4L
- Percentage of students that see themselves as an agent of change (D4L term)

The results are displayed in Table 8.

[37] Rutgers WPF confirmed this finding stating that, especially, additional training on value clarification is very much needed. Before DAKU is implemented teachers have to attend several trainings to increase their skills in: (1) computer using, (2) SRHR knowledge; (3) mastering DAKU module incl. micro teaching. However, as indicated by some teachers during a workshop on CSE, there were not enough rooms for value clarification exercises, especially on gender and sexual orientation, SGBV, and right-based approach. Please note, however, that DAKU is no longer supported under MFS II due to the introduction of the new programme SETARA.

**Table 8: Dissemination of programme participation and messages**

| School type | D4L-only | | DAKU&D4L | |
|---|---|---|---|---|
| **Student type** | D4L | DAKU | D4L | DAKU&D4L |
| **Sample size** | [n=25] | [n=14] | [n=16] | [n=43] |
| Percentage of students who like to share with other that they are participating in DAKU and/or D4L | 60.0% | 71.4% | 62.5% | 86.1% |
| Percentage of students that do tell others that they are involved in DAKU or D4L | 1.9% | 1.4% | 2.3% | 1.3% |
| Percentage of students that see themselves as an agent of change | 28.0% | 14.3% | 31.3% | 32.6% |

Source: Student endline survey E12, MFS II Evaluation Indonesia

The results show that at least one third of the participants would like to share their participation in the programme with other students. Though, only around 2% indeed tell other people about their involvement, probably due to the high social taboo on SRHR related issues. D4L has the specific aim to make students 'agents of change', meaning that students believe they can contribute in changing the world around them. About 24-33% of the participants in D4L indicate that they see themselves as agents of change.

## 9.2. Representativeness of sample

The results of the current study give us useful information about youth aged 14-19 years old in the targeted areas in which YPI is working; i.e. urban areas in Indonesia with high HIV/AIDS prevalence rates.

We compared some of our statistics to the general statistics of Indonesian youth to see how close we are to a representative sample (see Table 25 in Annex IX). The DHS 2007 and 2012 surveys[38] included a young adult sexual and reproductive health survey (IYARHS). We compared the data for the appropriate age group from these surveys to our baseline sample data and concluded the following:

- The knowledge level about HIV/AIDS for students who have answered these questions seems to be a bit lower in our sample. Looking at the IYARHS 2012 sample only, knowledge levels are more similar, especially to our treatment sample.
- The attitude about virginity before marriage is the same in both samples.
- Cigarette, alcohol and drugs use is comparable for our and the IYARHS 2012 sample.
- Slightly more respondents (around 10%) in our sample ever had a boy-/girlfriend than in the IYARHS 2012 sample. The percentage of respondents who currently have a boy-/girlfriend is the same for both samples.
- Sexual activity (held hands, kissed lips, touched/aroused) is lower in our sample than in the IYARHS 2007 sample (around 10%). The percentage of respondents who ever

[38] Demographic and Health Surveys (DHS) are nationally-representative household surveys conducted in various countries that collect data in the areas of population, health, and nutrition.

had actual intercourse is comparable between the IYARHS 2012 sample and our sample.

- A smaller fraction of the respondents in our sample have heard about different contraception methods than the respondents of IYARHS 2007. Only looking at knowledge of the diaphragm as well as emergency contraception, our sample is more informed.
- The respondents in our sample are only slightly less aware that a condom can prevent pregnancy and STI transmission than in the IYARHS 2012 sample.

Hence, our sample is representative when it comes to premarital attitude, relationship behaviour, knowledge about condoms as well as experience with drugs/alcohol. Looking at HIV/AIDS knowledge levels, activities with the boy/girlfriend, as well as awareness about different contraception methods, students in our sample display lower rates.

## 9.3. Does the project address an important issue for the beneficiaries?

According to Rutgers WPF, the project addresses an important issue for high school students who are the beneficiaries of the programmes. We have also argued throughout the report the importance of SRHR information for the targeted beneficiary group in order to prevent risky sexual behaviour among them.

Students also agree that the project addresses an important issue for them. For example, at the endline survey, almost 80 per cent of the students, including the comparison group, indicate that they want to learn more about 'How to protect yourself from HIV/AIDS and other STIs' and 'How to know if you have HIV/AIDS or other STIs'. In the qualitative study all students indicated that 'HIV/AIDS issues are an important issue for youths when specifically asked about this issue. As one student mentions "It is better to explain [about sexual activities] rather than hide that from young people, so that they will not try it out".

## 9.4. Satisfaction of beneficiaries (self-reported impact)

To assess the satisfaction of the beneficiaries with the project, we asked the students to indicate to what extent DAKU and/or D4L had an effect on their live. We tried to measure this in two different ways.

First, we asked them to mention 3 aspects of the programme that affected their lives. From the respondents that answered this question (n=109), a large amount reported that the project increased their knowledge about reproductive health (28.5%) and their awareness of HIV/AIDS (16.5%), in particular on how to prevent infection (4.5%). Some respondents mentioned an increased knowledge about how to protect yourself in a relationship (i.e. how to practice 'safe dating' and how to distinguish between good and bad relationships) (6.5%), how to live healthier lives (7.5%) and a better awareness of what the general concerns of their peer group are (5.5%). Moreover, some respondents reported that the project had made them adopt a more positive attitude towards life in general (9%) and towards themselves (4.5%). It had also taught them to have more respect and tolerance for others (5.5%), in particular for people with HIV (2%) and women (1%).

With respect to behaviour, some respondents indicated that the project(s) had caused them to be more careful when in a relationship (5.5%), to avoid sexual actions before marriage (5.5%) and to self-reflect about negative actions undertaken in the past (1%). 4.5% of the respondents mentioned that the programme caused them to help others by sharing information with them. Only 3 respondents (3%) reported that the project had had a negative effect on their lives: 1 of those respondents said that he/she had become "scared of sex" due to the programme, and the other 2 said that the programme had "destroyed their lives". One last respondent reported that the project had had no effect on his/her life at all.

Second, we asked the students to indicate on a scale from 1 to 5, where 1 is no effect, how big the impact of the programme was on their life. Note that the sample size is quite low, due to many 'don't knows' of the students. For those students who did know what to answer, the reported effect averages between 2.8 and 3.4. No clear distinction between the programmes is found.

**Table 9: Self-reported impact of the programme**

| **School type** | **D4L-only** | | **DAKU&D4L** | |
|---|---|---|---|---|
| **Student type** | D4L | DAKU | D4L | DAKU&D4L |
| **Sample size** | [n=14] | [n=10] | n=7] | [n=34] |
| Effect programme on live students | 2.9 | 3.3 | 3.4 | 3.3 |

Source: Student endline survey E12, MFS II Evaluation Indonesia

# 10. Evaluation question 4: Efficiency of project

This subsection will answer evaluation question 4: Were the development interventions of the Southern partner organizations efficient? To answer this question we will describe the cost effectiveness of the programme. First, the calculation of cost per beneficiary is discussed. Second, these costs are compared to the project effects per beneficiary. Finally, the obtained unit costs are compared to costs of similar projects (benchmark).

## 10.1. Costs per beneficiary

A first step to estimate the cost effectiveness of the programme is to calculate the project cost per beneficiary. To collect this information, we conducted a structured interview with the project manager and programme officers of YPI on 13 March 2014 using the 'budget survey' as described in section 5.1 In addition, we consulted relevant reports of YPI: Annual report (2010; 2011; 2012); Project financial statements (2011); Semi-annual expenditures report (2012; 2013). Hence, the cost figures are based on actual expenditure data. A follow-up interview with YPI was conducted on 26 June 2014.

Regarding the source of funding for the evaluated programmes implemented by YPI (DAKU and D4L), we learned that both programmes are funded by MFS II. However, D4L is not funded by Rutgers WPF

but Dance4Life, another SRHR Alliance member.[39] Regarding DAKU, Rutgers WPF has funded DAKU between 2007-2011 prior to the evaluation. The funding for DAKU has officially stopped by 2012, however, unspent budget from previous periods have been used to fund DAKU activities in 2012 and even 2013.

Table 10 gives a summary of the collected information and the estimates of the costs per month per beneficiary for the years: 2011, 2012 and 2013. Information on 2014 was not yet available at the time of the interview.

Note that despite the fact that D4L is not funded by the YPI project of Rutgers WPF, the cost per beneficiary is calculated for DAKU and D4L separately because D4L was implemented in all sampled treatment schools.[40]

The table reports the total costs spent on the DAKU/D4L project during the given period in Indonesian Rupiah (IDR) (column 1) and euros[41] (column 2), the percentage funded by the Co-Financing Agency or CFA (Rutgers WPF) under an MFS II contract (column 3) and the number of students participating in DAKU/D4L (beneficiaries) during the given period (column 4). The cost data are obtained from financial reporting of YPI to Rutgers WPF and include all costs of YPI related to the project, but not the cost of the CFA. Data on the number of beneficiaries is obtained from the output indicator form as reported to Rutgers WPF. Only direct beneficiaries (participants of DAKU/D4L) are included in the count. Indirect beneficiaries reached through the direct beneficiaries (spillover), social media and DAKU exhibition (campaign) are not reported. Hence, not all project costs can be linked to the students directly benefiting from the programme. However, we do not separate these costs. Also additional costs at the school are not taken into account.

[39] The funding for D4L runs through Rutgers WPF, however, the source of funding is Dance4Life. This has led to the confusion regarding the content of the YPI project.
[40] The evaluators were not aware at the time of the baseline period that D4L was not funded by Rutgers WPF.
[41] Unfortunately, we do not have information about the exchange rate used for the project. Instead we use the annual average exchange rate from http://www.oanda.com/currency/historical-rates/. The exchange rates used are 12,264 IDR/EUR in 2011, 12,087 IDR/EUR in 2012 and 13,923 IDR/EUR in 2013.

**Table 10: Overview of the costs and number of beneficiaries**

| Year | Total costs [IDR] | Total cost [EUR][1] | Percentage of costs funded by CFA | Number of beneficiaries (students) | Cost per beneficiary per year [IDR] | Cost per beneficiary per year [Int$ 2011][2] |
|---|---|---|---|---|---|---|
| **DAKU** | | | | | | |
| 2011 | 112,333,163 | 9,159.59 | 100% | 291 | 386,025 | 107.03 |
| 2012 | 231,402,836 | 19,144.45 | 100% | 315 | 734,612 | 202.02 |
| 2013 | 155,294,453 | 11,153.81 | 100% | 135 | 1,150,329 | 312.40 |
| **D4L** | | | | | | |
| 2011 | 127,420,000 | 10,389.76 | 0% | 3,064 | 41,586 | 11.53 |
| 2012 | 177,574,000 | 14,691.08 | 0% | 2,930 | 60,605 | 16.67 |
| 2013 | 124,295,980 | 8,927.38 | 0% | 2,041 | 60,900 | 16.54 |

Sources: Budget Survey 2013 and project documents.

Notes:

1. Annual average exchange rate is used. Data is obtained from http://www.oanda.com/currency/historical-rates/
2. PPP conversion factor to 2011 international dollars is calculated using the World Development Indicators: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#.

As mentioned in section 3.2, in the participating schools, DAKU is implemented by school teachers and not directly by YPI. Teachers received compensation from YPI per DAKU module (50,000-75,000 IDR/module).[42,43] This is included in the project costs.

Every year, different students participate in both DAKU and D4L. Therefore, the value of cost per beneficiary can be calculated on a yearly basis, dividing the total costs per year with the total number of student participants. This is reported in the column 5 of Table 10 in IDR, while in the last column the value in international dollars (Int$) is displayed. International dollars at 2011 prices[44] are used for the cost per unit calculation because it takes both purchasing power parity and inflation into account that would not be the case if we reported the unit costs in euros. Hence, using Int$, the costs can easily be compared across time and countries.

We calculate that the cost of DAKU was 202.02 Int$/student in 2012 (the year of the baseline survey), while it was 107.03 Int$ in 2011 and 312.40 Int$ in 2013.

The higher DAKU project costs in 2012 and 2013 are partially due to the training activity for teachers that did not take place in 2011. However, it has to be noted that trained teachers will be able to teach DAKU for multiple years if the school decides to continue implementing DAKU. However, out

[42] In total, there are 15 modules of DAKU.

[43] Since the funding for DAKU has stopped, the schools have to implement DAKU on their own account and on a voluntary basis in the future.

[44] The following exchange rates are used based on PPP conversion factor using the World Development Indicators: 3,606.57 IDR/Int$ in 2011, 3,636.38 IDR/Int$ in 2012, 3,682.25 IDR/Int$ in 2013 and 4,530.90 IDR/Int$ in 2014. Source: http://databank.worldbank.org/data/views/variableSelection/selectvariables.aspx?source=world-development-indicators#

of 26 schools trained on the computer-based DAKU between 2007 and 2012, only 3 schools were still implementing DAKU in 2014 (these schools are also part of our sample).

Despite its shortcomings, for the cost-benefit analysis we will use the cost per beneficiary reported for 2012 for both DAKU (202.02 Int$) and D4L (16.67 Int$).

## 10.2. Cost-benefit

As the next step, the unit costs of the project are compared to the benefits derived from the project. Given that it is difficult to monetize the benefit of increased SRHR knowledge, instead of directly comparing costs with benefits, we resort to indicating the achievements that we have attained using 1 Int$.

The results are displayed in Table 11 separately for DAKU (for students participating only in DAKU), DAKU and D4L and D4L only. Only significant effects are reported using the endline data (medium term effects) as reported in Table 7.

**Table 11: Benefits of DAKU and D4L per 1 international dollar at 2011 prices (percentage increase in outcomes)**

| CSE programme | DAKU only | | Combination of DAKU and D4L | | D4L only (in schools with only D4L) | |
|---|---|---|---|---|---|---|
| % increase in outcome indicator | Overall | Per Int$ (2011) | Overall | Per Int$ (2011) | Overall | Per Int$ (2011) |
| HIV/AIDS knowledge | - | - | 42.6% | 0.19% | 38.3% | 2.30% |
| STI knowledge | 129.7% | 0.64% | 106.3% | 0.49% | - | - |
| Contraceptive knowledge | - | - | 58.3% | 0.27% | - | - |
| SRHR information right knowledge | 26.9% | 0.13% | 17.9% | 0.08% | - | - |
| Acknowledgement of rights of HIV/AIDS patients | - | - | 34.5% | 0.16% | - | - |

Sources: Budget Survey 2013 and the student endline survey E12, MFS II Evaluation Indonesia

The results in the table should be understood cumulatively: 1 international $ spent on DAKU has contributed to 0.64% increase in STI knowledge and 0.13% increase in the knowledge of rights to information on SRHR. Spending 1 international $ on implementing both DAKU and D4L results in the combination of 0.19% increase in HIV/AIDS knowledge, 0.49% increase in STI knowledge, 0.27% increase in contraceptive knowledge, 0.08% increase in the knowledge of rights to information on SRHR and 0.16% increase in acknowledging the rights of HIV/AIDS patients to equal treatment.

## 10.3. Cost effectiveness

Unfortunately, we are not able to compare the cost-benefit of the YPI project to the outcomes of other youth sexual education programmes. However, based on Kivela et al (2011) the Synthesis team (2014) report the unit cost of comprehensive sexual education programmes to be between 1.33-17.06 Int$ per learning hour in the context of six different countries. For Indonesia, they report that the project costs were 17.06 Int$ per learning hour or 518.00 Int$ per year per student during the pilot phase of the project.

These benchmark costs are about double the costs reported for DAKU (202.02 Int$ in 2012). Assuming 30 learning hours for the 15 chapters of DAKU, the costs of DAKU were 6.73 Int$ per learning hour per student. However, this calculation may be misleading as it only accounts for the costs of YPI but not the costs incurred by the schools. Nonetheless, we can conclude that the implementation of DAKU is cost effective in terms of output units. No information is available for the efficiency of the DAKU project based on the realized results/outcomes.

Regarding D4L, if we assume a 2 hour session for each stage of D4L (four in total), D4L operates with a unit cost of 4.17 Int$ per learning hour. This is lower than the unit cost of DAKU. However, D4L addresses a large group of students at the same time, while DAKU works with smaller groups.

## 11. Contribution of Capacity Development and Civil Society

The YPI project has also been selected for the Capacity Development component of the MFS II Evaluation. Regarding the contribution of the capacity development of Rutgers WPF to YPI during the implementation, capacity development report identified three main organisational capacity changes that have been further analysed. These are a more motivated staff at YPI; the increased confidence of staff in giving trainings and in delivering SRHR information to beneficiaries; and improved reporting. The last two of these changes can be attributed to MFS II capacity development interventions of Rutgers WPF: SRHR training; training for youth friendly services; and a workshop on strategic communication, all held in 2013.

Unfortunately, the sampled beneficiaries have not benefitted from YPI's improved information delivery regarding SRHR information because they received the project interventions already in 2012. Hence, we are not able to reflect on the increased capabilities of YPI with respect to the MDG evaluation.

## 12. Conclusion

The YPI projects aims to educate junior and senior high school students about HIV/AIDS, and to increase the capacity of youth to make safe and informed decisions about their sexual and reproductive health and avoid risky sexual behaviour. Especially in countries like Indonesia where the social taboo and stigma on sexuality and HIV/AIDS issues is high, comprehensive SRHR education is important. YPI has implemented two SRH programmes in senior high schools in Jakarta. Both programmes are implemented as extracurricular programmes. The first programme is Dance4Life (D4L) and mainly aims at improving knowledge and attitude concerning HIV/AIDS issues. The other programme is DAKU, a computer-based programme covering a wide range of topics concerning youth aged 15-19 years old. In this report we tested for both programmes whether they enabled students to make more informed decisions. Quantitative panel data was collected for 279 students aged 14-19 years in 14 treatment and control schools in Jakarta.

The data shows only small changes in SRHR knowledge, attitude, and behaviour between the baseline and the endline survey. This is due to the fact that the SRHR programmes in most school were already (partly) implemented before the baseline survey. Our research methodology was

adapted to cope with this fact. In general, SRHR knowledge levels among students in the sample are low to moderate. The attitude of students towards healthy relationships, GBV, and people living with HIV/AIDS is moderate to good. The attitude towards homosexuality is unfavourable. None of the students are in favour of premarital sex. Regarding actual sexual activities, the average student report to have at most hold hands, embrace and caress, and/or kissed with their boy/girlfriends. Only 9 out of the 279 students in the sample indicate to have had sexual intercourse. Even though only a low percentage of students have engaged in sexual intercourse, the figures about student's contraceptive knowledge and intended sexual behaviour are worrisome. Moreover, the availability of SRHR services in Indonesia for non-married individuals or couples is low. Hence, the students in our sample are prone to show risky sexual behaviour (when the time comes). This study shows the high need for SRHR education programmes.

We have estimated the Intention to Treat (ITT) at the school and the Average Treatment Effect of the Treated (ATET) at the student level using repeated cross-sectional data analysis. Results for the ITT were weighted in order to make the results representative at the school level. Trends in the outcome variables in three groups: comparison, participants and non-participants were compared separately for base- and endline values. In general, the increases in SRHR knowledge, attitude, and safe sexual behaviour due to the SRHR programmes were highest for participants in DAKU or in both DAKU&D4L. D4L students showed increases in their HIV/AIDS knowledge due to the programme. Students in DAKU and DAKU&D4L show a significant impact of the intervention on SRHR knowledge for HIV/AIDS, STI, contraceptive and SRHR information rights related issues. No spillover effect of the programme on non-participants knowledge was found. The programme had a positive impact on attitude towards HIV/AIDS patients' rights and on homosexuality for participants of any programme. The SRHR interventions have not altered the opinion of students about premarital sex.

The literature review showed that in both the developed and the developing world school sexual education programs have shown to be an effective way to increase SRHR knowledge and attitude of the youth and only have limited impact on sexual activity and behaviour (intention). Hence, the findings for the YPI projects are perfectly in line with the literature.

In relative terms, the size of the impact (in percentages improvements attributable to the programme) is substantial for about half of the knowledge and attitude indicators. However, there is room left for improvements in students SRHR knowledge and attitude; the overall scores at the endline are not yet close to reaching their ceiling score of 100% score. The literature review showed that interventions similar to the YPI project report the same problem.

The ultimate goal of the whole MFS programme is to contribute to improvements on the MDG indicators. Both DAKU and D4L were selected under MDG 3: promote gender equality and empower women. The improvement on this goal was measured with the use of one uniform indicator (as set by the MFS synthesis team): index on attitudes towards GBV. D4L-participants and DAKU&D4L participants in DAKU&D4L schools showed an improvement on this indicator of about 6.2 to 7.8% due to the programmes they attended, implying that they are less accepting of GBV. While this is not a large improvement, we have to note that both programmes were not specifically designed to promote gender equality and empower women and only marginally include this issue in their

curriculum. Hence, we would not like to make any general conclusions about both programmes based on their improvements on MDG 3.

Finally, the MFS synthesis team asked to score each project along a few indicators. Table 12 displays the indicators and the scores we deemed valid for the DAKU programme, while the explanations are given below:

- **1. Design:** The YPI project has organically evolved since the launch of the DAKU programme in 2007. The project is designed in a sustainable manner: YPI transfers the know-how of implementing a comprehensive sexual education curriculum to the school teachers. Each school can decide on the timing and conditions of the implementation of DAKU in the following school years, which can result in the schools continuously implementing DAKU, recycling parts of DAKU in other curriculums or dropping the programme altogether. Therefore, there is a selection effect for the schools: only schools with progressive directors and teachers will participate in the programme. Given the social taboo and stigma on sexuality and HIV/AIDS in Indonesia, the YPI programme provides an important platform for educators open for engaging in sexuality and HIV/AIDS education and providing them with a state-of-art interactive curriculum for comprehensive sexual education. However, the role of YPI is not clear in providing feedback from the field to improve the curriculum of DAKU. Overall, we give a *grade of 8 for the design* of the YPI project due to the tackling of an important and difficult issue with a well-designed programme but note that there could be more emphasis put on the retaining of the schools in the DAKU programme for a longer period. (In addition, there has been development of new teaching materials at Rutgers WPF, which means that the 'old' computer-based DAKU is replaced by the paper-based DAKU (2013); and DAKU is replaced by SETARA, a paper-based educational tool like DAKU for junior high school students (end 2014).)
- **2. Implementation:** According to available information, the project was implemented as planned. In most years YPI has even underspent the available budget. Therefore, a grade of 9 is given.
- **3. Reaching objectives:** Unfortunately, the project has not been able to reach all of its objectives. Notably, very few students have told others about what they have learned. On the other hand, a total of 3,416 people have visited the exhibitions that presented the social activity work of the DAKU students in 2012 and 2013. For this aspect of the project we deem a grade of 7.
- **4. Attribution:** The MFS II evaluation period falls into a period of change: Rutgers WPF stopped funding for the computer-based DAKU, and Rutgers WPF was developing the paper-based DAKU in 2012 that was launched in 2013, and SETARA a paper-based educational tool like DAKU for junior high school students have been in development since 2012 and is launched in 2014. We observe that only half of the DAKU schools in our sample have received training in 2012, while the rest was already trained in 2009. Therefore, MFS II funding between 2012 and 2014 does not directly fund the impacts on the students in our sample. However, our findings can be generalized to the MFS II funding in 2012 for DAKU. We find that a large part of the changes can be attributable to the projects. Therefore, we give a grade of 8.

- **5. Relevance:** The project is relevant for the beneficiaries. However, unfortunately not all project results have been achieved. Therefore, we give a grade of 8.
- **6. Efficiency:** Compared to other projects in Indonesia, the project cost are lower for the YPI project. The project is also designed in a sustainable way. However, the retention rate of schools in the project could be improved. Therefore, we deem a grade of 8.

**Table 12: Overall project scoring**

| Statement | Score |
|---|---|
| **1. The project was well designed** | 8 |
| **2. The project was implemented as designed** | 9 |
| **3. The project reached all its objectives** | 7 |
| **4. The observed results are attributable to the project interventions** | 8 |
| **5. The observed results are relevant to the project beneficiaries** | 8 |
| **6. The project was implemented in the most efficient way** | 8 |
| Notes: Scores are on a scale of 1 to 10, with 1 being "no agreement at all" and 10 being "completely agree with statement". | |

# Annex I: Project context: results of the qualitative study

Near the end of the implementation period of the DAKU programme and Dance4Life programme a qualitative study was held with 8 students that participated in these programme(s), in order to learn more about the students' knowledge, attitudes and behaviour regarding reproductive health. A short description of the project context is given below:

As a result of the emergence of a more liberal, modern dating culture among contemporary Indonesian youth, traditional religious norms dictating that 'sex before marriage is forbidden' and 'dating is not allowed' have over recent years been renegotiated. The current norm: 'Dating is allowed, as long as the couple is not alone in a quiet place', is flexibly interpreted by the adolescents, in attempts to justify their own behaviour (by stretching the norm to mean 'as long as no intercourse is involved') or judge the behaviour of their peers, which is usually done more harshly, based on stricter traditional interpretations.

Informants reported that having sex before marriage is common among their peers, but that they themselves would never do this. However, all of them admitted to having undertaken some intimate acts with their partners ranging from holding hands to French kissing and touching. According to the male informants, boys were the ones to initiate sexual activities. Interestingly, most of the female informants argued that girls could just as well initiate, or conversely, refuse sexual acts according to their will. Even though this may possibly not correspond with what happens in reality, it at least hints at a more empowered attitude of female adolescents with regards to the recognition of their sexual rights and ability to decide within their relationships.

According to our informants the most pressing sexuality issues experienced by adolescents are unwanted pregnancies outside of marriage and HIV infection. Almost all of the informants agreed that it is important for them and their peers to receive information about safe relationships, condoms and other contraceptives, and HIV/AIDS issues.

At the time they were interviewed most informants were aware that HIV/AIDS is a deadly virus/disease that is incurable, and knew about the ways in which the HIV virus is transmitted and how transmission can be prevented. The informants also seemed to know the purpose of using a condom – to protect against pregnancy and HIV infection - fairly well. Nevertheless, most of them had never actually seen a condom and did not know how to use it correctly. A point of concern are the myths, false beliefs and negative attitudes regarding condom use and safe sex in general, which still persist among the informants and could act as impediments to young peoples' willingness or ability to refrain themselves from risky sexual behaviour.

Even though some ambiguity could be detected in the responses of the informants, they generally displayed a positive attitude towards HIV/AIDS infected people, expressing their support and stating that they think it is important not to alienate them. They are also aware that people with HIV/AIDS have the same rights and should be treated in the same way as healthy people. Attitudes towards homosexuals were far less positive, with some of the respondents expressing strong negative feelings and others having a reserved attitude at best, saying that, even though they would not ignore gay people, they would still keep their distance.

# Annex II: SPO and project description

### *YPI*

Pelita Ilmu Foundation[45] (YPI) is a non-governmental, non-profit organization established on 4 December 1989 in Jakarta by two medical doctors. YPI provides SRHR education and services focusing on HIV prevention, voluntary counselling and testing (VCT), health services, and support for PLHIV (people live with HIV-AIDS). As the ultimate mission, YPI wants to develop an independent, productive and healthy community and access to health services by focussing its services on treatment and prevention, testing and counselling, and supporting PLHIV. The primary focus group of YPI are young people, women and marginalized groups (PLHIV, street children). YPI has established 7 base camps in the provinces of Jakarta, West Java and Banten. YPI collaborates with NGOs in areas across Indonesia and with international partners. Presently, YPI is supported by 30 staff members and 142 (trained) volunteers.

In general, YPI has four programmes: HIV/AIDS Prevention Programme (including DAKU and D4L), Counselling Programme, HIV Testing and Health services, Community Support Programme for People Living with HIV-AIDS, and Communication and Development Programme. Issues reached by the different programmes are for example preventing the HIV transmission in the community, preventing unsafe abortion, preventing under-age drug involvement, provide basic treatment in relation to HIV/AIDS, drugs or reproductive health, providing a home (shelter) for people with HIV, and of course education programmes like DAKU and D4L. Figure 2 summarizes the time frame of the project.

### *DAKU*

As described in the main text, DAKU is a school based SRH Education programme, targeting senior high school students. Most schools need one semester to complete the 15 topics (like SRH, HIV prevention, sexual abuse) of the DAKU module, which means a commitment to follow the programme for 2 hours a week. Due to the need of a computer only a few students are able to participate in the programme.

However, early 2012 Rutgers WPF carried out a pilot with a printed version of the DAKU programme in two schools. This version allows DAKU to reach far more students per school and it can be implemented in a more flexible way, for example by moving the discussion out of the computer lab to the school garden. Until now, DAKU has been an extracurricular subject, but efforts are made to accept the module as an intracurricular subject (one such effort is the introduction of the paper-based version).

It has to be noted that YPI and other implementing NGOs only provide training for the teachers at the schools. The implementation of DAKU is left for the schools: it is up to the school to incorporate DAKU into their extracurricular schedule, leaving the actual implementation of DAKU far from identical among the schools. YPI meets with the implementing teachers every semester to discuss issues and exchange ideas related to DAKU.

[45] Source: YPI Semi Annual Report Jan-June 2012

Between 2007 and 2013, YPI has trained 26 schools on the computer-based DAKU and 12 schools on the paper-based DAKU. In principle, YPI trains teachers once and they can implement DAKU multiple times in the following years. However, only a few of these schools are still implementing the programme. According to YPI, schools often drop out of the programme due to no space for DAKU in the curriculum; due to the arrival of a new, more conservative principal at the school; or due to the DAKU teacher leaving the school.

Returning to the DAKU trainings, in February 2012, YPI trained 9 schools (14 teachers) on the computer-based DAKU, while in May 2013 12 schools (19 teachers) were trained on the new paper-based version of DAKU. In both cases the trainings lasted for 4 days, focusing on SRHR training and DAKU training. Unfortunately, due to budget concerns, the training did not explicitly address computer skills and facilitation skills.[46]

So what topics are covered by DAKU? The DAKU programme has been made specifically for the Indonesia context. The programme is based upon the comprehensive school-based sexuality education programme from Uganda: 'The world starts with me' (WSWM). The WSWM is targeted to secondary school students (age 12-19) in Uganda and is a voluntary extra-curricular computer-based programme, though the programme could also be done without a computer. It has been adapted to Indonesian circumstances with the use of Intervention Mapping. Some adjustments to the WSWM programme were made, but in the end most of the content stayed the same. One adjustment is worth mentioning: the 'condom demonstration' was not adopted, but replaced with a referral to another organization which provides condom demonstrations. In addition, the message was added that sexual activities preferably take place within the marriage (Leerlooijer et. al, 2011).

DAKU covers 15 modules in total:

1. The World Starts With Me
2. Emotional ups and downs
3. Is your body changing too?
4. Friends and other relationships
5. Boys and Girls, Men and Women
6. Fight for your rights
7. Sexuality and love
8. Pregnancy: 4 Girls and 4 Boys
9. Protect yourself: STIs & HIV/AIDS
10. HIV/AIDS: U have a role 2 play 2
11. Young people and drug abuse
12. Love shouldn't hurt
13. Your future, dreams and plans
14. My top peer book
15. Exhibition

[46] Please note that these trainings were conducted from remaining funds from the previous contract between Rutgers WPF and YPI.

### *D*4L

While the DAKU programme has been made specifically for the Indonesia context, D4L is an international and more or less universal programme. Like DAKU, D4L is an extracurricular programme as well. However, here the implementation takes about a year, and D4L is suitable for younger students (from age of 10) as well. Therefore, in addition to senior high schools, junior high schools also participate in D4L. The programme consists of four stages are in sequence:

- Inspire: facilitators motivate students to learn about SHR.
- Educate: with the help of dance and music D4L educates the participants about SHR.
- Activate: in this stage students are asked to create attractive and creative activities to motivate or educate other students or raise money to spread for D4L.
- Celebrate: in December students celebrate World AIDS day together with other students from more than 30 countries with mainly dancing and music.

Despite the lengthy implementation of the project, the actual activities cover much less time. In particular, the education component of D4L takes only about one 2 hour session in total.

YPI is one of the three NGOs implementing D4L in Jakarta since 2010.[47] In the case of D4L, it is the trainers of YPI (YPI volunteers) who conduct the 'inspire' component of the programme, and also conduct the 2 hour education session on HIV/AIDS related issues. However, the 'activate' and 'celebrate' components are implemented by the school teachers. Often more schools celebrate World AIDS day together.

YPI has implemented D4L in 11 schools in 2010, in 19 (11 old and 8 new) schools in 2011, in 30 (19 old and 11 new) schools in 2012, and 19 (13 old and 9 new) schools in 2013. To select schools for D4L, at the beginning of every school year, YPI discusses with the schools whether they are interested in implementing D4L. Some schools drop out because the teachers or the principal is not any more interested in implementing D4L. In this case, students of such schools can still follow D4L activities through social media.

### *Activities: realized versus expected*

The MFS II project has three objectives. Firstly, it aims to increase the quality in the delivery of Comprehensive Sexuality Education (CSE). Secondly, it aims to increase the utilization and quality of comprehensive SRH services. Thirdly, it aims at education the youth about SRHR. YPI aims at reaching its goals by means of funding and implementing certain activities. Yearly plans are made to reach these goals. With those activities YPI wanted to improve SRHR education programmes, increase the knowledge of existing CSE teachers, train new educators, have 3,000 young people participated in CSE programmes, and have reached another 3,000 people by SRHR awareness raising activities. The following activities were set for 2011:

- Rewriting the SRHR education programme to improve quality.
- Organising training session for 20 new educators and 20 educators to improve their knowledge on how to teach CSE.

[47] The other two NGOs are PKBI and PMI.

- Organising CSE sessions for students in selected schools.
- Organising training session to health service providers to improve their knowledge on SRH.
- Involving community members and leaders in organising SRHR awareness activities and.
- Organising awareness raising activities at the community level.
- Organising activities to link partner organisations to relevant networks.
- Drafting and implementing advocacy strategy and advocacy work plans on SRHR for partner organisations.
- Organising activities to have alliance members get in touch with policy makers at the national level.

### *Outputs*

The following targets were set for 2011:

- Improved SRHR education programme on quality standards of CSE.
- 20 new educators trained to deliver CSE, and 20 educators with improved knowledge to deliver CSE.
- 3000 young people, women and men have participated in CSE.
- Service providers trained to deliver SRH services.
- 3000 people reached by SRHR awareness raising activities.

### *Outcomes*

Firstly, the CSE programme implemented by the trained educators increases the capacity of young people to make safe and informed decisions related to their SRH. Secondly, the trainings for the service providers will improve their standards for youth friendly services, which will increase the satisfaction of young people with the SRHR services. Further, engaging community members in SRHR activities will increase the acceptance of SRHR at the community level. Finally, the networking and lobbying activities of YPI and other alliance members will contribute improved SRHR policies and legislation.

# Annex III. Overview outcome indicators indices

This Annex provides a detailed description about the used outcome indicators. In addition, it shows the variables which were used to construct the knowledge and attitude outcome indicator indices.

### *Knowledge*

As the baseline report lays out, misconceptions about sexual and reproductive health are widespread among the students (for example, almost all students think that AIDS is a disease that you get if you have sex with a lot of people).

For knowledge 4 indexes were created. The index is constructed by giving every right answer to a particular question a score of 1, every wrong or 'don't know' answer scores 0. For every index it is thus the case that the higher the score, the better the knowledge level of the student. In particular, the following indexes are used:

- **Index on HIV/AIDS knowledge (scale 0-17):** containing 17 questions about what HIV is, questions about the ways to conceive HIV, and questions about the ABC-method.:
  - Know what HIV is: students were asked via a multiple choice question what HIV is. Five answers were possible of which only one was right.
  - Know what AIDS is: students were asked via a multiple choice question what AIDS is. Five answers were possible of which only one was right.
  - Belief about possibility of getting cured from HIV/AIDS: students were asked if it is possible to get cured from HIV/AIDS.
  - Belief about possibility for healthy looking person to have HIV/AIDS: students were asked if it is possible for a healthy-looking person to have the HIV/AIDS virus.
  - Misconceptions about HIV/AIDS: students were asked to indicate for 6 cases whether it is possible to transmit HIV/AIDS or if a certain action reduces the chance of contracting the HIV virus. Each of the cases should be answered negatively to be correct. For every right answer the student received one point. The following misconceptions were used:
    - People get the HIV/AIDS virus by sharing food with a person who has HIV/AIDS
    - People get the HIV/AIDS virus by hugging and kissing on the cheeks with a person who has HIV/AIDS
    - People get the HIV/AIDS virus from mosquito bites
    - People get the HIV/AIDS virus because of witchcraft or other supernatural means
    - The chance of contracting the virus causing HIV/AIDS is reduced by not touching public toilets
    - The chance of contracting the virus causing HIV/AIDS is reduced by avoiding sick looking people
  - Knowledge about ways to contract HIV: the same structure for the questions is used as with the misconceptions, though here the correct answer is to indicate that with this method it is indeed possible to transmit HIV or increase the chance of

contracting the virus. For every right answer the student received one point. The following statements were used:
    - People get the HIV/AIDS virus by sharing razors or tooth brushes with a person who has HIV/AIDS
    - People get the HIV/AIDS virus by having oral sex with a person who has HIV/AIDS
    - The virus that causes HIV/AIDS can be transmitted from a mother to a child
  - Knowledge about ABC-method (abstinence, being mutually faithful, always using a condom). For every right answer the student received one point.
  - Knowledge about condoms protecting HIV/AIDS. This variable shows the percentage of students who have heard that the condom can safely prevent HIV/AIDS and other STIs.
- **Index on knowledge about counselling (scale 0-2):** this index tests if students know about counselling and if yes, were to go to for a consultation.
  - Knowledge about HIV/AIDS test preceding counselling. Students were asked if they 'know about voluntary HIV test preceded by counselling'.
  - Knowledge about a place where to get consultation and HIV/AIDS testing. Students were asked if they 'know where you can get consultation and HIV/AIDS testing'.
- **Index on other STI knowledge (scale 0-3):** containing 3 questions about what an STI is, and questions about the ways to conceive an STI.
  - Percentage of students heard of sexually transmitted infections: student were asked whether they ever heard of sexually transmitted infections other than HIV/AIDS.
  - Knowledge about causes and non-causes of STI: students were asked to indicate for 2 cases whether it is possible to transmit a STI. The first question concerns a misconception (hugging or petting), the second question indeed increases the risk (oral sex). For every right answer the student received one point.
- **Index on contraceptive knowledge (scale 0-2):**
  - Knowledge about condoms protecting pregnancy. Students were asked to indicate if a condom can safely prevent pregnancy.
  - Percentage of students that think to be able to obtain contraceptive methods for themselves.
- **Awareness of rights to SRHR information**: students were asked if they know 'that young people have the right to get information about reproductive health (including dating, sexual behaviour, sexually transmitted diseases, HIV/AIDS, pregnancy and contraception)'. If they indicate to know this, the answer is recoded as 1; 0 otherwise.

### *Attitude*

Next, we collected data on a certain number of variables concerning beliefs, attitudes, self-efficacy and intentions of students about sexual activities and relationships Except for the first and the last two outcome indicators, the following possible answers were allowed to choice from: 'agree', 'disagree', 'not sure', 'don't want to answer', and 'don't know'. The desirable answer was coded to 1, all other options were coded as 0. After each statement the desirable answer is given in brackets. In particular; the following outcome indicators will be used:

- **Index on the attitude towards relationships (scale 0-8)**: Students were given 8 situations and asked if that characterize a good or bad relationship between a men and women.
    - A partner agrees to have sexual intercourse when he/she actually does not want to [bad]
    - Both partners use methods to prevent STIs or unwanted pregnancy [good]
    - Two people have sex in exchange for gifts [bad]
    - A girl calls her boyfriend not manly enough when he does not want to have sex with her [bad]
    - When one partner does not feel ready to have sex yet, the other one waits [good]
    - A boy tells his girlfriend he will not love her anymore if she does not want to have sex [bad]
    - Two people have sex because everybody else is doing it [bad]
    - Two partners agree not to have sex with anybody else when they are in a relationship together [good]
- **Index on the attitude towards GBV (scale 0-5)**: 5 statements about Gender Based Violence (GBV) were asked.
    - I think that sometimes a boy has to force a girl to have sex if he loves her [disagree]
    - In my opinion, it is sometimes justifiable for a boy to hit his girlfriend [disagree]
    - I think that if someone refuses to have sex, it is acceptable to use some force/pressure [disagree]
    - I believe that if someone wants to have sex, his/her partner has the right to refuse [agree]
    - I think only the man should be held responsible if he rapes a woman who wears sexy clothing [agree]
- **Acceptance of HIV/AIDS rights**: the level of agreement with the statement 'A person with HIV/AIDS should have the same rights as anybody else' [agree]
- **Acceptance of homosexuality**: the level of agreement with the statement 'In my opinion, being attracted to someone of the same sex is ok' [agree]
- **Acceptance of contraceptive**: the level of agreement with: 'I think that unmarried boys and girls should use a contraceptive to prevent pregnancy if they have sex with each other.' [agree]
- **Action in case STI is suspected: inform partner**: the percentage of students who indicates to tell their partner in case s/he suspects to have a STI. It is hypothesized that the students of the treatment group more often tell their partner about this issue than the students of the comparison group, although this issue is not addressed in particular in both programmes.
- **Action in case STI is suspected: seeing a doctor**: the percentage of students which indicates to see a doctor in case s/he suspects to have a STI. It is hypothesized that the students of the treatment group would see a doctor more often than students of the comparison group, although this issue is not addressed in particular in both programmes.

In addition, we asked students on their intention to use a condom when they have sex in the future. However, no normative assumption about a right or wrong answer can be made without further knowledge. For example, if both partners have sex for the first time or both partners got tested,

using a condom is not necessary to protect for STIs. Hence, this variable could not be used as an outcome indicator.

### *Behaviour*

While it is estimated that many young people in Indonesia are sexually active (Leerlooijer et al., 2011), the issue is highly taboo. Even in anonymous questionnaires like ours, almost all students indicate not to have gone beyond *kissing* (see baseline report). Therefore, indicators like 'percentage of students using a form of contraception to avoid pregnancy' have a too low sample size to be used as an outcome indicator. Though, two outcome indicators can be used:

- **Discussion intimate relationship**: one of the aspects of the D4L programme is to encourage students to actively pass on the information. Therefore, a positive impact of the intervention on the level of agreement with the following statement is expected for D4L participants: 'With some of my friends we talk about intimate relationships and sex'.
- **Consultation of a clinic**: Students were asked how often they have visited a health centre (Puskesmas) or clinic for reproductive health problems, contraception, pregnancy, abortion or sexually transmitted diseases in the past year. It is hypothesized that the students of the treatment group visit more often a clinic than students of the comparison group, although this issue is not addressed in particular in both programmes. The variable is recoded as a dummy variable, equalling one if the student visited once or more a clinic. 'Don't want to answer' and 'don't know' answers are recoded to zero.

### *Unintended effects*

As explained in the result chain, we do not expect to see any impact of the programmes on the rate of sexual activity. However, some people might argue that talking about sexual behaviour stimulates the actual activity of students. Therefore, it is important to investigate whether or not the programme had this unintended side effect. Hence, the following two unintended effects variables will be included in the analysis:

- **Acceptance of premarital sex**: the level of agreement with: 'I believe there is nothing wrong with unmarried boys and girls having sexual intercourse if they love each other.'
- **Index on sexual activity (scale 0-8)**: the index for sexual activity is constructed using the percentage of students who ever engaged in one of the following activities with an (ex-)boy- or girlfriend: hold hands, embrace and cares, kiss, French kiss, grope, petting, mutual masturbation and/or oral sex, and sexual intercourse. If a respondent report to have done petting, it is assumed it also engaged in the activities listed before petting. If a respond never had a boy- or girlfriend, it was assumed the student did not engage in any sexual activity. If there were still missing values after this procedure, these were set to zero.

# Annex IV. Data cleaning

Our questionnaire allowed respondents to answer 'don't know' and 'don't want to answer' with some particular questions. In general, we took the conservative approach to recode those answers to no. This approach allowed us to comparing the baseline data with the endline data. If we followed a different approach or the number of responses with 'don't know' and/or 'don't want to answer' was high, we commented on this issue in the main text. For the same reason, also all missing values have been recoded as zero's (the undesirable answer).

Having both the baseline and an endline data made it possible to check the consistency of variables like gender. Two gender inconsistencies were present: one at baseline and one at endline. The inconsistencies were solved by checking the real gender of the respondents in the sampling file.

In addition, some ambiguities with respect to the grade a student attended at the baseline data were solved. For most schools, students were interviewed at the beginning and at the end of the school year. Hence, unless they dropped out of school, students should report the same grade at both base- and endline. The two schools where data have been collected at the beginning of the next year allows such a comparison as well; students should be either in the same grade as in the baseline (repeater) or should be one grade higher. In case of inconsistencies (6 cases), the baseline was taken as the right grade.

Next, some inconsistencies with respect to age were solved. In case of inconsistencies, for example if a student reported to be younger at the endline than at the baseline, the baseline age was taken as the appropriate age. In total, 6 students reported inconsistent date of births.

All other variables were checked on inconsistencies and outliers, and if possible also on differences between base- and endline data. Table 13 details the issues we encountered. The first column of the table indicates the variable number from the questionnaire, followed by the variable description, the number and type of inconsistencies, and finally the actions taken to solve the issues.

**Table 13: Data cleaning**

| Variable name | Subject variable | Number of inconsistencies | Solution |
|---|---|---|---|
| RC05;<br>RC09;<br>RC10 | Final grade;<br>Educ. father;<br>Educ. mother | Missing values at baseline, but at endline response was given:<br>Mathematics: 24<br>Indonesian: 31<br>English: 33<br>Educ. father: 19<br>Educ. mother: 12 | Take baseline data as starting point. Impute endline date in missing baseline data.<br>NB: baseline data is imputed in endline data when endline data is missing. |
| RC05;<br>RC09;<br>RC10 | Final grade;<br>Educ. father;<br>Educ. mother | After imputation (see row above), differences between base- and endline data are:<br>Mathematics: 63<br>Indonesian: 62<br>English: 55<br>Educ. father: 52<br>Educ. mother: 61 | Take baseline data as starting point. Impute baseline data in endline data. |

| Variable name | Subject variable | Number of inconsistencies | Solution |
|---|---|---|---|
| RC08 | Number of siblings | More than 10 siblings at baseline: 2<br><br>Number at baseline can't be lower at the endline: 27 | Take baseline data as starting point.<br>Impute endline data in baseline data.<br>Impute baseline data in endline data. |
| TL01 | Ever had a boyfriend | Yes at baseline, no at endline: 8 | Take endline data as starting point.<br>After TL01 there is a skip in the questionnaire if one answers no; yes at base- and no and endline makes these variables impossible to compare. If we fill out no for TL07 TL08, TL16.at the endline, no inconsistencies appear.<br>Replace yes at baseline with no for TL01. |
| TL16 | Engagement in sexual activities | Hold hands: 38<br>Embrace: 31<br>Kiss: 35<br>French kiss: 22<br>Grope: 12<br>Petting: 8<br>Masturbation/ oral sex: 6<br>Intercourse: 0 | Take baseline data as starting point.<br>We assume that no one answers 'yes' unless this is really the case.<br>Replace no at endline with yes.<br>Recalculate sexual behaviour index at endline.<br>NB: These inconsistencies appear in the raw data set to a larger extent. |
| KN23 | Use of contraceptive methods | Abstinence: 18<br>Pill: 2<br>IUD: 0<br>Injection: 3<br>Diaphragm/pessary: 0<br>Foam/gel/cream: 0<br>Condom: 2<br>Female condom: 2<br>Norplant/implant: 1<br>Herbal medicine: 2<br>Non penetrative sex: 2<br>Periodic abstinence: 2<br>Sex during girl's period: 1<br>Sex standing up: 0<br>Genital washing after intercourse: 1<br>Withdrawal: 0<br>Emergency contraception: 2 | Take baseline data as starting point.<br>Replace no at endline with yes. |

# Annex V. Correlates of programme participation

Source: Student baseline survey E12, MFS II Evaluation Indonesia

Notes: Standard errors given in brackets. Regressions are estimated with age and gender as covariates. For ITT school level (equation (1)), observations are weighted proportional to the inverse of the probability of being included in the sample due to stratification. Standard errors are corrected for clustering at the school level.

Notes:
- Our questionnaire is a self-reported interview, IYARHS is not self-reported.
- If the sample size deviates, the correct sample size is displayed in brackets.
1. We are aware of the fact that this should be HIV virus. However, we stick to the formulation of the questionnaires.

# Annex X. Qualitative report on the evaluation of DAKU and Dance4Life

**REPRODUCTIVE HEALTH EDUCATION AND**

**HIV AND AIDS PREVENTION THROUGH EDUCATION, MUSIC, AND DANCE FOR TEENAGERS**

**"Start dancing stop aids"**[48]

## 1. BACKGROUND

In response to the increase in unplanned teen pregnancies and HIV transmission rates resulting from risky sexual behaviour among Indonesian teenagers nowadays, the DAKU and D4L programmes have been brought to Indonesian high schools.

## 2. EVALUATION METHOD

To evaluate the DAKU and Dance4Life programmes we have conducted in-depth interviews with 8 informants that have been involved in one or both of the programmes. In order to discern the impact of the programme on behavioural changes, only informants who had a girlfriend/boyfriend were considered. The informants – 4 boys and 4 girls from 4 different vocational high schools - were randomly selected among the eligible respondents satisfying both criteria mentioned above. All of the selected informants turned out to be D4L participants. Only one of the informants (female) had also participated in the DAKU programme.

At the time the interviews were conducted, the male informants were 15, 18, 16 and 17 years old and were in a relationship with girls of 15, 17, 17 and 16 years old. The length of their relationships was 3 months, 6 months, 5 months and 1 year. The female informants were 16, 17, 17 and 17 years old and were in a relationship with slightly older boys of 20, 18, 21 and 19 years old. Their relationships already lasted 8 months, 8 months, 2 years and 2 years.

Seven of the interviews were conducted inside the schools. Six of which during school hours, and one (with a male informant) outside school hours. The remaining interview with a female informant who was currently doing an internship programme was conducted outside of school. All interviews were undertaken in easy and relaxed settings in an attempt to get open and honest answers from all the informants. To break shyness, jokes and teases were sometimes made. The teachers in all the 4 schools were very supportive and provided private rooms for the interviews to take place.

[48] Module dance 4 Life

# 3. FINDINGS ON THE FIELD

## 3.1. Project implementation

### *DAKU*

DAKU is a computer-based comprehensive sexual education programme that focuses on teaching high school students about various aspects of reproductive health, such as HIV prevention, sexuality and sexual abuse. The information transfer was carried out at school computer labs, usually in 2 one-to-two-hour sessions in which only around 30 students participated per school, which in the surveyed school turned out to be only girls. The process of recruitment was not publically announced. Instead, in the surveyed school participants were appointed by the counselling teacher.

After being taught about reproductive health with the use of the computer, students were allowed to ask questions about the material to the DAKU counsellor. However, the DAKU counsellor did not go into detail about what healthy reproduction exactly entails and focused only on male and female reproductive health in general. The highlight of the materials presented was about male and female organs, focusing in particular on menstruation and sperm.[49]

### *Dance4Life*

Meanwhile, the D4L programme has the purpose of preventing HIV and AIDS through the medium of dance activities. Unlike the DAKU programme, which only involved a limited number of students, the D4L programme could be joined by anyone, girls and boys alike, who was willing to participate.
**The D4L Programme is** divided into 4 stages known as the **4 Stages of *School4life,*** which are:

- ***Inspire: Heart Connection Tour*****,** aimed at motivating teenagers to have active roles in preventing the spread of HIV infection.
- ***Educate: Skill4life*****,** a series of interactive workshops with several themes; self-development, basic knowledge on gender-based violence, reproductive health and sexuality including HIV and AIDS, negotiation skills, public speaking, debating, leadership, and entrepreneurship.
- ***Activate: Act4life*****,** students are encouraged to communicate with and inform their peers, family members and neighbours about HIV and AIDS and undertake activities such as becoming volunteers who care about AIDS, fund raising, advocating, or making other efforts to prevent the spread of HIV both at school and in the community.
- ***Celebrate*****,** to celebrate their achievements reached in the previous three stages and to inspire and gain support from the rest of the word, the students dance together with other students from over the whole world on World Aids Day. This celebration moment is intended to strengthen the commitment of the teenagers as 'agents of change' and to connect them with teenagers from other countries where the Dance4Life programme is also applied.

[49] It should be noted here that this description is based on the reflections of only 1 informant.

The students could decide for themselves if they wanted to join all the 4 stages or just one or some of them. All 8 informants indicated that they had participated in the lectures about HIV/AIDS (the *educate stage*) and the dance (the *celebrate stage*). On the other hand, none of them mentioned that they had undertaken any activities outside of the classroom (the *activate stage*).

Most informants said that they still remembered how the different stages were implemented in the D4L Programme. For the *educate stage* for instance, they described how they received information from an LCD screen and students were asked to answer questions on the question sheets provided. They also described how they had the chance to ask questions. Unfortunately, 2 of the informants felt that the presentation of information was too fast and that they did not get enough opportunities to ask questions, as illustrated in their following remarks:

> The information was presented in the class for about 3 hours. They explained about HIV/AIDS very quick. And then they gave us question sheets to answer. We were given a chance to ask any question. Next was dancing performance which is accompanied by music.

> We were shy (to ask), because most of my friends replied all at once that they had already known about it. After that, there was no more chance to ask and we were asked to answer the question sheets.

### *DAKU vs. Dance4Life – weak and strong points*

The DAKU and D4L programmes have a similar goal in encouraging students to make healthy lifestyle choices and behave responsibly with regard to their relationships and sexuality. Among other things, by teaching them how to have safe relationships and to prevent themselves from undertaking risky sexual behaviour. However, the programmes differ in the fact that the DAKU programme was designed to promote healthy reproduction, while the D4L programme was more specifically designed to prevent the spread of HIV and AIDS.

Unlike in the D4L programme, there is neither game nor performance involved in the DAKU programme. One of the informants that participated in both the DAKU and the D4L programme stated that the DAKU programme felt "less dynamic" than the D4L programme, because it was conducted in the computer lab and had their own teacher acting as the instructor. She also felt that the limited number of students participating in the programme hindered them from expressing themselves. On the other hand, this same informant observed that the DAKU programme contained a broader scope of information as the emphasis of the D4L programme seemed to be more on the dance performance than on the transfer of information. When asked, only 2 of the 8 informants were able to recite the slogans from D4L. One of the informants that could not remember any of the slogans said that this was due to the fact that "they were all in English".[50]

[50] Rutgers WPF noted that while it is true that all slogans in D4L are in English, most of the campaign materials of D4L are actually in Indonesian.

Some suggestions for improvement for the D4L programme that were given by the other informants were; to hold the meetings in a tent instead of in the hot open air; to create more opportunities to ask questions; to modernize the dance; and for the facilitators to be better prepared. Overall, the informants were positive about the D4L programme, especially about the dance.

## 3.2. Project impacts

### *Knowledge about HIV/AIDS*

All informants reported that, as a result of the programme(s), they have become more knowledgeable and aware of HIV and AIDS, particularly about the ways in which the HIV virus is transmitted and how transmission can be prevented. Most informants were aware that HIV/AIDS is a deadly virus/disease that is incurable. Six of the informants explicitly mentioned that the programme had taught them to adopt a more "careful" attitude whilst in a relationship.

Interestingly however, when the informants were asked if they would want their partners to get tested for HIV/AIDS, all of them said "no". One informant answered that she did not think it's necessary because she "would not necessarily get infected" if her partner did carry the virus.[51] For 4 of the other informants the reason was that they trusted their partner to be healthy and/or tell them if they might not be. This faith in a partner's honesty, combined with a partner's potential reluctance to admitting to having had pre-marital sex stemming from the taboos that surround this topic, might have serious consequences for teen HIV transmission and may deserve extra attention in the future.

### *Sexual behaviour and knowledge about contraception*

Most of the informants said that by participating in the D4L and DAKU programme(s) they have become more aware of their own sexual behaviour. After some probing, 5 of the informants admitted to having undertaken sexual acts with their (ex-)partners limited to kissing and touching. None of these informants considered this risky behaviour. However, one male informant confessed that he had once touched his ex-girlfriend's body and felt embarrassed with it. With his current girlfriend he had done nothing but hanging out after school as they were only dating for 5 months.

With regard to reproductive health, most of the informants seemed unable to explain its meaning in a comprehensive way. Only some of the informants had heard the term STI (sexually transmitted infection) before. They were also unfamiliar with the term contraception, although all of them had heard about the condom. Additionally, some of the informants knew about family planning pills or injections. One informant said that she once watched TV and learned that an artist used an instrument applied in her abdomen in order to prevent unwanted pregnancy. Yet, the informant did not exactly know what it was at first and had only recently learned that this instrument was called an IUD or a spiral.

[51] Rutgers WPF noted that while young girls started to understand about their SRH rights, they still need to be more empowered to protect themselves and not letting intimate feeling mislead their behaviour.

### *Attitudes towards HIV infected people*

In general, all the informants displayed a positive attitude towards HIV/AIDS infected people. They expressed their support for people with HIV/AIDS and stated that they think it is important not to alienate them. They are also aware that people with HIV/AIDS have the same rights and should be treated in the same way as healthy people. However, one informant still confessed that he would think twice about continuing his relationship with his infected friends out of fear to get infected too. Likewise, 2 other informants mentioned that, even though they would have dinner with HIV infected friends, they would not share the dishes with them.

### *Attitudes towards homosexuals*

Because the topic of homosexuality was not extensively covered in the D4L programme, the effects of the programme on the attitudes of the students are difficult to determine. In general, the informants seemed to be more familiar with transsexuals, which they sometimes encounter on the streets in their neighbourhoods, than with homosexuals. However, one of the informants said that she knew about lesbians as she had a couple living in her community.

Where 3 of the informants said that "gay is also human" – a slogan they learned from the D4L programme according to one of the male informants – the other informants seemed to have a reserved attitude towards homosexuality at best. Some of the informants said that they had no problem with gay people as long as they did not cause any trouble with the community, such as the transgenders that sometimes "chase male students in the streets". Generally, these informants confessed that they would not avoid gay people, but would still keep a bit of distance, for example out of fear that the gay person would try to pursue and seduce them (2 male informants) or because it felt uncomfortable (1 female student). A few of the informants expressed stronger negative feelings towards gay people. One of them expressed his opinion that gay people must not receive equal treatment from society because they have sinned and homosexuality is clearly forbidden by religion. Another informant gave the following reason for avoiding gay people: "Gay is homo, it is disgusting just by watching them."

### *Sharing the message*

Almost all of the informants agreed that it is important for them and their peers to receive information about safe relationships (7 out of 8 informants), condoms and other contraceptives (7 out of 8 informants), and HIV/AIDS issues (8 out of 8 informants). Furthermore, all of them felt that they have a responsibility to share the knowledge they received from the D4L programme with their friends. Almost all informants reported that they have tried to spread the message of DAKU and D4L to their friends or their family at least once, particularly right after the presentation or after the dancing practice. However, the informants reported that their friends and/or family reacted ignorantly towards the HIV&AIDS issues they tried to raise with them, which left the informants feeling upset and disappointed. They mentioned feeling especially uncomfortable discussing the issues with adults. As a result of these demoralizing experiences the informants have not tried to further promote the information to their communities.

### 3.3. Youth Sexuality: norms versus Reality

Generally, the informants believed religion to be the most dominant factor in protecting the sexual health of young people. Informants reported to have received a lot of information about safe relationships and safe dating in religion class. One of the informants gave the following example "when we are dating we are not allowed to be alone in a quiet place." Another informant mentioned that he had learned that "all what we have done (with his girlfriend) before marriage is a sin, our religion forbid those things." In general, all the informants agreed that "teenagers are not allowed to have sex before getting married."

The lessons they receive from religion class provide teenagers with a strong grip to prevent themselves from slipping into norm violation. norms around sexual behaviour, mostly stemming from religious teaching, are further being established by parents and society in general, where teenagers are perpetually being exposed to normative messages about youth sexuality, teaching them that it is wrong to have sexual intercourse before marriage and date in quiet places. Additionally, the value placed on female virginity is reinforced by messages that teach girls in particular to "be careful and take good care of themselves".

Even though the religious rule that "a young couple is not allowed to date" has long been deeply rooted in Indonesian society and culture, "dating" has nowadays become a trend in modern Indonesian youth culture. Reflecting this situation, 4 informants mentioned that dating has become more common, and that society has become more open and permissive of dating. One of these informants gave an example of parking attendants putting a blind eye to young people dating in dark parking lots. Three of the informants stated that it is "very difficult to find a virgin boy or girl anymore" and 2 informants mentioned an increase in teen pregnancies. However, all informants expressed that, even though they are dating, they feel it is wrong to have sex before marriage and are quick to mention that they themselves would never do that.

In the process of mitigating the clash between, on the one side, the traditional norms that forbid young people to date, and on the other side, the actual reality of modern young people dating and experiencing with pre-marital sexuality, we see a situation in which religious teaching about dating is adapted to modern culture, resulting in the emergence of a new dating norm, namely: "Dating is allowed as long as the couple is not alone in a quiet place".

Another case that exemplifies the adaptation process of religious teaching to modern youth culture is veil wearing behaviour among female youths: 2 of our informants wore a veil at the time they were interviewed. From their statements, it was clear that both of them were aware that wearing a veil is obligatory for every female Muslim. One of the informants indeed gave a normative explanation for her daily practice of veil wearing. Interestingly, the other female informant considered it optional to wear the veil and said that she sometimes took off her veil to make herself feel more comfortable. Researchers, such as Zaky (2006), have indicated the existence of a 'pragmatic veil wearing culture'

among female Muslim youth, where female adolescents, for example, only wear veils when they are at school and take them off afterwards. Along the same lines our own female informant expressed the following statement:

> I only wear a veil at school. I even wear short pants when I hang out. Since I like wearing short pants I'm breaking up with my fourth boyfriend. I don't want his mother to reprimand me because I wear it, so I'd better dump him first before she scorns me. Anyway, I'm an easily fed up type of girl when it comes to dating. My longest relationship lasted 2 years (A., 17 years old).

According to our informants, many teenagers nowadays refuse to obey the rule to "never date in a quiet place", behaviour which can lead to risky sexual behaviour. Even though all of our informants said that they never have or take the opportunity to "spend some intimate time together", a few of them confessed to already having undertaken some intimate acts, the furthest being hand holding (4 informants), kissing on the cheek (2 informants), kissing (1 informant) and hugging and French kissing (1 informant). Some informants mentioned kissing on the motorbike while waiting for the traffic light. Others did it at home when no one was around. None of the informants confessed to having experienced petting, oral sex, or sexual intercourse.

Even though it would seem that by undertaking this kind of behaviour the informants have violated the norm, none of the informants felt that they did something wrong. In an attempt to condone their behaviour the informants seem to have shifted their idea of what they consider the normative boundary from "no dating in quiet places" to "as long as no sexual intercourse is involved". In contrast, when informants were asked about other people's dating behaviour they were inclined to judge them more harshly and based on the traditional dating norm. For example, when one of the female informants (n.) was asked to give her opinion about female students who accidentally got pregnant without being married, she argued that "it is their own fault, because they chose a quiet place to have a date." Likewise, informants S. and A. argued that "this happens because they don't have strong enough faith and it is their parents to blame."

This and previous examples make clear that sexual norms have a dynamic nature and that what is considered as acceptable sexual behaviour among youth is, to some extent, open for negotiation. It seems that young people who decide to start dating have a relative amount of autonomy to interpret and shape the norms for acceptable sexual behaviour to better fit their situation and needs. The following quote illustrates this flexible attitude:

> ...religious teaching received at this school is more than that of public school. However, the application depends on each individual (n., 18 years old).

### 3.4. Gender Roles and Decision Making in Dating Relationships

When asked about the role of boys and the role of girls in dating and relationships the informants gave various kinds of responses.

From the responses of both female and male informants we can gather that it is usually the girls who choose and initiate the non-sexual dating activities such as "hanging out" after school, going to the movies, having a meal together or going to the bookstore. The female informants seem confident in their role to decide on these activities as is shown by the following remarks made by informant P.: "Girls are usually right when choosing it", and informant n.: "Boys tend to follow what the girls want".

With regard to initiating sexual activities, 3 of the male informants and only 1 of the female informants say they think that it will usually be the boy who takes the lead, confirming the traditional gender roles of the sexually dominant male and the submissive female.

> ...for non-sexual actions it is usually girls who take the initiative, but when it comes to kissing or other sexual actions they tend to wait since they are shy, or refuse it when they did not want it (A., male informant, 17 years old).

> …it can be both sexes, but in reality it is the boy who usually takes that initiative (male informant).

However, the other 3 female informants say that "both sexes can initiate sexual activities". From their responses it becomes clear that they have come to realize that girls have equal rights to boys when it comes to deciding about sexual activities, and that they have adopted a more assertive attitude, or at least a more positive expectation of their ability to decide, even though these expectations may not necessarily live up to reality. The following remark, made by female informant A., illustrates this assertive attitude: "Well, it doesn't matter if the girl asks to have a kiss. It is already their habit that girls have more initiatives than the boys". Additionally, many of the informants indicated that they are assertive enough to refuse kissing or touching if they do not want to. Herein, the habit of girls deciding on the dating place and activities, might give girls an advantage in either indirectly preventing sexual acts from happening or, conversely, initiating sexual acts by choosing or not-choosing to date in "private places".

While discussing gender roles with regard to dating and relationships, the male informants also touched upon the issue of taking financial responsibility when dating. Many male informants mentioned that they feel they have to pay for the meals when they are on a date because society expects this of them, and say that it would even be inappropriate for a girl to pay the bill. The male informants are thus subscribing to traditional gender roles, according to which the man has the responsibility to fulfil the household needs.

## 3.5. Sexuality Issues among Adolescents

### *Important Sexuality Issues*

According to our informants the most pressing sexuality issues experienced by adolescents are unwanted pregnancies outside of marriage and HIV/AIDS or other STIs. Their concern for unwanted pregnancies was especially high, based on the fact that this could cause a "domino effect" in which the pregnant girl had to leave school, and as a result would encounter all sorts of family problems. One of the informants that went to a religious private vocational high school had personally experienced that 2 of her friends were forced to leave the school due to unwanted pregnancy.

The high concern about unwanted pregnancies actually seems to have incited several informants to remember little messages from the DAKU and D4L programme that were addressing this issue. One female informant said that the most striking message from the *education stage* of the D4L programme was: '*Be careful to a girl because you'll leave marks on her*'. According to her, this message meant that a pregnancy will leave visible traces in the body of a woman, but the body of a man who makes a girl pregnant will still look the same. The other message which she still remembered from the programme was a positive message about family relationships. Another male informant mostly remembered the message '*do not disappoint your parents because of an unwanted pregnancy'*.

The informants' concerns about HIV/AIDS transmission were a little less pronounced than those of unwanted pregnancy, but still all informants thought that this was an important issue for young people nowadays. In general, the informants could tell how the HIV virus was transmitted and how to treat a person who was infected by HIV/AIDS. However, the informants seemed unworried if their partners could be infected and most of them said that they would not ask their partners to get tested for HIV.

### *Myths and Attitudes with Regard to Safe Sex*

It is important to note that the DAKU and D4L programmes have been able to convey principal messages to the students about their 2 main concerns: how to prevent unwanted pregnancies and how to prevent HIV transmission. However, many untrue beliefs and myths around sexuality still exist.

An example of such a myth, asserted and believed by one of our male informants, is that you can determine if a woman has had sex before by the way she walks. If she is no longer a virgin she'll tend to walk straddling with her feet somewhat opened. Other myths, mentioned by one of the female informants, are that sperm can be used as a facial mask to smooth the skin, and that "drinking sperm will make you ageless". She got these ideas from a friend, who heard it from a friend who read this on the internet. Young people's believe in myths like these is problematic as it can discourage them from using condoms when having sex, and/or in other ways prevent them from behaving in a safe and healthy way when it comes to reproduction.

The issue is further complicated by young people's negative attitudes towards condoms. The informants seemed to know the purpose of using a condom – to protect against pregnancy and

HIV/AIDS infection - fairly well. Nevertheless, most of them had never actually seen a condom and did not know how to use it correctly. They explained that they had only read information about the condom as part of the DAKU and D4L programmes, and were only shown a picture of it. One of the male informants told that he had once seen a condom which was still in its package and was unopened. Another male informant confessed that he had seen and touched a condom, brought by one of his friends to show and make a balloon.

When asked what they thought about using condoms, a couple of the informants expressed negative feelings. Some female informants, for example, were of the opinion that it is better not to use a condom when having sexual intercourse. The reason being that the man will then be able to have sex with a woman without taking the responsibility of marrying her.

> Condom only make a man does not take responsibility for his behaviour. Because if the women is not pregnant, the man can escape from his responsibility (P., 17 years old).

Along the same lines, another informant said that "if the risk is not visible, the adolescent can keep doing their sexual behaviour". Lastly, one of the male informants stated that he "...would never touch a real condom, and would keep that away until he was married", possibly associating the condom with sinful behaviour.

From all this, we can conclude that the principal message of the programmes about the function of the condom has been understood by the students, but also that, unfortunately, this has not necessarily resulted in a positive attitude towards condom use. It is therefore important that the projects make an effort to improve adolescents' attitude and address existing false beliefs and myths about condoms and safe sex in their future proceedings. A lot of homework thus still exists for DAKU and D4L.

## 4. CONCLUSION

1. The DAKU and D4L programme have the same aim: encouraging adolescents to make responsible choices with regard to their sexual behaviour. The D4L programme specifically focuses on HIV/AIDS prevention, while the DAKU programme takes a broader approach and focuses on reproductive health in general. D4L has the playful element of dance incorporated in its programme, which coincidentally is the part that the students that participated in the programme remembered most. The DAKU programme is less dynamic than the D4L programme, but covers more topics and contains more information.

   Weak points of the programmes' implementation, according to the informants, are that DAKU had the students' own teacher (who lacked the skill to properly do this) act as counsellor and the fact that they didn't feel that they could express themselves freely as a result of the limited amount of participants. Weak points in the implementation of the D4L programme are that students

considered the material to go too fast, and that they felt there was not enough opportunity for them to ask questions.

2. The DAKU and/or D4L programmes are shown to have some positive impacts on the participants' knowledge about HIV/AIDS and other reproductive health issues. However, it is only the basic knowledge and ideas of the programmes that the informants seem to have remembered. Nevertheless, their attitudes towards people infected with HIV have grown more positive. On the other hand, their attitudes towards homosexuals are not yet fully positive and supportive. This could have something to do with their lack of education on the topic of sexual orientation.

   Even though there is some indication to assume that the projects have had an effect on the sexual behaviour of the informants - mainly the low level of reported sexual behaviour among our informants compared to the norm - it is very difficult to determine if these changes can actually be ascribed to the projects. However, as mentioned above, we have two informants' statements saying that they remember two important messages of the DAKU and D4L programmes about self-protection and not having sex on the basis of respecting your partner and following your parents' advice.

   The programmes have also, partly, succeeded in their aim to move the informants to try and share the information they learned with friends and close family, which all of the informants did. Unfortunately they were met with 'ignorant' and reluctant reactions and therefore stopped trying to spread the message altogether.

3. Traditional norms regarding relationships and sexuality, stemming from religion, prohibit dating and sexual activity before marriage. Schools play a big role in adolescents' socialization into these norms and values. However, traditional norms are now being challenged as a result of the modern dating culture that has emerged among Indonesian youth, which has resulted in a new norm: "dating is allowed, as long as the couple is not alone in a quiet place". Our informants' remarks show that they have room to flexibly interpret this norm and negotiate its meaning, in an attempt to justify their own actions (e.g. "taking the norm to mean: "as long as no sexual actions are performed") or judge the actions of others, which is usually done more harshly and based on a more traditional interpretation of the norm.

4. While girls usually seem to take the initiative for non-sexual dating activities, the male informants say boys are the ones to initiate sexual acts. However, most of the female informants say that girls and boys can equally take the initiative. Likewise, these informants claim they are assertive enough to refuse kissing or touching if they don't want too. It is unclear if this is actually the case in reality, but at the least, these statements attest to a more empowered attitude of the female informants with regards to the recognition of their sexual rights and their ability to decide within their relationships.

5. The two main sexuality issues that our informants are concerned about are unwanted pregnancies and HIV/AIDS. These issues are extensively addressed by the DAKU and D4L programmes. However, our data shows that, even though the informants have remembered and understood the key basic messages of the programme, false beliefs (obtained from friends and the internet) and negative attitudes regarding the practice of safe sex still persist among the informants. Because these could act as impediments to young peoples' willingness or ability to refrain themselves from risky sexual behaviour, it is important that the projects make an attempt to addressed these issues in their future proceedings.

## 5. DISCUSSION AND RECOMMENDATIONS

Following the research findings described above, we have formulated 2 important points of discussion about the potential development and improvement of the DAKU and D4L programmes. Firstly, we discuss opportunities for increasing project sustainability by adopting a 'peer educator' model into the project design. Secondly, we'll discuss the idea of reconsidering the project design to adopt a religious approach, and reformulate key messages from a religious perspective, in order to increase its effectiveness. The two discussions together form a note of recommendation for the future.

### 5.1. Programme Sustainability: Peer Educator Strategy

YPI has been successfully carrying out programmes focusing on HIV/AIDS and reproduction issues for a long time, and it is therefore likely that they will manage to keep implementing DAKU and D4L in the future. However, some critical notes for the two programmes exist: On the one side the overdone focus on dance in the Dance4Life programme, and on the other side the rigidity of the computer laboratory setting and choice of exclusively female participants of DAKU. As is shown by our research findings, these issues have the potential to prevent the intended adolescent KAP strengthening[52] from reaching its full potential.

To improve the sustainability of the projects, YPI could consider adopting a 'peer educator model' into its programme design. 'Peer education synergy programmes' have proven effective in several other similar settings and could therefore also be promising for YPI. Peer education in the context of the DAKU and D4L programmes would involve students informing and educating other students with the aim of changing their awareness and behaviour. The idea behind this strategy is that adolescents are more likely to accept information from their peers than they would from others.

To implement this peer educator strategy, YPI could make use of existing youth forums and youth organizations, such as student councils, PMR[53], and PRAMUKA[54], and have them continue the

[52] This abbreviation stands for: Knowledge, attitude and practices strengthening.
[53] This abbreviation stands for: Palang Merah Indonesia, which is the Indonesian "Red Cross" catering to youth.
[54] The Indonesian scouting organization.

discussion about the topics covered in the DAKU and Dance4Life programmes after the programmes have ended. This with the hopes that a prolonged exposure to the programmes' messages will help to ensure more profound changes in the attitudes and behaviour of the students.

To safeguard the sustainability of this method, it is advisable that a capable staff member of the school, such as the counselling teacher, supervises the youth forum. It is important that the person that is appointed understands the dynamics of adolescent life, has good rapport with the students, and has an open attitude towards the issues raised in the programmes.

## 5.2. Rethinking the Programmes' Design: Approach Sexuality and Gender Issues through Positive Religious Interpretation

Youth's attitude towards sexuality is a contestation space. On the one hand, religious norms and values strongly influence adolescents' attitudes towards sexuality. On the other hand, adolescents obtain – sometimes faulty – sex-related information through various media and friends. The core task of the DAKU and D4L programmes should be to examine the effects of these information flows on youth's attitudes towards sexuality, and to counter existing misconceptions and harmful ideas acquired from these sources by spreading knowledge based on scientific and medical facts. To succeed in doing this, the programmes' messages need to be communicated in a strong and effective way. If the messages are not clear and strong the students will be reluctant to adopt them, or will not remember them at all and will fall back on their old knowledge, as is shown in our research findings.

Because religion is a dominant factor in adolescents' lives, and religious norms and values strongly influence their ideas and attitudes, we recommend that the DAKU and D4L programmes adopt this approach and try to bring their messages more from a religious perspective in order to increase their uptake and acceptance. Responsibility for this not only lies with YPI, but also with the programme designer in Indonesia, who we recommend should hold a workshop to incorporate this new approach into the programme's design.

Kusters, C., Wieriks, M., Dwi Andari, B., Suprobo, N., Priyahita, W., Sihombing, R.R., Rokhmatulloh, S.W., Rosita, I., 2015. *Endline report – Indonesia, ASB. MFS II country evaluations; Capacity of Southern Partner Organisations (5C) component.* Centre for Development Innovation, Wageningen University & Research centre. Report CDI-15-042. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Indonesia, ASB. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

# Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation Aliansi Sumut Bersatu (ASB), and the Co-Financing Agency HIVOS for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to ASB, HIVOS, the synthesis team, IOB and NWO/Wotro.

# 1 Introduction & summary

## 1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: ASB in Indonesia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1.Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps

describe the identified key organisational capacity changes that are possibly related to MFS II interventions in these two capabilities, and how these changes have come about. More detailed information can be found in appendix 5.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR: Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

## 1.2 Brief summary of analysis and findings

Since the baseline, two years ago, ASB has seen most changes in the capability to act and commit. Better task delegation, clearer job descriptions and strategic planning have helped ASB's leadership in organizing staff and program activities better. The capability to adapt and self renew also slightly improved through the improved application of M&E and the establishment of a diversity communication forum, through which ASB can easier keep track of developments amongst its beneficiary communities. The capability to deliver on development objectives has improved through more systematic working. Day to day activities have been more aligned to the organization's strategy and each other. In the capability to relate ASB improved in its networking capacity. More stakeholders are engaged in the development of policies and strategies, which is a very slight improvement compared to the baseline. New partnerships with academia have strengthened external relations and opened up new opportunities. Finally, ASB has very slightly improved in its capability to achieve coherence. Operational guidelines of ASB have slightly improved with the introduction of standard operating procedures for all divisions.

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team. During the endline workshop some key organisational capacity changes were brought up by ASB's staff: the provision of health insurance (BPJS) linked to investments; increased job security, through more permanent staff contracts; improved staff capacity to implement programs.

Within two of these organisational capacity changes, changes overlap with the key organisational capacity changes that were selected for process tracing because they were linked to MFS II funded capacity development interventions, namely the capacity to manage the organization. More details can be found in the relevant section below.

The overall organizational capacity change to be more recognized as an organizationfocussed on pluralism issues, with its underlying 3 organisational capacity changes mentioned above, can only be partially attributed to MFS II supported capacity development interventions. In particular the MFS II (HIVOS) funded strategic planning workshop has played an important role in terms of the change in leadership style and having a strategic planning document. Furthermore, HIVOS (MFS II) supported the revision of the financial standard operating procedures (SPOs), which ultimately supported getting more funds for program implementation, more staff, better staff welfare and job security. However, non-MFS II funded interventions such as the TIFA foundation(in this case trainings supported and funded partially by external funders) in the field of finance and communication also played an important role in these changes. It can be said that the MFS II capacity development interventions contributed more to the strategic organizational changes, whilst other interventions provided more change at an operational level.

Two organizational capacity changes were more closely investigated with process tracing: the improved capacity to manage the organization, and the improved capacity to communicate results on diversity issues. The improved capacity to manage to manage the organization can be attributed to a large extent to the planned MFS II (HIVOS) capacity development intervention of the strategic planning workshop. The intervention was the main underlying reason for the change in leadership style and the development of a strategic plan. Both of these proved very important to bring about changes in the organisation for enhanced capacity to map to manage the organisation. The improved capacity to communicate results on diversity issues can only be partially attributed to MFS II interventions. Particularly competencies to communicate results about diversity issues have improved as a result of the English course, although other non-MFS II interventions (externally funded through TIFA) have impacted this as well. Despite HIVOS' detailed plans to address the issue, ASB has developed a great deal of initiatives on their own to address this issue and improve this particular capacity.

# 2 General Information about the SPO – Aliansi Sumut Bersatu

## 2.2 The socio-economic, cultural and political context in which the partner operates

**The socio-economic, cultural and political context in which the partner operates**
Initially focused on social pluralism regarding sexual and gender equality issues *Aliansi Sumut Bersatu* (ASB) has broadened its scope of action[1] since 2010, including freedom of religion. An example of this is ASB's present project: "Civil and Religious Societies' Participation in Promoting Peace and Diversity in North Sumatra". This program, which in the framework of MFSII is co-financed by HIVOS, aims at bringing about religious pluralism in North Sumatra. But what does pluralism mean and why does Indonesia need religious pluralism?

Religious pluralism means more than the coexistence or mere tolerance for diverse religious beliefs. Rather, pluralism means an *"energetic engagement with diversity"* as well as *"the active seeking of understanding across lines of difference".* [2]As such, pluralism means that different religious groups do not merely accept and tolerate each other's existence but understand, acknowledge and respect the validity of others' religious beliefs as they do with their own. In the context of Indonesia, which consists mostly of Muslim citizens, this very idea poses a considerable challenge for groups like ASB who intend to create a more pluralistic social landscape. This challenge is formed mainly due to monotheistic believers like Muslims and Christians who tend to have their own doctrines as the only possible truth. Furthermore, there are a myriad of different interpretations of Islam and Christianity among Indonesians as well as other religious currents, what does not make pluralism any easier to be reached. Besides facing the challenge of bringing monotheistic citizens to an understanding and comprehensive approach towards different beliefs, in its recent project ASB also needs to cope strategically with the Western political connotation that "pluralism" receives among certain groups in Indonesia[3].

[1] Aliansi Sumut Bersatu (2011), ASB Proposal Form to HIVOS
[2] *Eck, L. D. (2011) Harvard Pluralism Project*, http://pluralism.org/pages/pluralism/what_is_pluralism, Accessed on 08.11.2012
[3] HIVOS (2012) *"Promoting Pluralism in Indonesia"* article viewed in http://www.hivos.net/Knowledge-Program2/Themes/Promoting-Pluralism/Topics/Promoting-Pluralism-in-Indonesia, accessed on 08.11.2012

As pointed out by Robert Hefner (2001:4-6)[4], Indonesia is one of the countries in Southeast Asia where, since its independence after World War II, deep-rooted religious and ethnic divisions have been strikingly damaging for the society[5]. Attacks in churches by Muslims as well as Bible-inspired local regulations in Papua[6] (and the tensions these events brought up) are but a few examples of this religious impasse and how it damages the Indonesian society. In the past year 39 cases of interreligious tensions were registered and it has been concluded that (in comparison with last year) violence due to religious differences has doubled. Nevertheless, the Indonesian government has played down the case[7]. Moreover, religious segregation amounts to *"lack of common social will"*[8], what reflects civil society weakness and undermines democracy.

The results of the media monitoring in 2012, ASB found some news of freedom violation of religion and belief that mass media highlighted a lot the issues that are[9] :

1. Rejection of religious activity that is Congress Confucianism in Emerald Garden on June 22 to 26, 2012. These discriminatory actions are repeatedly reported by several Mainstream Newspapers.
2. Issues and destruction of Houses of Worship and threats
3. Throughout the year 2012, the United North Sumatra Alliance also advocated sealing of 17 houses of worship in Singkil and 14 houses of worship in Banda Aceh.

These data indicate a violation of religious freedom tends to spread and massive. This is a problem that is equally harmful damage the harmony of society within the framework of the Unitary Republic of Indonesia.

## 2.3 Contracting details

When did cooperation with this partner start: 1st July 2009.

What is the MFS II contracting period: 5th of January 2013 until 4th of December 2015

Did cooperation with this partner end: Not applicable

If yes, when did it finish: Not applicable

What is the reason for ending the cooperation with this partner: Not applicable

Is there expected cooperation with this partner after 31st of December 2015: Yes.

## 2.4 Background to the Southern Partner Organisation

**History**

North Sumatera is an area that is often used as the symbols of diversity in indonesia. As the largest province on the island of Sumatra based on statistical data; the inhabitants of north sumatera are 12.985.075 individuals. From the religious aspect of north inhabitant of Sumatra consisting of Islam ( 65,45 % ) , Protestant ( 26,62 % ) , Catholic ( 4,78 % ) , Buddhist ( 2,82 % ) , official Hindu ( % ) , and an adherent of other faiths 0,14 % .[10]

[8] Aliansi Sumut Bersatu (2011), Proposal Form to HIVOS

[9] Concept Paper Program ASB 2013-2015

[10] Ibid.

There are 27.841 houses of worship in North Sumatera, consisting of 15.752 mosques, 9.777 protestant churches, 1.855 Catholic churches, 194 puras, 128 Viharas, and 135 Klentengs. Based on inhabitant percentage of ethnic are Melayu ( 5,86 % ), Karo ( 5,09 % ), Batak ( 25,62 % ), Mandailing ( 11,27 % ), Nias 6,36 % ), Simalungun ( 1.04 % ), and Pakpak ( 0,73 % ). And also ethnic immigrants is Java ( 33,4 % ), Minang ( 2.66 % ), Chinese ( 2.71 % ), Aceh ( 0,97 % ), and the combine of other ethnic 3,29 %.[11]

Those data very often become material used by the government of Indonesia, especially in North Sumatra to describe diversity in North Sumatra so that North Sumatra often declared as a barometer of tolerance in Indonesia. But in reality people in North Sumatra often faced with the reality of intolerance.[12]

The United Alliance of Northern Sumatra (*Aliansi Sumut Bersatu*-ASB) was initiated in 2006, intentionally at the occasion of the International Women's Day. The creation of the ASB took place in the context of a "come together" of various NGO's, artists, students, activists and others against an *"ultra-conservative-district-level-"*[13]bill against pornography and indecent behaviour, the so-called RUU APP. This bill was intended by the PKS (*Partai Keadilan Sejahtera* or Justice and Prosperity Party) as a way of gaining political popularity among Muslims (90% of Indonesian population) through creating this bill based on PKS' conservative understanding of the Islamic principles. The dialogue between the organizations that stood up against what this bill represented and could bring forth resulted in the declaration of the *Aliansi Sumut Bersatu*. Through peaceful actions, discussions, hearings with the House of Parliament and the collection of signatures ASB was created to stand against RUU APP and all activities, laws, norms and behaviour that generate social exclusion. *Aliansi Sumut Bersatu* was officially established in 2008[14].

**Vision**

Aliansi Sumut Bersatu's vision is "the achievement of recognition, protection, fulfilment of and respect toward diversity".[15]

**Mission**

Aliansi Sumut Bersatu's mission are[16] :

1. Implement the diversity education
2. Conduct efforts in the protection of intolerance victims of violence
3. Conduct advocacy for realizing policies that respect diversity and favor of the marginalized groups and minorities
4. Conduct studies and research to the diversity issues
5. Build and encourage civil society organizations to be involved in the recognition, protection, fulfillment and respect for diversity.

**Strategies**

*Aliansi Sumut Bersatu's* strategies are: to offer education in feminism, sexuality and pluralism to the community. In the context explained above, "community" encompasses the cross-religion student activists and other social groups. Furthermore, ASB engages in monitoring the practices of religious intolerance in North Sumatra, advocating on policy and advocacy for groups which became the victim of intolerance and doing research on the practices of pluralism in North Sumatra[17].

# 3 Methodological approach and reflection

## 3.1 Overall methodological approach and reflection

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

## 3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012[18].

[18] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

## 3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: **To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?** and the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

### 3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

### 3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop

have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

### 3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified

organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design:** mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

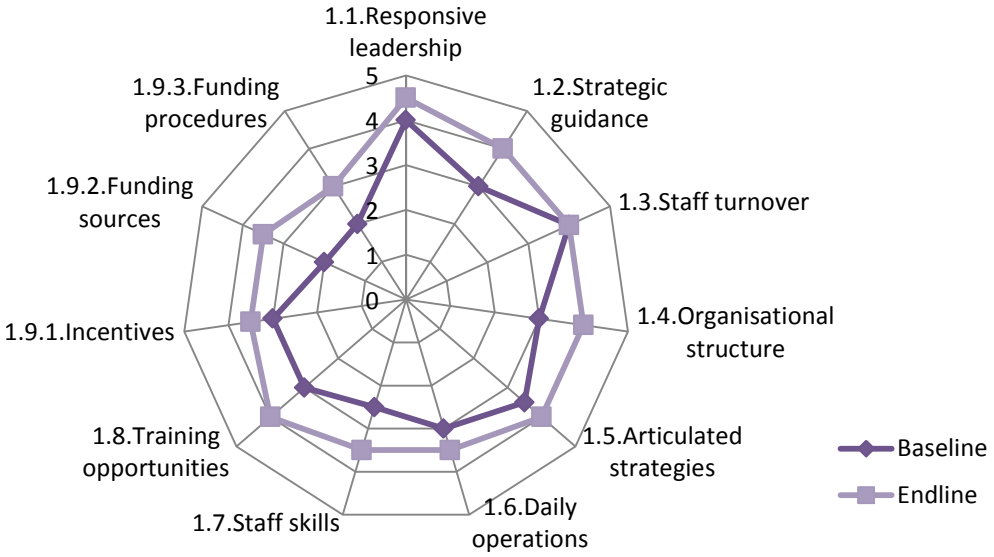
# 4 Results

## 4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of ASB that have taken place since 2011 are described. The information is based on the information provided by HIVOS.

Table 1
*Information about MFS II supported capacity development interventions since baseline*

| Title of the MFS II supported capacity development intervention | Objectives | Activities | Timing and duration | Budget |
|---|---|---|---|---|
| Strategic planning workshop to develop work plans 2012/2013-2015 | N/a | Reviewed and revised the SOP of work division and on finance | October 2011 | 700 Euro |
| English course | n/a | Intensive coaching and training on English skills to focus on both writing proposals and project reports to encourage skills that would affect both the capability to act and commit as well as the capability to adapt and self-renew | 2013-2015 (ongoing) | 700 Euro |



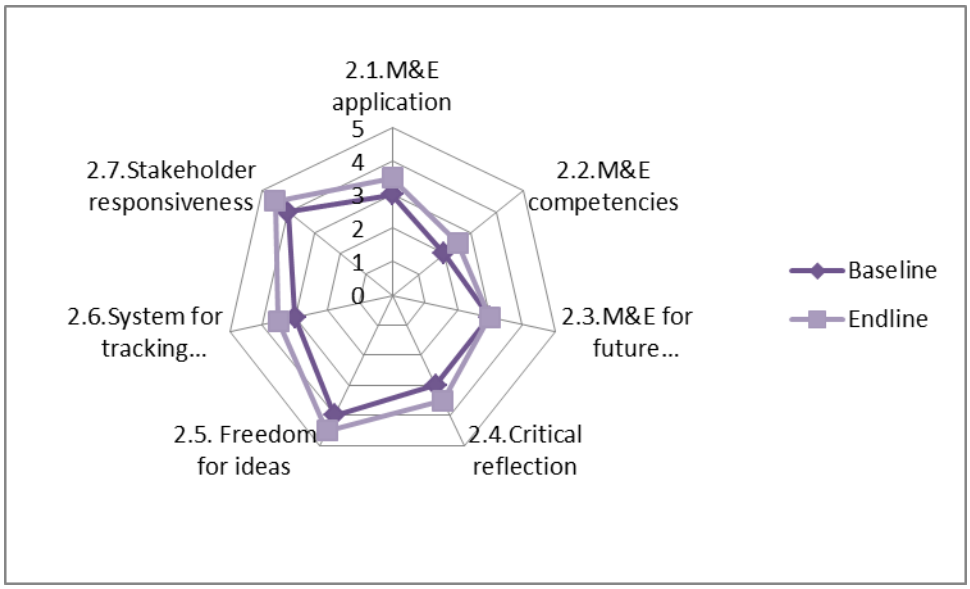
Source: 5C endline_support to capacity development sheet_CFA perspective_Indonesia_ASB

## 4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities. This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also annex 3.

### 4.2.1 Changes in the five core capabilities

**Capability to act and commit**

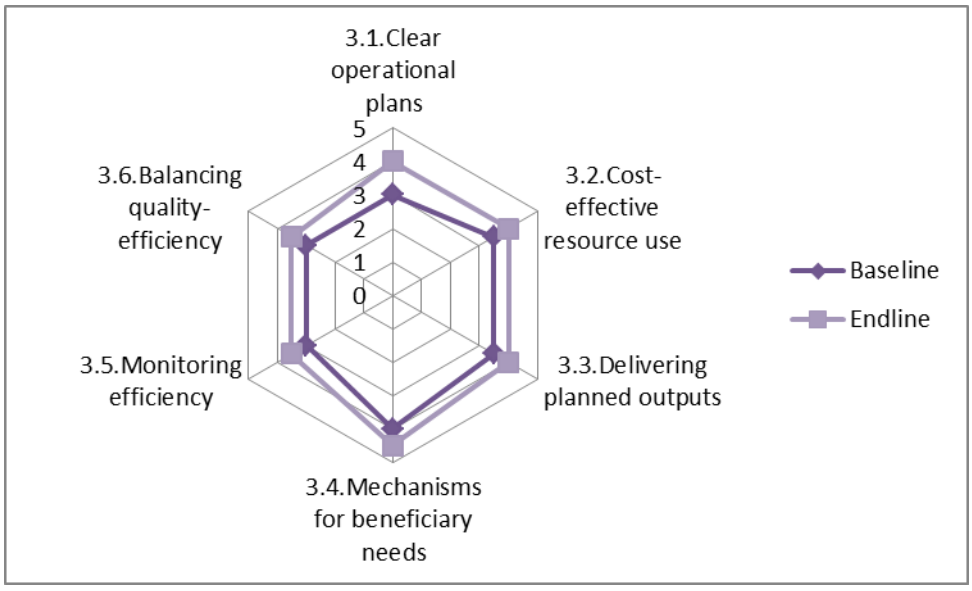


Overall, the capability to act and commit considerably improved since the leader of ASB has changed his leadership style from a one man show to a leader who delegates work well. This change occurred after the strategic planning workshop (sponsored by HIVOS) returned a lot of feedback to the organization's leadership. Ever since, delegation of tasks has increased, job descriptions have become clearer, more feedback on staff performance has been given and the overall gap between leadership and staff has decreased. With improved strategic guidance and better articulated strategies also the daily activities are now more in line with the strategies.

More opportunities now exist for the staff to take their own responsibilities and staff experiences more independently in their work, particularly amongst senior staff, and this has improved staff to be motivated in their work. Staff turnover has not changed, even though some staff left, the other staff joined in the organization, other people with appropriate skills for the job have been hired. The skill gap between senior staff and leadership has diminished, which has allowed the director to lead with general strategic directions and technical guidelines as opposed to hands-on control.

After ASB has acquired new donor funds (TIFA) in 2013, new and more staff training opportunities become available. Particularly on the field of media monitoring, advocacy, investigative journalistic and writing skills and general analytical thinking and data analysis with further training is required. Similar training has been conducted in 2011, however some new staffs hired in 2013, has not been participated in these type of training yet.

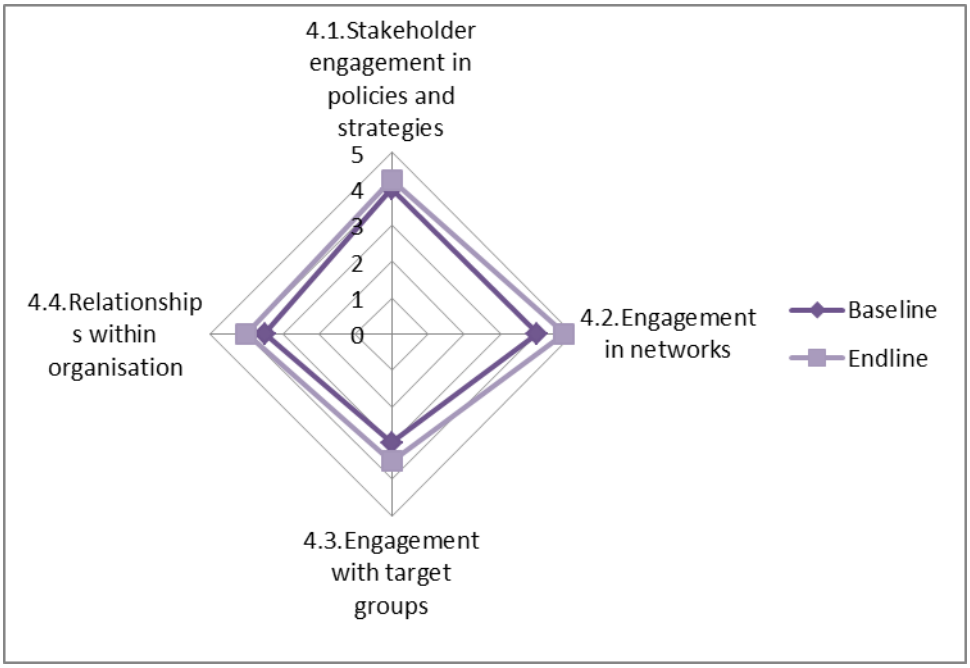
Score: From 3.0 to 3.8 (improvement)



**Capability to adapt and self-renew**

ASB has continued to apply the same M&E approach for the last two years. More frequent meetings in the form of staff meetings and the annual evaluation & planning meetings have enabled ASB to capture more input and optimize M&E. ASB continuously compares the work plans with the results and output of activities. Furthermore staff indicated that stakeholder opinions are now included more frequently in M&E activities. Through regular meetings and annuals reviews a systematic evaluation method is in place which allows for all staff members to provide their input on current projects and general organizational developments. Although the system is in place M&E is still performed by individual staff members, and not a dedicated M&E function. The director continuously plays an important role in this. In terms of the internal culture of critical reflection and sharing of ideas, the atmosphere in ASB is considered to be more open and communication is stimulated. Beneficiaries are able to approach the organization more easily and in general ASB has become more responsive to stakeholders . Overall this capability has improved slightly, mainly due to the greater frequency in meeting and greater role of staff input. Being involved in networks and having students do research at ASB helps them to keep track of what is happening in the environment.

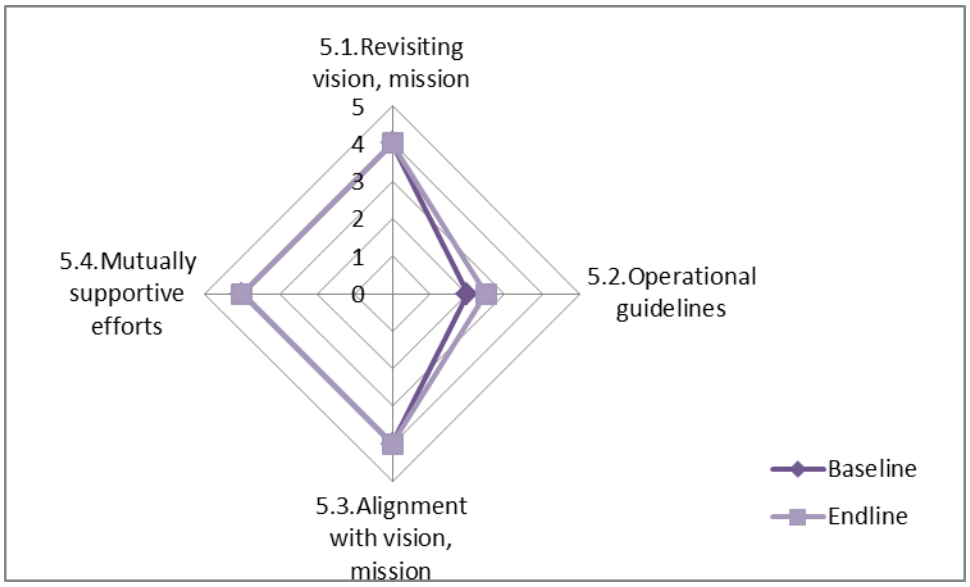
Score: From 3.1 to 3.6 (slight improvement)



**Capability to deliver on development objectives**

The capability to deliver on development objectives has slightly improved mainly due to the fact that ASB has more clear operational plans and gives opportunity to the staff to align their activities to their organization's strategic level. Even though ASB has acquired more donor funds, they are more creative in terms of using their resources cost effectively. This care is displayed for instance in how staff is now more carefully selected for attending external or internal events, and also through coordinating events with universities to reduce operational costs for venues. The saved costs are in turn utilized to fund programs which are not directly supported by donors. There is no formal system in place to assess beneficiary needs, but through the established FKK (Diversity and Communication Forum), beneficiary and stakeholder needs could be checked and balanced. Although there is no formal system to compare inputs with outputs but they have regular meetings to help them assessing the work progress as a part of work efficiency assessment.

Score: From 3.3 to 3.9 (slight improvement)



**Capability to relate**

The capability to relate has slightly improved mainly due to having an extended network on local, national and even in the international level. ASB has also established new partnerships with universities which resulted in the establishment of a support system for the handling of legal cases. Collaboration with universities and being involved in the FKK network has also improved relationships with beneficiaries. In relation to the improved supporting system for handling cases, ASB's bargaining position in the networks has increased, which has led to opportunities for new collaborations and funding. Internally, relationships have improved due to having a director who often invites the staff to have dinner and watching movies after hours.

Score: From 3.6 to 4.1 (slight improvement)

**Capability to achieve coherence**

Even though there is no formal discussion about vision and mission, ASB still operate based on the same vision and mission. However, with the help of HIVOS, the strategic planning process has taken place, which is also helped develop implementation plans in line with the strategies. Generally, program, strategies and activities are in line with the vision and mission of the organization. Project activities are still complimentary as in the baseline such as program from HIVOS for case handling while program from TIFA for counseling training. Counseling training completed the case handling activities as when handling some cases, it is needed skill to be a good listener or a good counselor.

Score : From 3.5 to 3.6 (very minor improvement)

### 4.2.2 General changes in the organisational capacity of the SPO

The evaluation team carried out an endline assessment at *Aliansi Sumut Bersatu (ASB*) from 16 July 2014 to 18 July 2014. During this workshop, the team made a recap of key features of the organisation in the baseline in September 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline. The three main changes that happened in the organisation since the baseline, as identified by the staff during the endline workshop were:

1. Being more recognized as an organization working on pluralism issues [1].
2. The provision of health insurance (BPJS) linked to investments [2].
3. Increased job security, with through more permanent staff contracts [3]
4. The first is the most important change in the organization. Each of these changes and how these have come about is explained more in detail below. Numbers in the narrative correspond to numbers in the visual.
5. Both these latter changes were achieved through better staff welfare [8]

More recognized as an organization focussed on pluralism issues [1]
Provision of Health insurance (BPJS) linked to investments [2]
Increased job security (more staff has permanent contracts) [3]
Improved staff capacity to implement programs [4]
Increased trust from stakeholders [5]
Staff is more confident in implementing program activities [6]
More opportunity to participate in training/capacity building [7]
Staff capacity is better recognized by the Board [13]
Greater staff autonomy [17]
Increased opportunities and ability of staff to manage programs [21]
More work delegated to senior and junior staff [24]
Better staff welfare [8]
Addition of 3 staff members (advocacy, monitoring, finance) [9]
Better office infrastructure [10]
Increase in program activities [11]
Organization is widely acknowledged [12]
The addition of funds from TIFA [14]
Improved diversity of funding [19]
Increased confidence of donors and stakeholders [22]
Increased capacity and confidence to propose to donors [25]
Clearer programatic guidance to propose for funding [30]
Strategic planning paper created [34]
More frequent internal meetings to discuss issues [18]
Increased awareness among staff for operational performance [29]
Change in leadership style [33]
Financial statements more transparent and accountable through website [26]
Better operational financial management [31]
Improved acceptance amongst stakeholders [15]
Improved quality service delivery [27]
Lower cost handling case and inceased efficiency [32]
Support in handling cases stronger [35]
Increased cooperation with religious and faith based leaders for case handling [36]
Increased awareness to introduce pluralism issues to the public [37]
Dissemination to the public through seminars, workshops etc. [16]
Increased documentation and publication of work on diversification and pluralism issues [20]
Increased cooperation with academics and journalists for publications [23]
Increased capacity to communicate results [28]
Strategic planning funded by HIVOS in 2013 [38]
BITRA Indonesia financial management training in 2011 [39]
Review and revise standard operating procedures on finance in 2013 [40]
Writing course by KIPAS in 2012 [41]
Investigative journalistic writing by YAKOMA in 2011 [42]

**Being more recognized as an organization focusing on pluralism issues [1].**
According to ASB staff present at the end line workshop, the main change that has taken place in the organization since the baseline in 2012 is being more recognized as an organization working on pluralism issues [1]. ASB has become the benchmark for both private and public organizations working in the field of pluralism in North Sumatra. In general it can be concluded that the strategic planning session organized by HIVOS in October 2013 has played an important underlying factor in realizing the abovementioned key change in the organization.

The greater recognition of ASB in terms of pluralism issues was the result of:

1. Improved staff capacity to implement programs [4]
2. Increased trust from stakeholders [5]

Each of these factors is explained below:

First of all improved staff capacity to implement programs came about from five developments, each of which are listed here. First, staff became more confident in implementing program activities [6]. Second, better staff welfare resulted in a more productive and motivated workforce [8]. Third, three new staff members were added to the organization in the fields of advocacy, monitoring and finance that did not yet exist before the baseline in 2012 [9]. Fourth, better office infrastructure allowed staff to work more efficiently [10]. Staff used to work with limited office support facilities, but with the addition of voice recorders, laptops, projectors and a stable internet connection, communication was greatly enhanced. Finally, fifth, an overall increase in program activities increased the speed at which staff learned about program implementation [11]. Each of these areas is further explained below.

Greater confidence amongst staff in implementing their program activities [6] came largely about from a greater number of opportunities for staff to participate in training and capacity building activities [7]. These opportunities were created by the board, who soon came to recognize the (importance of) staff capacity [13] because staff operated with greater autonomy on the one hand [17] whilst communicating results in more frequent internal meetings to discuss issues on the other [18].

Staff was enabled with greater autonomy through more opportunities to manage programs independently [21]. This was the direct result of more and more work being delegated from management to senior and junior staff [24], one of the key decisions that came about in the change in leadership style that occurred [33]

The increase in meeting frequently [18] came about from an overall increase in awareness amongst staff for the need of operational performance [29]. This was carefully communicated by the new leadership in place [33]. The change in leadership style was an important change as a result of the strategic planning session funded by HIVOS in 2013 [38].

The other four factors that affected improved staff capacity (better welfare) [8], new staff additions [9], better office infrastructure [10], and more program activities [11]) all resulted from the addition of funds enabled by acquiring the TIFA foundation as a new sponsor [14]. This was enabled shifting the policy of single funders to achieve greater diversity of funding sources [19]. ASB was able to shift towards this new paradigm—from single funders to the greater variety of funding sources-- through increased confidence of donors and stakeholders [22], which in turn occurred as a result of three factors:

1. An increased capacity and confidence amongst staff to develop proposals and present these to donors [25] therefore getting in touch with more potential funding candidates;
2. More transparent financial statements and accountable reporting through the website [26];
3. Improved quality of service delivery [27].

The first of these factors resulted from increased awareness amongst the staff regarding operational performance [29]. Simply put, with greater awareness the overall sense for the need to proactively engage with stakeholders came about amongst staff. In addition to this, a clearer programmatic guidance to propose for funding [30] significantly increased both capacity and confidence of staff to propose to donors. The guidance resulted from a strategic planning paper [34] written as a result from the HIVOS funded strategic planning workshop in 2013 [38].

The second factor, greater transparency in financial statements and accounting resulted from an overall improvement in operational financial management [31]. This improvement can be attributed to the BITRA financial management training which was performed in 2011 on the one hand [39], and the review and revision of standard operating procedures on finance sponsored by HIVOS in 2013 on the other [40].

The third factor, improved quality of service delivery resulted from the lower cost to handle case work and an increase in overall efficiency in doing so [32]. The greater support from stakeholders and partner organizations [35] through increased cooperation with religious and faith based leaders [36] was the main reason for this. Overall, this support came about through the increased awareness in partner networks about ASB's ambition to introduce pluralism issues to the public [37], which in turn was identified in the strategic planning workshop in 2013 [38].

Prior to 2012, the network of the organization was limited only to certain religious leaders among which were Protestant and *Parmalim* (local religion) religious leaders. From 2012 onwards, ASB expanded their network to universities *(Universitas Sumatera Utara, Universitas Negeri Medan),* journalists, local NGOs, and religious leaders from other religions such as *Matakin* (local religion), Hindhuism, Bahai, Konghucu, and Advent Protestant. ASB also started working with religious-based organizations such as *Majelis Kelenteng Konghucu Indonesia (MKKI), Majelis Budhayana Indonesia (MBI)* and *Persatuan Hindu Darma Indonesia).*

All of the above has explained how ASB's improved staff capacity to implement programs has come about [4]. But there is a second factor which has influenced the key change of ASB being recognized as an organization focusing on pluralism issues: the increased trust from stakeholders in ASB [5]. This came about from a wide public acknowledgement of ASB, and what they are doing [12]. On the one hand this occurred through an improved acceptance of ASB by its stakeholders through ASB's improved quality of service delivery [27]. On the other hand, the public itself became more and more aware of ASB and their objectives through the various seminars, workshops and other events organized by the organization [16]. ASB staff members got more and more public interest to attend such events through the increased documentation and publication of their work [20]. This practice was enabled by cooperating with various academics and journalists on publications [23], but largely founded on the increased capacity of the staff members to communicate results [28]. The latter greatly benefited from a writing course sponsored by KIPAS in 2012 [41], and a workshop on investigative journalistic writing sponsored by YAKOMA PGI in 2011 [42].

Since 2013, ASB has maintained an agreement with the local university by providing a scholarship program to college students to write their thesis on pluralism issues. In addition to that, academic publishing and public publishing with the help of university experts has increased. The ties to the academic and media networks have significantly increased the organization's visibility to become the leading organization for pluralism issues.

## 4.3 Attributing changes in organisational capacity development - evaluation question 2 and 4

Note: for each country about 50% of the SPOs has been chosen to be involved in process tracing, which is the main approach chosen to address evaluation question 2. For more information please also see chapter 3 on methodological approach. For each of these SPOs the focus has been on the capability to act and commit and the capability to adapt and self-renew, since these were the most commonly addressed capabilities when planning MFS II supported capacity development interventions for the SPO.

For each of the MFS II supported capacity development interventions -under these two capabilities- an outcome area has been identified, describing a particular change in terms of organisational capacity of the SPO. Process tracing has been carried out for each outcome area. The following outcome areas have been identified under the capability to act and commit and the capability to adapt and self-renew. Also the MFS II capacity development interventions that could possibly be linked to these outcome areas are described in the table below.

Table 2

*Information on selected capabilities, outcome areas and MFS II supported capacity development interventions since the baseline*

| Capability | Outcome area | MFS II supported capacity development intervention(2) |
|---|---|---|
| Capability to act and commit | Improved capacity to manage the organization | Strategic planning workshop to develop work plans 2012/2013-2015 |
| Capability to adapt and self-renew | Improved capacity to communicate results on diversity issues | English course |

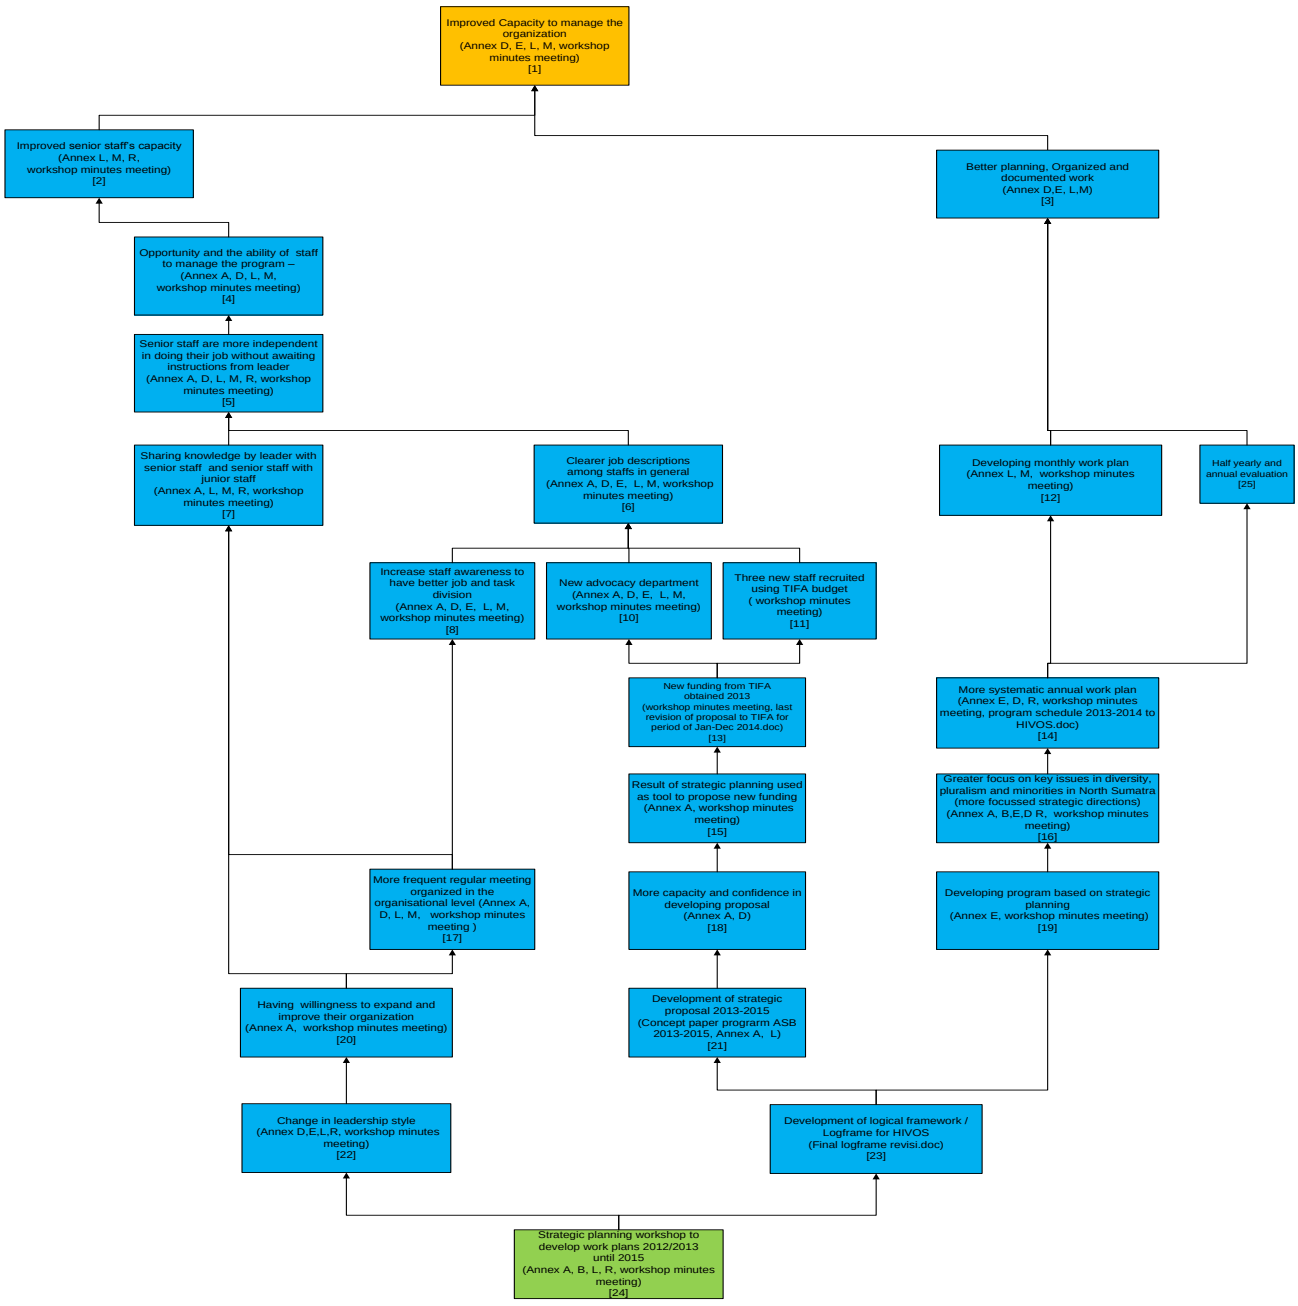
The next sections will describe the results of process tracing for each of the outcome areas, and will describe to what extent these outcome areas have taken place as a result of MFS II supported capacity development interventions and/or other related factors and actors.

All key organisational capacity changes that were identified during the general map exercise happen to coincide with the outcome areas selected for process tracing. Each of these three areas is described more in detail below, and a full description of these changes and how they have come about is provided in Appendix 5. In the descriptions the numbers refer to the visual which includes all organisational capacity changes and can be found below.

### 4.3.1 Improved capacity to manage the organization

In the capability to act and commit the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'improved capacity to manage the organization'.

In the capability to adapt and self-renew the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'improved staff capacity to communicate results on diversity issues'



- Below you will find a description of the 'improved capacity to manage the organization' and how this has come about. According to staff present at the (process tracing) endline Process Tracing Minutes Meeting the improved capacity to manage the organization is mainly due to: Improved senior staff capacity [2] (Annex L, M, R, Process Tracing Minutes Meeting minutes meeting)Better planning, organized and documented work [3] (Annex, D, E, L, M)

Both of these factors are further described explained below. The numbers in the visual correspond with the numbers in the narrative.

**Improved senior staff capacity [1]**

First of all, the improved ability to manage the organization came about from an improvement in senior staff's capacity. This was validated by both internal and external stakeholders [1] (Annex D, E, L, M, and Process Tracing Minutes Meeting minutes meeting). The greater capacity of senior staff resulted from greater opportunity for senior staff to manage the program [4] (Annex A, D, L, M, Process Tracing Minutes Meeting minutes meeting). This in turn came about from an ability to work more independently without having to wait for leadership instructions [5] (Annex A, D, L, M, R, Process Tracing Minutes Meeting minutes meeting). The statement was echoed by senior program staff during the end line Process Tracing Minutes Meeting. The Director said that currently they have more opportunity to work independently including making decisions. Further, more staff has been better recognized by the partners of the organization, not only by the Director.

Causal map ASB –
C1.1 Improved ability to manage the organization

Staff members indicated during the end line Process Tracing Minutes Meeting (Annex D, E, M, L, P, and Process Tracing Minutes Meeting minutes meeting) that the greater independence in their work resulted from two occurrences: sharing knowledge by leadership with senior staff, and by senior staff with junior staff [7] on the one hand, and clearer job descriptions on the other. The two paragraphs below describe each occurrence.

First of, a of knowledge took place by leadership with staff members [7] (Annex A, L, M, R, Process Tracing Minutes Meeting minutes meeting). This was enabled by the willingness of the organization to expand and improve their organization [20] (Annex A, Process Tracing Minutes Meeting minutes meeting) and more frequent meetings at the organizational level [17] (Annex A, D, L, M, Process Tracing Minutes Meeting minutes meeting). In the baseline, the regular meetings between staff and the Director were conducted monthly, while in the end line, they stated that they have had bi-weekly meetings in addition to monthly meetings.

Both these factors resulted from a change in leadership style[22] (Annex D, E, L, R, Process Tracing Minutes Meeting minutes meeting). Some staff said that previously the Director tended to be "one man show" and did not really provide great autonomy to staff. However, based on the Director's opinion, the narrowed autonomy he provided to staff was by intention. The Director wanted to do stepwise delegation due to the great competency gap among leader, senior and junior staff. The leadership style was significantly changed as a result of the strategic planning supported by HIVOS in 2011 [24] One of the agenda points in the strategic planning Process Tracing Minutes Meeting was to reflect and evaluate the leadership style of the current Director as proposed by the Board of the organization. The Board has advised to the Director to give greater autonomy to the staff (Annex A, B, L, R, Process Tracing Minutes Meeting minutes meeting).

The second development that enabled senior staff to do their work with more indepence was the development of clearer job descriptions for the staff in general [6] (Annex A, D, E, L, M, Process Tracing Minutes Meeting minutes meeting). Previously in ASB, there was a lot of overlap among staff responsibilities [6] (Annex E,M,L,P, Process Tracing Minutes Meeting minutes meeting). One staff member could work on more than one task. The need for a clearer description of work responsibilities for staff members therefore came about for three different reasons. Firstly, staff realized that a better job and task division was required and they realized this during their regular staff meetings [8]. Secondly, there was a new Department for advocacy [10] (Annex A, D, E, L, M, Process Tracing Minutes Meeting minutes meeting).Thirdly, three new staff members were recruited utilizing the newly acquired TIFA budget [11] (Process Tracing Minutes Meeting minutes meeting).

These last two factors were derived from the new funding obtained from TIFA in 2013. The success to obtain funding from TIFA came about from the result of strategic planning that was used as a tool to propose new funding [13] (Process Tracing Minutes Meeting minutes meeting, last revision of proposal to TIFA for period of Jan-Dec 2014.doc).

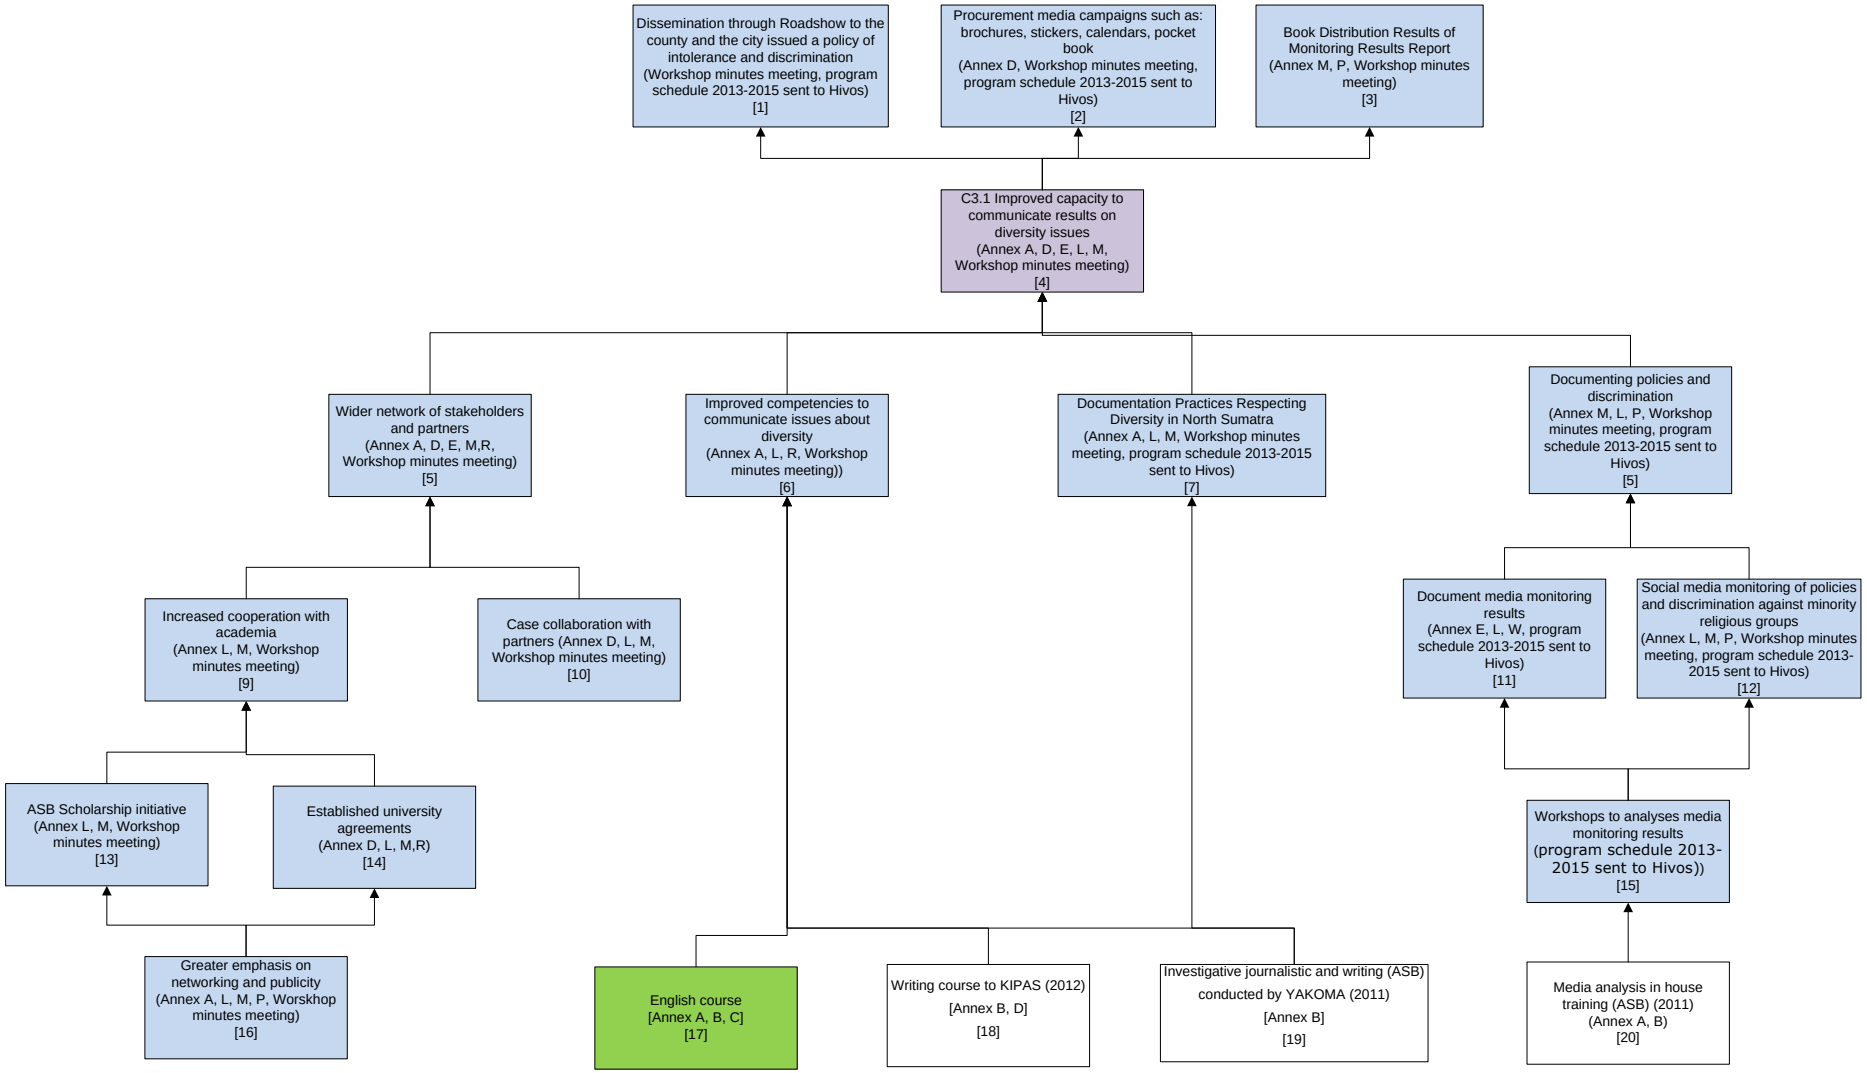
**Better planning, organized and documented work [3]**

The improved capacity to manage the organization was not only due to improved senior staff capacity, but also to better planning, organized and documented work [3] (Annex, D, E, L, M). . Staff stated that this occurred primarily based on the now regular (monthly) development of monthly work plans [12] (Annex L, M, Process Tracing Minutes Meeting minutes meeting), but was also due to having half yearly and annual 'evaluations' [25] (Annex L, M, Process Tracing Minutes Meeting minutes meeting), which specifically supported the documentation of the work being implemented. This monthly meetings, and improved evaluation came about from the having more systematic and well developed annual work plans [14] (Annex E, D, R, Process Tracing Minutes Meeting minutes meeting, program schedule 2013-2014 to HIVOS.doc), which in turn were enabled by a much greater focus on strategic directions and key issues in diversity, pluralism and minorities in North Sumatra [16] (Annex A, B, E, D, R, Process Tracing Minutes Meeting minutes meeting). This more specific focus was formulated in a program, as explained in the strategic proposal 2013-2015. This was based on the logical framework that was developed for HIVOS in 2011 [23](Final log frame revisi.doc), as result of the Strategic Planning Process Tracing Minutes Meeting in 2011, which was focused on developing a work plans until 2015 [24] (Annex A, B, L, R, Process Tracing Minutes Meeting minutes meeting).

### 4.3.2 Improved capacity to communicate results on diversity issues

- ASB is an institution that was founded in 2006 and was officially established in 2009 as association. Initially focused on social pluralism regarding sexual and gender equality issues *Aliansi Sumut Bersatu* (ASB) has broadened its scope of action[19] since 2010. An example of this is ASB's present project: "Civil and Religious Societies' Participation in Promoting Peace and Diversity in North Sumatra". This program, which in the framework of MFSII is co-financed by HIVOS, aims at bringing about religious pluralism in North Sumatra. The end line focused on the following key organizational capacity change or key outcome in the capability to adapt and self-renew: improved capacity to communicate results on diversity issues [4] (Annex A, D, E, L, M). This came out of document

[19] Aliansi Sumut Bersatu (2011), ASB Proposal Form to HIVOS



review as well as discussion with staff present at the end line workshop (Annex A, B).Improved capacity to communicate is expected to and already affects communication of results, through the following means :

- Dissemination through a road show to five ASB area namely Siantar, Aceh Singkil, Binjai, Langkat, and Medan. These areas were targeted to disseminate the result of ASB regular reporting on pluralism and diversity and discussed what possible action can be done to response the report. These five areas have issued a policy of intolerance and discriminatory [1] (Process Tracing Minutes Meeting.)
- Procurement media campaigns such as: brochures, stickers, calendars and pocket books[2] (Annex D, Process Tracing Minutes Meeting, program schedule 2013-2015 sent to HIVOS.
- Book Distribution Results of Monitoring Results Report [4]. They did the monitoring of diversity issues and collected the monitoring results in the form of books. As part of ASB's advocacy strategy, ASB disseminated diversity information by distributing the monitoring result books. Process Tracing Minutes Meeting)

Staff's capacity to communicate results in diversity issues has improved because of the following four reasons:

- A wider network of stakeholders and partner [5] (Annex A,D,E,M,R, Process Tracing minutes of meeting)
- Improved competencies to communicate issues about diversity [6] (Annex A, L, R, Process Tracing Minutes Meeting)
- Documentation of practices respecting diversity in North Sumatra [7] (Annex A, L, M, Process Tracing Minutes Meeting, program schedule 2013-2015 sent to HIVOS)
- Documenting policies and discrimination [8] (Annex M, L, P, Process Tracing Minutes Meeting, program schedule 2013-2015 sent to HIVOS)

Each of these factors and their underlying logic is explained below.

**Wider network of stakeholders and partners [5]**
*Aliansi Sumut Bersatu* (ASB) has an extensive network including various communities, media, and religious groups. In 2012, ASB expanded their network to academia with various religions such as *Konghucu, Islam, Hindu, Budha, Bahai, Ahmadiyah, Parmalin and Advent*. Previously, these stakeholders have not been part of ASB. In other words, ASB has wider network of stakeholders and partners [5] (Annex A, D, E, M, R, )

This improved network was realized through increased cooperation with academia [9] (Annex L, M, Process Tracing Minutes Meeting) on the one hand, and case collaboration with partners on the other [10] (Annex D, L, M, Process Tracing Minutes Meeting).

Increasing the network with academia was also part of ASB's strategy to improve the institutions' efficiency.To strengthen commitment to pluralism, ASB has expanded networking to local, national and international partner organizations.

- At the local level these organizations included: Fitria, Human Rights Study Center, Medan University, and Sumatra Utara University (Annex E, M, P, and Process Tracing Minutes Meeting).
- At the national level these included: Setara Institute, Wahid Institute, ILRC (Indonesian Legal Resource Center), SEJUK, Asean Moslem Action Network (AMAN), PGI (Persekutuan Gereja Indonesia – Indonesian Church Community), and YAKOMA (Annex A, D, E, M, P.
- At the international level these included: Amnesty International and CSW (Christian Solidarity Worldwide) (Annex E, M, L, and Process Tracing Minutes Meeting).

Agreements were made in order to establish relationships with universities [14] (Annex D, L, M,R).The relationship was in the form of providing venues to conduct workshops and or seminars related to pluralism issues. One of the program staff said that another reason of the intensified relationships with academia was the provision of scholarships by the organization for university students whose thesis was about pluralism issues [13](Annex L, M, L, Process Tracing Minutes Meeting) which was used as a strategy to disseminate pluralism issues at the university level.

With respect to handling cases, ASB was supported by some networking and partners. Case collaboration has been affected to the escalation of ASB network and partners – i.e, ASB has stronger collaborative work with the National Commission on Violence Against Women (*Komnas Perempuan*) in Jakarta when they handle the cases [10] (Annex D, L, M, Process Tracing Minutes Meeting).

Case collaboration, scholarship initiative, and agreement with university have been influenced by a greater emphasis networking and publicity [16] (Annex B, D). ASB has a strong commitment regarding pluralism issues.

**Improved competencies to communicate issues about diversity [6]**
The fact that staff have improved their competencies to convey diversity issues [6](Annex A, L, R, Process Tracing Minutes Meeting), is the second factor that influenced the improved capacity to communicate results on diversity issues [4] (Annex A, D, E, L, M, Process Tracing Minutes Meeting). This improvement can be attributed to three factors. The first factor was an English course funded by MFS II [17] (Annex A, B C) after the partner organization realized that communication needed to be improved. The second factor affecting the improved communication competency was the writing course conducted by KIPAS in 2012. KIPAS has been ASB's partner since 2009. KIPAS has the same concern as ASB – advocacy strategy through journalism [18] (Annex B, D). The third and last contributing factor was a journalism investigative and writing training which was held by YAKOMA PGI in 2011[19] (Annex B).

**Documentation practices respecting diversity in North Sumatra [7]**
The third factor relating to the improved capacity to communicate results on diversity issues was improved documentation practices regarding diversity in North Sumatra [7] (Annex A, L, M, Process Tracing Minutes Meeting, program schedule 2013-2015 sent to HIVOS). Similarly to the improved competencies to communicate issues about diversity [6] (Annex A, L, R, Process Tracing Minutes Meeting) as described in the previous section, this was the result of the writing course [18] (Annex B, D) and the investigative journalistic writing training [19] (Annex B, Interview questionnaire staff). ASB

creates annual reports on media monitoring and documenting cases of intolerance in Aceh and North Sumatra (doc: meeting minutes). The data is used as a reference for media and community and society to reveal the diversity of pluralism in Indonesia.

**Documenting policies and discrimination [8]**

The final factor contributing to the improved capacity to communicate results on diversity issues includes the documenting of policies [8] (Annex B, D).This in turn was affected by two factors. On the one hand documentation of media monitoring results[11] (Annex E, L, W, program schedule 2013-2015 sent to HIVOS) on the other hand social media monitoring of policies and discrimination against minority religious group[12](Annex L, M, P, Process Tracing Minutes Meeting, program schedule 2013-2015 sent to HIVOS). ASB has staff that is responsible for monitoring intolerance cases through media and social media (Process Tracing Minutes Meeting). Starting from 2011, the ASB published a book as a result of the monitoring of the media and social media monitoring, and HIVOS supported this publication (Annex E, L, W, program schedule 2013-2015 sent to HIVOS).

Both the documentation of media monitoring results as well as actively monitoring social media for policies came forward from a workshop to analyze media monitoring results funded by HIVOS in 2013[15] (Annex A,B). This workshop on analyzing media monitoring results came about from the first similar workshop came which was conducted in 2011. This 2011 workshop also funded by HIVOS [20] (Annex A, B).

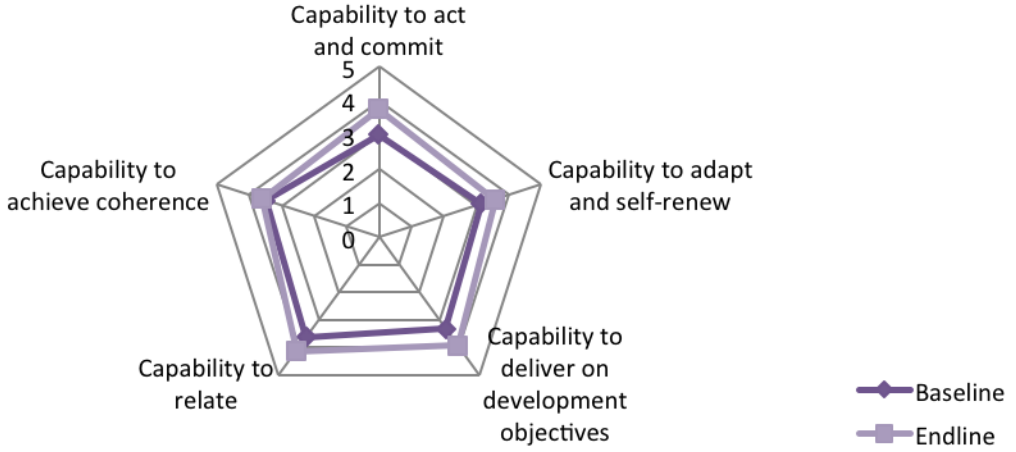
# 5 Discussion and conclusion

## 5.1 Methodological issues

**General: Applied to all or most SPOs**
With regard to the methodology, Indonesia has made some data collection adjustment based on the context. The first adjustment was related to the type of instrument used. To assess the organizational capacity, the study has provided self-assessment, observation and interview sheets. These all were used during the baseline with all SPOs. During the end line the team used self-assessment, interview and observation sheets. However the evaluator applied interview sheets as self-assessment—where participants were asked to fill these sheets by themselves. For the participants who did not attend the workshop, the interviews were done separately using the interview sheet and the results from the interview were included in the subgroup interview sheet that was already filled by the staff member. Were combined into the relevant sub categories in the interview sheet. Interview sheets were also applied for interviews with the CFAs, partners and consultants.

The baseline study showed that having two similar instruments (self assessments, and interview sheets) did not have any effect in relation to obtaining adequate and quality data.

Another adjustment to the methodology was the language. The team has translated all instruments in to Bahasa Indonesia to be able better understood by the SPO's. This also applied to the initial findings (translated back into Indonesia) for three SPOs that are YRBI, ASB and PT.PPMA.



To have some clarification post visit to all SPOs, the evaluator used email and phone interviews.

**Aliansi Sumut Bersatu (ASB)**
The interview sheet was sent prior to the workshop and filled by most of the respondents. The participants involved in this end line process were 1 management, 2 coordinator programs, 1 finance and administration, 4 field staffs, 1 partner and 1 consultant. The organization was selected for process tracing and had the chance to be visited twice by the evaluators. In relation to process tracing, six staffs filled the training questionnaire related to MFS II funded training events since the baseline in 2012. For the process-tracing workshop, the evaluator has provided initial draft causal maps for the evaluator as guidance. These initial draft causal maps were developed, based on document review. The first map on the capability to act and commit was not shown during the workshop and the participants developed the map based on their own understanding led by the evaluator (bottom up process). Due to limited time and workshop participants being tired, the initial draft causal map for the capability to adapt and self-renew was used as the basis for discussions with the workshop participants. After the had seen the map, the evaluator asked for their verification, clarification and allowed them to modify the map where necessary. It is not clear whether the initial causal map that was developed directed the workshop participants into a particular thinking. But all the issues have been checked and verified.

## 5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Whilst changes took place in all of the five core capabilities, the improvements were only minor. Below the changes in each of the capabilities are further explained, by referring to the specific indicators that changed.

Over the last two years most improvements took place in the indicators under the capability to act and commit. A slight improvement occurred in the responsiveness of leadership. The current leadership is considered to have improved in task delegation in the absence of leadership, greater clarity in staff's job descriptions, staff regeneration, and feedback to staff performance as a post-monitoring mechanism. An improvement occurred in terms of strategic guidance in the organization as well. The Director is now focusing on more strategic tasks to the level of responding to organizational issues instead of internal staff conflicts. He is able to provide strategic direction to the staff whilst allowing them to solve implementation problems on their own. An improvement also occurred in the organisational structure. This occurred particularly due to the increased clarity in tasks and responsibilities for staff members. A slight improvement happened in the articulation of strategies. ASB has increasingly utilized strategic planning in their approach to communicate and frame their work activities and plans. Daily operations improved slightly due to staff members placing their work plans on the writing board for everyone to see and refer to on a day to day basis. Staff skills have improved due to the delegation of work tasks and sharing of information to subordinates. This has empowered subordinate staff throughout the organization. Training opportunities have improved due to the availability of new funding sources from for example TIFA. In addition the ASB director now plays an important role in deciding who will participate in which training, giving a fairer chance to all staff members. Incentives have slightly improved. Even though nothing changed in terms of remuneration, the increased freedom to manage work independently and the addition of flexible working hours, added to overall staff motivation and stimulated creativity on the job. Funding resources improved as well. With assistance from HIVOS, ASB's strategic plan has become a reference to seek new funding opportunities. This mechanism has allowed ASB to act more strategically on proposals, initiatives and directions instead of the former responsive attitude.

In the capability to adapt and self-renew ASB also slightly improved on various indicators. In terms of M&E application a slight improvement occurred as more frequent meetings in the form of staff meetings and the annual evaluation & planning meetings have enabled ASB to capture more input and optimize M&E. M&E competencies also slightly improved as the role of M&E person is now fulfilled by another person next to the director. Critical reflection within ASB improved slightly as the director encourages staff to attend informal meetings in order to discuss their concerns. A slight improvement was also found relating to the freedom of ideas, staff stated that their director has readjusted his expectations to the staff's work to be more in line with the challenges faced in the field. The system for tracking the environment has been slightly improved as ASB established the FKK (a Diversity Communication Forum) as part of their networking support. Within this forum they encourage members of their network to assist them by extending their case monitoring in the field. Finally there was a slight improvement in the stakeholder responsiveness: since the baseline, ASB has actively expanded their network of partner organizations and beneficiaries. Feedback from the network and beneficiaries are taken into account during program planning and the development of strategic plans.

In terms of the capability to deliver on development objectives, an improvement has taken place with the development of ASB's strategic plan, which has positively affected the operational plans that were already in place. Day to day and operational activities now align better with the organizational strategy. Similarly a slight improvement took place on cost-effective resource use as ASB has become creative through their concern in spending funds. ASB also adjusted their operational strategy and organizational decisions to reflect this. Delivering planned outputs has slightly improved for the organization. ASB delivers planned outputs in a timely manner, even with its limited resources through the involvement of volunteers and their network. The mechanism for beneficiary needs has slightly improved too, as the strategy to establish the FKK (Diversity and Communication Forum) has been proven to be a successful mechanism to meet beneficiary needs. Monitoring efficiency has slightly improved as ASB always evaluates the progress of each project biweekly and monthly and utilizes the feedback to evaluate work efficiency. In terms of balancing efficiency requirements with the quality of work, a slight improvement occurred as all work plans are aligned to each other and used to examine the quality of achievements versus implementation time.

In the capability to relate ABS improved in its networking capacity. More stakeholders are engaged in the development of policies and strategies, which is a very slight improvement compared to the baseline. Engagement in networks has improved, as new partnerships but also academia are approached. Target groups have been engaged more through the Diversity Communication Forum. Finally, relations within the organisation have slightly improved as relationships are considered more open and equal, since the director has delegated more tasks and roles and responsibilities are more clear.

Finally, SDS has very slightly improved in its capability to achieve coherence. Operational guidelines of ASB have slightly improved with the introduction of standard operating procedures for all divisions.

**General organisational capacity changes related to MFS II Interventions**

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. Please note that this information is based only on the information provided by ASB staff during the endline workshop, but no validation of this information has been done like with the process tracing causal maps. For details in relation to attribution, we refer to the next section (5.3).

During the endline workshop some key organisational capacity changes were brought up by ASB staff, these have been captured in the general causal map in 4.2.2: the provision of health insurance (BPJS) linked to investments; increased job security, through more permanent staff contracts; improved staff capacity to implement programs. All of these are expected to contribute to ASB being more recognised as an organisation to focus on pluralism issues. ASB staff experienced these as the most important capacity changes in the organisation since the baseline.

First, both the provision of Health insurance (BPJS) linked to investments, and the increased job security through permanent contracts, can be attributed to better staff welfare through an addition of funds from the TIFA funding. TIFA funds could be acquired through a more diverse funding focus after donors and stakeholders gained confidence in the organisation to invest. This confidence could be attributed to the increased capacity to propose to donors, more transparent and accountable statements and improved quality of service delivery. Greater capacity to propose for funding can be attributed to clearer programmatic guidance, based on a strategic planning paper being created after the MFS II funded strategic planning workshop in 2013. Clearer programmatic guidance also occurred through increased awareness on operational performance as instructed by the leader through his new leadership style. This shift in style also occurred after the strategic planning workshop was concluded.

Increased financial statement transparency and accountability on the other hand, was enabled by better operational financial management. This can be attributed to the BITRA Indonesia financial management training in 2011 (non-MFS II) but also to the review and revision of standard operating procedures (SPOs) on finance in 2013, which was MFS II funded.

The improved quality of service was the result from lower cost in handling cases and increased efficiency. This can be attributed to greater support in handling cases through increased cooperation with religious and faith based leaders. This was enabled by increased awareness on the topic of pluralism issues amongst the public, which was one of the recommendations and key actions defined in the HIVOS sponsored strategic planning workshop in 2013.

Improved staff capacity to implement programs occurred through the addition of new staff members, an increase in program activities and staff being more confident in implementing those activities. New staff, improved office infrastructure and more activities could all be attributed to the addition of TIFA funds. The acquisition of those funds follows the same line of changes as described above, and are tied to the MFS II funded strategic planning workshop in 2013, as well as the review and revision of SOP's in 2013, although also to the BITRA Indonesia financial management training in 2011.

The increase in confidence to implement program activities occurred through more opportunities to participate in trainings and capacity building activities, after the board started to recognize the value of staff capacity. This in turn was enabled by greater staff autonomy and more frequent internal meetings, in which staff got the chance to prove said capacity to their leadership. More autonomy can be attributed to an increase in opportunities to manage the program after more delegation from the top down into the organization took place. This was the direct result of the change in leadership style, which occurred per recommendation in the MFS II funded strategic planning workshop in 2013. The increase in meeting frequency also can be attributed to this leadership style as that increased awareness of staff on operational performance, which was carefully communicated to all staff.

Finally, the greater recognition of ASB as an organization focussing on pluralism issues also came about through increased trust from stakeholders. This was in part enabled by the increase in program activities as described earlier, but on the other hand through the organization being more widely acknowledged. The latter change occurred in part through more communication initiatives which were partially related to two other non-MFS II developments: a writing course by KIPAS in 2012, and an investigative journalistic writing course by YAKOMA PGI in 2011.

In conclusion, the overarching organizational capacity change area of ASB being more recognized as an organization focussed on pluralism issues can be only partially attributed to MFS II supported capacity development interventions. The MFS II funded strategic planning workshop and financial SOP review and revision contributed to a large extent to organizational changes related to staff capacity and welfare. However, non-MFS II funded interventions in the field of finance and communication also played an important role in these changes. It can be said that the MFS II interventions contributed more to the strategic organizational changes, whilst other interventions provided more change at an operational level. This was not the purpose of this particular exercise. It must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect. More detailed information can be found in the next section where selected organisational capacity changes have been thoroughly investigated through process tracing.

## 5.3 Attributing changes in organisational capacity development to MFS II

This section aims to provide an answer to the second and fourth evaluation questions:

2. *To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*
4. *What factors explain the findings drawn from the questions above?*

To address the question of attribution it was agreed that for all the countries in the 5C study, the focus would be on the capability to act and commit and the capability to adapt and self-renew, with a focus on MFS II supported organisational capacity development interventions that were possibly related to these capabilities. 'Process tracing' was used to get more detailed information about the changes in these capabilities that were possibly related to the specific MFS II capacity development interventions. The organisational capacity changes that were focused on were:

- Improved capacity to manage the organization
- Improved capacity to communicate results on diversity issues

The first organisational capacity change falls under the capability to act and commit (in relation to the part on improved staff's capacity) and the capability to adapt and self-renew (in relation to the part on planning and M&E). The second organisational capacity change falls under the capability to adapt and self-renew. The organisational capacity change areas that were chosen are based on document review as well as discussions with the SPO and CFA. Each of these organisational capacity changes is further discussed below.

*The following issues are discussed for the MFS II funded activities that are related to the above-mentioned organisational capacity changes:*

a. Design: the extent to which the MFS II supported capacity development intervention was well-designed. (Key criteria: relevance to the SPO; SMART objectives)
b. Implementation: the extent to which the MFS II supported capacity development was implemented as designed (key criteria: design, according to plans during the baseline);
c. Reaching objectives: the extent to which the MFS II capacity development intervention reached all its objectives (key criteria: immediate and long-term objectives, as formulated during the baseline);
d. The extent to which the observed results are attributable to the identified MFS II supported capacity development intervention (reference made to detailed causal map, based on 'process tracing').

Please note that whilst (d) addresses the evaluation question related to attribution (evaluation question 2), the other three issues (a, b and c) have been added by the synthesis team as additional reporting requirements. This was done when fieldwork for the endline process had already started and is also not the focus on this 5c evaluation. With the minimum information available the evaluation team tried to address these first 3 questions.

**Improved capacity to manage the organization**

The following MFS II capacity development intervention supported by HIVOS is linked to the key organisational capacity, change "improved capacity to manage the organization":

**1. Strategic planning workshop to develop work plans 2012/2013-2015**

*Strategic planning workshop to develop work plans 2012/2013-2015 – October 2011*

**Design**

This capacity development intervention was not explicitly planned during the baseline, and took place in October 2011. HIVOS assisted in the formulation of work plans, since ASB struggled in finding the right focus of work. Both HIVOS and ASB have confirmed the CFA intervention in both the self-assessments and interviews.

The immediate objective of the workshop was to create focused work areas and related work plans for 2013 to 2015. In addition, more strategic organizational questions were discussed, such as the "fit" of leadership style of the acting director.

The capacity development intervention was initiated by the management of ASB after good experiences in self-reflection during the MFS II baseline evaluation and the need for more focussed work plans and activities. The exercise therefore proved very relevant to the organisation as it was meant to outline activities and directions for the coming years that up until that point did not yet exist. Nonetheless it quickly became apparent that input and assistance from HIVOS was required to sharpen the organization's objectives, vision and mission.

Due to the spontaneity of the intervention, expected effects were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound).

**Implementation**

Based on the information that is available to the evaluation team, the implementation of the capacity development intervention occurred as designed during a one day workshop. In this workshop, the vision, mission and strategy were for established for the period of 2013, with the agreement of revising these items once every three years. The only major difference was the involvement of HIVOS in the process. Originally the workshop was intended to be an ASB exclusive activity. The HIVOS coordinator who participated in the workshop stated that all of the staff members attended and participated in the workshop.

**Reaching objectives**

Not having objectives that were defined as SMART objectives makes it difficult to assess whether they have been successfully accomplished. The immediate objective to create focused work areas was met through the production of clear work plans for 2013 to 2015 as well as the foundations laid for a logframe exercise from HIVOS. With respect to long term objectives, the workshop resulted in a change in leadership style of the director which led him to allow greater autonomy of his staff members. Finally the workshop set a precedent for a continuing series of strategic planning sessions from 2013, in which operational and strategic plans are reassessed periodically.

**Attribution of observed results to MFS II capacity development interventions**

Overall, the improved capacity to manage the organization was due to improved senior staff's capacity as well as better planning and organized, documented work. Both these capacity changes can be attributed to the MFS II intervention of the strategic planning workshop as an underlying reason for changes in terms of managing the organisation.

The improved senior staff's capacity was due to the opportunity and ability of staff to manage the programs they were involved in, which can be attributed to the fact that senior staff has become more independent in their jobs. Other than before the baseline, senior staff did not require to await instructions from the director before carrying on with their work. This development was enabled by the director sharing more knowledge with senior staff, and senior staff doing the same with their juniors. Having more information ready at hand enabled all staff members make better decisions independently. On the other hand clearer job descriptions amongst the staff in general made it clearer for staff members to carry out their work without having to first get permissions or answers from their superiors. Clearer job descriptions were developed due to an increase in staff awareness to have a better division of labour and task division, the development of a new advocacy department which allowed more effective splitting of work, as well as the recruiting of three new staff members under the newly acquired TIFA budget.

The new process of superiors sharing knowledge with the subordinates, as well as the increased staff awareness for better job and task division can be attributed to more frequent regular meetings that were organized at the organisational level. In addition to monthly staff meetings, bi-weekly meetings were added between staff members and ASB's director, which allowed for more frequent discussions of issues and solutions. Both the greater frequency of meetings as well as the sharing of information and knowledge to superiors resulted from a greater willingness of the organization to expand and improve itself. This could be attributed directly to the change in leadership style, which became less strict and more open to initiative and autonomy of the staff members. The change in leadership style in turn was the direct result of the strategic planning workshop in October 2011, in which after much discussion, the Board of ASB advised the director to alter his leadership style.

The newly acquired TIFA budget obtained in 2013 was the result of strategic planning used as a tool to propose for new funding. In practice, this meant that in the proposal, submitted in 2013 to TIFA, ASB's vision, mission and specific goals were presented with the 2011 strategic plan as foundation. Similarly specific activities and outputs related to these goals were presented, resulting in a well-rounded proposal for the period of January to December 2014. Writing this proposal was possible due

to the greater capacity and confidence of staff to develop and submit proposals for new funding sources. This capacity growth can be attributed to the development of the strategic proposal 2013-2015 developed as a concept paper early 2013. The development of this concept paper was made possible due to the ground work laid out in the development of the logical framework (LogFrame) for HIVOS in 2011. This logframe development was one of the actions defined for the work plans during the strategic planning workshop in 2011.

Finally, the improved capacity to manage the organization also came about from better planning and more organized and documented work. This could be attributed to the development of frequent (monthly) work plans as well as half-yearly evaluations. Both of these procedures were enabled by the more systematic annual work plan developed in 2013 as a result of a greater focus on key issues in diversity, pluralism and minorities in North Sumatra in an effort to develop more focussed strategic directions. The development of these directions can be attributed to the developed program based on the strategic planning which came about from the logframe exercise for HIVOS.

In conclusion the above series of developments displays how the improved capacity to manage to manage the organization can be attributed to a large extent to the planned MFS II capacity development intervention, as the main underlying reason for a change in leadership style and the strategic plan, which both proved very important to bring about changes in the organisation for enhanced capacity to map to manage the organisation.

***Improved capacity to communicate results on diversity issues***

The following MFS II capacity development interventions supported by HIVOS are linked to the key organisational capacity change "Improved capacity to communicate results on diversity issues" (please also see section 4.3):

1. English course

*English course (2013-ongoing)*

**Design**

These capacity development interventions were planned for during the baseline and were, according to HIVOS, one the most important aspects for ASB to develop. HIVOS intended for intensive coaching and training on english skills to focus on both writing proposals and project reports to encourage skills that would affect both the capability to act and commit as well as the capability to adapt and self-renew. According to the CFA, for a small and young organization like ASB with a limited number of staff members these trainings were expected to have a big impact on the organization and highly relevant. ASB itself benefits from the English course as it allows them to contact new potential fundraisers and connections.

It was not specified in what form the course would be given, or whether it would occur as a single training.

More specifically, HIVOS expected immediate effects of the training to allow ASB to be able to develop project proposals and revise their standard operating procedures. Additionally they expected that as a result of a more structured way of working through writing – ASB would adhere stricter to the strategic plan, and not work as impulsively as they did prior to the baseline evaluation in 2012.

In the long term, HIVOS expected that ASB would actually get support from other Donors than HIVOS as well as a result of successfully developing proposals. This should lead to more stability in the implementation of ASB's programs and activities.

This intervention was planned for during the baseline workshop and specified in the Theory of Change and thereby relevant to the organisation.

The expected effects were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). Then again, the evaluation team did not ask the CFA for SMART objectives specifically during the baseline, but rather asked about the expected or observed immediate and long term effects of the interventions.

**Implementation**
The English course was implemented in 2013 as an ongoing activity until 2015 for all staff members of ASB to attend. Other than only focussing on writing skills, teaching the English language was also included on this intervention. In the implementation ASB was also assisted by other initiatives on behalf of ASB themselves. KIPAS, a partner organization helped in organizing a separate writing workshop. No further details are known to the evaluation team regarding the specific design or setup of the intervention.

**Reaching objectives**
Since the objectives haven't been formulated as SMART objectives, it is difficult to assess to what extent these objectives have been reached. Additionally, the course is still ongoing and therefore only partially implemented which makes evaluation of long term objectives difficult. However, as can be seen in section 4.3.1, the capacity and confidence to write reports have increased which is in line with the immediate expected effect as formulated by HIVOS in the baseline evaluation. Similarly, ASB was able to secure additional funding from TIFA through the development of its own proposal based on strategic planning. This aligns to the long-term expected effect that HIVOS formulated earlier. Whether or not this will lead to a more sustainable and independent ASB is however as of yet inconclusive.

**Attribution of observed results to MFS II capacity development interventions**
ASB has improved its' capacity to communicate results on diversity issues over the last years. This development can be attributed to four distinct factors, namely: a wider network of stakeholders and partners; improved competencies to communicate issues about diversity; better documentation practices respecting diversity issues; and overall better documentation on policies and discrimination.

Out of these four factors only one attributes to an MFS II capacity development intervention. Each factor will be described in detail below.

First, the wide network of stakeholders and partners was due to increased cooperation with academia, as well as case collaboration with partners. The cooperation with academia resulted from the ASB scholarship initiative on the one hand and the establishment of university agreements on the other. Both of these could be attributed to a greater emphasis on networking and publicity by ASB.

Secondly, improved competencies to communicate issues about diversity could be attributed directly to the English course provided to all the staff members by HIVOS from 2013 to 2015. KIPAS, ASB's partner organization aided in a writing course as well provided in 2012. The competence to communicate can therefore be attributed in part to MFS II sponsored interventions.

Thirdly, documentation practices respecting diversity in North Sumatra were realized in 2013. These practices can be attributed to the writing course provided by KIPAS in 2012, as well as an investigative journalistic and writing course conducted by YAKOMA in 2011 on ASB's own initiative.

Finally the documenting of policies and discrimination was due document media monitoring results conducted in 2013 as well as a social media monitoring initiative of policy discriminating against minority religious groups in the same year. Both these were enabled by a series of workshops organized by ASB between 2013 and 2014 to analyse media monitoring results as a result of an in-house media analysis training organized by ASB themselves in 2011.

In conclusion, the improved capacity to communicate results on diversity issues can only be partially attributed to MFS II interventions. Particularly competencies to communicate results about diversity issues have improved as a result of the English course, although other non-MFS II interventions have impacted this as well. Despite HIVOS detailed plans to address the issue, ASB has developed a great deal of initiatives on their own to address this issue and improve this particular capacity.

# Appendix 1 Methodological approach & reflection

## Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

## Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.[20] Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

[20] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
   - -2 = Considerable deterioration
   - -1 = A slight deterioration
   - 0 = No change occurred, the situation is the same as in 2012
   - +1 = Slight improvement
   - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*

3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
   - Intervention, actor or factor at the level of or by **SPO**: ..... .
   - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
   - Intervention, actor or factor at the level of or by the **other funders**: ..... .
   - **Other** interventions, actors or factors: ..... .
   - Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;

- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5.* ***Prepare and organise the field visit*** *to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6.* ***Interview the CFA*** *– CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

*Step 7.* ***Run the endline workshop*** *with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

***Purpose of the fieldwork*:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

***Brainstorm on key organisational capacity changes and influencing factors***: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative.This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

***Self-assessments*:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8.* ***Interview SPO staff*** *– in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9.* ***Fill-in observation sheets*** *– in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

*Step 10.* ***Interview externals*** *– in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11.* ***Upload and auto-code all the formats*** *collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the **overview of information** per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13. **Analyse the data and develop a draft description** of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14. **Analyse the data and finalize the description** of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15. **Analyse the information** in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

## Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

- Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.
- Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.
- Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the

purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

*The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia*

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

*SPOs selected for process tracing – Ethiopia*

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| AMREF | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| CARE | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| ECFA | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| FSCE | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| HOA-REC | Sustainable Energy project (ICCO Alliance): 2014<br>Innovative WASH (WASH Alliance): Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| HUNDEE | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| NVEA | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |
| OSRA | C4C Alliance project (farmers marketing): December 2014<br>ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| TTCA | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

*The extent to which the Dutch NGO explicitly targets the following capabilities – India*[21]

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

*SPOs selected for process tracing – India*

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BVHA | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| COUNT | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| DRISTI | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| FFID | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |

[21] RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Jana Vikas | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| NEDSF | | | | | | | No – delayed baseline |
| RGVN | | | | | | | No - delayed baseline |
| Samarthak Samiti (SDS) | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| Shivi Development Society (SDS) | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| Smile | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| VTRC | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

*The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia*

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | PT. PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, PT.PPMA, YPI, YRBI.

Table 6

*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| ASB | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| Dayakologi | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| ECPAT | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| GSS | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| Lembaga Kita | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| PT.PPMA | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| Rifka Annisa | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| WIIP | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Yayasan Kelola | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| YPI | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| YRBI | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| Yadupa | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

*The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia*

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

*SPOs selected for process tracing – Liberia*

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BSC | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| DEN-L | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| NAWOCOL | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| REFOUND | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| RHRAP | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

- A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
- A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
- **Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
- **Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for **coding** documents received from SPO and CFA in NVivo on the following:

- **5C Indicators**: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the **capacity development interventions implemented by the CFA** (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
  - In the 2012 **theory of change** on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
  - During the baseline the CFA indicated a link between **the planned MFS II support** to organisational development and the expected short-term or long-term results in one of the selected capabilities;
  - During the endline the **CFA** indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
  - During the endline the **SPO** indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.
The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

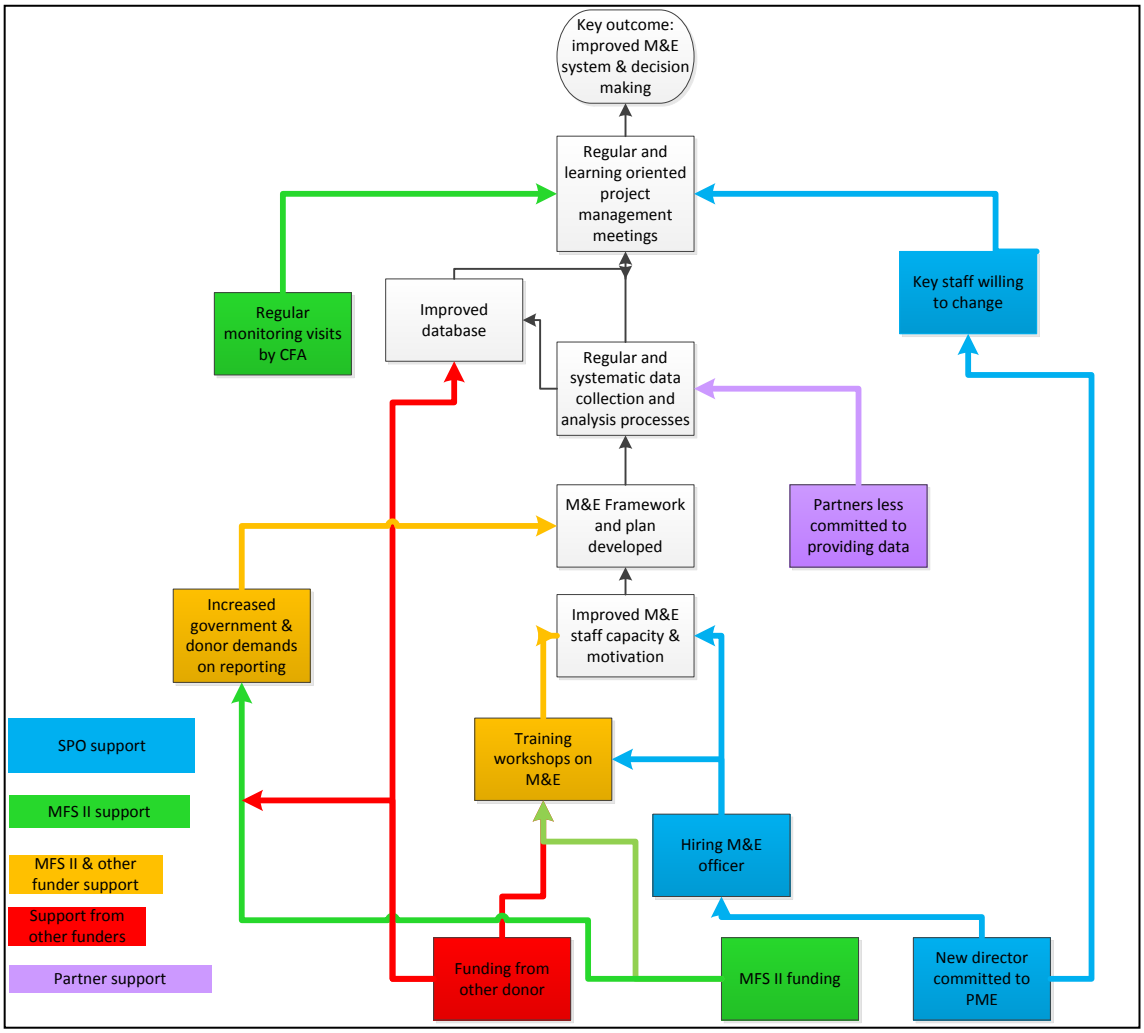

***Figure 1*** *An imaginary example of a model of change*

*Step 5. Identify* ***types of evidence*** *needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, *"What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?"*. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

- **Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.
- **Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
- **Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.
- **Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

*Format for identifying types of evidence for different causal relationships in the model of change (example included)*

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| Describe relationship between the subcomponents of the model of change | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions.<br>Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y?<br>Can we find this information by means of :<br>Pattern evidence;<br>Sequence evidence;<br>Trace evidence;<br>Account evidence? | Describe where you can find this information |
| Example:<br>Training workshops on M&E provided by MFS II funding and other sources of funding | Example:<br>What type of training workshops on M&E took place?<br>Who was trained?<br>When did the training take place?<br>Who funded the training?<br>Was the funding of training provided before the training took place?<br>How much money was available for the training? | Example:<br>Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br><br>Sequence evidence on timing of funding and timing of training<br><br>Content evidence: what the training was about | Example:<br>Training report<br>SPO Progress reports<br>interviews with the CFA and SPO staff<br>Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or

discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6.* ***Collect data*** *to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7.* ***Assess the quality*** *of data and* ***analyse data****, and develop the* ***final detailed causal map*** *(model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

| *Example format for the adapted evidence analysis database (example included)* **Description of causal relation** | **Confirming/ rejecting a causal relation (yes/no)** | **Type of information providing the background to the confirmation or rejection of the causal relation** | **Strength of evidence: strong/ rather strong/ rather weak/ weak** | **Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected** |
|---|---|---|---|---|
| e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

## Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

## Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes

comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design** – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment

and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

- The capability to act and commit;
- The capability to deliver on development objectives;
- The capability to adapt and self-renew;
- The capability to relate (to external stakeholders);
- The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed. A detailed overview of capabilities with outcome domains and indicators is attached in Appendix 3.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other

capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Appendix 3 Changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

**Description of Endline Indicators_Aliansi Sumut Bersatu (ASB)**

**Capability to Act and to Commit**

1.1 Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

*How would you describe your leadership? Leadership within the organisation (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organisation?)*

The leadership practiced in ASB has enhanced along with their organizational development. The ASB leadership is still practicing what they have done since the baseline although some areas have developed. The current leadership is considered to have improved in task delegation in the absence of leadership, greater clarity in staffs job descriptions, staff regeneration, and feedback to staff performance as a post-monitoring mechanism. The Director ensures that the staffs have more opportunities and access to capacity building both internally and externally. Task delegation by the director has been especially appreciated by the board, which can now focus on future programs, strategic planning and mitigating emerging issues. The staff's independency in performing their work has improved even in the absence of their leader. Nonetheless, the need for standard operating procedures (SOPs), regeneration at staff level and the need for additional board members are frequently mentioned during the interviews. Furthermore, the urge of ensuring that staff participates in capacity building is demanded to the Director.

Score: From 4 to 4.5 (slight improvement)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

*This is about the extent to which the leader(s) provide strategic directions*

There has been mission a shift in focus and role of leadership since the baseline. The staff considered these positive changes, and mentioned that leadership has significantly improved. The Director is now focusing on more strategic tasks to the level of responding to organizational issues instead of internal staff conflicts. Instead of responding to staff obstacles in implementing their work, the Director is able to provide strategic direction to the staff whilst allowing them to solve implementation problems on their own. This has allowed for staff to develop their own problem solving capacity and independence. Due to this, the Board has gained more trust in the director and reduced the number of interventions throughout the year. Nevertheless, the board remains involved in the annual review and utilizes it as a place to provide their strategic view and feedback to the program.

Score: From 3 to 4 (improvement)

1.3. Staff turnover: 'Staff turnover is relatively low'

*This is about staff turnover.*

The staff turnover rate is still as low as during the baseline. There are only four project staff members who completed their project of which three of them are continuing their studies whilst the other one moved to other organisation. The acquisition of an additional funding source from TIFA has allowed for the addition of four new staff members in ASB. The new staff recruitment was also based on specific requirements imposed by TIFA who expected staff with a background in Law. ASB currently has eight staff members of whom six are full time and two are part time employed.

Score: From 4 to 4 (no change)

1.4 Organisational structure: 'Existence of clear organisational structure reflecting the objectives of the organisation'

*This is about leadership within the organisation (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organisation.*

ASB has extended their organizational structure. Currently eight staffs has fulfilled the need of human resource. Meanwhile, the clarity in tasks and responsibilities for the individual staff members and divisions has increased, particularly as an effect of increased use of strategic planning for guidance.

Score: From 3 to 4 (improvement)

1.5.Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E'

*Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.*

There has only been a slight change in this indicator compared to the baseline situation.ASB has increasingly utilized strategic planning as the approach to communicate and discuss work plans. At the same time, HIVOS still assists ASB in sharpening their strategic directions and plays an important role in using strategic planning as a form of capacity building for ASB.

Score: From 3.5 to 4 (slight improvement)

1.6 Daily operations: 'Day to day operations are in line with strategic plans'

*This is about the extent to which day-to-day operations are aligned with strategic plans.*

ASB has continued to use their strategic plan from 2011. With support from HIVOS, ASB has started to develop and use strategic planning and annual work plans to deliver their activities. In practice, staff members have placed the work plan in writing on the writing board so that everybody can see and refer to it on a day to day basis. This has allowed ASB staff to reflect and understand what is happening in the program, assess implementation challenges, and to discuss partnerships and networking issues they may encounter.

Score: From 3 to 3.5 (slight improvement)

1.7. Staff skills: 'Staff have necessary skills to do their work'

*This is about whether staff have the skills necessary to do their work and what skills they might they need.*

Overall, senior staff capacity and work performance has increased since the baseline. Their ability to manage and delegate work to junior level staff has had great impact on program implementation. On top of that, an additional funding source from HIVOS has brought further opportunities for capacity building for the staff. Through increased networking and advocacy, staffs have also created external capacity building opportunities for themselves. Director and senior staff have collaborated to facilitate a media analysis in-house training for junior staff in 2011. The media analysis training has led them to distribute result of diversity issue monitoring in a form of book annually.

Nonetheless it was found that additional capacity building is required in particular for the new staff hired in 2013 who had not participated in the training in 2011. The additional training identified in

particular for newly hired staff are media monitoring and advocacy, investigative journalistic and writing skills, general analytical skills and data analysis.

Score: From 2.5 to 3.5 (considerable improvement)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

*This is about whether staff at the SPO are offered appropriate training opportunities*

The new funding sources from HIVOS and TIFA have opened up more training opportunities for ASB in the last two years. HIVOS and TIFA have provided technical training for ASB staffs in order to improve their technical skills in delivering program activities. In addition to that, the ASB director now plays an important role in deciding who will participate in which training. This change has brought about a positive response from the staff who consider and appreciate this change as a fair mechanism. Staff members now consider themselves as having the same opportunities for training and development as their colleagues. Despite this positive development however staff has indicated that there is still room for development. Some staff members indicated they would prefer to see a standardized way of sharing training lessons and experienced amongst colleagues.

Score: From 3 to 4 (improvement)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

*This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.*

According to staff, the most appreciated incentive that ASB offers is its' family-like working environment. Staff admitted working in ASB feels like being part of a family. They also experienced equality in the working place. Even though nothing changed in terms of remuneration, the increased freedom to manage work independently and the addition of flexible working hours, added to overall staff motivation and stimulated creativity on the job.

core: From 3 to 3.5 (slight improvement)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

*This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.*

ASB has significant improvement to seek and secure their funding. A change in organizational strategy by developing strategic planning has attracted many new donors to fund their activities. For the last two years ASB has received more variety and continuous funding from HIVOS and TIFA (2013-2014), *Pelayanan Komunikasi Masyarakat* /Community Communication Services (YAKOMA PGI) (2013-2014), *Suara Kita*/Our Voice (2010-2014), and *Persekutuan Gereja-Gereja Indonesia Pusat (PGI Pusat)*/Church World Service (CWS) (2013-2014). Funding from CWS was the result of improved organizational networking capacity in ASB which in turn was recommended by PGI.

Score: From 2 to 3.5 (considerable improvement)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'

*This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.*

With assistance from HIVOS, ASB's strategic plan has become a reference to seek new funding opportunities. During each call for proposal, the organization's strategic direction and program focus was discussed at the hand of this document. This assisted ASB in determining whether a proposal or new funding call was in line with their strategic directions, and if it should be accepted or not.

This mechanism has allowed ASB to act more strategically on proposals, initiatives and directions instead of the former responsive attitude. Finally, ASB has also opened themselves up for more information about funding opportunities by increasing their networking and communication activities.

Score: From 2 to 3 (improvement)

**Summary of Capability to Act and to Commit**

Overall, the capability to act and commit considerably improved since the leader of ASB has changed his leadership style from a one man show to a leader who delegates work well. This change occurred after the strategic planning workshop (sponsored by HIVOS) returned a lot of feedback to the organization's leadership. Ever since, delegation of tasks has increased, job descriptions have become clearer, more feedback on staff performance has been given and the overall gap between leadership and staff has decreased. With improved strategic guidance and better articulated strategies also the daily activities are now more in line with the strategies.

More opportunities now exist for the staff to take their own responsibilities and staff experiences more independently in their work, particularly amongst senior staff, and this has improved staff to be motivated in their work. Staff turnover has not changed, even though some staff left, the other staff joined in the organization, other people with appropriate skills for the job have been hired. The skill gap between senior staff and leadership has diminished, which has allowed the director to lead with general strategic directions and technical guidelines as opposed to hands-on control.

After ASB has acquired new donor funds (TIFA) in 2013, new and more staff training opportunities become available. Particularly on the field of media monitoring, advocacy, investigative journalistic and writing skills and general analytical thinking and data analysis with further training is required. Similar training has been conducted in 2011, however some new staffs hired in 2013, has not been participated in these type of training yet.

Score: From 3.0 to 3.8 (improvement)

**Capability to Adapt and to Self Renew**

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

*This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organisational).*

ASB is still applying the same M&E approach it used for the last two years. The monthly meetings that were used to do this have now also been used as an activity planning point, which opens up the possibility to directly apply lessons learned. More frequent meetings in the form of staff meetings and the annual evaluation & planning meetings have enabled ASB to capture more input and optimize M&E. ASB continuously compares the work plans with the results and output of activities. Furthermore staff indicated that stakeholder opinions are now included more frequently in M&E activities. ASB has been applied program monitoring through monthly, semester, and annual program report. There appeared to be some improvement in the M&E process in terms of the systematic recording of results in their program. For the accountability at the end of a program, ASB report the financial audit result to a public accountant.

Score : From 3 to 3.5 (slight improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

*This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.*

Since the baseline, the responsibility of M&E functions still remains with the director. There is no dedicated person to perform M&E in the organization. Staff indicated that in the last two years at least

two staff members took on this role. One of these included the director, who frequently acts as M&E person due to his M&E experience.

Score : From 2 to 2.5 (slight improvement)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

*This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.*

Description of the endline situation:

ASB's practice to apply M&E for strategic purposes remains the same as during the baseline. Notwithstanding, ASB have no particular M&E staff but ASB has been applied program monitoring through monthly, semester, and annual program report. The evaluation results are used as references for decision making. The annual program evaluation is also used for compiling the strategic planning for the next year. For example, previously monitoring process was done by the staff, but now the media monitoring process involves the beneficiaries. Another example is ASB worked only for case handling but now they also begin to plan the advocacy in the government level.

Score: From 3 to 3 ( no change)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

*This is about whether staff talk formally about what is happening in their programmes; and, if so, how regular these meetings are; and whether staff are comfortable raising issues that are problematic.*

Staff has indicated that there is sufficient space to discuss problems or issues. Staffs communicates both informally and formally about what is happening in their programs. Moreover, the director encourages staff to attend informal meetings in order to discuss their concerns. Formally, staffs holds biweekly meetings per project on the one hand, and monthly meetings for all staff on the other.

Score: From 3 to 3.5 (slight improvement)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives'

*This is about whether staff feel that ideas they bring for implementation of the programme are welcomed and used.*

The ASB director plays an important role in creating a supportive environment for staff to share their ideas. Improving upon the common practices applied since the baseline, staff stated that their director has readjusted his expectations to the staff's work to be more in line with the challenges faced in the field. Staff also indicated that they felt that their office environment is now more open and accessible to beneficiaries.

Score: From 4 to 4.5 (slight improvement)

2.6. System for tracking environment: 'The organisation has a system for being in touch with general trends and developments in its operating environment'

*This is about whether the SPO knows what is happening in its environment and whether it will affect the organisation.*

ASB uses its network to keep track of its environment. They encourage students at universities to be involved in their programs by providing final year student research opportunities to students who want to graduate on issues relevant to ASB's work. This helps them in staying in touch with state of the art academic developments relating to their work. Furthermore, ASB established the FKK (a Diversity Communication Forum) as part of their networking support. Within this forum they encourage members of their network to assist them by extending their case monitoring in the field.

Score: From 3 to 3.5 (slight improvement)

2.7. Stakeholder responsiveness: 'The organisation is open and responsive to their stakeholders and the general public'

*This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.*

Stakeholders and beneficiaries are actively involved in ASB's strategic planning development. Since the baseline, ASB has actively expanded their network of partner organizations and beneficiaries. Feedback from the network and beneficiaries are taken into account during program planning and the development of strategic plans. The FKK (Diversity Communication Forum) aids in reaching out to beneficiaries.

Score: From 4 to 4.5 (slight improvement)

**Summary of Capability to Adapt and To Self Renew**

ASB has continued to apply the same M&E approach for the last two years. More frequent meetings in the form of staff meetings and the annual evaluation & planning meetings have enabled ASB to capture more input and optimize M&E. ASB continuously compares the work plans with the results and output of activities. Furthermore staff indicated that stakeholder opinions are now included more frequently in M&E activities. Through regular meetings and annuals reviews a systematic evaluation method is in place which allows for all staff members to provide their input on current projects and general organizational developments. Although the system is in place M&E is still performed by individual staff members, and not a dedicated M&E function. The director continuously plays an important role in this. In terms of the internal culture of critical reflection and sharing of ideas, the atmosphere in ASB is considered to be more open and communication is stimulated. Beneficiaries are able to approach the organization more easily and in general ASB has become more responsive to stakeholders . Overall this capability has improved slightly, mainly due to the greater frequency in meeting and greater role of staff input. Being involved in networks and having students do research at ASB helps them to keep track of what is happening in the environment.

Score: From 3.1 to 3.6 (slight improvement)

**Capability to Deliver Development Objective**

3.1. Clear operational plans: 'Organisation has clear operational plans for carrying out projects which all staff fully understand'

*This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.*

The development of ASB's strategic plan has positively affected the operational plans that were already in place. Day to day and operational activities now align better with the organizational strategy. Staff members now have clear guidelines on how to develop their operational plans to the annual work plan. At staff level, the annual work plan has been printed and placed at the board where they used it as reminder between themselves. Additionally, ASB has tried to develop the simple M&E framework to reflect the result chains.

Score: From 3 to 4  improvement)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

*This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.*

ASB is still applying their strategy in using their own resources to preserve and avoid unnecessary cost. As noted in the baseline evaluation, ASB has become creative through their concern in spending

funds. ASB also adjusted their operational strategy and organizational decisions to reflect this. In terms of operational strategies, they chose the lowest price and utilized their own property (such as motorbike) in an effort to save on operational costs. ASB will only have to pay the maintenance and gas for the cost incurred for program implementation. ASB also saves costs which are in turn utilized to fund programs which are not directly supported by donors. On the other hand, ASB now carefully selects which staff to be assigned for external or internal events such as seminars or workshops. In addition to that, the cooperation with universities also reduced operational cost due to the use of university locations for venues.

Score: From 3.5 to 4 (slight improvement)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

*This is about whether the SPO is able to carry out the operational plans.*

There is a slight improvement in this indicator. ASB delivers planned outputs in a timely manner, even with its limited resources. They are able to carry out their operational plans by involving volunteers and their network. Besides that, ASB has received increased support, not only from their network, but also from getting additional funds from TIFA which enabled more flexibility in implementing their programs. Previously ASB had to get funds before implementing

Score: From 3.5 to 4 (slight improvement)

3.4. Mechanisms for beneficiary needs: 'The organisation has mechanisms in place to verify that services meet beneficiary needs'

*This is about how the SPO knows that their services are meeting beneficiary needs*

The strategy to establish the FKK (Diversity and Communication Forum) has been proven to be a successful mechanism to meet beneficiary needs. It channels the two way communication between ASB, stakeholders, and beneficiaries to check and balance their support to the community. The forum has also proven to be a good response to the baseline assessment, as it significantly changed their approach in how to work with beneficiaries.

Score: From 4 to 4.5 (slight improvement)

3.5. Monitoring efficiency: 'The organisation monitors its efficiency by linking outputs and related inputs (input-output ratio's)'

*This is about how the SPO knows they are efficient or not in their work.*

ASB always evaluate the progress of each project biweekly and monthly. Beside, the input from stakeholders becomes one of the tools to evaluate their work efficiency. There is no particular monitoring to examine the relation between output (result) and input (fund and time)

Score: From 3 to 3.5 (Slight improvement)

3.6. Balancing quality-efficiency: 'The organisation aims at balancing efficiency requirements with the quality of its work'

*This is about how the SPO ensures quality work with the resources available*

ASB ensures their working quality by examine the achievement of the biweekly work plan and examine their project timeline. Biweekly work plan is derived from monthly work plan while the monthly work plan is derived from the annual work plan. Each project has progress implementation evaluation in biweekly meeting. We can see from the project timeline that there are some works have not conducted yet; such as dissemination through road show for regency and municipality that establishes intolerance and discriminative policies. This work should be done in the first semester of 2014 but has not conducted yet.

Score: From 3 to 3.5 (slight improvement)

**Summary of Capability to Deliver Development Objective**

The ccapability to deliver on development objectives has slightly improved mainly due to the fact that ASB has more clear operational plans and gives opportunity to the staff to align their activities to their organization's strategic level. Even though ASB has acquired more donor funds, they are more creative in terms of using their resources cost effectively. This care is displayed for instance in how staff is now more carefully selected for attending external or internal events, and also through coordinating events with universities to reduce operational costs for venues. The saved costs are in turn utilized to fund programs which are not directly supported by donors. There is no formal system in place to assess beneficiary needs, but through the established FKK (Diversity and Communication Forum), beneficiary and stakeholder needs could be checked and balanced. Although there is no formal system to compare inputs with outputs but they have regular meetings to help them assessing the work progress as a part of work efficiency assessment.

Score: From 3.3 to 3.9 (slight improvement)

**Capability to Relate**

4.1. Stakeholder engagement in policies and strategies: 'The organisation maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organisation'

*This is about whether the SPO engages external groups in developing their policies and strategies, and how.*

ASB still uses the same method in engaging the beneficiaries and stakeholders to sharpen their strategies. ASB engages external groups in developing their policies and strategies. For the evaluation & planning meeting and strategic planning meeting, ASB invites more various stakeholders, beneficiaries and partners to participate in discussions about the programs. The stakeholders that ASB is involved with are local partners, national organizations and international NGOs, and also specific target groups. Their input influences next years' work plan

Score: From 4 to 4.25 (very slight improvement)

4.2. Engagement in networks: 'Extent to which the organisation has relationships with existing networks/alliances/partnerships'

*This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.*

ASB has intensified its networks locally, nationally and internationally with respect to baseline situation two years ago. ASB has expanded their network with stakeholders such as KIPAS, HKTP (Violence Against wWmen) networks, KBB, ILRC (Indonesia Legal Resource Center), Wahid Institute, AMAN, ILRC, Sejuk (*Serikat Jurnalis Untuk Perdamaian*), YIPC (Young Interfaith Pluralism Community), and media network such as Tribun Medan, Sindo, and Radio Suara Berkah Sidikalang. ASB has also established new partnerships with universities such as USU, UNIMED and IMKRIS. As a result of that, over the last two years ASB has established a support system to promote pluralism and diversity issues among the university students, which has strengthened ASB in their bargaining position within the others network such as university, religious institution, and improve access to the organizations within the network. In addition to that, ASB engagement gained more funding from national networks.

Score: From 4 to 4.75 (improvement)

4.3. Engagement with target groups: 'The organisation performs frequent visits to their target groups/ beneficiaries in their living environment'

*This is about how and when the SPO meets with target groups.*

The establishment of the FKK (Diversity Communication Forum) has strengthened ASB's approach in engaging target groups. FKK has assisted to intensify the communication with target groups and

increase their level of trust. In addition to that, ASB has facilitated the relationship between the victims to become closer.

Score: From 3 to 3.5 (slight improvement)

4.4. Relationships within organisation: 'Organisational structure and culture facilitates open internal contacts, communication, and decision-making'

*How do staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?*

The organizational culture has improved slightly since the baseline. Relationships are considered more open and equal, since director has delegated more tasks and roles and responsibilities are more clear . The staff is free to talk to whomever they want to talk to. Previously, most of the decisions were taken by the director, but currently decisions are made in cooperation with staff members. This occurred for instance in determining the theme for a live talk show on radio.

Score: From 3.5 to 4 (slight improvement)

**Summary Capability to Relate**

The capability to relate has slightly improved mainly due to having an extended networks on local, national and even in the international level. ASB has also established new partnerships with universities which resulted in the establishment of a support system for the handling of legal cases. Collaboration with universities and being involved in the FKK network has also improved relationships with beneficiaries. In relation to the improved supporting system for handling cases, ASB's bargaining position in the networks has increased, which has led to opportunities for new collaborations and funding. Internally, relationships have improved due to having a director who often invites the staff to have dinner and watching movies after hours.

Score: From 3.6 to 4.1 (slight improvement)

**Capability to Achieve Coherence**

5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organisation'

*This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.*

The vision and mission of ASB have not changed since the baseline but with the support of HIVOS, ASB has focus more on the pluralism and religion diversity issues and the strategic planning has improved in the organisation over the last two years.

Score : From 4 to 4 (no change)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

*This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.*

In February 2014, ASB started to discuss the idea of developing standard operating procedures for all divisions. The discussion was held during the general staff meeting which was attended by all of the board and director. The result in this meeting was only a guideline to develop those SOPs, but, it is uncertain if, when and how the idea will be further developed.

Score: From 2 to 2.5 (slight improvement)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organisation'

*This is about whether the operations and strategies are line with the vision/mission of the SPO.*

ASB still operates based on the same vision and mission. They also implement their activities in accordance with their core mandate which aligns program, strategies and implementation on the field. This process has been strengthened with the support from HIVOS to develop a strategic plan and annual work plan.

Score: From 4 to 4 (no change)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

*This is about whether the efforts in one project complement/support efforts in other projects.*

ASB project activities still have the same support to other activities or program implementation and provided opportunity for mutual supportive efforts, for example case handling is supported by the counselling training for staff and beneficiaries (in pluralism victim) therefore the staff can understand the beneficiaries' feeling and know how to respond them.

Score: From 4 to 4 (no change)

**Summary Capability to Achieve Coherence**

Even though there is no formal discussion about vision and mission, ASB still operate based on the same vision and mission. However, with the help of HIVOS , the strategic planning process has taken place, which is also helped develop implementation plans in line with the strategies. Generally, program, strategies and activities are in line with the vision and mission of the organization. Project activities are still complimentary as in the baseline such as program from HIVOS for case handling while program from TIFA for counseling training. Counseling training completed the case handling activities as when handling some cases, it is needed skill to be a good listener or a good counselor.

Score : From 3.5 to 3.6 (very minor improvement)

# Appendix 4 Results - key changes in organisational capacity - general causal map

**Aliansi Sumut Bersatu (ASB) General Causal Map**

**Narrative of Aliansi Sumut Bersatu (ASB) General Causal Map**

The evaluation team carried out an endline assessment at Aliansi Sumut Bersatu (ASB) from 16 July 2014 to 18 July 2014. During this workshop, the team made a recap of key features of the organisation in the baseline in September 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline. The three main changes that happened in the organisation since the baseline, as identified by the staff during the endline workshop were:

1. Being more recognized as an organization working on pluralism issues [1].
2. The provision of health insurance (BPJS) linked to investments [2].
3. Increased job security, with through more permanent staff contracts [3]

The first is the most important change in the organization. Each of these changes and how these have come about is explained more in detail below. Numbers in the narrative correspond to numbers in the visual.

4. Both these latter changes were achieved through better staff welfare [8]

**Being more recognized as an organization focusing on pluralism issues [1].**

According to ASB staff present at the end line workshop, the main change that has taken place in the organization since the baseline in 2012 is being more recognized as an organization working on pluralism issues [1]. ASB has become the benchmark for both private and public organizations working in the field of pluralism in North Sumatra. In general it can be concluded that the strategic planning session organized by HIVOS in October 2013 has played an important underlying factor in realizing the abovementioned key change in the organization.

The greater recognition of ASB in terms of pluralism issues was the result of:

1. Improved staff capacity to implement programs [4]
2. Increased trust from stakeholders [5]

Each of these factors is explained below:

First of all improved staff capacity to implement programs came about from five developments, each of which are listed here. First, staff became more confident in implementing program activities [6]. Second, better staff welfare resulted in a more productive and motivated workforce [8]. Third, three new staff members were added to the organization in the fields of advocacy, monitoring and finance that did not yet exist before the baseline in 2012 [9]. Fourth, better office infrastructure allowed staff to work more efficiently [10]. Staff used to work with limited office support facilities, but with the addition of voice recorders, laptops, projectors and a stable internet connection, communication was greatly enhanced. Finally, fifth, an overall increase in program activities increased the speed at which staff learned about program implementation [11]. Each of these areas is further explained below.

Greater confidence amongst staff in implementing their program activities [6] came largely about from a greater number of opportunities for staff to participate in training and capacity building activities [7]. These opportunities were created by the board, who soon came to recognize the (importance of) staff capacity [13] because staff operated with greater autonomy on the one hand [17] whilst communicating results in more frequent internal meetings to discuss issues on the other [18].

Staff was enabled with greater autonomy through more opportunities to manage programs independently [21]. This was the direct result of more and more work being delegated from management to senior and junior staff [24], one of the key decisions that came about in the change in leadership style that occurred [33]

The increase in meeting frequently [18] came about from an overall increase in awareness amongst staff for the need of operational performance [29]. This was carefully communicated by the new leadership in place [33]. The change in leadership style was an important change as a result of the strategic planning session funded by HIVOS in 2013 [38].

The other four factors that affected improved staff capacity (better welfare) [8], new staff additions [9], better office infrastructure [10], and more program activities [11]) all resulted from the addition of funds enabled by acquiring the TIFA foundation as a new sponsor [14]. This was enabled shifting

the policy of single funders to achieve greater diversity of funding sources [19]. ASB was able to shift towards this new paradigm—from single funders to the greater variety of funding sources-- through increased confidence of donors and stakeholders [22], which in turn occurred as a result of three factors:

1. An increased capacity and confidence amongst staff to develop proposals and present these to donors [25] therefore getting in touch with more potential funding candidates;
2. More transparent financial statements and accountable reporting through the website [26];
3. Improved quality of service delivery [27].

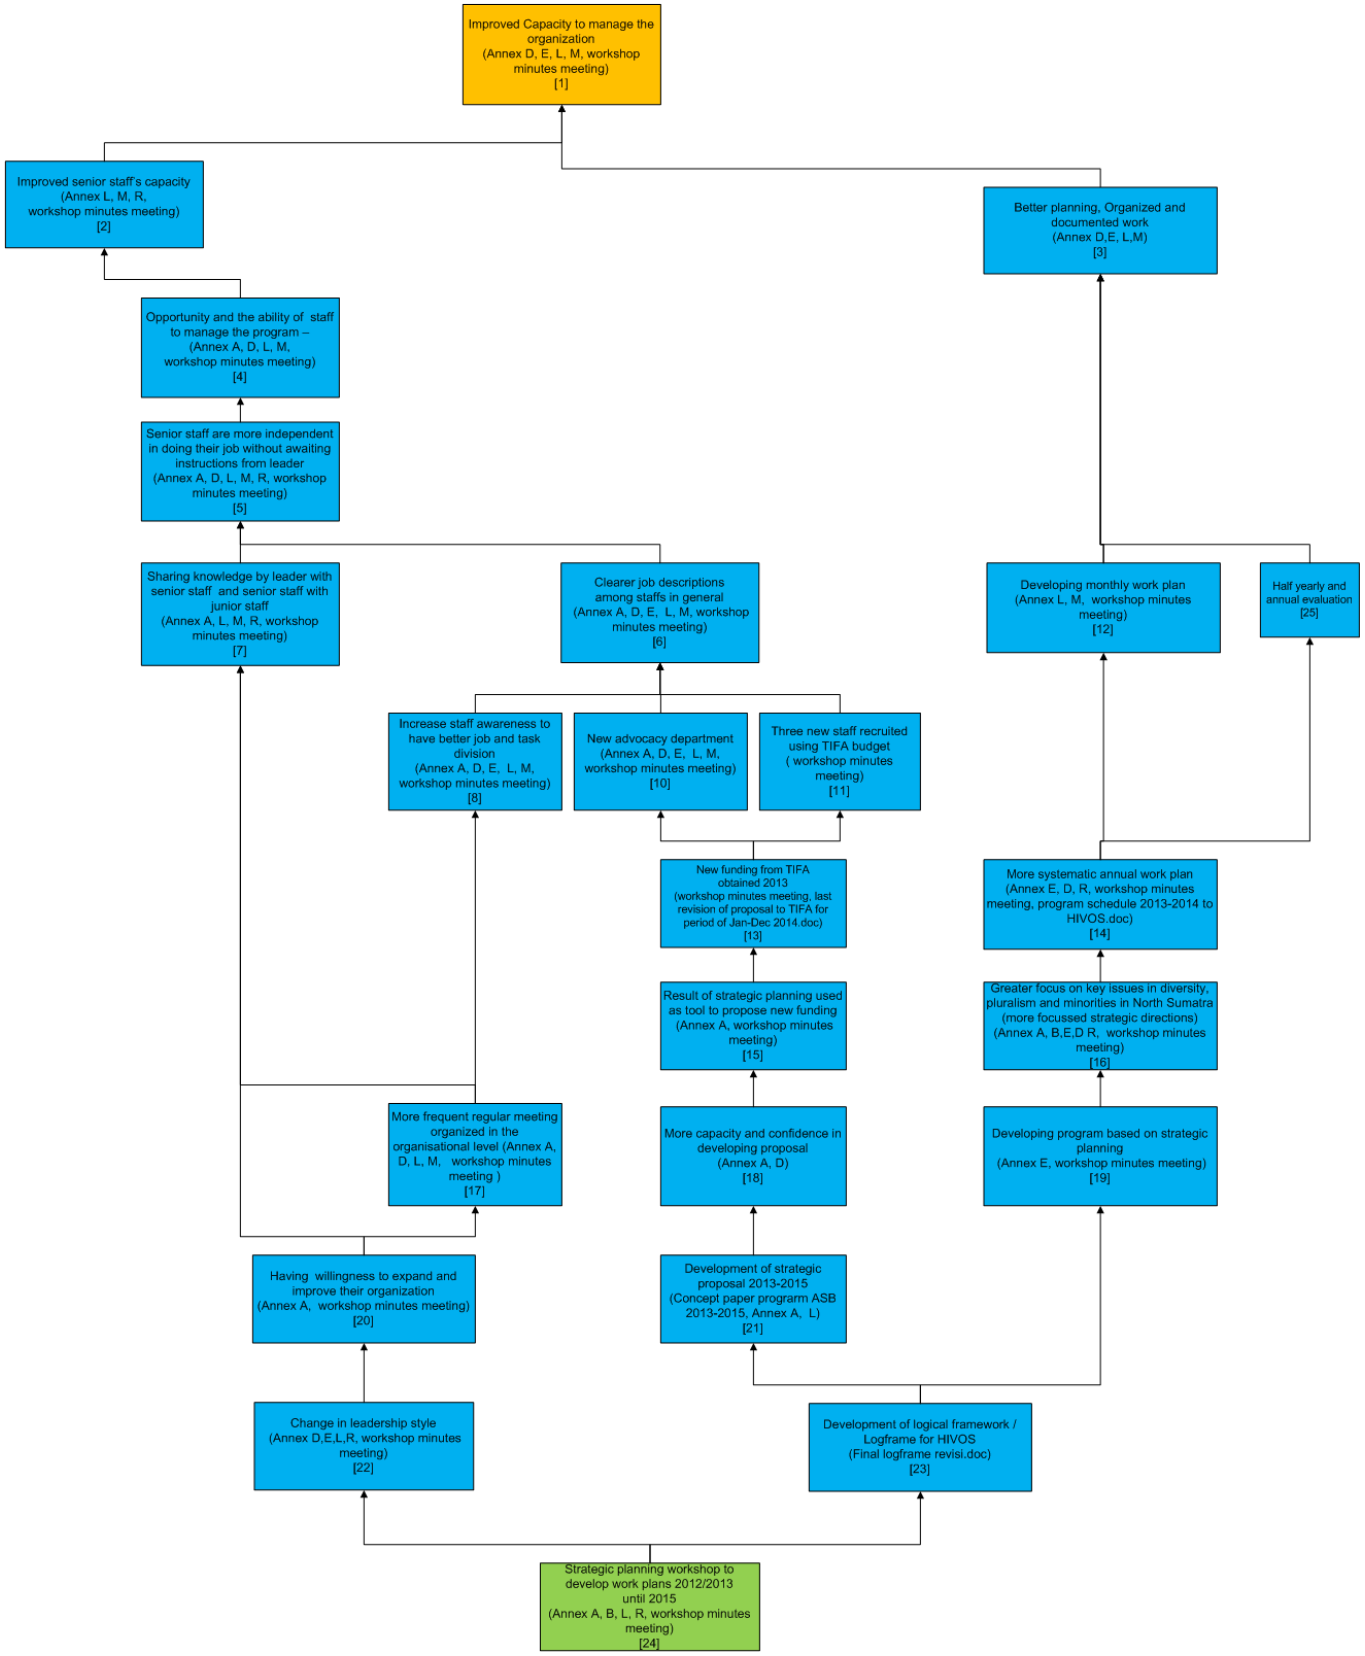
The first of these factors resulted from increased awareness amongst the staff regarding operational performance [29]. Simply put, with greater awareness the overall sense for the need to proactively engage with stakeholders came about amongst staff. In addition to this, a clearer programmatic guidance to propose for funding [30] significantly increased both capacity and confidence of staff to propose to donors. The guidance resulted from a strategic planning paper [34] written as a result from the HIVOS funded strategic planning workshop in 2013 [38].

The second factor, greater transparency in financial statements and accounting resulted from an overall improvement in operational financial management [31]. This improvement can be attributed to the BITRA financial management training which was performed in 2011 on the one hand [39], and the review and revision of standard operating procedures on finance sponsored by HIVOS in 2013 on the other [40].

The third factor, improved quality of service delivery resulted from the lower cost to handle case work and an increase in overall efficiency in doing so [32]. The greater support from stakeholders and partner organizations [35] through increased cooperation with religious and faith based leaders [36] was the main reason for this. Overall, this support came about through the increased awareness in partner networks about ASB's ambition to introduce pluralism issues to the public [37], which in turn was identified in the strategic planning workshop in 2013 [38].

Prior to 2012, the network of the organization was limited only to certain religious leaders among which were Protestant and *Parmalim* (local religion) religious leaders. From 2012 onwards, ASB expanded their network to universities *(Universitas Sumatera Utara),* journalists, local NGOs, and religious leaders from other religions such as *Matakin* (local religion), Hindhuism, Bahai, Konghucu, and Advent Protestant. ASB also started working with religious-based organizations such as *Majelis Kelenteng Konghucu Indonesia (MKKI), Majelis Budhayana Indonesia (MBI)* and *Persatuan Hindhu Darma Indonesia).*

All of the above has explained how ASB's improved staff capacity to implement programs has come about [4]. But there is a second factor which has influenced the key change of ASB being recognized as an organization focusing on pluralism issues: the increased trust from stakeholders in ASB [5]. This came about from a wide public acknowledgement of ASB, and what they are doing [12]. On the one hand this occurred through an improved acceptance of ASB by its stakeholders through ASB's improved quality of service delivery [27]. On the other hand, the public itself became more and more aware of ASB and their objectives through the various seminars, workshops and other events organized by the organization [16]. ASB staff members got more and more public interest to attend such events through the increased documentation and publication of their work [20]. This practice was enabled by cooperating with various academics and journalists on publications [23], but largely founded on the increased capacity of the staff members to communicate results [28]. The latter greatly benefited from a writing course sponsored by KIPAS in 2012 [41], and a workshop on investigative journalistic writing sponsored by YAKOMA PGI in 2011 [42].



Since 2013, ASB has maintained an agreement with the local university by providing a scholarship program to college students to write their thesis on pluralism issues. In addition to that, academic publishing and public publishing with the help of university experts has increased. The ties to the academic and media networks have significantly increased the organization's visibility to become the leading organization for pluralism issues.

# Appendix 5 Results - attribution of changes in organisational capacity - detailed causal maps

**Aliansi Sumut Bersatu**

**Narrative Key Outcome C.1.1 Capacity to manage organisation**

Causal map ASB –
C1.1 Improved ability to manage the organization

Note: for each country about 50% of the SPOs has been chosen to be involved in process tracing, which is the main approach chosen to address evaluation question 2. For more information please also see chapter 3 on methodological approach. For each of these SPOs the focus has been on the capability to act and commit and the capability to adapt and self-renew, since these were the most commonly addressed capabilities when planning MFS II supported capacity development interventions for the SPO.

For each of the MFS II supported capacity development interventions -under these two capabilities- an outcome area has been identified, describing a particular change in terms of organizational capacity of the SPO. Process tracing has been carried out for each outcome area. The following outcome areas have been identified under the capability to act and commit and the capability to adapt and self-renew.

In the capability to act and commit the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'improved capacity to manage the organization'.

In the capability to adapt and self-renew the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'improved staff capacity to communicate results on diversity issues'

- Below you will find a description of the 'improved capacity to manage the organization' and how this has come about. According to staff present at the (process tracing) endline Process Tracing Minutes Meeting the improved capacity to manage the organization is mainly due to: Improved senior staff capacity [2] (Annex L, M, R, Process Tracing Minutes Meeting minutes meeting)Better planning, organized and documented work [3] (Annex, D, E, L, M)

Both of these factors are further described explained below. The numbers in the visual correspond with the numbers in the narrative.

**Improved senior staff capacity [1]**
First of all the improved ability to manage the organization came about from an improvement in senior staff's capacity. This was validated by both internal and external stakeholders [1] (Annex D, E, L, M, and Process Tracing Minutes Meeting minutes meeting). The greater capacity of senior staff resulted from greater opportunity for senior staff to manage the program [4] (Annex A, D, L, M, Process Tracing Minutes Meeting minutes meeting). This in turn came about from an ability to work more independently without having to wait for leadershipinstructions [5] (Annex A, D, L, M, R, Process Tracing Minutes Meeting minutes meeting). The statement was echoed by senior program staff during the end line Process Tracing Minutes Meeting. The Director said that currently they have more opportunity to work independently including making decisions. Further, more staff has been better recognized by the partners of the organization, not only by the Director.

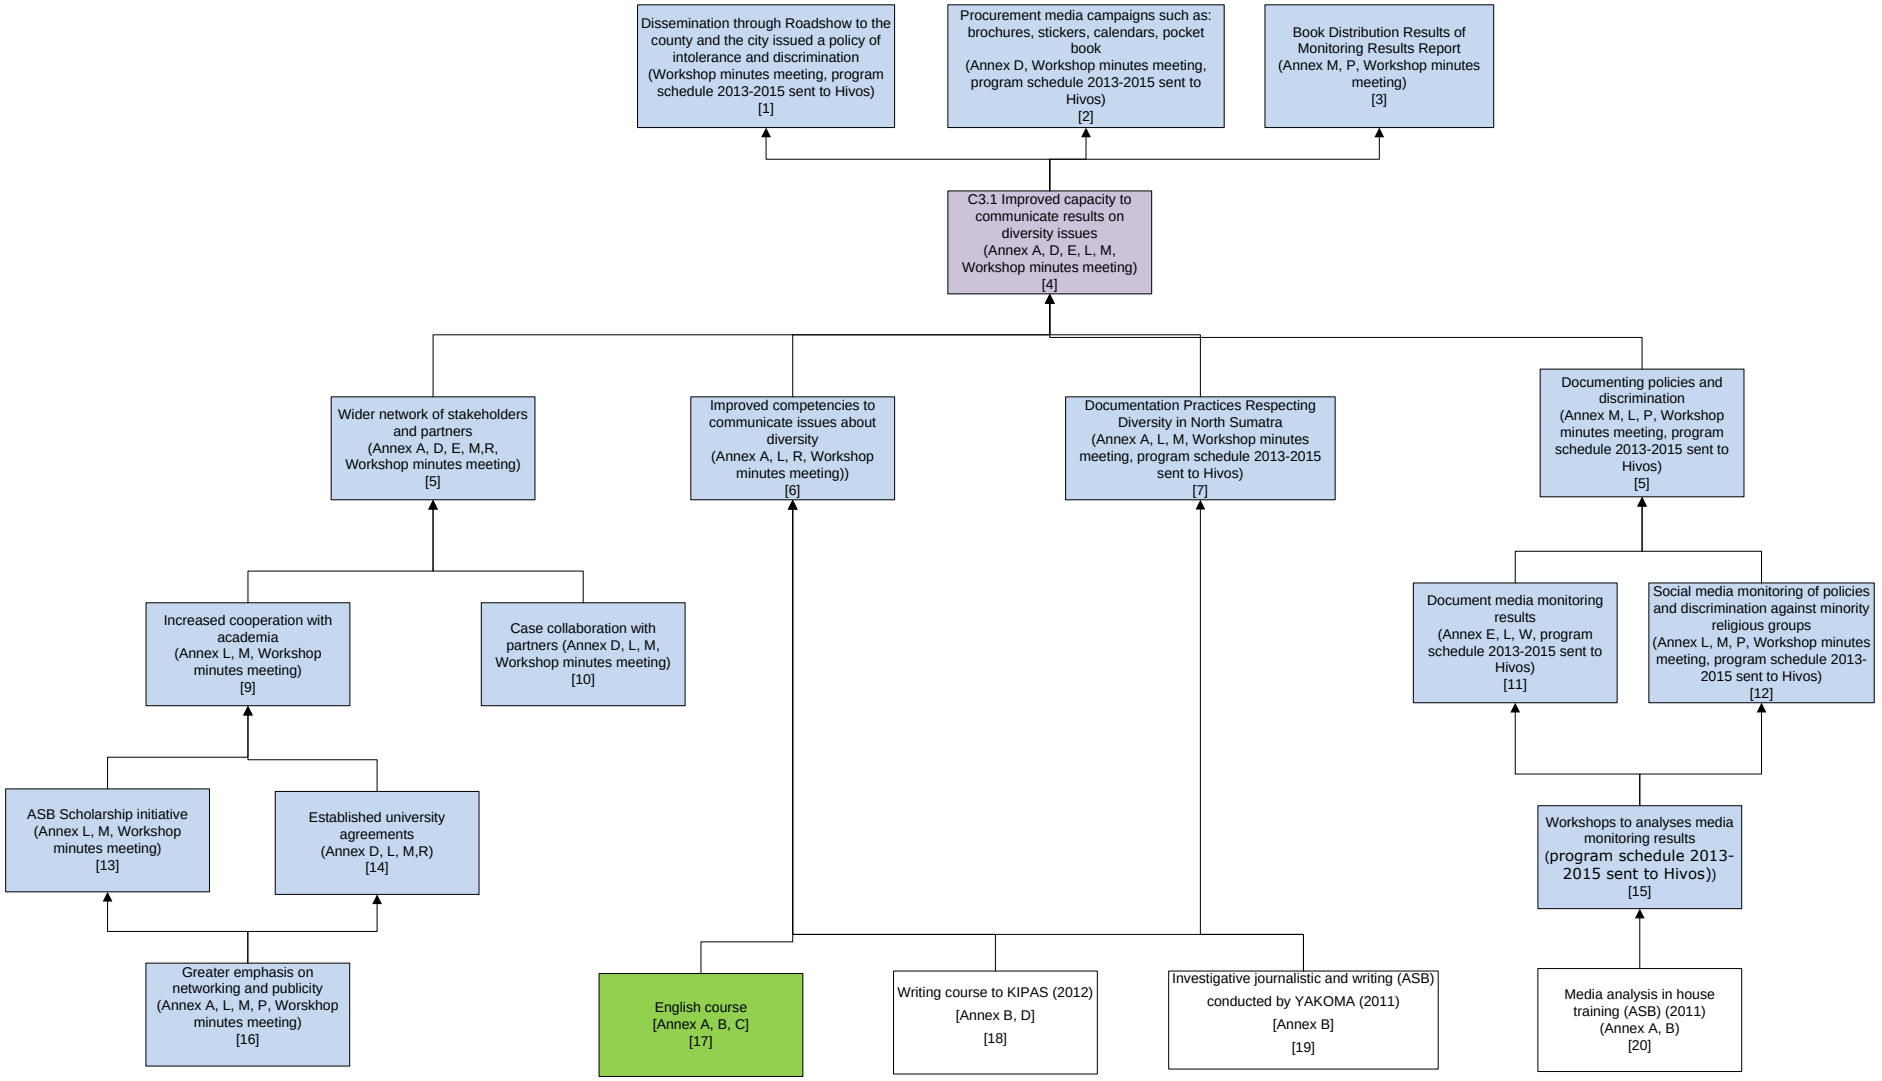
Staff members indicated during the end line Process Tracing Minutes Meeting (Annex D, E, M, L, P, and Process Tracing Minutes Meeting minutes meeting) that the greater independence in their work resulted from two occurrences: sharing knowledge by leadership with senior staff, and by senior staff with junior staff [7] on the one hand, and clearer job descriptions on the other. The two paragraphs below describe each occurrence.

First of, a of knowledge took place by leadership with staff members [7] (Annex A, L, M, R, Process Tracing Minutes Meeting minutes meeting). This was enabled by the willingness of the organization to expand and improve their organization [20] (Annex A, Process Tracing Minutes Meeting minutes meeting) and more frequent meetings at the organizational level [17] (Annex A, D, L, M, Process Tracing Minutes Meeting minutes meeting). In the baseline, the regular meetings between staff and the Director were conducted monthly, while in the end line, they stated that they have had bi-weekly meetings in addition to monthly meetings.

Both these factors resulted from a change in leadership style[22] (Annex D, E, L, R, Process Tracing Minutes Meeting minutes meeting). Some staff said that previously the Director tended to be "one man show" and did not really provide great autonomy to staff. However, based on the Director's opinion, the narrowed autonomy he provided to staff was by intention. The Director wanted to do stepwise delegation due to the great competency gap among leader, senior and junior staff. The leadership style was significantly changed as a result of the strategic planning supported by HIVOS in

2011 [24] One of the agenda points in the strategic planning Process Tracing Minutes Meeting was to reflect and evaluate the leadership style of the current Director as proposed by the Board of the organization. The Board has advised to the Director to give greater autonomy to the staff (Annex A, B, L, R, Process Tracing Minutes Meeting minutes meeting).

The second development that enabled senior staff to do their work with more indepence was the development of clearer job descriptions for the staff in general [6] (Annex A, D, E, L, M, Process Tracing Minutes Meeting minutes meeting). Previously in ASB, there was a lot of overlap among staff responsibilities [6] (Annex E,M,L,P, Process Tracing Minutes Meeting minutes meeting). One staff member could work on more than one task. The need for a clearer description of work responsibilities for staff members therefore came about for three different reasons. Firstly, staff realized that a better job and task division was required and they realized this during their regular staff meetings [8]. Secondly, there was a new Department for advocacy [10] (Annex A, D, E, L, M, Process Tracing Minutes Meeting minutes meeting).Thirdly, three new staff members were recruited utilizing the newly acquired TIFA budget [11] (Process Tracing Minutes Meeting minutes meeting).



These last two factors were derived from the new funding obtained from TIFA in 2013. The success to obtain funding from TIFA came about from the result of strategic planning that was used as a tool to propose new funding [13] (Process Tracing Minutes Meeting minutes meeting, last revision of proposal to TIFA for period of Jan-Dec 2014.doc).

**Better planning, organized and documented work [3]**

The improved capacity to manage the organization was not only due to improved senior staff capacity, but also to better planning, organized and documented work [3] (Annex, D, E, L, M). . Staff stated that this occurred primarily based on the now regular (monthly) development of monthly work plans [12] (Annex L, M, Process Tracing Minutes Meeting minutes meeting), but was also due to having half yearly and annual 'evaluations' [25] (Annex L, M, Process Tracing Minutes Meeting minutes meeting), which specifically supported the documentation of the work being implemented. This monthly meetings, and improved evaluation came about from the having more systematic and well developed annual work plans [14] (Annex E, D, R, Process Tracing Minutes Meeting minutes meeting, program schedule 2013-2014 to HIVOS.doc), which in turn were enabled by a much greater focus on strategic directions and key issues in diversity, pluralism and minorities in North Sumatra [16] (Annex A, B, E, D, R, Process Tracing Minutes Meeting minutes meeting). This more specific focus was formulated in a program, as explained in the strategic proposal 2013-2015. This was based on the logical framework that was developed for HIVOS in 2011 [23](Final log frame revisi.doc), as result of the Strategic Planning Process Tracing Minutes Meeting in 2011, which was focused on developing a work plans until 2015 [24] (Annex A, B, L, R, Process Tracing Minutes Meeting minutes meeting).

**Aliansi Sumut Bersatu**

**Narrative of Key Outcome 3 : Improved capacity to communicate results on diversity issue**

**Aliansi Sumut Bersatu**

**Narrative of Key Outcome 3 : Improved capacity to communicate results on diversity issue**

- ASB is an institution that was founded in 2006 and was officially established in 2009 as association. Initially focused on social pluralism regarding sexual and gender equality issues *Aliansi Sumut Bersatu* (ASB) has broadened its scope of action[22] since 2010. An example of this is ASB's present project: "Civil and Religious Societies' Participation in Promoting Peace and Diversity in North Sumatra". This program, which in the framework of MFSII is co-financed by HIVOS, aims at bringing about religious pluralism in North Sumatra. The end line focused on the following key organizational capacity change or key outcome in the capability to adapt and self-renew: improved capacity to communicate results on diversity issues [4] (Annex A, D, E, L, M). This came out of document review as well as discussion with staff present at the end line workshop (Annex A, B).Improved capacity to communicate is expected to and already affects communication of results, through the following means :
- Dissemination through a road show to five ASB area namely Siantar, Aceh Singkil, Binjai, Langkat, and Medan. These areas were targeted to disseminate the result of ASB regular reporting on pluralism and diversity and discussed what possible action can be done to response the report. These five areas have issued a policy of intolerance and discriminatory [1] (Process Tracing Minutes Meeting.)
- Procurement media campaigns such as: brochures, stickers, calendars and pocket books[2] (Annex D, Process Tracing Minutes Meeting, program schedule 2013-2015 sent to HIVOS.
- Book Distribution Results of Monitoring Results Report [4]. They did the monitoring of diversity issues and collected the monitoring results in the form of books. As part of ASB's advocacy strategy, ASB disseminated diversity information by distributing the monitoring result books. Process Tracing Minutes Meeting)

Staff's capacity to communicate results in diversity issues has improved because of the following four reasons:

- A wider network of stakeholders and partner [5] (Annex A,D,E,M,R, Process Tracing minutes of meeting)
- Improved competencies to communicate issues about diversity [6] (Annex A, L, R, Process Tracing Minutes Meeting)
- Documentation of practices respecting diversity in North Sumatra [7] (Annex A, L, M, Process Tracing Minutes Meeting, program schedule 2013-2015 sent to HIVOS)
- Documenting policies and discrimination [8] (Annex M, L, P, Process Tracing Minutes Meeting, program schedule 2013-2015 sent to HIVOS)

Each of these factors and their underlying logic is explained below.

**Wider network of stakeholders and partners [5]**
*Aliansi Sumut Bersatu* (ASB) has an extensive network including various communities, media, and religious groups. In 2012, ASB expanded their network to academia with various religions such as *Konghucu, Islam, Hindu, Budha, Bahai, Ahmadiyah, Parmalin and Advent*. Previously, these stakeholders have not been part of ASB. In other words, ASB has wider network of stakeholders and partners [5] (Annex A, D, E, M, R, )

This improved network was realized through increased cooperation with academia [9] (Annex L, M, Process Tracing Minutes Meeting) on the one hand, and case collaboration with partners on the other [10] (Annex D, L, M, Process Tracing Minutes Meeting).

Increasing the network with academia was also part of ASB's strategy to improve the institutions' efficiency.To strengthen commitment to pluralism, ASB has expanded networking to local, national and international partner organizations.

[22] Aliansi Sumut Bersatu (2011), ASB Proposal Form to HIVOS

- At the local level these organizations included: Fitria, Human Rights Study Center, Medan University, and Sumatra Utara University (Annex E, M, P, and Process Tracing Minutes Meeting).
- At the national level these included: Setara Institute, Wahid Institute, ILRC (Indonesian Legal Resource Center), SEJUK, Asean Moslem Action Network (AMAN), PGI (Persekutuan Gereja Indonesia – Indonesian Church Community), and YAKOMA (Annex A, D, E, M, P.
- At the international level these included: Amnesty International and CSW (Christian Solidarity Worldwide) (Annex E, M, L, and Process Tracing Minutes Meeting).

Agreements were made in order to establish relationships with universities [14] (Annex D, L, M,R).The relationship was in the form of providing venues to conduct workshops and or seminars related to pluralism issues. One of the program staff said that another reason of the intensified relationships with academia was the provision of scholarships by the organization for university students whose thesis was about pluralism issues [13](Annex L, M, L, Process Tracing Minutes Meeting) which was used as a strategy to disseminate pluralism issues at the university level.

With respect to handling cases, ASB was supported by some networking and partners. Case collaboration has been affected to the escalation of ASB network and partners – i.e, ASB has stronger collaborative work with the National Commission on Violence Against Women (*Komnas Perempuan*) in Jakarta when they handle the cases [10] (Annex D, L, M, Process Tracing Minutes Meeting).

Case collaboration, scholarship initiative, and agreement with university have been influenced by a greater emphasis networking and publicity [16] (Annex B, D). ASB has a strong commitment regarding pluralism issues.

**Improved competencies to communicate issues about diversity [6]**

The fact that staff have improved their competencies to convey diversity issues [6](Annex A, L, R, Process Tracing Minutes Meeting), is the second factor that influenced the improved capacity to communicate results on diversity issues [4] (Annex A, D, E, L, M, Process Tracing Minutes Meeting). This improvement can be attributed to three factors. The first factor was an English course funded by MFS II [17] (Annex A, B C) after the partner organization realized that communication needed to be improved. The second factor affecting the improved communication competency was the writing courseconducted by KIPAS in 2012. KIPAS has been ASB's partner since 2009. KIPAS has the same concern as ASB – advocacy strategy through journalism [18] (Annex B, D). The third and last contributing factor was a journalism investigative and writing training which was held by YAKOMA PGI in 2011[19] (Annex B).

**Documentation practices respecting diversity in North Sumatra [7]**

The third factor relating to the improved capacity to communicate results on diversity issues was improved documentation practices regarding diversity in North Sumatra [7] (Annex A, L, M, Process Tracing Minutes Meeting, program schedule 2013-2015 sent to HIVOS). Similarly to the improved competencies to communicate issues about diversity [6] (Annex A, L, R, Process Tracing Minutes Meeting) as described in the previous section, this was the result of the writing course [18] (Annex B, D) andthe investigative journalistic writingtraining [19] (Annex B, Interview questionnaire staff). ASB creates annual reports on media monitoring and documenting cases of intolerance in Aceh and North Sumatra (doc: meeting minutes). The data is used as a reference for media and community and society to reveal the diversity of pluralism in Indonesia.

**Documenting policies and discrimination [8]**

The final factor contributing to the improved capacity to communicate results on diversity issues includes the documenting of policies [8] (Annex B, D).This in turnwas affected by two factors. On the one hand documentation of media monitoring results[11] (Annex E, L, W, program schedule 2013-2015 sent to HIVOS) on the other hand social media monitoring of policies and discrimination against minority religious group[12](Annex L, M, P, Process Tracing Minutes Meeting, program schedule 2013-2015 sent to HIVOS). ASB has staff that is responsible for monitoring intolerance cases through media and social media (Process Tracing Minutes Meeting). Starting from 2011, the ASB published a book as

a result of the monitoring of the media and social media monitoring, and HIVOS supported this publication (Annex E, L,W,program schedule 2013-2015 sent to HIVOS).

Both the documentation of media monitoring results as well as actively monitoring social media for policies came forward from a workshop to analyze media monitoring results funded by HIVOS in 2013[15] (Annex A,B). This workshop on analyzing media monitoring results came about from the first similar workshop came  which was conducted in 2011. This 2011 workshop also funded by HIVOS [20] (Annex A, B).

Report CDI-15-042

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Kusters, C., Wieriks, M., Dwi Andari, B., Suprobo, N., Priyahita, W., Sihombing, R.R., Rokhmatulloh, S.W., Rosita, I., 2015. *Endline report – Indonesia, ECPAT. MFS II country evaluations; Capacity of Southern Partner Organisations (5C) component.* Centre for Development Innovation, Wageningen University & Research centre. Report CDI-15-041. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Indonesia, ECPAT. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Keywords: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

# 1 Introduction & summary

## 1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: ECPAT in Indonesia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1.Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps

describe the identified key organisational capacity changes that are possibly related to MFS II interventions in these two capabilities, and how these changes have come about. More detailed information can be found in appendix 5.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR: Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

## 1.2 Brief summary of analysis and findings

Since the baseline, two years ago, ECPAT has seen a slight improvement in the capability to act and commit. The change in leadership style brought about more open communication between staff and management and more room for feedback. Staff turnover remained high, whilst day to day operations were more in line with the strategic plan and supported by new SOPs. ECPAT has very slightly improved in its capability to adapt and self-renew, which was mainly due a clear M&E protocol being in place for 2014 and onwards. ECPAT staff has also developed it's M&E competencies, and is more aware of developments in their environment. A slight improvement occurred in the capability to deliver on development objectives as well: clear operational plans have been developed in the form of an implementation work plan and budget plan to control the execution of activities. Delivering planned outputs has improved as virtually all objectives have been met, particularly in the CSEC case program. The capability to relate improved somewhat as a result of better coordination of with partners and stakeholders. Strong lobby activities ensured strong ties to key government and policy makers. Informal communication amongst the staff is now stronger and helps them connect and discuss programmatic issues. Finally, ECPAT has realised a slight improvement in the capability to achieve coherence through its operational guidelines. In 2013 ECPAT hired a consultant to support them to improve the management system and develop several new sets of standard operating procedures in terms of finance, HR and program procedures.

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team. During the endline workshop some key organisational capacity changes were brought up by ECPAT's staff: professionalization of the organization; expansion and sustaining of donors; more effective advocacy; improved staff capacity for CSEC case monitoring.

Professionalization of the organization occurred mainly due to the improvement of ECPAT's financial system and staff management. Both factors can be partially attributed to the development of the secretariat on the one hand, and the development and expansion of program activities on the other. Both these factors can be attributed in part to MFS II funding, whilst funds from the Bodyshop Indonesia were also applied. Improved program management and implementation capacity also led to the professionalization of the organization, and could be attributed to a specific MFS II intervention in the form of a capacity scan carried out by Mensen met een Missie in 2012. In addition the hiring of new manpower of the organization as part of the MFS II funded legal service unit program, has also led to organizational capacity change in the form of improved job descriptions, functioning of the secretariat and ultimately the improved program management and implementation capacity.

The expansion and sustaining of donors can be attributed to the fact that donors credited ECPAT's work more frequently, which significantly raised their profile amongst other potential partners and donors. This was enabled by better program implementation, made possible through the strategic

planning 2011-2014 as well as the staff's capacity improvements to manage programs, their knowledge on CSEC as well as the lobby and negotiation skills. This was in turn enabled by the program becoming more diverse and larger in scale, which was enabled by Mensen met een Missie's support in developing ECPAT's program. The development of ECPAT's program and secretariat were both due MFS II funding and funding from The Bodyshop Indonesia, although not specific MFS II capacity development interventions.

More effective advocacy can be attributed to ECPAT having a better bargaining position in their negotiations with authorities. This came about from the support and recommendations from ECPAT International, the expansion of the national network, as well as more information about the organization and their activities being distributed. This can be attributed to becoming more recognized by various stakeholders in Indonesia after the program has expanded and became more diverse, largely funded with MFS II funds. However, no MFS II funded capacity development interventions were specifically mentioned under this organisational capacity change.

Lastly the improved staff capacity for CSEC monitoring was enabled by an increased ability to conduct written documentation, raising the awareness about CSEC issues, and having a monitoring instrument in place. The former two changes were the result of assisting the reflection process of the law unit service, the latter through a better understanding about monitoring CSEC issues of the program staff. Strengthening the ECPAT monitoring and investigation efforts contributed significantly to this. Both these changes can be attributed to the development of program documentation, as part of the program diversification and expansion funded by MFS II. These are not organisational capacity development interventions, but through staff's experience of being involved in these projects their understanding in conducting investigations, monitoring and reporting on CSEC cases has improved and they have been able to develop a monitoring instrument for CSEC cases. Therefore, their capacity has been built not through specific organisational capacity development interventions but rather through the experience in these 2 projects.

During the process tracing workshop a closer look was taken at detailed information concerning the organizational development changes that have occurred. This was done in order to get a better answer to the second and fourth evaluation questions dealing with the attribution of changes to specific development interventions and their underlying factors. The organizational capacity changes that were focussed on were:

- Improved program management and implementation capacity;
- Improved skill of ECPAT in the investigation, monitoring and reporting of CSEC cases.

According to ECPAT, the improved program management and implementation capacity of ECPAT has resulted in better organizational work performance, increased bargaining power over donors and government and greater recognition of ECPAT as an organization dealing with CSEC issues. The improved program management and implementation capacity can be attributed to the improved functioning (operating) of the secretariat, the availability of human resources to conduct programming, and improved operational management. Whilst none of these capacity changes can be directly attributed to MFS II interventions, the hiring of staff that has occurred, as well as the consultant assessments are results of the funding from programs sponsored by Mensen met een Missie (legal unit service implementation, November 2013).

On the other hand operational management improved due to an improved administration mechanism as regulated in the organization's statutes, as well as due greater financial efficiency. This administrative mechanism was altered due to a revision in the organization's statutes and SOP's, as recommended by the consultant in the March 2013 assessment, as well as the 2012 capacity scan performed by an external consultant hired by MM. Greater financial efficiency could also be attributed to the development of these new SOPs, which regulated stricter financial procedures as well as program and project procedures. More accountable and transparent financial reports allowed for improved financial management as well, which was enabled by the revision of the financial guidelines as recommended by the Indonesian consultant in her assessment. The MFS II funded intervention of hiring another independent consultant to perform a capacity scan in 2012 was part of a greater Mensen met een Missie initiative to scan all their partner organizations in Indonesia. This resulted in a report which laid the foundation for self-inspection of ECPAT, and the series of organizational capacity changes, initiatives and developments that took place.

Improved skill of ECPAT in the investigation, monitoring and reporting of CSEC cases resulted in the successful handling of 10 CSEC victim cases as well as the development of a referral mechanism of CSEC cases for other organizations to use. This skill was improved due to a monitoring instrument for CSEC cases being available, and to program staff having gained better understanding in conducting investigations, monitoring and reporting of CSEC cases in practice. ECPAT's monitoring system can be attributed to the development of program documentation for the justice unit service project. The program was intended to build a model for other organizations to work on similar issues, which was done through the publication of a book and a database on the 10 CSEC cases that were followed and supported. This in turn was enabled by the staff's increased ability to capitalize on learning experiences which can be attributed to the staff's work on the reflection process in the case work to find lessons learned, challenges and develop best practices. This resulted directly from the Legal Unit Service Project supported by MFS II, which was a continuation of the CSEC investigating, Monitoring and Reporting project which took place in 2012.

In conclusion the key organizational capacity of improved skill of ECPAT on CSEC monitoring, investigation and monitoring of CSEC cases can be fully attributed to both MFS II funded intervention programs. These are not organisational capacity development interventions, but through staff's experience of being involved in these projects their understanding in conducting investigations, monitoring and reporting on CSEC cases has improved and they have been able to develop a monitoring instrument for CSEC cases. Therefore, their capacity has been built not through specific organisational capacity development interventions but rather through the experience in these 2 projects.

# 2 General Information about the SPO – Name SPO

## 2.1 General information about the Southern Partner Organisation (SPO)

## 2.2 The socio-economic, cultural and political context in which the partner operates

**The socio-economic, cultural and political context in which the partner operates**
Human trafficking is the third biggest crime in the world and believed to produce by the quintillion dollars annually. Related to the Commercial Sexual Exploitation of Children (CSEC), the fact remains that nearly 80 percent of trafficking in all over the world is for the purpose of sexual exploitation, and an estimated 1.2 million children are trafficked globally for the purpose of sexual exploitation and other purposes each year.

Indonesia is known for being a transition country where mostly women and children are the victims of human trafficking. ECPAT's activities concentrate on trafficking of children and have a strong focus on preventing the sexual exploitation of children. As these activities take place in secret, data on sexual exploitation and trafficking of children is limited. Nevertheless, some research has been done and a few statistics are available. It estimated that, every year, around 100.000 Indonesian women and children are being trafficked, about 30% is below 18 years old. Trafficking of women and girls occurs within and across the borders of Indonesia. The International Organization for Migration (2010) studied and published some figures of the 3,735 cases that were assisted by IOM during the period March 2005 and March 2010. The International Organization for Migration (IOM) estimated that more than 80 per cent of victims they assisted were cross-border cases, the rest involved internal trafficking. About half worked in domestic servitude outside of Indonesia and 16 per cent was forced into prostitution within Indonesia. Approximately 30 per cent of victims experienced sexual abuse and/or rape.

Most trafficking victims originate from Java, West Kalimantan, Lampung, North Sumatra, Banten, South Sulawesi, West Nusa Tenggara, East Nusa Tenggara and North Sulawesi. Common trafficking destinations are Malaysia, Singapore, Japan, Saudi Arabia, Kuwait and other part of the Middle - East. IOM (2010) reports that especially women and girls trafficked to Malaysia and Japan end-up sex industry. IOM (2010) explains that initially victims are labour migrants employed as domestic workers but are later on sold and forced into prostitution. This displays one of the major problems with labour migration in Indonesia: labour agencies and brokers are not providing transparent information and people are often misled. IOM (2010) states that illegal but also legal recruitment agencies are

misleading women and girls about what type and duration of their employment abroad as well as their salary. Debt bondage is a common problem and used as a means for exploitation.

Also internal trafficking is occurring in Indonesia. IOM (2010) cited two reports that indicate increasing figures on internal trafficking of women and children for sexual exploitation. More particularly, there seems to be a rise in the number of young rural women who are exploited as sex workers in urban areas.

During the past years the Government of Indonesia has developed multiple policies to combat human trafficking. For example, the Government adopted Law no. 21 on the "Eradication of Criminal Act of Trafficking in Persons" in 2007. In 2008 the Ministry for Women's Empowerment provided anti-trafficking outreach education in 33 provinces. And in 2009 they legalized the "National Plan of Action on the Eradication of Trafficking in Persons and Sexual Exploitation of Children 2009 – 2014". In 2011, the Ministry of Women's Empowerment and Child Protection launched a program, "Protecting and Empowering Victims of Indonesia (EMPOWER), aimed at improving the capacity of state as well as non-state organizations working in the field of trafficking in West-Java, West Kalimantan and West Nusa Tenggara. Activities within this program are: policy support; training of law enforcement officials, service providers and health workers; equipment grants, coordination meetings and research; victim assistance and community awareness on safe migration and the risks of trafficking; and capacity building for high-risk communities to better prevent human trafficking at the community level. The Indonesian Government also follows international conventions with respect to Human Trafficking and Child Labour such as ILO Conventions 182 on the "Worst Form of Child Labour" in 2000 and the "Protocol to Prevent Suppress and Punish Trafficking in Persons, Especially Women and Children Supplementing the United Nations Convention Against Transnational Organized Crime" in 2009. However enforcement of these laws and convention by the Government of Indonesia can be improved.

As a part of a global network, ECPAT Indonesia is involved in the implementation of various initiatives on key issues at both national and regional level. The involvement of the national coalition is to be followed by the members at provincial level on behalf of the national initiatives. Our commitment is strengthen national actions in the efforts to prevent and eliminate CSEC within the country by building collaboration with crossed-sectoral key stakeholders include civil society actors and broader child rights organizations, academics, professionals, government bodies, private sectors, international agencies and many more. Our presence is to ensure the state community and the government to take serious action addressing this severe crime.

## 2.3 Contracting details

When did cooperation with this partner start: 1st July 2009.

What is the MFS II contracting period: 1-1-2014 to 31-12-2014

Did cooperation with this partner end: Not applicable

If yes, when did it finish: Not applicable

What is the reason for ending the cooperation with this partner: Not applicable

Is there expected cooperation with this partner after 31st of December 2015: Yes.

## 2.4 Background to the Southern Partner Organisation

**History**

ECPAT Indonesia is the National Coalition for the elimination of Commercial Sexual Exploitation of Children (CSEC).[1] It was founded when a group of professionals organized a National Consultation Meeting on Fighting CSEC in Jakarta in 2000. This National Consultation resulted in the establishment of the National Coalition for the Elimination of CSEC in Indonesia named ECPAT Indonesia. The objective of this coalition is: "*to eliminate child prostitution, child pornography and child trafficking for sexual purposes and to push community members and government to ensure the fulfillment of children's basic rights and protection from sexual exploitation*".[2]In 2005, the National Coalition was acknowledged as an Affiliate Member Group of the ECPAT International Network.

ECPAT International was founded in 1990 to end child prostitution in relation to travelling in Asia. ECPAT's original name End Child Prostitution in Asian Tourism was changed in 1996 to End Child Prostitution, Child Pornography and the Trafficking of Children for Sexual Purposes, reflecting the organization's geographic expansion and broader mandate. There are now 81 groups in 75 countries in the ECPAT network. The International Secretariat is based in Bangkok, Thailand.[3]

ECPAT Indonesia is a network of 24 members, 20 NGOs in Indonesia and 4 individuals who are working in the field of CSEC. These organizations are spread over 11 provinces in Indonesia: Aceh, North Sumatra, Lampung, Kepulauan Riau, Jakarta, West Java, East Java, Central Java, Yogyakarta, West Kalimantan and West Nusa. The network does not cover all areas where child trafficking takes place because in these areas there is no (trustworthy) NGO working on CSEC.[4]

For more details on the history of ECPAT please see appendix A for the historical time line that was developed during the baseline workshop.

**Vision**

The mission of ECPAT Indonesia since 2000 is the following: *Every child in Indonesia is free and protected from any forms of commercial sexual exploitation and the fulfillment of fundamental rights of the children is guaranteed by the whole elements of the society and government*.[5]

**Mission**

The mission of ECPAT Indonesia from 2000 until 2012 is: Working together for the elimination of child sex trafficking, child prostitution, child pornography, child sex tourism and child marriage and encouraging the state community and the government to ensure the fulfillment of the rights and the protection of the children from all forms of commercial sexual exploitation in Indonesia.[6]

Since 2012 ECPAT Indonesia specifies its mission towards three different target groups, being members, society and government[7]:

- Mission towards members: to build strong commitment and cooperation, adequate capacity and broader network in every effort to combating CSEC [8].
- Mission towards society: to build and raise awareness cares critical value and participation of society at large, children, and young people to work together in combating CSEC[9].
- Mission towards government: to encourage the government to commit and make tangible efforts[10].

**Strategies**

Strategic program of ECPAT Indonesia[11] are trough advocacy, prevention, protection, strengthening the capacity of staff and strengthening Networking and Communications.

**Strategic Direction of 2014-2016[12] :**

1. **To strengthen the provision of legal aid, rehabilitation and psychosocial services for sexually exploited children.**

*Strategy:*

- Cooperating with various law enforcement institutions at national level in Indonesia
- Building the capacity of civil society organizations to enable them to directly provide legal aid for sexually exploited children
- Developing a model for working with sexually exploited children comprehensively
- Building the capacity of local partners to enable them to provide rehabilitation and psychosocial services

*Main Activities:*

- Cooperating with the Supreme Court, Attorney General's Office, the Indonesian Police Headquarters and Indonesian Advocates Association
- Providing direct legal aid or referral services
- Holding various trainings, education and information sharing with partner organizations
- Providing psychosocial and rehabilitation training for sexually exploited children to strengthen them internally and externally

2. **To advocate for policy making and harmonize national laws related to sexual exploitation of children with the Convention on the Rights of the Child**

*Strategy**:***

- Raising the status of the Convention on the Rights of the Child from presidential decree to law
- Encouraging the revision of Law on Child Protection and
- other laws, including local regulations, related to sexual exploitation of children
- Ensuring budget allocation for sexually exploited children in the national and local budgets
- Developing a model for a sustainable advocacy work at provincial and national levels

*Main Activity:*

- Actively participating in efforts to raise the ratification status of the
- CRC from presidential decree to law through public studies and reviews
- Proactively and constructively participating in the formulation of the National Plan of Action for the Elimination of CSEC and in monitoring its implementation

3. **To raise public awareness of the elimination of demands for sexual exploitation of children**

*Strategy*:

- Developing a guide and instrument for the prevention of sexual exploitation of children at sex buyer level
- Building a strategic partnership with a number of tourism and recreation industries to promote the prevention of sexual exploitation of children
- Developing IT-based and conventional strategies to raise public awereness of the issue
- Building IT-based and conventional capacity for child protection
- Improving young people participation in CSEC elimination

*Main activity:*

- Developing a guide and instrument for the prevention of sexual exploitation of children at sex buyer level
- Establishing cooperation with a number of tourism and recreation industries in promoting the prevention of sexual exploitation of children at sex buyer level
- Developing IT-based and conventional strategies to raise public awareness of the issue

[11] http://ecpatindonesia.org/tentang-kami, accessed 18/12/2014
[12] Strategic Directions Ecpat Indonesia 2014-2016

- Building IT-based and conventional capacity for child protection

**4. To encourage the development of a mechanism that is integrated with human rights to improve the implementation of the Optional Protocol to the CRC on the sale of children, child prostitution and child pornography**

*Strategy*:

- Advocating government to immediately implement the Optional Protocol to the CRC on the sale of children, child prostitution and child pornography
- Advocating for policy changes through the writing of an alternative
- report to the UN Committee on the Rights of the Child, especially for cluster 8, by civil society organizations

*Main Activity:*

- Encouraging government to immediately implement the Optional Protocol to the CRC on the sale of children, child prostitution and child pornography
- Writing an alternative report to the UN Committee on the Rights of the Child, especially for cluster 8, by civil society organizations

# 3 Methodological approach and reflection

## 3.1 Overall methodological approach and reflection

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

## 3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012[13].

[13] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

## 3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: **To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?** and the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

### 3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

### 3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop

have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

### 3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified

organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design:** mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# 4 Results

## 4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of ECPAT that have taken place since 2011 are described. The information is based on the information provided by Mensen met een Missie.

Table 1
*Information about MFS II supported capacity development interventions since baseline*

| Title of the MFS II supported capacity development intervention | Objectives | Activities | Timing and duration | Budget |
|---|---|---|---|---|
| MM Capacity Scan by Independent consultant in 2012 | Evaluate the organization's capacity development needs and highlight opportunities for growth | Capacity scan, evaluation report and recommendations for follow-up. Basis for collective as well as individual capacity building trajectories. | July-August 2012 | 2000 Euro |
| Training on law enforcement | Increasing knowledge on the processes of law enforcement | 3 day training and exchanging knowledge | 5-8 Februari 2012 | 6320 Euro |
| Project Cycle Management training | Increase knowledge on project cycle management | One week training on PCM | Late 2014 | 18000 Euro (for all partners in MFSII program – not exclusively ECPAT) |

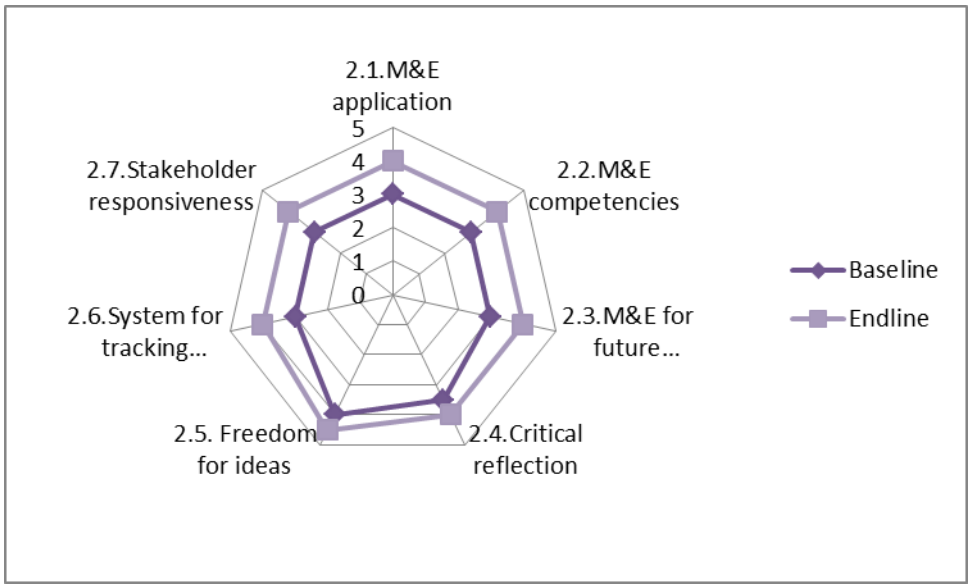
## 4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities. This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also annex 3.

### 4.2.1 Changes in the five core capabilities

**Capability to act and commit**

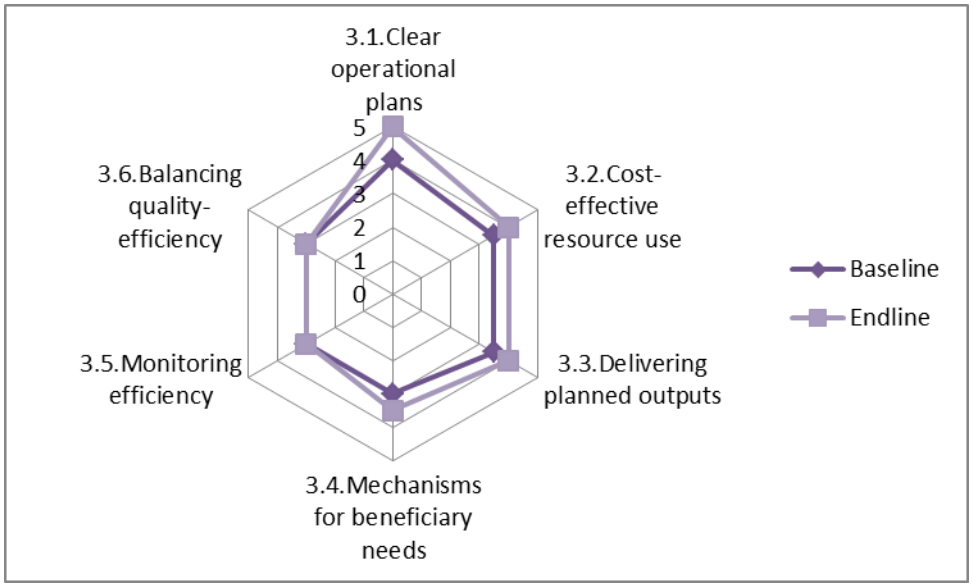


After the program manager resigned, the responsibility was taken over by the director who then fulfilled a dual role as both director and program manager, and leadership has been more active, hands-on, inspiring, and engaging since then. This has helped to bridge the large capacity gap between the director and staff, although a gap still remains. Staff has been involved in developing plans and strategic guidance by the director has improved which led to the board to reduce their strategic input. The strategic plan has been developed for the period of 2013-2016, and together with having standard operating procedures in place; this guided the day-to-day implementation of activities. Staff are motivated to work for ECPAT in relation to its work and is due to increased funding staff remuneration has improved which has also contributed to improved staff incentives. This improved funding situation is due to having a strategic plan which attracted more funders.

In terms of staff knowledge and skills, there have been some slight improvements in terms of capacity to implement the program due to the staff's professional skill on legal service, but much of the learning relates to internal sharing and learning on-the-job. In terms of the organizational structure, ECPAT has broadened the organization structure due to new program which obviously needs extra staff. ECPAT recruited some new staff to fill in the position to implement program, but overall there has been a high staff turnover with two people leaving the organisation since 2012 and 8 people joining the organisation and having an increase in staff members from 4 in 2012 to 10 in 2014.

Score: from 3.3 to 3.7 (slightly improved)

**Capability to adapt and self-renew**

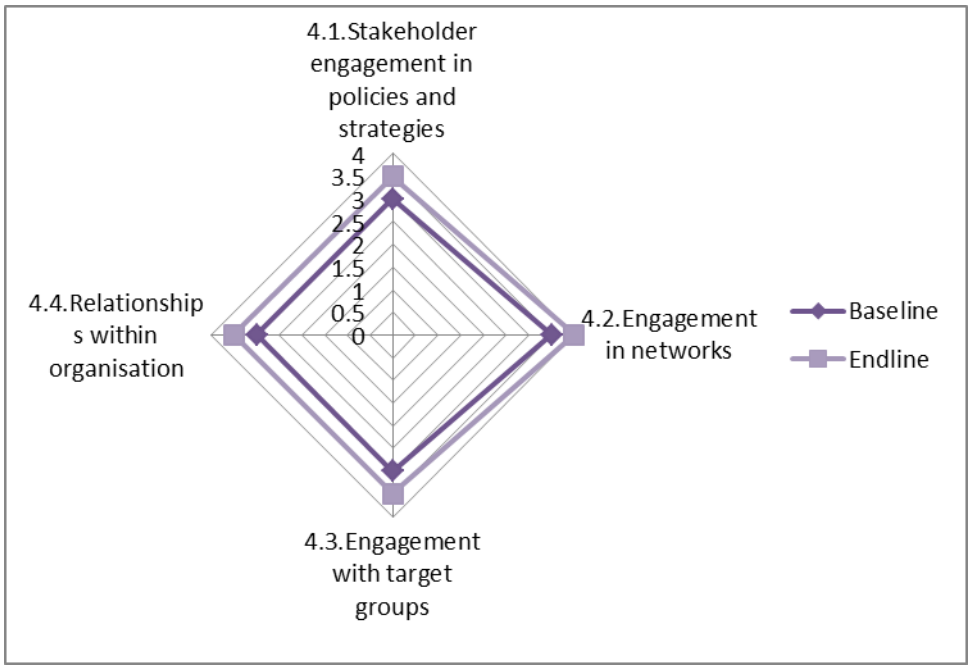


M&E in ECPAT has improved mainly in relation to donor requirements and donor support for strengthening M&E capacity. An overall monitoring and evaluation system is lacking in the organisation, although on the whole, monitoring and evaluation has become more systematic. The monitoring and evaluation refers to ME in Pelhuk implementation; the monitoring, investigating, and reporting of CSEC Cases. However, the director also applied day to day web based monitoring. He would provide feedback on the reports written by staff. Monitoring and evaluation is mainly focus on activities and outputs, but not outcomes and impact. Overall ECPAT currently has strong capacity in M&E in 'the form of its leader, but less so in it's' staff members. The skill gap is bridged through close assistance of the leader in day to day activities and hands-on training.

The staff has practiced monitoring in their regular visits or activities and the results are discussed at monthly meeting. They also have simple monitoring tools in place such as child protection cases handling monitoring. The director implemented web based monitoring to ensure the day to day operations and provided feedback on the assignment or work that has been in progress or completed. One of the staff members has good research skills and this assists in scanning the environment for relevant issues.

The organization's internal culture has been described as open and positive, allowing for feedback and input from all levels of staff. Although the role of ECPAT as coalition network manager has diminished, the external connections to stakeholders and beneficiaries has increased over the last two years in the form of the establishment of a new service division on the one hand, and stronger cooperation with government and public agencies as a result of their newly acquired status to function as the official ECPAT Indonesia organization.

Score: from 3.2 to 4.1 (improvement)

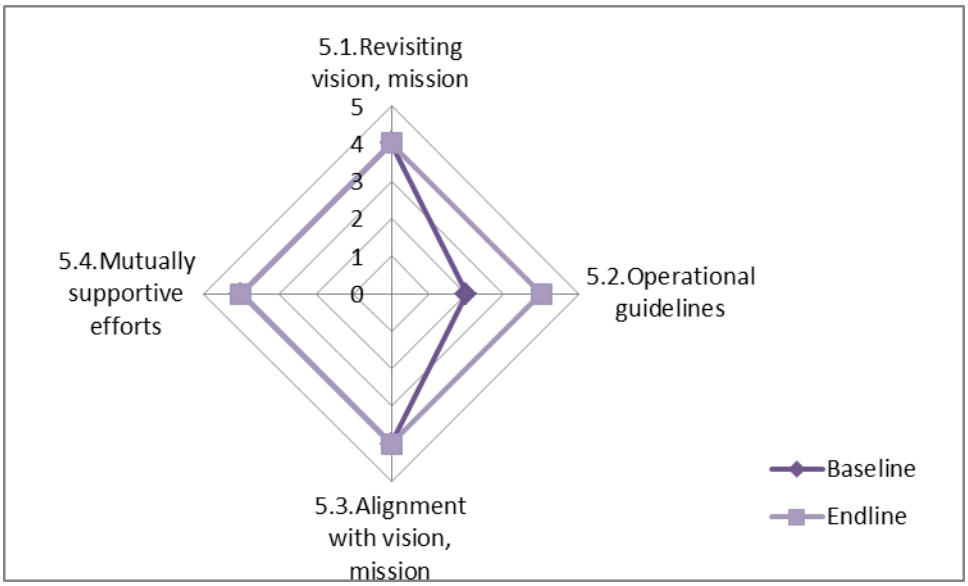


**Capability to deliver on development objectives**

Based on the strategic plan and the new standard operating procedures, there are clear work plans and budgets in place. The organization aims to work as cost effectively as possible and efficiency is being measured by having an external finance expert help in the organization and by reviewing progress with plans and budgets regularly. However, there is no clear mechanism in place to balance efficiency with quality of the work. ECPAT verifies whether the organization meets the needs of the beneficiary by direct observation, as well as close collaboration with other organizations. From the coalition manager's point of view, ECPAT Indonesia failed to deliver the expected results, but this did not affect the program and development objectives of ECPAT themselves.

Score: From 3.3 to 3.7 (slight improvement)

**Capability to relate**



ECPAT is very strong in lobbying and has an extensive network with the government and other key players in ECPAT's policy making, planning and implementation. Overall, ECPAT is a reliable, strong partner in the field of combating CSEC, especially through advocacy, lobby and publishing, and remains widely considered as the expert institute on CSEC issues. On the other hand the function of

ECPAT Indonesia as CSEC coalition manager has deteriorated after the leadership change due to a shift in organizational priorities. Coalition members now publicly voice their concern and wonder what added value ECPAT still provides to the coalition as a whole. There was a change in terms of relating to the beneficiaries of ECPAT due to the implementation of *Pelhuk* program. The nature of direct service has made ECPAT possible to engage closely with the dynamic of the beneficiaries. Internally, relationships have improved due to improved leadership and more regular meetings.

Score: from 3.1 to 3.6 (slight improvement)

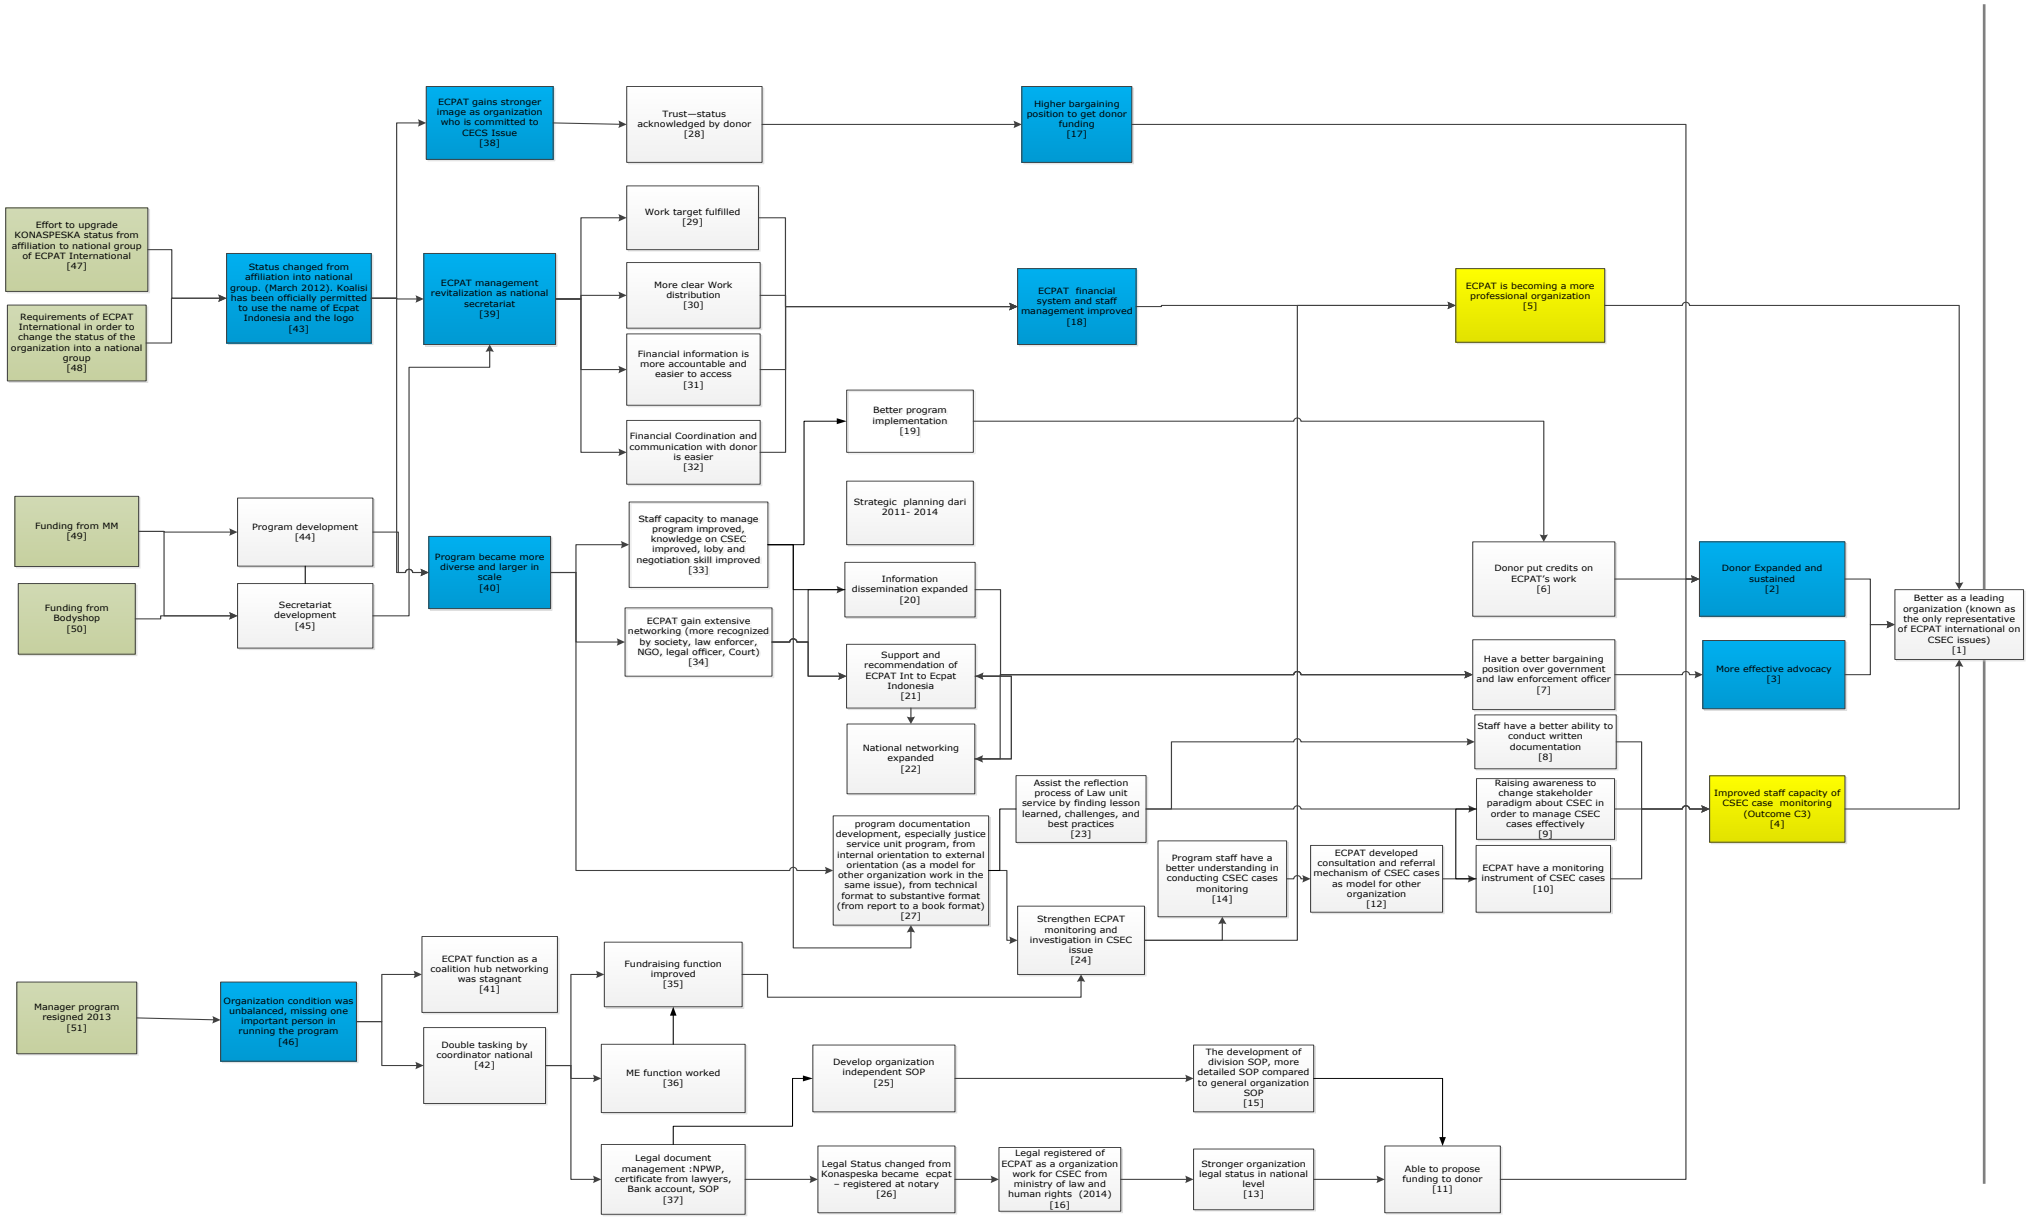
**Capability to achieve coherence**

ECPAT has consistently adjusted strategic plan and program area with its vision and mission. It was stated clearly in the new strategic program 2014-12016. The new strategic program area has been discussed with the boards member and reflected ECPAT International strategic directions.

The vision, mission and strategies are still yearly review with the support from other stakeholders, especially coalition members. And they program activities are line with the vision and mission of ECPAT, and also mutually supportive.  Since the baseline in 2012, several new standard operating procedures have been put in place with the help of an external consultant. This has supported programme implementation.

Score: from 3.5 to 4 (slightly improvement)

### 4.2.2 General changes in the organisational capacity of the SPO



The evaluation team carried out an end line assessment at ECPAT from 23th to 25th June 2014. During the end line workshop, the team made a recap of key features of the organisation in the baseline in 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline.

According to ECPAT staff present at the end line workshop, the key change in ECPAT since the baseline in 2012 was the development of ECPAT into a leading organization on CSEC issues with good management, independent, transparent, accountable, and supportive to its member.

There are four developments that have led to this change:

1. Professionalization of the organization [5]
2. Expansion and sustaining of donors [2]
3. More effective advocacy [3]
4. Improved staff capacity for CSEC case monitoring [4]

Each of these factors will be explained below. The numbers in the narrative correspond to the numbers in the visual.

ECPAT gains stronger image as organization who is committed to CECS Issue [38]
Trust—status acknowledged by donor [28]
Higher bargaining position to get donor funding [17]
Effort to upgrade KONASPESKA status from affiliation to national group of ECPAT International [47]
Requirements of ECPAT International in order to change the status of the organization into a national group [48]
Status changed from affiliation into national group. (March 2012). Koalisi has been officially permitted to use the name of Ecpat Indonesia and the logo [43]
ECPAT management revitalization as national secretariat [39]
Work target fulfilled [29]
More clear Work distribution [30]
Financial information is more accountable and easier to access [31]
Financial Coordination and communication with donor is easier [32]
ECPAT financial system and staff management improved [18]
ECPAT is becoming a more professional organization [5]
Better program implementation [19]
Strategic planning dari 2011- 2014
Information dissemination expanded [20]
Support and recommendation of ECPAT Int to Ecpat Indonesia [21]
National networking expanded [22]
Donor put credits on ECPAT's work [6]
Donor Expanded and sustained [2]
Funding from MM [49]
Funding from Bodyshop [50]
Program development [44]
Secretariat development [45]
Program became more diverse and larger in scale [40]
Staff capacity to manage program improved, knowledge on CSEC inproved, loby and negotiation skill improved [33]
ECPAT gain extensive networking (more recognized by society, law enforcer, NGO, legal officer, Court) [34]
Have a better bargaining position over government and law enforcement officer [7]
More effective advocacy [3]
Staff have a better ability to conduct written documentation [8]
Assist the reflection process of Law unit service by finding lesson learned, challenges, and best practices [23]
program documentation development, especially justice service unit program, from internal orientation to external orientation (as a model for other organization work in the same issue), from technical format to substantive format (from report to a book format) [27]
Strengthen ECPAT monitoring and investigation in CSEC issue [24]
Program staff have a better understanding in conducting CSEC cases monitoring [14]
ECPAT developed consultation and referral mechanism of CSEC cases as model for other organization [12]
Raising awareness to change stakeholder paradigm about CSEC in order to manage CSEC cases effectively [9]
ECPAT have a monitoring instrument of CSEC cases [10]
Improved staff capacity of CSEC case monitoring (Outcome C3) [4]
Better as a leading organization (known as the only representative of ECPAT international on CSEC issues) [1]
Manager program resigned 2013 [51]
Organization condition was unbalanced, missing one important person in running the program [46]
ECPAT function as a coalition hub networking was stagnant [41]
Double tasking by coordinator national [42]
Fundraising function improved [35]
ME function worked [36]
Legal document management :NPWP, certificate from lawyers, Bank account, SOP [37]
Develop organization independent SOP [25]
Legal Status changed from Konaspeska became ecpat – registered at notary [26]
Legal registered of ECPAT as a organization work for CSEC from ministry of law and human rights (2014) [16]
The development of division SOP, more detailed SOP compared to general organization SOP [15]
Stronger organization legal status in national level [13]
Able to propose funding to donor [11]

**Professionalization of the organization [5]**
According to ECPAT staff present at the end line workshop, the organization of ECPAT professionalized over the last two years. Two factors contributed to this.

First, ECPAT's financial system and staff management improved [18]. This occurred due to the successful accomplishing of work targets [29], a better distribution of work activities [30], financial information being more accountable and easier to access [31] and financial coordination and communication with the donor being easier [32]. Each of these developments resulted from the overall revitalization of the ECPAT as the national secretariat [39], through the addition of new personnel, an independent financial mechanism (without ties to the previous PKPA arrangement), and moving in to a new office space. This spurt in development was enabled on the one hand by now being able to handle the name and logo of ECPAT Indonesia [43] by adhering to the strict requirements of ECPAT International and efforts to upgrade the status of *Konaspeska-Koalisi Nasional Penghapusan Eksploitasi Seksual Komersial Anak/*National Coalition on the Elimination of Child Sexual Commercial Exploitation-embrio of ECPAT from affiliate to National group of ECPAT International [48]. On the other hand through the development of the secretariat [45] through funding from two separate sources (The Body Shop [49] and Mensen met een Missie [50]).

Secondly, fundraising efforts finally got rewarded as the system in place started to perform [35] after significant efforts by the national coordinator in a double role, as a director of ECPAT and took over the role of the resigned project manager [42]. The drive for the national coordinator to take on the double role came about from the organization's need for additional key personnel [46] as the program manager resigned in 2013 [51].

**Expansion and sustaining of donors [2]**
The acquisition of new donors and sustaining current donors was greatly supported by the fact that donors started affiliating themselves more with ECPAT's work [6]. They explicitly gave their credits on activities carried out by ECPAT Indonesia, which significantly raised their profile amongst other potential donors in the network. The willingness of donors to do so resulted from the overall higher quality of program implementation [19] that has occurred over the last two years as set out in the strategic planning 2011-2014 [52]. Overall, this quality improvement can be attributed to the improved staff's capacity to manage their programs and their increased CSEC related knowledge as well as lobbying and negotiation skills [33]. The latter was largely a learning effect resulting from a more diverse and larger program and related work activities [40]. Examples of the diversification and expansion of activities include the Justice support service, direct CSEC services in terms of rehabilitation, reintegration and consultation, monitoring and investigating of CSEC cases and the engagement in international activities for instance through the youth partnership project. The expansion in terms of all these program activities was driven by systematic program development [44] enabled by funds from Mensen met een Missie (MM) [49] and The Body Shop [50].

The second factor which has led to expansion and sustaining of donors was the ability to (successfully) propose for funding [11]. In doing so, ECPAT expanded its funding sources to for example Child fund in 2013. This ability came about from two factors. First, the development of clear standard operating procedures (SOPs) for each division[15], based on SPO for the organization as a whole and independent from other organizations [25], allowed for clear guidelines on how to formulate proposals. Secondly, the organizations legal status at the national level became much stronger [13] which made ECPAT Indonesia a more attractive partner for funding. The improvement of legal status was initiated through registering ECPAT with the ministry of law and human rights in 2014 [16]. This was made possible after the official affiliation with ECPAT international was made official in Indonesian law through registration at a notary [26].Both the development of ECPATs own SOP and the registration as a formal and legally accepted institution were made possible by the creation and management of the right set of official documentation [37]. This included the organizations *NPWP* (tax registration number), a certificate from lawyers and a bank account. The preparation of all this legal work was done by the national coordinator in his double role [42], who next to this important role in fundraising [35], also oversaw the function of monitoring and evaluation [36].

**More effective advocacy [3]**
Advocacy efforts by ECPAT increased greatly over the last two years largely due to an improvement in the bargaining position of ECPAT over government and law enforcement authorities [7]. This bargaining position got strengthened for three particular reasons: (a) greater access and dissemination of information [20]; (b) The close involvement of ECPAT International with direct support and advice of ECPAT International [21] and; (c) the expansion of the national network [22]. Each of these factors in turn was developed through the higher quality of connections to key stakeholders in society, NGOs legal and law enforcement authorities as well as the local courts [34]. Access and contacts to these key stakeholders was once again possible through the larger and more diverse program activities that were now carried out [40].

**Improved staff capacity to of CSEC case monitoring [4]**
ECPAT's staff was able to increase its capacity regarding CSEC case monitoring through three specific factors: (a) an increased ability to write documentation on case work [8]; (b) ability to engage stakeholder in the reflection process in order to change stakeholders' paradigm about CSEC [9] and; (c) staff now being able to utilize the ECPAT monitoring instrument for CSEC cases [10]. The first two of these three factors were enabled by increased reflection on working processes within the law service unit by looking at lessons learned, challenges and best practices [23]. The last of the three factors, the utilization of the monitoring instrument, was enabled by the formulation of a clear referral mechanism for CSEC cases as a model for other organizations [12]. This model was developed as a result of the increased understanding of program staff on how to conduct CSEC case monitoring [14] which was enabled by strengthened ECPAT's monitoring and investigation in CSEC issues gained through the implementation of the program [24]. All these previous factors were enabled by a greater effort in program documentation and reporting [27]. ECPAT expanded its reporting from mere technical formats to more substantive forms such as reports or even books for publication. The greater effort required to write these documents formed a clear learning process for all staff involved. This effort once again sprung from the diversification and overall increase of program activities [40].

## 4.3 Attributing changes in organisational capacity development - evaluation question 2 and 4

Note: for each country about 50% of the SPOs has been chosen to be involved in process tracing, which is the main approach chosen to address evaluation question 2. For more information please also see chapter 3 on methodological approach. For each of these SPOs the focus has been on the capability to act and commit and the capability to adapt and self-renew, since these were the most commonly addressed capabilities when planning MFS II supported capacity development interventions for the SPO.

For each of the MFS II supported capacity development interventions -under these two capabilities- an outcome area has been identified, describing a particular change in terms of organisational capacity of the SPO. Process tracing has been carried out for each outcome area. In the capability to act and commit the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'improved program management and implementation capacity'. However, this organisational change area was not limited to this capability but also covered other capabilities. This indicates the importance of the interconnectedness of the 5 core capabilities.

In the capability to adapt and self-renew the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'improved skill of ECPAT in the investigation, monitoring and reporting of CSEC'

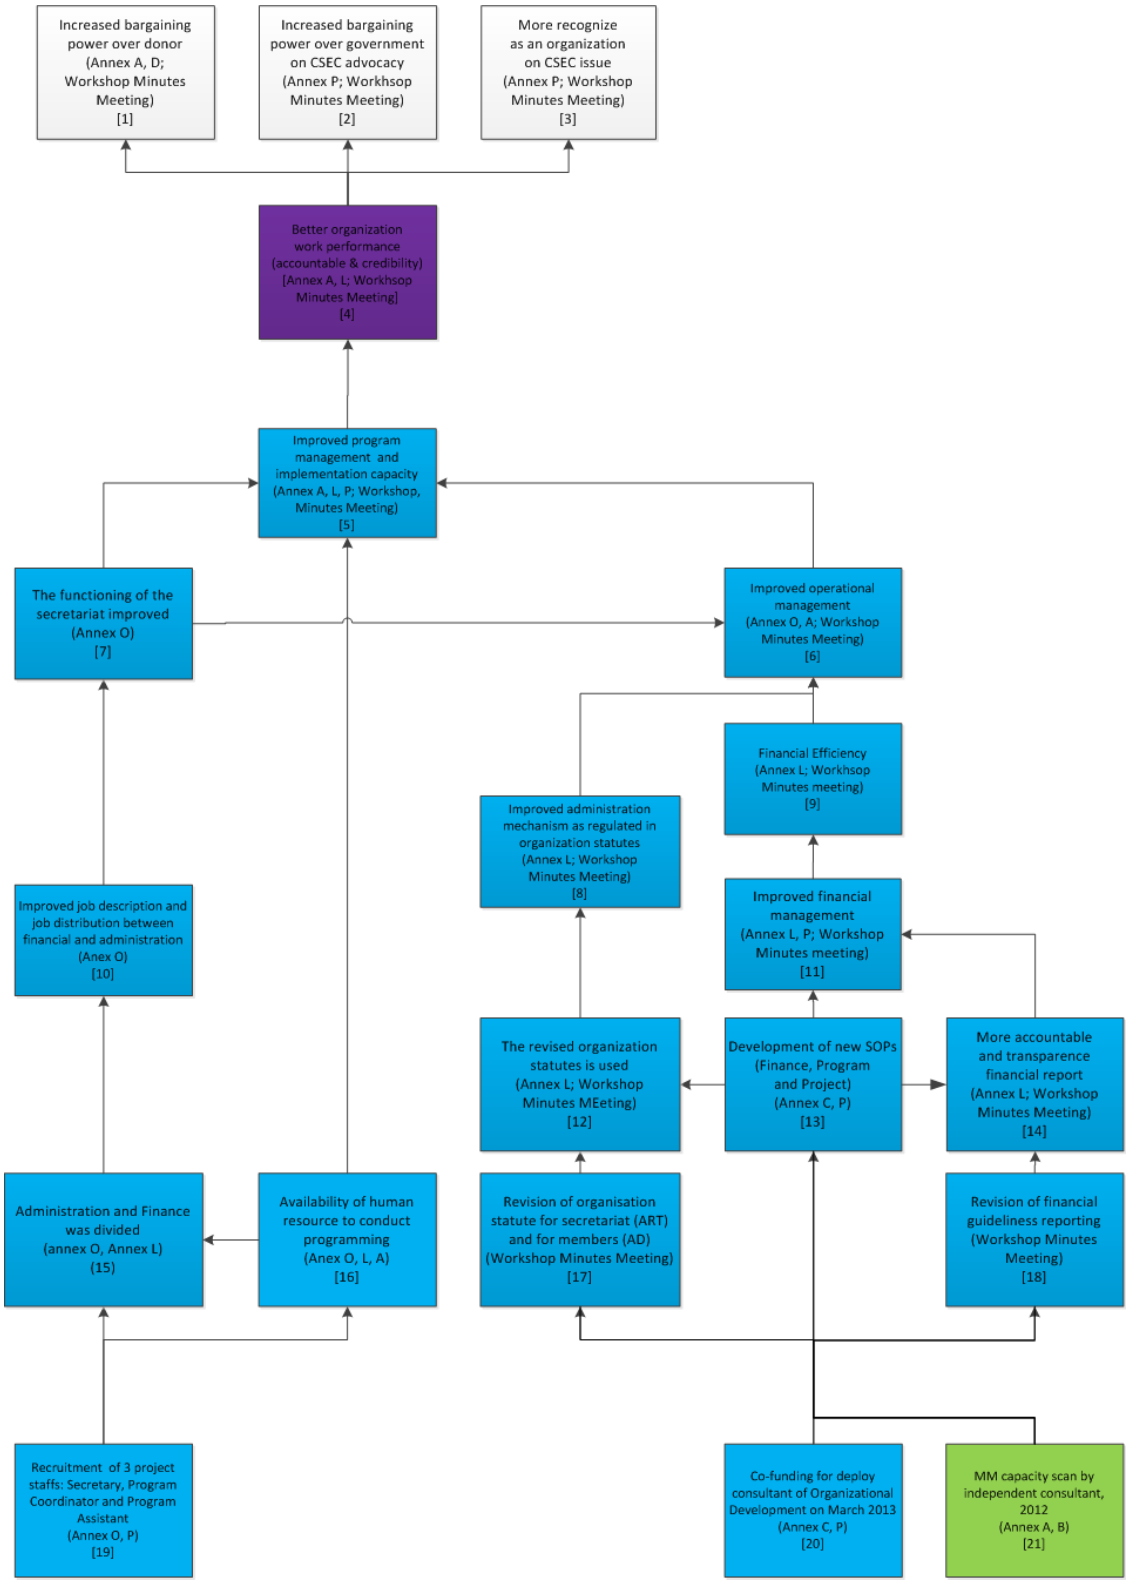


Table 2

*Information on selected capabilities, outcome areas and MFS II supported capacity development interventions since the baseline*

| Capability | Outcome area | MFS II supported capacity development intervention(2) |
|---|---|---|
| Capability to act and commit | Improved program management and implementation capacity | MM Capacity Scan by Independent consultant in 2012 |
| Capability to adapt and self-renew | Improved skill of ECPAT in the investigation, monitoring and reporting of CSEC cases | n/a |

The next sections will describe the results of process tracing for each of the outcome areas, and will describe to what extent these outcome areas have taken place as a result of MFS II supported capacity development interventions and/or other related factors and actors.

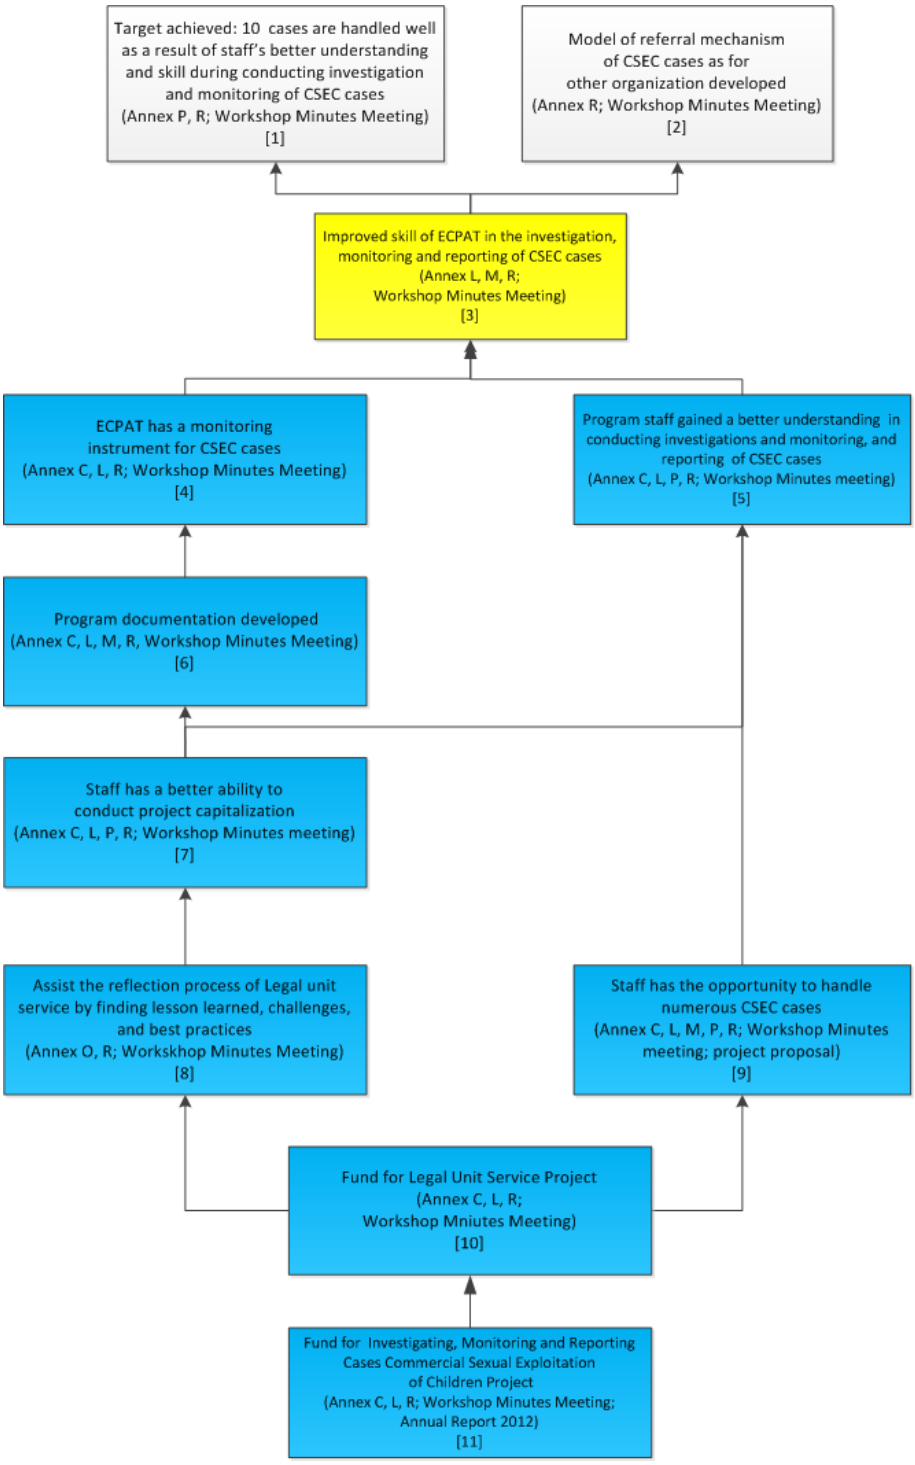
### 4.3.1 Improved program management and implementation capacity

ECPAT International has officially recognized ECPAT Indonesia as part of its organization and network. One of the requirements from ECPAT International was that ECPAT Indonesia carries out programs and activities independently. The organization was forced to take on more responsibilities and to formulate and carry out their own programs to maintain the new status and secure funding. For this purpose, there was a need to strengthen the program management of ECPAT. This is expected to improve program management and implementation capacity [5] (source: *(annex L, annex A, Process*

*tracing minutes meeting)* and herewith overall work performance. This is expected to lead to increased bargaining power with donors *[1] (annex, A, annex D, process tracing minutes meeting)*; increased bargaining power with over government on CSEC advocacy [2] *(annex P, process tracing minutes meeting)*; and being more recognized as an organization on CSEC *issues [3] (annex P, process tracing minutes meeting).*

ECPAT achievement to be an organization with improved program management & implementation capacity was the result of *[6] (source: annex O, annex A, and process tracing minutes meeting)* Improved functioning of the secretariat [7]; more human resources for implementation [16]; and improved operational management [6]. Each of these areas is further discussed below.

**The functioning of the secretariat improved** due to having an improved job description and job distribution between administration and finance [10] *(source: annex o and process tracing minutes meeting).* This was the result of ECPAT starting to separate the financial function and administration function [15] *(source: annex O, annex L)*. There was a clear job distribution and description between finance and administration which has contributed to strengthen administration and made administration function well[15] *(annex O and annex L)* . The other reason for improved functioning of the secretariat is having more human resources available to conduct programming: a secretary, a programme coordinator and a programme assistant [19] (source: annex O, annex P).



The second reason for improved program management and implementation capacity was **the improved Operational management of the organization** [6] (source: annex O, A; workshop minutes meeting) which was the result of improved administration mechanisms [8] (source: annex L; process tracing meeting minutes) and improved financial efficiency [9] (source: annex L; process tracing meeting minutes). In relation to administrative mechanisms [8], all the organizational documents and organization used to follow PKPA mechanisms and management. But as a new organization, ECPAT needed to have their own organizational management mechanism [8]. According to some staff, the organizational development was not funded by MM, however. ECPAT also put some of the budget from MM on the process of organizational development.

The administrative mechanisms have improved due to using the revised organisation statues [12] (source: annex L; process tracing meeting minutes). This was the result of having a revised organization statute document (ART) for the secretariat and Anggaran Dasar (basic regulations of an organization) for ECPAT members [17] *(source: process tracing minutes meeting) .* The Indonesian organisational development consultant [20] (source: annex C&P) assisted in this revision in March 2013. It is unclear who funded this consultant: MM or the Body Shop Indonesia. On the other hand, MM funded their own capacity scan in 2012 performed by another external consultant [21].

The other reason for improved operational management [6] (source: annex O&A; process tracing meeting minutes) was the improved financial efficiency [9] (source: annex L; process tracing meeting minutes) The Financial matters were efficiently applied because there was an improvement on the financial management (11) (source: annex L&P, process tracing meeting minutes). The improved Financial management existed as a result of the development of new SOPs for divisions, such as finance SOP, program SOP, and project SOP) [13] *(source: annex C, annex P)*, and the assistance of the organisational development consultant [20], as well as recommendations made by the MM funded external consultant who did the capacity scan in 2012 [21]. One of the staff said that finance SOP has made them easier to conduct procurement.

Furthermore, financial management improved due to having more accountable and transparent financial reports [14] (source: annex L; process tracing meeting minutes). These financial reports have improved due to the newly developed SOPs [13] (source: annex C&P) and through revised financial guidelines on reporting [18] (source*: process tracing minutes meeting)*. Again here the support of the Indonesian organisational development consultant has helped [20], as well as the MM capacity scan performed in 2012 [21].

### 4.3.2 Improved skill of ECPAT in the investigation, monitoring and reporting of CSEC cases

During 2012-2014, there was an improvement on the ECPAT staff's skill in the investigation, monitoring, and reporting of CSEC cases [3] (Annex L, M, R; Workshop Minutes Meeting). This improvement has helped ECPAT in achieving their target. They succeeded to handle 10 cases as a result of staffs' better understanding and skills during conducting investigation and monitoring of CSEC cases [1] (Annex P, R; Workshop Minutes Meeting). Besides that, it also encouraged ECPAT to generate a model of referral mechanism for CSEC cases for other organization [2] (Annex R; Workshop Minutes Meeting). The referral mechanism for CSEC cases model provided steps, guidance, also strategy to manage CSEC cases. It was expected that other organization can learn, adopt, and adjust the model of CSEC cases handling.

The improved skill of ECPAT staff in investigating, monitoring and reporting of CSEC cases [3], can be attributed on the one hand to the fact that ECPAT now has a monitoring instrument in place for CSEC cases [4] (Annex C, L, R; Workshop Minutes Meeting). The other reason is that program staff gained better understanding in how to, investigate, monitor, and report on CSEC cases [5] (Annex C, L, P, R; Workshop Minutes Meeting). Each of these two reasons is explained in more detail below.

**ECPAT as a monitoring system for CSEC cases [4]**

ECPAT now has a monitoring instrument for CSEC cases [4] (Annex C, L, R; Workshop Minutes Meeting). This is the result of the development of program documentation for the justice unit service [6] (Annex C, L, M, R; Workshop Minutes Meeting). This program was intended to build a model for other organizations to work on the same issues. The form of that documentation is a book containing the details of how ECPAT handled 10 CSEC cases. The book also became a reporting mechanism for cases of CSEC and is available nationally through a database system. This reporting mechanism has changed in terms of being more externally oriented than only internally oriented. This means that ECPAT shared the lesson learned of the CSEC cases handling and provided models for other organization working in CSEC issues Furthermore, the format has changed from being more administrative reporting to being described in the form of a book.

The development of the program documentation was enabled by the fact that ECPAT staff now has a better ability to develop program documentation as the staff were now better able to capitalise on their learning during the justice service project implementation [7] (Annex C, L, P, R; Workshop Minutes Meeting). This learning process occurred amongst staff following an increased focus on the process of reflection on work and challenges, developing lessons learned and best practices. [8] (Annex O, R; Workshop Minutes Meetings). This shift in critical reflection can be attributed to requirements established in the fund received for the development of the legal unit service project [10] (Annex C, L, R, Workshop Minutes).

**Increased staff skill in investigating, monitoring and reporting on CSEC cases [5]**

Program staff now has a better understanding of how to investigate, monitor and report on CSEC cases [5] (Annex C, L, P, R; Workshop Minutes Meeting). This was due to two reasons. Firstly,there was an increased ability of staff to capitalize on project learning [7] [6] (Annex C, L, P, R; Workshop Minutes Meeting), as already disclosed above. Secondly, staff have had the opportunity to handle a greater number of CSEC cases [9] (Annex C, L, M, P, R; Workshop Minutes Meeting; Project Proposal). This is demonstrated by the fact that the staff succeed to reach the target to handle at least 10 cases during the implementation of the project.

The foundation of the positive organizational developments with respect to this key outcome is a series of activities and processes of two projects. First, the fund for the Legal Service Unit Project – commenced in November 2012 [10] (Annex C, L, R; Workshop Minutes Meeting). The Legal Unit Service Project implementation was a new direct service for CSEC cases handling, and this is funded by MM. This project is actually a continuation of the Investigating, Monitoring, and Reporting CSEC Project [11] (Annex C, L, R; Workshop Minutes Meeting, Annual Report 2012), - which was concluded in September 2012. The initiative to develop a model of handling CSEC cases has started during the implementation of that project. So that it has resulted in the development of guideline of CSEC handling cases for the member of ECPAT [2].

# 5 Discussion and conclusion

## 5.1 Methodological issues

**General: Applied to all or most SPOs**

With regard to the methodology, Indonesia has made some data collection adjustment based on the context. The first adjustment was related to the type of instrument used. To assess the organizational capacity, the study has provided self-assessment, observation and interview sheets. These all were used during the baseline with all SPOs. During the end line the team used self-assessment, interview and observation sheets. However the evaluator applied interview sheets as self-assessment—where participants were asked to fill these sheets by themselves. For the participants who did not attend the workshop, the interviews were done separately using the interview sheet and the results from the interview were included in the subgroup interview sheet that was already filled by the staff member. Were combined into the relevant sub categories in the interview sheet. Interview sheets were also applied for interviews with the CFAs, partners and consultants.

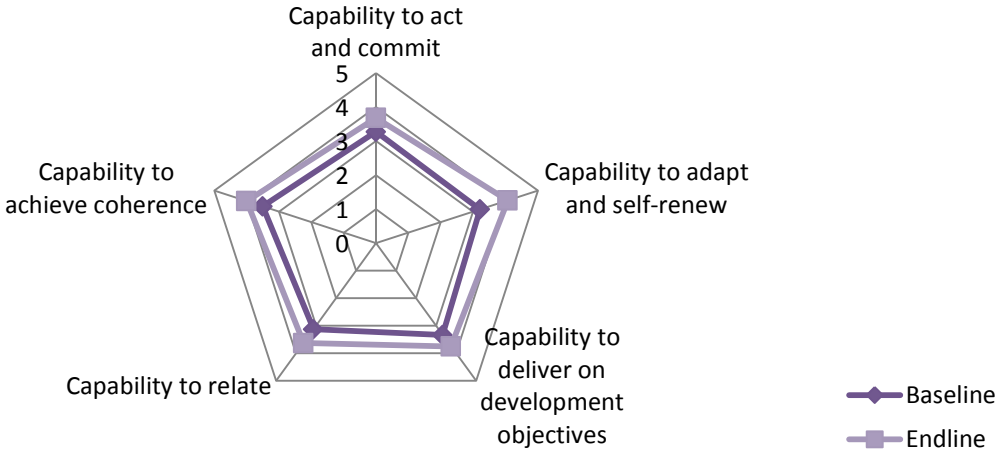
The baseline study showed that having two similar instruments (self assessments, and interview sheets) did not have any effect in relation to obtaining adequate and quality data.

To have some clarification post visit to all SPOs, the evaluator used email and phone interviews.

**ECPAT**

Prior to the endline workshop, the interview sheets were sent to the SPO. Although it was instructed to be filled in within group, the SPO worked on the interview sheet individually. However, the SPO was able to send back the filled interview sheets prior to the endline workshop. All staff, mostly newly recruited and a representation from management, admin/HR, program, and field staff attended the endline workshop. However, the key persons, - the finance manager and the program manager of Legal service Division- were not available during the process tracing workshop. Therefore, the team conducted phone interviews and email communication with these key persons after the workshop to gain more information and to confirm information from the endline workshopThere was no person with specific M&E role, but this function was attached to the coordinators and director's role. The evaluation team was able to interview 1 partner and 1 consultant of organization capacity development.

The general causal map was developed, which included key organizational capacity changes as from the perspective of the SPO. As ECPAT was one of the selected SPOs for process tracing, a pre workshop activity was conducted to analyze the secondary data and draw initial causal maps for the selected capabilities, and this was used during the endline workshop. The initial process tracing causal map that has been developed prior to the endline workshop, needed to be adjusted based on the new information from the staff involved in the endline workshop. In relation to this process tracing, only 1 staff who attended MFS II funded training is still in the organisation, the others have left. This is a program manager from the legal service division and this person filled the training questionnaire on the Proposal Development, Monitoring and Evaluation training that was held in 2014 and MFS II funded.



Although the endline workshop had been planned carefully, some key persons were absent during the endline process due to personal reasons. Most staff that attended the workshop were new to the organisation and they did not have a complete picture of the initial condition of the organization. In the process tracing workshop, only the director attended as senior staff, and provided most of the information. As a result of the process, the evaluation team needed to verify all the information with key staff of ECPAT such as, the admin staff/secretary, finance manager, and program manager so as to develop the final causal map of ECPAT after the workshop. Another concern about ECPAT was in the analysis process; ECPAT has two different functions as a secretary of the consortium and as organization. As the focus was not clear in the beginning, the workshop and process tracing did not differentiate ECPAT's two functions. As a result, the causal map development put the two functions as

outcome of the organizational capacity changes. However, after reviewing this, it was decided that the analysis should focus on the role of ECPAT as organization not as a consortium. The causal map was adapted accordingly.

## 5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Whilst changes took place in all of the five core capabilities, over the last two years most improvements for ECPAT took place in the indicators under the capability to adapt and self-renew. Below the changes in each of the capabilities are further explained, by referring to the specific indicators that changed.

The capability to act and commit improved slightly for ECPAT in the last two years. Responsive leadership improved slightly as the overall leadership style within ECPAT has changed from a 'one man show' to a more accommodating and inspiring style. Particularly the supportive style, open communication, as well as the increased clarity in the descriptions of roles and responsibilities was much appreciated. Strategic guidance also improved slightly: a monthly meeting is now organized as to regularly meet staff, discuss issues and evaluate performance which involves all staff members. Staff turnover deteriorated, and overall turnover has remained high, with experienced staff members resigning to seek out better job offers, whilst new inexperienced staff take over and must be hired with the addition of new program activities. Organisational structure improved as with the new direct service program of Pelhuk (Pelayanan Hukum_Legal Service Unit), the organogram has reflected strongly the objectives of the organization to commit more in addressing the CSEC issues. In terms of daily operations, a slight improvement has occurred: ECPAT has implemented its operations in accordance to the strategic plan, which has attracted additional funding for research projects, internships and direct legal services. Strategies have been more articulated due to this strategic plan for 2014-2016 as well, as current strategic planning was formulized based on the consultation with ECPAT's board members and aligned with ECPAT International's strategic directions for the East Asia Region. Daily operations have improved slightly with the introduction of several new standard operating procedures SOPs related to this strategic plan. Overall staff skills improved slightly too, this occurred mainly due to the increase of ECPAT's internal spending on training and development. Incentives for staff members have improved slightly due to a raise in staff benefits and remuneration. New funding sources were found in forms of DH and Child Fund as well as local campaign funds from the Ministry of Education and Culture. Funding procedures have improved as the involvement of staff members has increased in proposal development.

In the capability to adapt and self-renew ECPAT also improved slightly in various indicators. In the application of M&E, ECPAT now has a clear M&E protocol in place for 2014 and onwards as a result of stricter donor requirements on the generation of monitoring and evaluation data. M&E competences increased as well due to the active involvement of the Director to teach and assist his staff members in conducting M&E. The application of these results for future strategies has resulted in an improvement of this indicator. ECPAT also actively gathered data on CSEC cases which were bundled and teaching materials have been developed for new employees, partners and other interest groups. Overall critical reflection improved slightly with as more meetings were created for staff to express themselves. For the same reason, the freedom for staff to express their ideas slightly improved. ECPAT's system to track their environment has improved too. The director actively performs situational analysis and collects details on issues related to the organization and its' activities. He also seeks information through coalition members and from the media. The responsiveness of stakeholders has improved after ECPAT adopted the name ECPAT Indonesia. This change in status associated to the name ("brand") have allowed networking activities to expand.

In terms of the capability to deliver on development objectives, there has been a slight improvement overall. Clear operational plans have been developed in the form of an implementation work plan and budget plan to control the execution of activities. Furthermore clear standard operating procedures have been developed to guide operational work. Delivering planned outputs has improved as virtually all objectives have been met, particularly in the CSEC case program. Beneficiaries have enjoyed ECPAT's improved mechanism to ensure their needs are being met. Close cooperation with beneficiaries at all stages of project execution ensures their continuous involvement, albeit an intensive effort to maintain.

In the capability to relate ECPAT slightly improved its stakeholder engagement by coordinating their work more with government parties, for instance the Pelhuk Program. Similarly other stakeholders such as local enforcement authorities are closely integrated in the handling of case work. ECPAT's engagement in its network is strong through lobbying activities amongst key government and policy making figures. Despite this overall improvement, some coalition members have voiced their concern whether ECPAT can still maintain its role as leader of the coalition given its current priorities. Target groups continue to be engaged through direct services to beneficiaries, and ECPAT expanded these groups to youth clubs and schools to raise awareness to prevent CSEC. Overall relationships within the organisation have improved slightly. Informal communication amongst the staff is now stronger and helps them connect and discuss programmatic issues.

Finally, ECPAT has realised a slight improvement in the capability to achieve coherence through its operational guidelines. In 2013 ECPAT hired a consultant to support them to improve the management system and develop several new sets of standard operating procedures in terms of finance, HR and program procedures.

**General organisational capacity changes related to MFS II Interventions**

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provide by the evaluation team. Please note that this information is based only on the information provided by ECPAT staff during the endline workshop, but no validation of this information has been done like with the process tracing causal maps. For details in relation to attribution, we refer to the next section (5.3).

During the endline workshop some key organisational capacity changes were brought up by ECPAT staff, these have been captured in the general causal map in 4.2.2: professionalization of the organization; expansion and sustaining of donors; more effective advocacy; improved staff capacity for CSEC case monitoring. All of these changes are expected to contribute to ECPAT being better as a leading organization (known as the only representative of ECPAT international on CSEC issues). ECPAT staff experienced these as the most important capacity changes in the organisation since the baseline.

According to SPO staff present at the endline workshop, professionalization of the organization can be attributed to the improvement of ECPAT's financial system and staff management, this occurred through the achieving of work targets, clearer work distribution, more accountable and accessible

financial information and financial coordination and communication with the donor having become easier. Each of these factors in turn were enabled by ECPAT's management revitalization as a national secretariat. This can be attributed to the status change into ECPAT Indonesia on the one hand, and a more diverse and larger scale program on the other. The status change occurred after serious effort was undertaken on ECPAT Indonesia's behalf, and by meeting the requirements of ECPAT International. On the other hand the more diverse programs resulted from the expansion and development of the programs as well as the secretariat. Both of these changes occurred with help of capacity development interventions funded by MFS II by Mensen met een Missie, but were also enabled by some additional funding from the Bodyshop Indonesia.

The expansion and sustaining of donors can be attributed to the fact that donors credited ECPAT's work more frequently, which significantly raised their profile amongst other potential partners and donors. This was enabled by better program implementation, made possible through the strategic planning 2011-2014 as well as the staff's capacity improvements to manage programs, their knowledge on CSEC as well as the lobby and negotiation skills. This was in turn enabled by the program becoming more diverse and larger in scale, which was enabled by Mensen met een Missie's support in developing ECPAT's. On the other hand, a better bargaining position of ECPAT due to a better trust status by the donor allowed it to make it easier to expand and sustain donor support. This trust increase can be attributed to ECPAT's stronger image as an organization who is committed to the CSEC issues, which was enabled by the name and status change of the organization. The last capacity change that can be attributed to the sustaining and expansion of ECPAT's donors is the ability to develop proposals for funding. This was enabled by the development of standard operating procedureson the one hand, and a stronger legal status at the national level on the other hand. Both can be attributed to the management of legal documents to formalize the organization as a legitimate entity under Indonesian law.

More effective advocacy can be attributed to ECPAT having a better bargaining position in their negotiations with authorities. This came about from the support and recommendations from ECPAT International, the expansion of the national network, as well as more information about the organization and their activities being distributed. This can be attributed to becoming more recognized by various stakeholders in Indonesia after the program has expanded and became more diverse, largely funded with MFS II funds.

Lastly the improved staff capacity for CSEC monitoring was enabled by an increased ability to conduct written documentation, raising the awareness about CSEC issues, and having a monitoring instrument in place. The former two changes were the result of assisting the reflection process of the law unit service, the latter through a better understanding about monitoring CSEC issues of the program staff. Strengthening the ECPAT monitoring and investigation efforts contributed significantly to this. Both these changes can be attributed to the development of program documentation, as part of the program diversification and expansion funded by MFS II. The strengthening of ECPAT's monitoring and investigation was enabled by the improvement of the fundraising function, which can be attributed to the double tasking set for the national coordinator who filled in on one of the missing organizational roles after the manager resigned in 2013.

In conclusion, the general organizational capacity changes that were identified as importance by SPO staff during the endline workshop can be partly related to MFS II funded capacity development interventions, particularly in terms of staff capacity for CSEC case monitoring, effective advocacy and professionalization of the organization in terms of better work distribution, more accountable financial information, better program implementation, more detailed SOPs and a better legal foundation of the organization according to the Indonesian law. Funding from other sources (e.g. the Bodyshop) have also enabled some of these changes. Fundraising capacities on the other hand were more the result of internal developments, namely the resignation of the program manager, and the effect of the name change and status associated with the adoption of the ECPAT name. This was not the purpose of this particular exercise. It must be noted that the information provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect. More detailed information can be found in the next section where selected organisational capacity changes have been thoroughly investigated through process tracing.

## 5.3 Attributing changes in organisational capacity development to MFS II

This section aims to provide an answer to the second and fourth evaluation questions:

2. *To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*
4. *What factors explain the findings drawn from the questions above?*

To address the question of attribution it was agreed that for all the countries in the 5C study, the focus would be on the capability to act and commit and the capability to adapt and self-renew, with a focus on MFS II supported organisational capacity development interventions that were possibly related to these capabilities. 'Process tracing' was used to get more detailed information about the changes in these capabilities that were possibly related to the specific MFS II capacity development interventions. The organisational capacity changes that were focused on were:

- Improved program management and implementation capacity
- Improved skill of ECPAT in the investigation, monitoring and reporting of CSEC cases

The first organisational capacity change falls under the capability to act and commit. The second falls under the capability to adapt and self-renew. The organisational capacity change areas that were chosen are based on document review as well as discussions with the SPO and CFA. Each of these organisational capacity changes is further discussed below.

*The following issues are discussed for the MFS II funded activities that are related to the above mentioned organisational capacity changes:*

a. Design: the extent to which the MFS II supported capacity development intervention was well-designed. (Key criteria: relevance to the SPO; SMART objectives)
b. Implementation: the extent to which the MFS II supported capacity development was implemented as designed (key criteria: design, according to plans during the baseline);
c. Reaching objectives: the extent to which the MFS II capacity development intervention reached all its objectives (key criteria: immediate and long-term objectives, as formulated during the baseline);
d. The extent to which the observed results are attributable to the identified MFS II supported capacity development intervention (reference made to detailed causal map, based on 'process tracing').

Please note that whilst (d) addresses the evaluation question related to attribution (evaluation question 2), the other three issues (a, b and c) have been added by the synthesis team as additional reporting requirements. This was done when fieldwork for the endline process had already started.

**Improved program management and implementation capacity**

The following MFS II capacity development interventions supported by Mensen met een Missie (MM) were linked to the key organisational capacity change "Improved program management and implementation capacity":

1. MM Capacity Scan by Independent consultant in 2012

In addition to this capacity intervention, human resources were hired through the Mensen met een Missie sponsored projects. The hiring of these people can not be seen as a capacity development intervention, but did contribute to capacity changes in the organization. More on this will be elaborated whilst answering the attribution question.

*MM Capacity scan by independent consultant in 2012*

**Design**
This intervention was planned for all partner organizations of Mensen met een Missie during the baseline in 2012, although the details still had to be specified.

The short term objective of this intervention was that the document would serve as input for all SPO's for reflection. The long term expectation was that based on this document and this self-reflection, decisions would be made in terms of capacity strengthening.

The relevancy for both Mensen met een Missie and ECPAT are clear; as the capacity scan was to act as an evaluation moment for the organization and highlight opportunities for growth. The objectives were not formulated in a SMART way.

**Implementation**
This intervention was planned for during the baseline in 2012, and took place later that year in July-August 2012. As far as the evaluation team knows, it was implemented as designed, however, details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

**Reaching objectives**
Not having objectives formulated makes it difficult to assess this issue. Despite that, the MM funded capacity scan was communicated to the SPO and served as a basis for new capacity development interventions. Amongst others, an additional initiative to hire an Indonesian consultant for an organizational management scan was taken, which resulted in a series of organizational changes related to organizational development.

**Attribution of observed results to MFS II capacity development interventions**
According to ECPAT, the improved program management and implementation capacity of ECPAT has resulted in better organizational work performance, increased bargaining power over donors and government and greater recognition of ECPAT as an organization dealing with CSEC issues. The improved program management and implementation capacity can be attributed to the improved functioning (operating) of the secretariat, the availability of human resources to conduct programming, and improved operational management. Whilst none of these capacity changes can be directly attributed to MFS II interventions, the hiring of staff that has occurred, as well as the consultant assessments are results of the funding from programs sponsored by Mensen met een Missie. How these have contributed to organizational capacity change will be explained in detail below.

The improved functioning and operating of the secretariat was due to improved job descriptions and job distributions between financial and administrative tasks. This in turn could be attributed to the new recruitment of three project staff members; a secretary, program coordinator and program assistant. These new functions were possible due to the recruitment of staff to implement the legal unit service, a program funded by Mensen met een Missie in November 2012. Similarly, the availability of human resources to conduct programming of staff was enabled by the hiring of new staff in light of the MM funded legal unit service project. Although these are not interventions specifically, the hiring of human resources and manpower to work on the MFS II sponsored program for a Legal Unit Service, has contributed a lot to the organizational changes described above.

On the other hand operational management improved due to an improved administration mechanism as regulated in the organization's statutes, as well as due greater financial efficiency. This administrative mechanism was altered due to a revision in the organization's statutes and SOP's, as recommended by the consultant in the March 2013 assessment, as well as the 2012 capacity scan performed by an external consultant hired by MM. Greater financial efficiency could also be attributed to the development of these new SOPs, which regulated stricter financial procedures as well as program and project procedures. More accountable and transparent financial reports allowed for improved financial management as well, which was enabled by the revision of the financial guidelines as recommended by the Indonesian consultant in her assessment. The MFS II funded intervention of hiring another independent consultant to perform a capacity scan in 2012 was part of a greater

Mensen met een Missie initiative to scan all their partner organizations in Indonesia. This resulted in a report which laid the foundation for self-inspection of ECPAT, and the series of organizational capacity changes, initiatives and developments that took place.

In conclusion, the improved program management and implementation capacity observed in ECPAT since the baseline can be attributed to the MFS II funded intervention supported by Mensen met een Missie, in particular the capacity scan performed in July-August 2012. In addition the hiring of new manpower of the organization as part of the MFS II funded legal service unit program, has also lead to organizational ccapacity change in form of improved job descriptions, functioning of the secretariat and ultimately the improved program management and implementation capacity

**Improved skill of ECPAT in the investigation, monitoring and reporting of CSEC cases**
No specific MFS II capacity development interventions supported by Mensen met een Missie (MM) were implemented since the baseline in relation to "Improved skill of ECPAT in the investigation, monitoring and reporting of CSEC" (please also see section 4.3). Instead, the execution of the MFS II funded programs for a legal unit service as well as its preceding program on Investigating, Monitoring and Reporting of CSEC cases, has led to organizational learning which has brought about organizational capacity changes. This will be explained in more detail below

**Attribution of observed results to MFS II capacity development interventions**
Improved skill of ECPAT in the investigation, monitoring and reporting of CSEC cases resulted in the successful handling of 10 CSEC victim cases as well as the development of a referral mechanism of CSEC cases for other organizations to use. This skill was improved due to a monitoring instrument for CSEC cases being available, and to program staff having gained better understanding in conducting investigations, monitoring and reporting of CSEC cases in practice.

ECPAT's monitoring system can be attributed to the development of program documentation for the justice unit service project. The program was intended to build a model for other organizations to work on similar issues which was done through the publication of a book and a database on the 10 CSEC cases that were followed and supported. This in turn was enabled by the staff's increased ability to capitalize on learning experiences which can be attributed to the staff's work on the reflection process in the case work to find lessons learned, challenges and develop best practices. This resulted directly from the Legal Unit Service Project supported by MFS II, which was a continuation of the CSEC investigating, Monitoring and Reporting project which took place in 2012.

On the other hand, better staff understanding on how to conduct investigations as well as monitor and report on CSEC cases was the direct cause of staff being able to handle several CSEC cases, as well as studying these cases closely. This too was enabled by the Legal Unit Service Project.

In conclusion the key organizational capacity of improved skill of ECPAT on CSEC monitoring, investigation and monitoring of CSEC cases can be fully attributed to both MFS II funded intervention programs. These are not organisational capacity development interventions, but through staff's experience of being involved in these projects their understanding in conducting investigations, monitoring and reporting on CSEC cases has improved and they have been able to develop a monitoring instrument for CSEC cases. Therefore, their capacity has been built not through specific organisational capacity development interventions but rather through the experience in these 2 projects.

# Appendix 1 Methodological approach & reflection

## Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

## Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.[14] Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

[14] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

*What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?*

*What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?*

**List of questions to be asked for each of the 5C indicators** (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
   - -2 = Considerable deterioration
   - -1 = A slight deterioration
   - 0 = No change occurred, the situation is the same as in 2012
   - +1 = Slight improvement
   - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*

3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
   - Intervention, actor or factor at the level of or by **SPO**: ..... .
   - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**: .... .
   - Intervention, actor or factor at the level of or by the **other funders**: ..... .
   - **Other** interventions, actors or factors: ..... .
   - Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;

- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will coded these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

*Step 5.* ***Prepare and organise the field visit*** *to the SPO – in-country team*

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews coulc be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

*Step 6.* ***Interview the CFA*** *– CDI team*

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

*Step 7.* ***Run the endline workshop*** *with the SPO – in-country team*

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

***Purpose of the fieldwork*:** to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

***Brainstorm on key organisational capacity changes and influencing factors***: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative.This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

***Self-assessments*:** respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

*Step 8.* ***Interview SPO staff*** *– in-country team*

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

*Step 9.* ***Fill-in observation sheets*** *– in-country team*

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

*Step 10.* ***Interview externals*** *– in-country team & CDI team*

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

*Step 11.* ***Upload and auto-code all the formats*** *collected by in-country team and CDI team – CDI team*

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the **overview of information** per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13. **Analyse the data and develop a draft description** of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14. **Analyse the data and finalize the description** of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15. **Analyse the information** in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

## Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as "a complex system which produces an outcome by the interaction of a number of parts" (Glennan, 1996, p. 52). Process tracing involves "attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable" (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

- Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.
- Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.
- Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which 'theories' are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of 'explaining outcome process tracing', since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

**Selection of SPOs for 5C process tracing**

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on

17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

**ETHIOPIA**

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

*The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia*

| Capability to: | AMREF | CARE | ECFA | FSCE | HOA-REC | HUNDEE | NVEA | OSRA | TTCA |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 4 | 5 | 5 | 5 | 3 | 4 | 4 | 3 |
| Deliver on development objectives | 2 | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 4 | 2 | 3 | 4 | 2 | 5 | 3 | 3 | 3 |
| Relate | 3 | 1 | 2 | 2 | 3 | 2 | 1 | 3 | 1 |
| Achieve coherence | 2 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

*SPOs selected for process tracing – Ethiopia*

| Ethiopia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| AMREF | Dec 2015 | Yes | Yes | Yes | Yes | AMREF NL | Yes |
| CARE | Dec 31, 2015 | Partly | Yes | Yes | Yes – slightly | CARE Netherlands | No - not fully matching |
| ECFA | Jan 2015 | Yes | Yes | Yes | Yes | Child Helpline International | Yes |
| FSCE | Dec 2015 | Yes | Yes | Yes | Yes | Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands | Yes |
| HOA-REC | Sustainable Energy project (ICCO Alliance): 2014<br>Innovative WASH (WASH Alliance): Dec 2015 | Yes | Yes | Yes | Yes - slightly | ICCO | No - not fully matching |
| HUNDEE | Dec 2014 | Yes | Yes | Yes | Yes | ICCO & IICD | Yes |
| NVEA | Dec 2015 (both) | Yes | Yes | Yes | Yes | Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) | Suitable but SKN already involved for process tracing FSCE |
| OSRA | C4C Alliance project (farmers marketing): December 2014<br>ICCO Alliance project (zero grazing: 2014 (2nd phase) | Yes | Yes | Yes | Yes | ICCO & IICD | Suitable but ICCO & IICD already involved for process tracing - HUNDEE |
| TTCA | June 2015 | Partly | Yes | No | Yes | Edukans Foundation | No - not fully matching |

**INDIA**

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

*The extent to which the Dutch NGO explicitly targets the following capabilities – India*[15]

| Capability to: | BVHA | COUNT | DRISTI | FFID | Jana Vikas | Samarthak Samiti | SMILE | SDS | VTRC |
|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 5 |
| Deliver on development objectives | 1 | 5 | 1 | 1 | 1 | 1 | 1 | 2 | 1 |
| Adapt and self-renew | 2 | 2 | 1 | 3 | 1 | 1 | 4 | 1 | 4 |
| Relate | 3 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 2 |
| Achieve coherence | 1 | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 2 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

*SPOs selected for process tracing – India*

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BVHA | 2014 | Yes | Yes | Yes | Yes | Simavi | Yes; both capabilities |
| COUNT | 2015 | Yes | Yes | Yes | Yes | Woord en Daad | Yes; both capabilities |
| DRISTI | 31-03-2012 | Yes | Yes | No | no | Hivos | No - closed in 2012 |
| FFID | 30-09-2014 | Yes | Yes | Yes | Yes | ICCO | Yes |

15 RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

| India – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew –by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Jana Vikas | 2013 | Yes | Yes | Yes | No | Cordaid | No - contract is and the by now; not fully matching focus |
| NEDSF | | | | | | | No – delayed baseline |
| RGVN | | | | | | | No - delayed baseline |
| Samarthak Samiti (SDS) | 2013 possibly longer | Yes | Yes | Yes | No | Hivos | No - not certain of end date and not fully matching focus |
| Shivi Development Society (SDS) | Dec 2013 intention 2014 | Yes | Yes | Yes | No | Cordaid | No - not fully matching focus |
| Smile | 2015 | Yes | Yes | Yes | Yes | Wilde Ganzen | Yes; first capability only |
| VTRC | 2015 | Yes | Yes | Yes | Yes | Stichting Red een Kind | Yes; both capabilities |

**INDONESIA**

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

*The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia*

| Capability to: | ASB | Daya kologi | ECPAT | GSS | Lem baga Kita | PT. PPMA | Rifka Annisa | WIIP | Yad upa | Yayasan Kelola | YPI | YRBI |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Act and commit | 4 | 4 | 4 | 5 | 4 | 4 | 5 | 3 | 3 | 2 | 5 | 4 |
| Deliver on development objectives | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 3 | 1 | 2 | 4 | 2 | 3 | 4 | 4 | 1 | 1 | 4 | 3 |
| Relate | 1 | 1 | 2 | 3 | 3 | 2 | 1 | 2 | 2 | 2 | 3 | 2 |
| Achieve coherence | 1 | 1 | 1 | 2 | 1 | 1 | 2 | 2 | 1 | 1 | 2 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, PT.PPMA, YPI, YRBI.

Table 6

*SPOs selected for process tracing – Indonesia*

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| ASB | February 2012; extension Feb,1, 2013 – June,30, 2016 | Yes | Yes | Yes | Yes | Hivos | Yes |
| Dayakologi | 2013; no extension | Yes | Yes | Yes | No | Cordaid | No: contract ended early and not matching enough |
| ECPAT | August 2013; Extension Dec 2014 | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | Yes |
| GSS | 31 December 2012; no extension | Yes | Yes | Yes, a bit | Yes | Free Press Unlimited - Mensen met een Missie | No: contract ended early |
| Lembaga Kita | 31 December 2012; no extension | Yes | Yes | No | Yes | Free Press Unlimited - Mensen met een Missie | No - contract ended early |
| PT.PPMA | May 2015 | Yes | Yes | No | Yes | IUCN | Yes, capability to act and commit only |
| Rifka Annisa | Dec, 31 2015 | No | Yes | No | Yes | Rutgers WPF | No - no match between expectations CFA and SPO |
| WIIP | Dec 2015 | Yes | Not MFS II | Yes | Not MFS II | Red Cross | No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II |

| Indonesia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| Yayasan Kelola | Dec 30, 2013; extension of contract being processed for two years (2014-2015) | Yes | Not really | Yes | Not really | Hivos | No - no specific capacity development interventions planned by Hivos |
| YPI | Dec 31, 2015 | Yes | Yes | Yes | Yes | Rutgers WPF | Yes |
| YRBI | Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet. | Yes | Yes | Yes | Yes | ICCO | Yes |
| Yadupa | Under negotiation during baseline; new contract 2013 until now | Yes | Nothing committed | Yes | Nothing committed | IUCN | No, since nothing was committed by CFA |

**LIBERIA**

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

*The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia*

| Capability to: | BSC | DEN-L | NAWOCOL | REFOUND | RHRAP |
|---|---|---|---|---|---|
| Act and commit | 5 | 1 | 1 | 1 | 3 |
| Deliver on development objectives | 3 | 1 | 1 | 1 | 1 |
| Adapt and self-renew | 2 | 2 | 2 | 2 | 2 |
| Relate | 1 | 2 | 2 | 2 | 2 |
| Achieve coherence | 1 | 1 | 1 | 1 | 1 |

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

*Source*: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

*SPOs selected for process tracing – Liberia*

| Liberia – SPOs | End of contract | Focus on capability to act and commit– by SPO | Focus on capability to act and commit – by CFA | Focus on capability to adapt and self-renew – by SPO | Focus on capability to adapt and self-renew – by CFA | CFA | Selected for process tracing |
|---|---|---|---|---|---|---|---|
| BSC | Dec 31, 2015 | Yes | Yes | Yes | Yes | SPARK | Yes |
| DEN-L | 2014 | No | No | Unknown | A little | ICCO | No – not matching enough |
| NAWOCOL | 2014 | Yes | No | No | A little | ICCO | No – not matching enough |
| REFOUND | At least until 2013 (2015?) | Yes | No | Yes | A little | ICCO | No – not matching enough |
| RHRAP | At least until 2013 (2014?) | Yes | Yes | Yes | Yes | ICCO | Yes |

**Key steps in process tracing for the 5C study**

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

- A **detailed causal map** (or **model of change)** = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
- A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
- **Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
- **Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was be found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and

then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for **coding** documents received from SPO and CFA in NVivo on the following:

- **5C Indicators**: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the **capacity development interventions implemented by the CFA** (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
  - In the 2012 **theory of change** on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
  - During the baseline the CFA indicated a link between **the planned MFS II support** to organisational development and the expected short-term or long-term results in one of the selected capabilities;
  - During the endline the **CFA** indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
  - During the endline the **SPO** indicated a link between **the implemented MFS II capacity development interventions** and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on

climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same ime there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.
The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

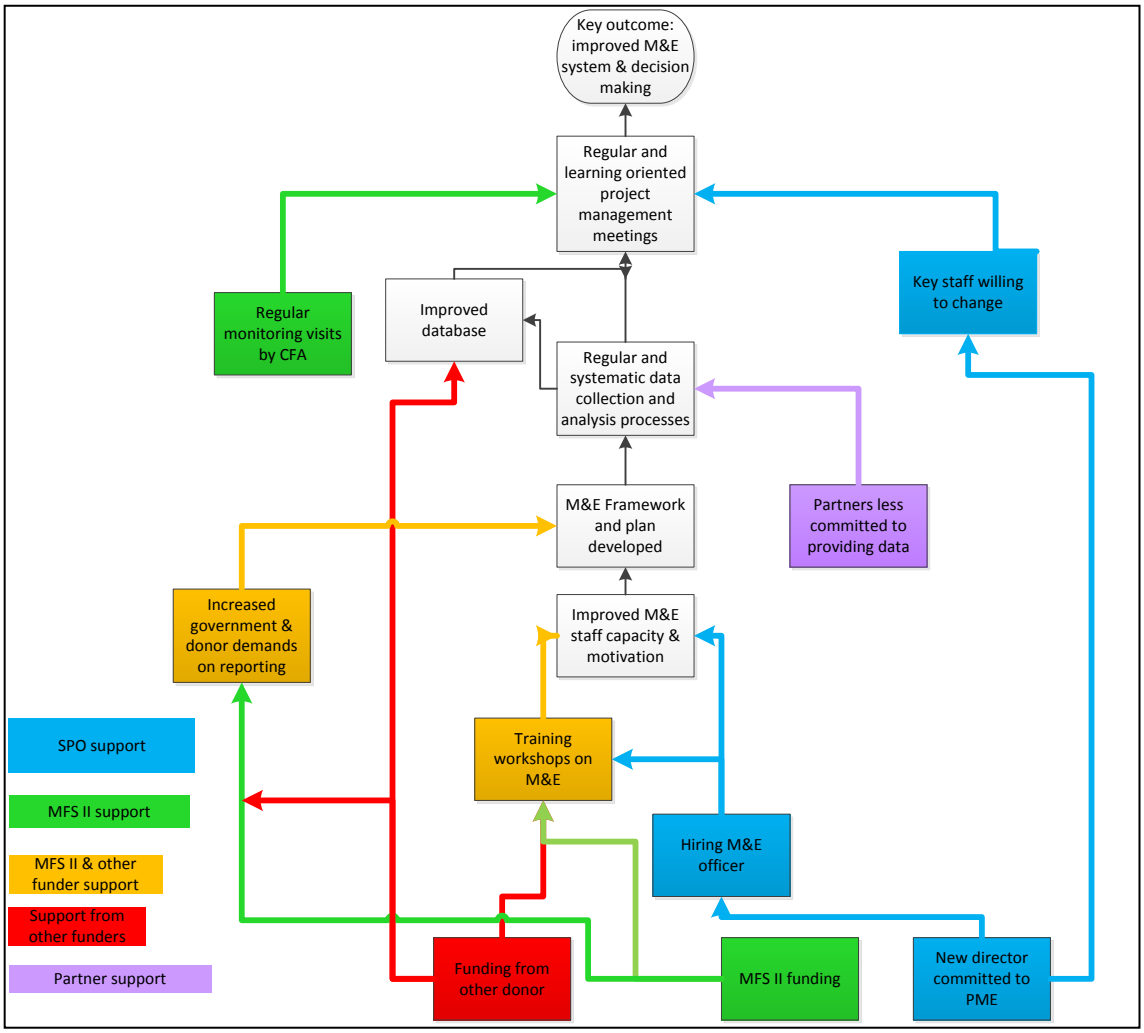

***Figure 1*** *An imaginary example of a model of change*

*Step 5. Identify* ***types of evidence*** *needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, *"What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?"*. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

- **Pattern evidence** relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.
- **Sequence evidence** deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).
- **Trace evidence** is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.
- **Account evidence** deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

*Source*: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

*Format for identifying types of evidence for different causal relationships in the model of change (example included)*

| Part of the model of change | Key questions | Type of evidence needed | Source of information |
|---|---|---|---|
| Describe relationship between the subcomponents of the model of change | Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related | Describe the information that we need in order to answer these questions.<br>Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y?<br>Can we find this information by means of :<br>Pattern evidence;<br>Sequence evidence;<br>Trace evidence;<br>Account evidence? | Describe where you can find this information |
| Example:<br>Training workshops on M&E provided by MFS II funding and other sources of funding | Example:<br>What type of training workshops on M&E took place?<br>Who was trained?<br>When did the training take place?<br>Who funded the training?<br>Was the funding of training provided before the training took place?<br>How much money was available for the training? | Example:<br>Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training<br><br>Sequence evidence on timing of funding and timing of training<br><br>Content evidence: what the training was about | Example:<br>Training report<br>SPO Progress reports<br>interviews with the CFA and SPO staff<br>Financial reports SPO and CFA |

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or

discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality** of data and **analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

| *Example format for the adapted evidence analysis database (example included)* **Description of causal relation** | **Confirming/ rejecting a causal relation (yes/no)** | **Type of information providing the background to the confirmation or rejection of the causal relation** | **Strength of evidence: strong/ rather strong/ rather weak/ weak** | **Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected** |
|---|---|---|---|---|
| e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice | e.g. Confirmed | e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training | | |

*Step 8.* ***Analyse and conclude*** *on findings– in-country team and CDI team*

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *"To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?"* and *"What factors explain the findings drawn from the questions above?"* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

## Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes

comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design** – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and

SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value'** and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

**Capacity** is referred to as the overall ability of an organisation or system to create value for others;

**Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

**Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities:**

- The capability to act and commit;
- The capability to deliver on development objectives;
- The capability to adapt and self-renew;
- The capability to relate (to external stakeholders);
- The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed. A detailed overview of capabilities with outcome domains and indicators is attached in Appendix 3.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

# Appendix 3 Changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

**Description of Endline Indicators ECPAT Indonesia**

**Capability to Act and to Commit**

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

*This is about leadership within the organization (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organization.*

Since the baseline ECPAT went through a series of changes in terms of leadership. After the program manager resigned, the responsibility was taken over by the director who then fulfilled a dual role as both director and program manager. The absence of a dedicated program manager influenced ECPAT's work both as an organization and as a coordinator of the coalition of organizations work on CSEC issues. Upon taking over the dual leadership role, a large gap of capacity existed between leaders and working staff. To address this, the new leader became more involved in day to day administrative and program activities. This hand on approach was paired with close coaching which enabled staff to develop their own responsibilities. Staff acknowledged that the overall leadership style within ECPAT has changed from a 'one man show' to a more accommodating and inspiring style. Particularly the supportive style, open communication, as well as the increased clarity in the descriptions of roles and responsibilities was much appreciated. Even though, some of the staff mentioned that there is a possibility that his leadership style will lead to a 'single fighter image' of the organization, the organization is stronger under his leadership. Staff has stressed that their involvement in decision making and planning has led to better decisions and stated further that they perceive his leadership as effective, inspiring and action-oriented.

The second role that ECPAT fulfills is that as the national secretariat of the coalition. Within this role, ECPAT's leadership was not considered very strong. Board members were unable to meet frequently due to a lack of financial support, which severely undermined the influence of ECPAT as a coalition leader. After the resignation of the former program manager and leadership change, ECPAT focused its' activities inwards in order to develop and strengthen their internal capacity. As the internal organization grew stronger, so did the capabilities of the coalition's secretariat. However, due to the minimal contact and interaction of the coalition, coalition members have grown uneasy and have started to question ECPAT's leadership and role as acting secretariat for the coalition.

Score: From 4 to 4.5 (slightly improvement)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

*This is about the extent to which the leader(s) provide strategic directions*

Since 2013, ECPAT leadership has been applying a new approach towards handling relationships to staff members with respect to strategic and operational aspects. A monthly meeting is now organized as to regularly meet staff, discuss issues and evaluate performance. On an annual basis a general meeting is organized in which future programming and general organizational development issues are discussed openly. Staff experienced many benefits in relation to this strategy of constructive guidance. For example, all staff members are involved in the new proposal development process.

Staff considers this as personal development on how to develop proposals, but also appreciate the opportunity to give input and offer their own ideas. Both program staff and non-program staff are included on these meetings, to also offer those staff members not directly involved in field work the opportunity to develop program related skills. On the other hand, the board members have reduced their involvement in these operational meetings as a result of their increased confidence in the capacity of the organization's leadership and guidance.

Whereas internal strategic guidance improved, the guidance offered to the coalition and to coalition partners decreased in intensity. Members of the coalition indicated that they thought of ECPAT as having their own agenda instead of fulfilling their role and responsibilities as a national secretariat. Coordination between coalition members has proven weak, which is in sharp contrast to the way the coalition was managed under previous leadership. The former program manager actively built communication and coordination amongst other members of the coalition. But as the current leader holds two responsibilities at once (as both a director of national secretariat and coordinator of national network), he prioritizes the development and strengthening of the internal ECPAT organization.

Score: From 3.5 to 4 (slightly improvement)

1.3. Staff turnover: 'Staff turnover is relatively low'

*This is about staff turnover.*

ECPAT has increased the number of staff as a result of additional funding. The new funding sources included MM The Body Shop, which have been supporting the organization for the last two years. ECPAT has 10 (ten) staff members in total, with three of them as non-exempt (permanent) staff and the rest of them as contractual/project based staff. Only two staff members resigned in this period with as reason getting a better offer from another organization. Compared to 2012, ECPAT has increased the number of staff from 4 in 2012 to 10 in 2014. Some staff left in 2012 whilst 8 joined the organization in 2012 and 2013. The organogram in 2012 and in 2014 had showed clearly the different number of the staff due to addition of new programs.

Score: From 3.5 to 2.5 (deterioration)

1.4 Organisational structure: 'Existence of clear organisational structure reflecting the objectives of the organisation'

*Observable indicator: Staff have copy of org. structure and understand this*

The current organizational structure of ECPAT has accommodated the need of staff to carry out the program implementation. With a total of ten staff, clearly separated function and roles of finance and administration, and the new direct service program of Pelhuk (*Pelayanan Hukum*_Legal Service Unit), the organogram has reflected strongly the objectives of the organization to commit more in addressing the CSEC issues. In the baseline, ECPAT had 4 staff that focused more to work on advocating the CSEC issues with coalition members, whilst in the end line; ECPAT had opportunity to carry out direct service to CSEC victims

Score: From 3 to 4 : (considerable improvement)

1.5 Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E'

*Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.*

A strategic plan 2014-2016 has been developed which has attracted additional funding for research projects, internships and direct legal services. This success is also contributed by donor intervention to develop ECPAT institutional capacity in strategic planning. The current strategic planning was formulized based on the consultation with ECPAT's board members and aligned with ECPAT international's strategic directions for East Asia Region. The strategic directions were developed based

on the recommendation from the ECPAT's evaluation, the organization capacity assessment done by consultant, and consultation with ECPAT International.

Score: From 3.5 to4 (slightly improvement)

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'

*This is about the extent to which day-to-day operations are aligned with strategic plans.*

ECPAT has implemented its operations in according to the strategic plan. In addition to that, the strategic plan developed has proven attracted additional funding for research projects, internships and direct legal services. This success is also contributed by donor intervention to develop ECPAT institutional capacity in strategic planning. The development of the several SOPs which were the reflection of the strategic planning has played as important guidelines to ensure the day to day operations are in line with strategic plans. ECPAT's activities in conducting the program have reflected the strategic plans.

Score: From 4 to 4.5 (slightly improvement)

1.7. Staff skills: 'Staff have necessary skills to do their work'

*This is about whether staff have the skills necessary to do their work and what skills they might need.*

The budget allocation for personal development has helped to improve the technical capacity of ECPAT staff. Despite these efforts the need for further technical capacity development is apparent in the organization. Staff members are now actively involved in program implementation and generating lessons learned to boost their experience and skills. Management and staff are open to external capacity building opportunities whenever they arise. To implement direct legal service program funded by MM, ECPAT recruited experienced staff to ensure the implementation and reflection process of monitoring, investigation, and reporting CSEC cases. The staff has provided her skill to develop the steps by steps legal process (SOP) in documentation to the organization.

Score: From 3 to 3.5 (slightly improved)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

*is about whether staffs at the SPO are offered appropriate training opportunities*

Various training opportunities are available and encouraged for staff members. Most of them are offered through external channels through ECPAT's network and coalition. Due to limited budget allocation to training, ECPAT actively seeks out alternative training opportunities at lower cost. These include participation in seminars, talkshows, public discussions as well as invitation to act as presenters and moderators in related events. For the last two years ECPAT has internally trained their finance staff in support management. The objective to train all other staff in this field remains, but will not be able to be realized until after this MFS II evaluation has been completed. MM provided training opportunity to develop project proposal in May 2014, one staff joined the training, however, further follow up has not yet taken after the training. Other trainings funded by MM was for staff who have left the organisation in 2012 and 2013.

Score: From 2 to 2.5 (slightly improved)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

*This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.*

With respects to incentives, ECPAT's situation has remained stable since the baseline evaluation. At several times during the interviews, staff members indicated that their primary reasons for working with ECPAT are non-monetary, but instead driven by a passion for the work and beneficiaries. Their

achievements with the organization lead to respect from colleagues and partners in their network and coalition which in turn resulted in a lot of motivation to keep organizational performance high.

The acquisition of new funding sources allowed for management to raise staff benefits and remuneration.

Score: From 3 to 3.5 (slightly improved)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

*This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.*

Overall ECPAT was able to increase their funding sources since the baseline. Additional funding was secured for research projects from TDH and ChildFund. Direct support service and campaign funds were acquired from the Indonesian Ministry of Education and Culture (KEMENDIKBUD). Program support was received from ECPAT International, ECPAT Netherlands and MM-N.

Despite the acquisition of new sources, staff members indicated that funding competition on the issue of child protection is increasing. In future it may therefore become more difficult to secure steady funding growth.

Score: From 3.5 to 4 (slightly improved)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'

*This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.*

The existence of strategic planning for the years 2013 to 2016 has facilitated resource mobilization, particularly to regulate and identify funding opportunities. The involvement of all staff including their leader has strengthened the strategic plan and, as acknowledged by all staff, functions as the guideline to find more funding sources. The role of the board in fundraising has diminished however. The director of ECPAT acted as the only upper management person to deal with fundraising.

Score: From 3 to 3.5 (slightly improved)

**Summary Capability to Act and to Commit**

After the program manager resigned, the responsibility was taken over by the director who then fulfilled a dual role as both director and program manager, and leadership has been more active, hands-on, inspiring, and engaging since then. This has helped to bridge the large capacity gap between the director and staff, although a gap still remains. Staff has been involved in developing plans and strategic guidance by the director has improved which led to the board to reduce their strategic input. The strategic plan has been developed for the period of 2013-2016, and together with having standard operating procedures in place; this guided the day-to-day implementation of activities. Staff are motivated to work for ECPAT in relation to its work and is due to increased funding staff remuneration has improved which has also contributed to improved staff incentives. This improved funding situation is due to having a strategic plan which attracted more funders.

In terms of staff knowledge and skills, there have been some slight improvements in terms of capacity to implement the program due to the staff's professional skill on legal service, but much of the learning relates to internal sharing and learning on-the-job. In terms of the organizational structure, ECPAT has broadened the organization structure due to new program which obviously needs extra staff. ECPAT recruited some new staff to fill in the position to implement program, but overall there has been a high staff turnover with two people leaving the organisation since 2012 and 8 people joining the organisation and having an increase in staff members from 4 in 2012 to 10 in 2014.

Score: from 3.3 to 3.7 (slightly improved)

**Capability to Adapt and Self Renew**

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

*This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).*

At ECPAT M&E is perceived as a donor driven mechanism. Despite adequate M&E mechanisms being in place, and it function quite well at the strategic level. Donor interventions , such as MM through Direct Legal Service Unit funding  and the body shop have assisted ECPAT in strengthening overall M&E capacity. For example, strict funding requirements from The Body Shop have imposed the generation of monitoring and evaluation data for every meeting they have together. ECPAT now has a clear M&E protocol in place for 2014 and onward, although there is no dedicated person who handles the portfolio. The director takes up a role in monitoring and evaluation. For example, he has implemented web based monitoring to ensure the day to day operations are being implemented and to provide feedback on the assignment or work that has been in progress or completed.

For their latest direct service project, PELHUK- *Pelayanan Hukum,* direct legal unit service required an intensive case monitoring and documentation system of all the steps taken. The procedures to do so provide a clear guide for stakeholders and coalition members to carry out M&E and program activities on CSEC.

Score: From 3 to 4 (considerable improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

*This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.*

The current ECPAT leader has a strong capacity and experience in M&E. In order to assist staff members in developing these skills of their own four major developments took place. First, the director directly assisted staff members in the implementation of their activities and allowed them to practice M&E in the field. Secondly, simple monitoring tools such as child protection cases handling monitoring were put in place and applied. Thirdly, a yearly program review was conducted to evaluate overall program implementation with the whole organization. Finally, staff was trained in project cycle management for 5 days in May 2014 as supported by the MM.

Struggling to document CSEC case monitoring, ECPAT published a book on the compilation of all case management that took place between 2012 and 2014. Documenting over 10 CSES cases in the form of a book has greatly supported staff members in learning to apply M&E.

Score: From 3 to 4 (considerable improvement)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

*This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.*

ECAPT did not have specific person in ME; however the latest direct service project, PELHUK required an intensive cases monitoring and documented all the steps and experienced in conducting cases monitoring in a book. The documentation process has provided opportunity for the staff to assess the effect of the program delivery as it captured the details on the planning and outcome even impact of the program. The book provided a resources and a guide for the stakeholders and members of coalition specifically to carry out program on CSEC.

Struggling to document the CSEC cases monitoring; ECPAT developed a book on the compilation of all CSEC cases management within 2012-2014. The experience of documenting 10 CSEC cases monitoring in a book has already supported staff learning process in conducting ME.

Score: From 3 to 4 (considerable improvement)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

*This is about whether staffs talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staffs are comfortable raising issues that are problematic.*

The regular monthly meetings conducted for the last two years has facilitated discussion related to the program, achievements and problems amongst the staff. The leader role has stimulated the discussion in the meetings to be more open and comfortable whilst discussing implementation problems. The director implemented web based monitoring to ensure the day to day operations are being implemented and to provide feedback on the assignment or work that has been in progress or completed. Next to being a strong control mechanism of the work of staff members, the daily web based monitoring system encouraged staff members to be more critical about their own work, communication and scheduling.

Score: From 3.5 to 4 (slight improvement)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives

*This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.*

Staff indicated that ECPAT offers an open office environment where it is possible to freely discuss ideas and provide input. This is also possible during the internal meetings that occur on a monthly basis, which can be characterized as less formal. The current leader plays an important role in managing the meetings to be a safe environment to share knowledge, discuss ideas and receive constructive feedback.

Score: From 4 to 4.5 (slight improvement)

2.6. System for tracking environment: 'The organisation has a system for being in touch with general trends and developments in its operating environment'

*This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.*

ECPAT benefits from the skills of one particular staff member-, the director, who has a strong research background. He performs situational analysis and collects details on issues related to the organization and its' activities. He also seeks information through coalition members and from the media. Apart from this individual's efforts, ECPAT has made it a habit to use their networks to gather information about their surroundings.

Score: From 3 to 4 (improvement)

2.7. Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and general public'

*This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.*

The most noticeable response that ECPAT has received from its stakeholders and the general public has come about from its formal acknowledgement as ECPAT Indonesia. The change in status has become an important factor for ECPAT to expand its networking activities. ECPAT is now involved in several projects with government authorities, law enforcers and other organizations. Furthermore a new division was established whose responsibility has become to provide direct service to beneficiaries.

Score: From 3 to 4 (improvement)

**Summary Capability to Adapt and to Self Renew**

M&E in ECPAT has improved mainly in relation to donor requirements and donor support for strengthening M&E capacity. An overall monitoring and evaluation system is lacking in the organisation, although on the whole, monitoring and evaluation has become more systematic. The monitoring and evaluation refers to ME in Pelhuk implementation; the monitoring, investigating, and reporting of CSEC Cases. However, the director also applied day to day web based monitoring. He would provide feedback on the reports written by staff. Monitoring and evaluation is mainly focus on activities and outputs, but not outcomes and impact. Overall ECPAT currently has strong capacity in M&E in 'the form of its leader, but less so in it's' staff members. The skill gap is bridged through close assistance of the leader in day to day activities and hands-on training.

The staff has practiced monitoring in their regular visits or activities and the results are discussed at monthly meeting. They also have simple monitoring tools in place such as child protection cases handling monitoring. The director implemented web based monitoring to ensure the day to day operations and provided feedback on the assignment or work that has been in progress or completed. One of the staff members has good research skills and this assists in scanning the environment for relevant issues.

The organization's internal culture has been described as open and positive, allowing for feedback and input from all levels of staff. Although the role of ECPAT as coalition network manager has diminished, the external connections to stakeholders and beneficiaries has increased over the last two years in the form of the establishment of a new service division on the one hand, and stronger cooperation with government and public agencies as a result of their newly acquired status to function as the official ECPAT Indonesia organization.

Score: from 3.2 to 4.1 (improvement)

**Capability to Deliver Development Objectives**

3.1. Clear operational plans: 'Organisation has clear operational plans for carrying out projects which all staff fully understand'

*This is about whether each project has an operational work plan and budget, and whether staffs use it in their day-to-day operations.*

Guided by the strategic plan, ECPAT developed an implementation work plan and budget plan to control the execution of activities. In addition to that, ECPAT has hired a consultant to develop standard operating procedures (SOPs) to guide operational work to become better and more transparent. The activities and budget are always reviewed in monthly meetings to ensure their compliance and progress against the plan.

Score: From 4 to 5 (considerable improvement)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

*This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.*

ECPAT has external support in financial expertise to monitor the organization financially. They are continuously working within the network to support their activities and reduce cost. Additionally, more care is taken in who should travel in response to field activities in order to cut down on travelling expenses.

Score: From 3.5 to 4 (slight improvement)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

*This is about whether the SPO is able to carry out the operational plans.*

In the FGD it was mentioned that ECPAT research project was finished as expected. Staff reported that not all output in the *Pelhuk* program was delivered in a timely manner. ECPAT succeeded in handling 10 CSEC cases and sent to court, however, as some cases needed extra time to conclude, ECPAT need more time to finish developing a book about how to monitor, investigate, and report CSEC cases. In sum, the achievements made were (1) capacity and expertise of ECPAT Indonesia increased in investigating, monitoring and reporting of cases of CSEC, (2) ECPAT Indonesia and the Indonesian National Police (POLRI) have agreed to cooperate in the handling of cases of CSEC and (3) reporting mechanism for cases of CSEC is available nationally through database system.

The MOU with the police was still in the process of lobbying due to the rotation within police authorities. Most of the unfinished program was caused by external factors which were very difficult to handle by ECPAT. Some of the unfinished output was carried away to the next phase of funding.

However, staff indicated that ECPAT submitted activity report to ECPAT Netherland on time to fulfill the requirement of being a member of ECPAT International. The punctuality to submit report on time to ECPAT International was a strict requirement as in influenced the ECPAT Indonesia status as a member of ECPAT International. ECPAT Indonesia gained the first rank in the report submission punctuality from ECPAT Netherland.

Compared to the baseline, ECPAT gained slightly improvement on the output delivery due to the finishing some projects in a timely manner.

Score: From 3.5 to 4 (slight improvement)

3.4. Mechanisms for beneficiary needs: 'The organisation has mechanisms in place to verify that services meet beneficiary needs'

*This is about how the SPO knows that their services are meeting beneficiary needs*

The *Pelhuk* program has implemented direct observation to check whether ECPAT has met beneficiary needs. The regular monitoring, investigating, and reporting mechanism on the cases using monitoring form has enabled ECPAT to ensure that the program has met the needs of the beneficiaries (victim of CSEC). Some of the cases took longer time to conclude to meet the beneficiary's expectation. As the CSEC cases are individual cases, the solution of each cases was very contextual, based on the needs of the beneficiaries. The regular monitoring has assisted ECPAT to ensure the proper intervention needed by beneficiaries. Nonetheless this method proved quite intensive and challenging to apply in practice, leading to mixed results. The Apart from direct contact with beneficiaries, ECPAT worked closely together with other organizations to check on trending issues in the field of CSEC and how the organization could contribute to solving these.

From the perspective of the coalition members however, ECPAT was considered weak in meeting the needs of the coalition. In fact, a specific call for a mechanism to ensure meeting the needs of coalition beneficiaries was mentioned by some partner organizations The mechanism of close monitoring, investigating, and reporting CSEC cases was not yet applied in the baseline. Regardless the challenge in the implementation, the Pelhuk program implementation has made ECPAT possible to verify that service meet beneficiaries need.

Score: From 3 to 3.5 (slight improvement)

3.5. Monitoring efficiency: 'The organisation monitors its efficiency by linking outputs and related inputs (input-output ratio's)'

*This is about how the SPO knows they are efficient or not in their work.*

The mechanism of monitoring program efficiency in the end-line applied the same mechanism as in the baseline. Both staff accounts and documentation shows that linking outputs to inputs takes place. ECPAT has demonstrated that they efficiently use their budget by considering lower cost alternatives in the implementation of activities. The regular monitoring, investigating, and reporting of CSEC cases

has encouraged ECPAT to apply efficiency by linking output and input more often and reported in the staff monthly meeting.

Score: From 3 to 3 (no change)

3.6. Balancing quality-efficiency: 'The organisation aims at balancing efficiency requirements with the quality of its work'

*This is about how the SPO ensures quality work with the resources available*

ECPAT still ensures quality of their work by looking at the achievements of the project through monthly, quarterly, and annual meetings. They aim to find out the results of their work and look at the changes that occur in the target group., and the possibility to conduct the program more efficient and keep the quality of its work.Every activity in the program implementation applied budget wiseand pursue a quality of the work.

Score: From 3 to 3 (no change)

**Summary Capability to deliver on development objectives**
Based on the strategic plan and the new standard operating procedures, there are clear work plans and budgets in place. The organization aims to work as cost effectively as possible and efficiency is being measured by having an external finance expert help in the organization and by reviewing progress with plans and budgets regularly. However, there is no clear mechanism in place to balance efficiency with quality of the work. ECPAT verifies whether the organization meets the needs of the beneficiary by direct observation, as well as close collaboration with other organizations. From the coalition manager's point of view, ECPAT Indonesia failed to deliver the expected results, but this did not affect the program and development objectives of ECPAT themselves.

Score: From 3.3 to 3.7 (slight improvement)

**Capability to relate**

4.1. Stakeholder engagement in policies and strategies: 'The organisation maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organisation'

*This is about whether the SPO engages external groups in developing their policies and strategies, and how.*

ECPAT has actively involved stakeholders, particularly government, in annual evaluation or review. The government parties provide their input to program planning as well as feedback to government for their program improvement. The *Pelhuk* Program implementation has broadened ECPAT's networking, especially in building cooperation with other parties such as legal aid and NGOs in handling the cases of children and cooperation in handling of the special case with law enforcer, Police Headquarter , METRO JAYA Police, South Jakarta Police, East Jakarta Resort Police, Bogor Police, Tangerang Police, Singaraja Denpasar police, south Sumatra Police, Tegal Police, Bogor Attorney, south of Jakarta district Attorney, Attorney State of Singaraja, Palembang District Attorney , South Jakarta District Court , Singaraja District Court, Bogor District Court, and Palembang District Court.

Score: From 3 to 3.5 (slight improvement)

4.2. Engagement in networks: 'Extent to which the organisation has relationships with existing networks/alliances/partnerships'.

*This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.*

ECPAT is very strong in lobbying and has an extensive network with the government and other key players in policy making and implementation, especially after it' newly acquired formal recognition by ECPAT International Overall, ECPAT is a reliable, strong partner in the field of combating CSEC,

especially through advocacy, lobby and publishing. Current networking capability has increased when ECPAT played at international level. On the other hand, there are some concerned voices relating to the role of ECPAT as coalition manager. Some coalition members have indicated that they consider that there is no added value of ECPAT for the coalition.

Score: From 3.5 to 4 (slight improvement)

4.3. Engagement with target groups: 'The organisation performs frequent visits to their target groups/ beneficiaries in their living environment'

*This is about how and when the SPO meets with target groups.*

ECPAT provides direct service to beneficiaries, such as closely assisting and provide referral consultation service, advocating and lobbying to law enforcers, as well as government. ECPAT also worked directly in youth clubs and schools to raise awareness to prevent CSEC. In the baseline, the work of ECPAT was still limited to connect stakeholders and duty bearer in child protection issue as well as linking referral systems. However, in the last two years, the role as a hub was weaker than previous because no professional individual was available to maintain the networking.

Score: From 3 to 3.5 (slight improvement)

4.4. Relationships within organisation: 'Organisational structure and culture facilitates open internal contacts, communication, and decision-making'

*How does staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?*

ECPAT has not established a new internal mechanism since baseline. They intensified the use of current and available means of communication through monthly meetings. The significant change shows in informal relationships amongst the staff when the leadership changed. Informal communication within the staff is now stronger and it helps them to connect and discuss more programmatic issues with their leader and amongst themselves.

Score: From 3 to 3.5 (slight improvement)

**Summary Capability to relate**

ECPAT is very strong in lobbying and has an extensive network with the government and other key players in ECPAT's policy making, planning and implementation. Overall, ECPAT is a reliable, strong partner in the field of combating CSEC, especially through advocacy, lobby and publishing, and remains widely considered as the expert institute on CSEC issues. On the other hand the function of ECPAT Indonesia as CSEC coalition manager has deteriorated after the leadership change due to a shift in organizational priorities. Coalition members now publicly voice their concern and wonder what added value ECPAT still provides to the coalition as a whole. There was a change in terms of relating to the beneficiaries of ECPAT due to the implementation of *Pelhuk* program. The nature of direct service has made ECPAT possible to engage closely with the dynamic of the beneficiaries. Internally, relationships have improved due to improved leadership and more regular meetings.

Score: from 3.1 to 3.6 (slight improvement)

**Capability to Achieve Coherence**

5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organisation'

*This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.*

ECPAT Indonesia has revised its vision and mission in 2012, but no further revisions have taken place since. The revision affected the current policies in ECPAT. The Board members, the National

Coordinator and the Program Manager were involved in this process. The Board members of ECPAT are mostly the leaders of the coalition members. ECPAT discusses the vision, mission and strategies at least once per year with the coalition members. They consult the coalition members and based on this consultation a program strategy for the next three years is formulated. They subsequently convey the vision, mission and strategy to the staff, so that the staff can understand and implement them in their daily operations. This process has been continued up until now.

Score: From 4 to 4 (no change)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

*This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.*

In 2013, ECPAT hired a consultant to support them to improve the management system. The activity has resulted in the development of several standard operating procedures (SOPs), such as: financial SOP, HR SOP, and Program SOP. All the SOPs have been used as a guideline in conducting day to day operations and program implementation.

Score: From 2 to 4 (significant improvement)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organisation'

*This is about whether the operations and strategies are line with the vision/mission of the SPO.*

ECPAT has launched new strategic programs for 2014-2016. The strategic programs were formulized based on consultation with respective members and board and aligned with ECPAT International's strategic directions for East Asia Region. All programs are in line with the vision and mission of ECPAT. They have been working on children's issues consistently. ECPAT is coherent in their vision and mission and their goals and activities. Their work on policy influencing, trainings and protocols is all connected to their primary mission. This alignment is done with relative ease due to their specific focus. Last year a new program paired with a new legal unit service was launched to address youth projects for CSEC, which again aligns clearly with the organizations overall vision and mission.

Score: From 4 to 4 (no change)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

*This is about whether the efforts in one project complement/support efforts in other projects.*

ECPAT's work has supported the youth roles in advocacy and legal aid which provides several opportunities for mutually supportive efforts. Nonetheless the degree to which mutually supportive efforts take place remains the same to those two years ago. The close relations of programs and divisions have made it very easy for staff members from different programs to cooperate and support each other mutually. For instance, the newly establish legal services unit not only supports CSEC case handling of youths, but also provides opportunities for other stakeholders such as law enforcement agencies and government to strengthen, learn and cooperate on case work. A second example is the advocacy program, a citizen advocacy project of a group of young social advocates supported by the European Union to strengthen youth participation in the elimination of trafficking.

Score: From 4 to 4 (no change)

**Summary Capability to Achieve Coherence**

ECPAT has consistently adjusted strategic plan and program area with its vision and mission. It was stated clearly in the new strategic program 2014-12016. The new strategic program area has been discussed with the boards member and reflected ECPAT International strategic directions.

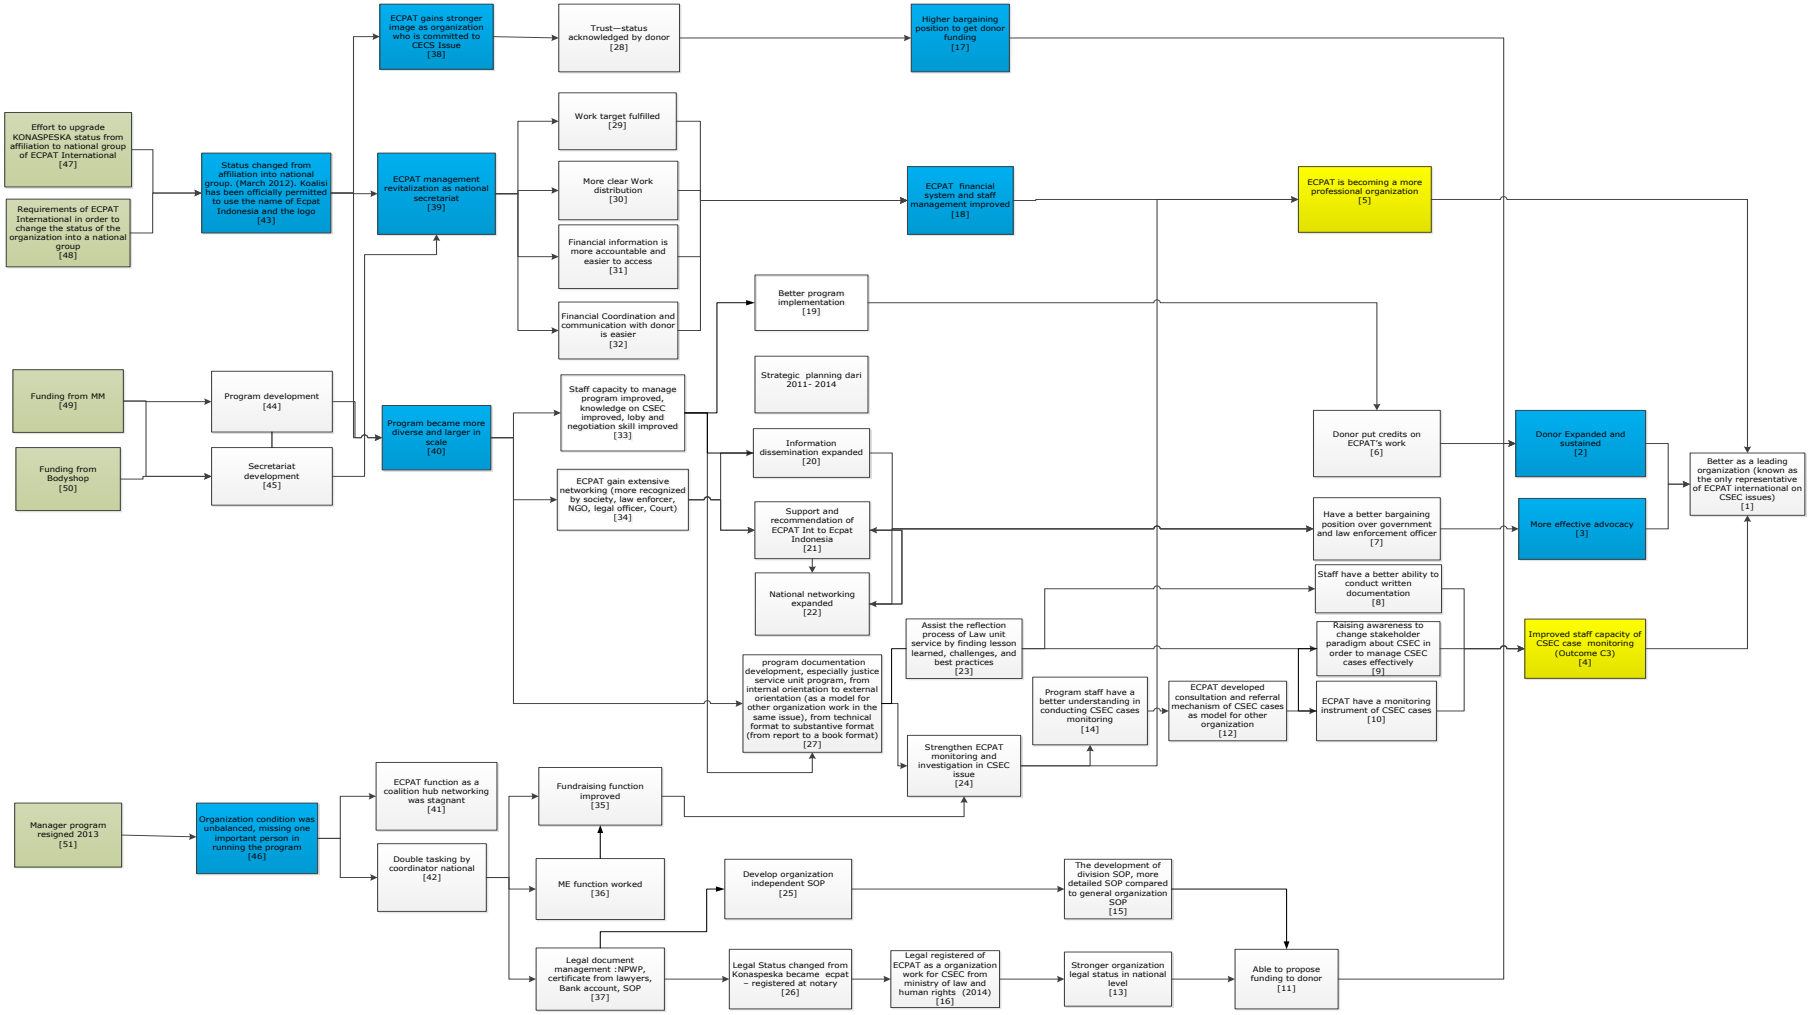
The vision, mission and strategies are still yearly review with the support from other stakeholders, especially coalition members. And they program activities are line with the vision and mission of ECPAT, and also mutually supportive.  Since the baseline in 2012, several new standard operating procedures have been put in place with the help of an external consultant. This has supported programme implementation.

Score: from 3.5 to 4 (slightly improvement)

# Appendix 4 Results - key changes in organisational capacity - general causal map

**Narrative of ECPAT Indonesia General Causal Map**

The evaluation team carried out an end line assessment at ECPAT from 23th to 25th June 2014. During the end line workshop, the team made a recap of key features of the organisation in the baseline in 2012 (such as vision, mission, strategies, clients, partnerships). This was the basis for discussing changes that had happened to the organisation since the baseline.



According to ECPAT staff present at the end line workshop, the key change in ECPAT since the baseline in 2012 was the development of ECPAT into a leading organization on CSEC issues with good management, independent, transparent, accountable, and supportive to its member.

There are four developments that have led to this change:

1. Professionalization of the organization [5]
2. Expansion and sustaining of donors [2]
3. More effective advocacy [3]
4. Improved staff capacity for CSEC case monitoring [4]

Each of these factors will be explained below. The numbers in the narrative correspond to the numbers in the visual.

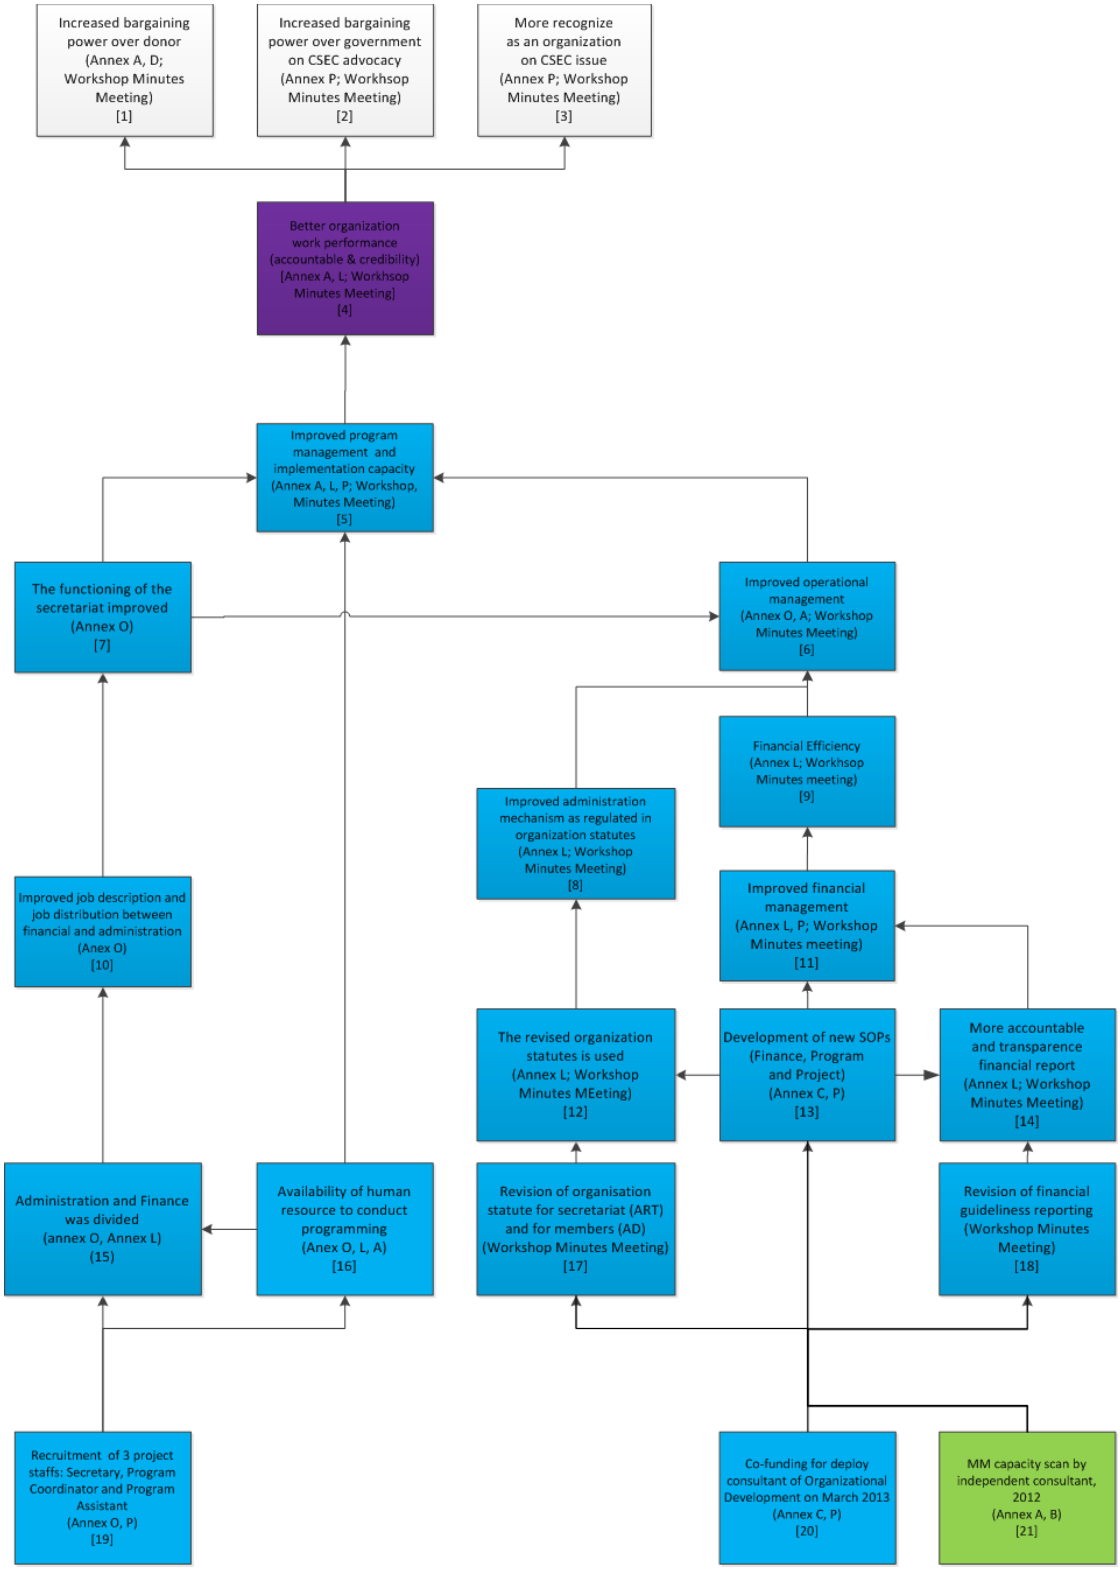
# *ECPAT Indonesia General Causal Map*

**Professionalization of the organization [5]**
According to ECPAT staff present at the end line workshop, the organization of ECPAT professionalized over the last two years. Two factors contributed to this.

First, ECPAT's financial system and staff management improved [18]. This occurred due to the successful accomplishing of work targets [29], a better distribution of work activities [30], financial information being more accountable and easier to access [31] and financial coordination and communication with the donor being easier [32]. Each of these developments resulted from the overall revitalization of the ECPAT as the national secretariat [39], through the addition of new personnel, an independent financial mechanism (without ties to the previous PKPA arrangement), and moving in to a new office space. This spurt in development was enabled on the one hand by now being able to handle the name and logo of ECPAT Indonesia [43] by adhering to the strict requirements of ECPAT International and efforts to upgrade the status of Konaspeska-Koalisi Nasional Penghapusan Eksploitasi Seksual Komersial Anak/National Coalition on the Elimination of Child Sexual Commercial Exploitation-embrio of ECPAT from affiliate to National group of ECPAT International [48]. On the other hand through the development of the secretariat [45] through funding from two separate sources (The Body Shop [49] and Mensen met eenMissie [50]).

Secondly, fundraising efforts finally got rewarded as the system in place started to perform [35] after significant efforts by the national coordinator in a double role, as a director of ECPAT and took over the role of the resigned project manager [42]. The drive for the national coordinator to take on the double role came about from the organization's need for additional key personnel [46] as the program manager resigned in 2013 [51].

**Expansion and sustaining of donors [2]**
The acquisition of new donors and sustaining current donors was greatly supported by the fact that donors started affiliating themselves more with ECPAT's work [6]. They explicitly gave their credits on activities carried out by ECPAT Indonesia, which significantly raised their profile amongst other potential donors in the network. The willingness of donors to do so resulted from the overall higher quality of program implementation [19] that has occurred over the last two years as set out in the strategic planning 2011-2014 [52]. Overall, this quality improvement can be attributed to the improved staff's capacity to manage their programs and their increased CSEC related knowledge as well as lobbying and negotiation skills [33]. The latter was largely a learning effect resulting from a more diverse and larger program and related work activities [40]. Examples of the diversification and expansion of activities include the Justice support service, direct CSEC services in terms of rehabilitation, reintegration and consultation, monitoring and investigating of CSEC cases and the engagement in international activities for instance through the youth partnership project. The expansion in terms of all these program activities was driven by systematic program development [44] enabled by funds from Mensen met een Missie (MM) [49] and The Body Shop [50].



The second factor which has led to expansion and sustaining of donors was the ability to (successfully) propose for funding [11]. In doing so, ECPAT expanded its funding sources to for example Child fund in 2013. This ability came about from two factors. First, the development of clear standard operating procedures (SOPs) for each division[15], based on SPO for the organization as a whole and independent from other organizations [25], allowed for clear guidelines on how to formulate proposals. Secondly, the organizations legal status at the national level became much stronger [13] which made ECPAT Indonesia a more attractive partner for funding. The improvement of legal status was initiated through registering ECPAT with the ministry of law and human rights in 2014 [16]. This was made possible after the official affiliation with ECPAT international was made official in Indonesian law through registration at a notary [26].Both the development of ECPATs own SOP and the registration as a formal and legally accepted institution were made possible by the creation and management of the right set of official documentation [37]. This included the organizations NPWP (tax registration number), a certificate from lawyers and a bank account. The preparation of all this legal work was done by the national coordinator in his double role [42], who next to this important role in fundraising [35], also oversaw the function of monitoring and evaluation [36].

**More effective advocacy [3]**
Advocacy efforts by ECPAT increased greatly over the last two years largely due to an improvement in the bargaining position of ECPAT over government and law enforcement authorities [7]. This bargaining position got strengthened for three particular reasons: (a) greater access and dissemination of information [20]; (b) The close involvement of ECPAT International with direct support and advice of ECPAT International [21] and; (c) the expansion of the national network [22]. Each of these factors in turn was developed through the higher quality of connections to key stakeholders in society, NGOs legal and law enforcement authorities as well as the local courts [34]. Access and contacts to these key stakeholders was once again possible through the larger and more diverse program activities that were now carried out [40].

**Improved staff capacity to of CSEC case monitoring [4]**
ECPAT's staff was able to increase its capacity regarding CSEC case monitoring through three specific factors: (a) an increased ability to write documentation on case work [8]; (b) ability to engage stakeholder in the reflection process in order to change stakeholders' paradigm about CSEC [9] and; (c) staff now being able to utilize the ECPAT monitoring instrument for CSEC cases [10]. The first two of these three factors were enabled by increased reflection on working processes within the law service unit by looking at lessons learned, challenges and best practices [23]. The last of the three factors, the utilization of the monitoring instrument, was enabled by the formulation of a clear referral mechanism for CSEC cases as a model for other organizations [12]. This model was developed as a result of the increased understanding of program staff on how to conduct CSEC case monitoring [14] which was enabled by strengthened ECPAT's monitoring and investigation in CSEC issues gained through the implementation of the program [24]. All these previous factors were enabled by a greater effort in program documentation and reporting [27]. ECPAT expanded its reporting from mere technical formats to more substantive forms such as reports or even books for publication. The greater effort required to write these documents formed a clear learning process for all staff involved. This effort once again sprung from the diversification and overall increase of program activities [40].

# Appendix 5 Results - attribution of changes in organisational capacity - detailed causal maps

**Narrative Key Outcome C.1.2.: Improved program management and implementation capacity**

Note: for each country about 50% of the SPOs has been chosen to be involved in process tracing, which is the main approach chosen to address evaluation question 2. For more information please also see chapter 3 on methodological approach. For each of these SPOs the focus has been on the capability to act and commit and the capability to adapt and self-renew, since these were the most commonly addressed capabilities when planning MFS II supported capacity development interventions for the SPO.

For each of the MFS II supported capacity development interventions -under these two capabilities- an outcome area has been identified, describing a particular change in terms of organisational capacity of the SPO. Process tracing has been carried out for each outcome area.

In the capability to act and commit the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'improved program and implementation capacity'. However, this organisational change area was not limited to this capability but also covered other capabilities. This indicates the importance of the interconnectedness of the 5 core capabilities.

In the capability to adapt and self-renew the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'improved staff capacity to communicate results on diversity issues'

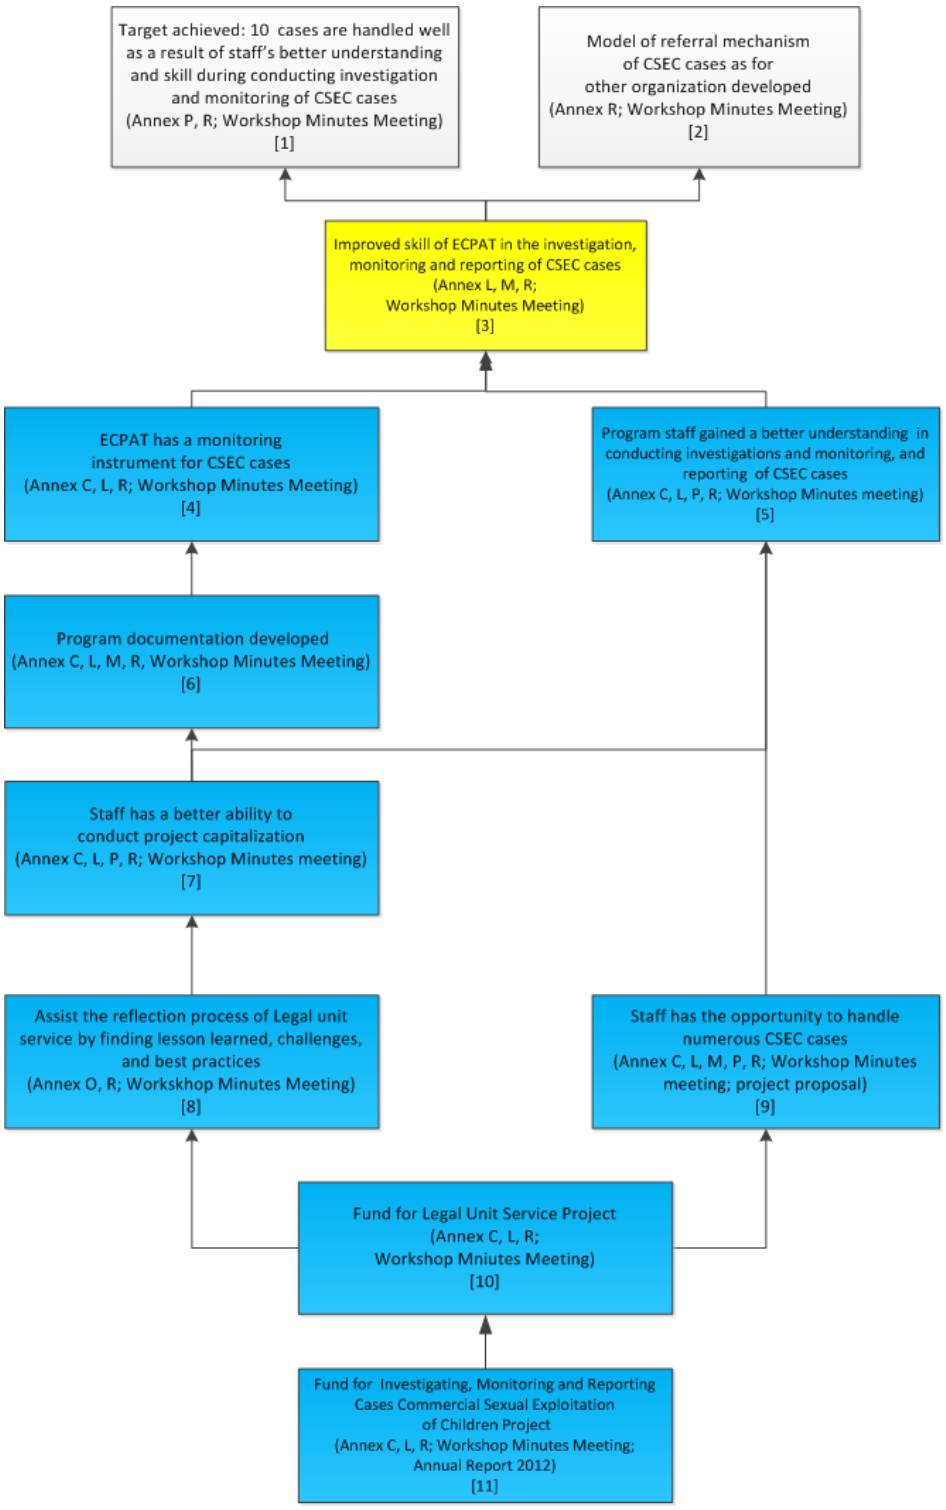
Below you will find a description of the 'improved program and implementation capacity and how this has come about.

ECPAT International has officially recognized ECPAT Indonesia as part of its organization and network. One of the requirements from ECPAT International was that ECPAT Indonesia carries out programs and activities independently. The organization was forced to take on more responsibilities and to formulate and carry out their own programs to maintain the new status and secure funding. For this purpose, there was a need to strengthen the program management of ECPAT. This is expected to improve program management and implementation capacity [5] (source: *(annex L, annex A, Process tracing minutes meeting)* and herewith overall work performance. This is expected to lead to increased bargaining power with donors *[1] (annex, A, annex D, process tracing minutes meeting)*; increased bargaining power with over government on CSEC advocacy [2] *(annex P, process tracing minutes meeting)*; and being more recognized as an organization on CSEC *issues [3] (annex P, process tracing minutes meeting).*

ECPAT achievement to be an organization with improved program management & implementation capacity was the result of *[6] (source: annex O, annex A, and process tracing minutes meeting)* Improved functioning of the secretariat [7]; more human resources for implementation [16]; and improved operational management [6]. Each of these areas is further discussed below.

**The functioning of the secretariat improved** due to having an improved job description and job distribution between administration and finance [10] *(source: annex o and process tracing minutes meeting).* This was the result of ECPAT starting to separate the financial function and administration function [15] *(source: annex O, annex L)*. There was a clear job distribution and description between finance and administration which has contributed to strengthen administration and made administration function well[15] *(annex O and annex L)* . The other reason for improved functioning of the secretariat is having more human resources available to conduct programming: a secretary, a programme coordinator and a programme assistant [19] (source: annex O, annex P).

The second reason for improved program management and implementation capacity was **the improved Operational management of the organization** [6] (source: annex O, A; workshop minutes meeting) which was the result of improved administration mechanisms [8] (source: annex L; process tracing meeting minutes) and improved financial efficiency [9] (source: annex L; process tracing meeting minutes). In relation to administrative mechanisms [8], all the organizational documents and organization used to follow PKPA mechanisms and management. But as a new organization, ECPAT needed to have their own organizational management mechanism [8]. According to some staff, the organizational development was not funded by MM, however. ECPAT also put some of the budget from MM on the process of organizational development.



The administrative mechanisms have improved due to using the revised organisation statues [12] (source: annex L; process tracing meeting minutes). This was the result of having a revised organization statute document (ART) for the secretariat and Anggaran Dasar (basic regulations of an

organization) for ECPAT members [17] *(source: process tracing minutes meeting) .* The Indonesian organisational development consultant [20] (source: annex C&P) assisted in this revision in March 2013. It is unclear who funded this consultant: MM or the Body Shop Indonesia. On the other hand, MM funded their own capacity scan in 2012 performed by another external consultant [21].

The other reason for improved operational management [6] (source: annex O&A; process tracing meeting minutes) was the improved financial efficiency [9] (source: annex L; process tracing meeting minutes) The Financial matters were efficiently applied because there was an improvement on the financial management (11) (source: annex L&P, process tracing meeting minutes). The improved Financial management existed as a result of the development of new SOPs for divisions, such as finance SOP, program SOP, and project SOP) [13] *(source: annex C, annex P)*, and the assistance of the organisational development consultant [20], as well as recommendations made by the MM funded external consultant who did the capacity scan in 2012 [21]. One of the staff said that finance SOP has made them easier to conduct procurement.

Furthermore, financial management improved due to having more accountable and transparent financial reports [14] (source: annex L; process tracing meeting minutes). These financial reports have improved due to the newly developed SOPs [13] (source: annex C&P) and through revised financial guidelines on reporting [18] (source*: process tracing minutes meeting)*. Again here the support of the Indonesian organisational development consultant has helped [20], as well as the MM capacity scan performed in 2012 [21].

**Narrative of Causal Map C3 : Improved Skill on ECPAT in the investigation, monitoring and reporting of CSEC cases**

Note: for each country about 50% of the SPOs has been chosen to be involved in process tracing, which is the main approach chosen to address evaluation question 2. For more information please also see chapter 3 on methodological approach. For each of these SPOs the focus has been on the capability to act and commit and the capability to adapt and self-renew, since these were the most commonly addressed capabilities when planning MFS II supported capacity development interventions for the SPO.

For each of the MFS II supported capacity development interventions -under these two capabilities- an outcome area has been identified, describing a particular change in terms of organisational capacity of

the SPO. Process tracing has been carried out for each outcome area. In the capability to act and commit the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'recognised as a leading organisation on CSEC issues'.

In the capability to adapt and self-renew the following outcome area has been identified, based on document review and discussions with SPO and CFA: 'improved skill of ECPAT in the investigation, monitoring and reporting on CSEC cases'

Below you will find a description of the 'improved skill of ECPAT in the investigation, monitoring and reporting on CSEC cases' and how this has come about. The numbers in the visual correspond with the numbers in the narrative.

During 2012-2014, there was an improvement on the ECPAT staff's skill in the investigation, monitoring, and reporting of CSEC cases [3] (Annex L, M, R; Workshop Minutes Meeting). This improvement has helped ECPAT in achieving their target. They succeeded to handle 10 cases as a result of staffs' better understanding and skills during conducting investigation and monitoring of CSEC cases [1] (Annex P, R; Workshop Minutes Meeting). Besides that, it also encouraged ECPAT to generate a model of referral mechanism for CSEC cases for other organization [2] (Annex R; Workshop Minutes Meeting). The referral mechanism for CSEC cases model provided steps, guidance, also strategy to manage CSEC cases. It was expected that other organization can learn, adopt, and adjust the model of CSEC cases handling.

The improved skill of ECPAT staff in investigating, monitoring and reporting of CSEC cases [3], can be attributed on the one hand to the fact that ECPAT now has a monitoring instrument in place for CSEC cases [4] (Annex C, L, R; Workshop Minutes Meeting). The other reason is that program staff gained better understanding in how to, investigate, monitor, and report on CSEC cases [5] (Annex C, L, P, R; Workshop Minutes Meeting). Each of these two reasons is explained in more detail below.

**ECPAT as a monitoring system for CSEC cases [4]**

ECPAT now has a monitoring instrument for CSEC cases [4] (Annex C, L, R; Workshop Minutes Meeting). This is the result of the development of program documentation for the justice unit service [6] (Annex C, L, M, R; Workshop Minutes Meeting). This program was intended to build a model for other organizations to work on the same issues. The form of that documentation is a book containing the details of how ECPAT handled 10 CSEC cases. The book also became a reporting mechanism for cases of CSEC and is available nationally through a database system. This reporting mechanism has changed in terms of being more externally oriented than only internally oriented. This means that ECPAT shared the lesson learned of the CSEC cases handling and provided models for other organization working in CSEC issues Furthermore, the format has changed from being more administrative reporting to being described in the form of a book.

The development of the program documentation was enabled by the fact that ECPAT staff now has a better ability to develop program documentation as the staff were now better able to capitalise on their learning during the justice service project implementation [7] (Annex C, L, P, R; Workshop Minutes Meeting). This learning process occurred amongst staff following an increased focus on the process of reflection on work and challenges, developing lessons learned and best practices. [8] (Annex O, R; Workshop Minutes Meetings). This shift in critical reflection can be attributed to requirements established in the fund received for the development of the legal unit service project [10] (Annex C, L, R, Workshop Minutes).

**Increased staff skill in investigating, monitoring and reporting on CSEC cases [5]**
Program staff now has a better understanding of how to investigate, monitor and report on CSEC cases [5] (Annex C, L, P, R; Workshop Minutes Meeting). This was due to two reasons. Firstly,there was an increased ability of staff to capitalize on project learning [7] [6] (Annex C, L, P, R; Workshop Minutes Meeting), as already disclosed above. Secondly, staff have had the opportunity to handle a greater number of CSEC cases [9] (Annex C, L, M, P, R; Workshop Minutes Meeting; Project Proposal). This is demonstrated by the fact that the staff succeed to reach the target to handle at least 10 cases during the implementation of the project.

The foundation of the positive organizational developments with respect to this key outcome is a series of activities and processes of two projects. First, the fund for the Legal Service Unit Project – commenced in November 2012 [10] (Annex C, L, R; Workshop Minutes Meeting). The Legal Unit Service Project implementation was a new direct service for CSEC cases handling, and this is funded by MM. This project is actually a continuation of the Investigating, Monitoring, and Reporting CSEC Project [11] (Annex C, L, R; Workshop Minutes Meeting, Annual Report 2012), - which was concluded in September 2012. The initiative to develop a model of handling CSEC cases has started during the implementation of that project. So that it has resulted in the development of guideline of CSEC handling cases for the member of ECPAT [2].

Report CDI-15-041

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Report CDI-15-036

Kusters, C., Wieriks, M., Dwi Andari, B., Suprobo, N., Priyahita, W., Sihombing, R.R., Rokhmatulloh, S.W., Rosita, I., 2015. *Endline report – Indonesia, GSS. MFS II country evaluations; Capacity of Southern Partner Organisations (5C) component.* Centre for Development Innovation, Wageningen University & Research centre. Report CDI-15-036 Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Indonesia, GSS. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

# Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation GSS and the Co-Financing Agency Mensen met een Missie for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to GSS, Mensen met een Missie, the synthesis team, IOB and NWO/Wotro.

# 1 Introduction & summary

## 1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: ECPAT in Indonesia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1.Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps

describe the identified key organisational capacity changes that are possibly related to MFS II interventions in these two capabilities, and how these changes have come about. More detailed information can be found in appendix 5.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR: Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

## 1.2 Brief summary of analysis and findings

Since the baseline, two years ago, GSS has seen a slight improvement in the capability to act and commit. A greater number of training opportunities have increased staff skill and promoted the sharing of knowledge amongst sisters and volunteers. The capability to adapt and self-renew has slightly improved now that M&E application and understanding has improved. No changes occurred however in terms of the capability to deliver on development objectives. The capability to relate improved very slightly as GSS focussed its engagement on its biggest area of influence: the Catholic Church. Overall more engagement with target groups has taken place as well. No change has occurred in the capability to achieve coherence.

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team. During the endline workshop some key organisational capacity changes were brought up by GSS's staff: more effective work performance and improved case handling.

GSS has become more visible on the issues of single moms and trafficking largely due to the increased trust from stakeholders (donors, beneficiaries and partners). This can be attributed to more effective work performance, improved case handling and the fact that GSS has a better position in its network, which has allowed them to reach out to new partners, form new alliances and overall streamline operational processes.

More effective work performance resulted from better financial management, better job descriptions and better program directions. These last two developments can be attributed to improved organizational management skills, whilst better program directions resulted from the development of impact indicators as a result of better monitoring and evaluation. Mensen met een Missie supported GSS with a one week training on M&E in 2014, which contributed to this capacity improvement. The underlying improved organizational management skills came from improved staff capacity, which can be attributed to the sharing of knowledge from volunteers to the sisters. This in turn can be attributed to more volunteers being involved in GSS (supported by MFS II capacity training on anti-trafficking), as more RGS communities are collaborating with GSS, and the more active role that GSS plays in its network.

Improved case handling was enabled by improved advocacy skills and better technical support from GSS's network. Whilst the former results from the improved staff capacity, the latter is the result from a wider network, which enabled more support, as well as the direct support from three main dioceses.

In conclusion, according to the GSS staff present at the endline workshop, MFS II capacity development interventions can be tied to several of the organizational capacity changes as indicated by the SPO, although GSS did not specify exactly how. This was not the purpose of this particular exercise, since GSS was not selected for process tracing. It must be noted that the information

provided has not been validated through other sources of information, and therefore the conclusions must be understood in that respect.

# 2 General Information about the SPO – Good Shepherd Sisters

## 2.2 The socio-economic, cultural and political context in which the partner operates

**The socio-economic, cultural and political context in which the partner operates**
Indonesia is known for being a transition country where mostly women and children are the victims of human trafficking. It is estimated that, every year, around 100.000 Indonesian women and children fall into the hands of traffickers, about 30% is below 18 years old. [1] More specifically, is estimated that each week 300 migrants, who have been abused or held imprisoned by the government, return from Malaysia and other countries to the harbor in Jakarta.

Good Shepherd Sisters works on preventing human trafficking by providing information through community and religious networks and by building community involvement as a means to decrease the incidence of human trafficking in the long-run.

Through community and religious networks GSS wants to disseminate information about complexity of this issue so that this knowledge should be published and subsequently in long term GSS wants to decrease human trafficking through community involvement by building sustainable way to prevent human trafficking.[2]

Religious network has strengthened GSS in dedicating themselves for women and children, since trafficking and single mom become an issue to be taken seriously by policy makers in Diocese of Ruteng , Jakarta , and Semarang . Both issues have been included in Catholic church's policy in those three dioceses. [3]

[1] Press Freedom 2.0 (2011) Beoordelingsmemo incl. kenschets ECPAT Indonesia – Onderzoek, monitoren en rapporteren van cases mbt seksuele uitbuiting van kinderen
[2] Good Shepherd Sisters (2014). Final Report.
[3] Annex Q . Observation Sheet (2014).

There are some local issues that trigger GSSWC policy becomes part of the diocesan policy that

- The vision of GSS WC is in line with "Arah Dasar Keuskupan Agung Semarang, Jakarta, and Ruteng"
- Consistency of GSSWC program since 2008
- Issue of trafficking becomes urgent local agenda that urged the church that takes religiois part for social issue.
- Issue of trafficking becomes global agenda urged the religious women. Declaration of 2008 was attended by 49 congregations, and GSS is one of the most active .
- Issue a single mom began to be accepted as a reality that must be addressed by the people to the diocese as a policy maker for many cases of single mom and trafficking .
- The implications of the inclusion of both these issues into the structure of diocese are:
- Cooperation with the diocese make GSSWC more easily obtain resources
- Part of funding for single mom was obtained from diocese.
- Stakeholders has changed paradigm of single mom
- Cooperation with the diocese enabled GSSWC in expanding network.

The 4 things mentioned above enabled anti- trafficking services and single mom is growing and become sustainable.[4]

At the same time Good Shepherd Sisters offers support and protection to victims by their crisis centers. The main target groups of Good Shepherd Sisters are women and children from rural areas and the poorer suburbs of urban and industrial areas. [5]

The project that receives MFSII funding through Press Freedom 2.0 is part of "Good Shepherd Services for women & children is active in three regions that are most affected by human trafficking: a) Ruteng (Flores), a poor and remote area where labor migration is common, thereby making the region prone to being a sending and transit area for human trafficking[6]; b) Batam (Riau Islands), is situated close to Singapore and as a result a hotspot for (forced) prostitution[7]; c) Jakarta. Good Shepherd Sisters employs the following activities in the three regions supported by the MFSII Project[8] :

1. **Jakarta**: Good Shepherd Sisters mostly focuses on advocacy, providing services to victims of trafficking and human development programs for the poor and single mothers. The activities include:
   - Anti-trafficking center (outreaching, sheltering, data gathering, disseminating issue, networking).
   - Single Mother Services (advocacy through research, strengthening individual and community, parenting programs, scholarship for children, vocational training).
   - Women empowerment program (income generating, training on gender).
   - Family and Youth Program (family counseling).

   Reunification (They pursued reunification of their client with their family members by calling them and inviting them to their shelter to meet and to accept their clients in whatever condition is).[9]
2. **Ruteng (Flores)**: the center in Flores is involved in rural community development and advocacy. The focus is on providing economic support and education opportunities especially to the family of migrant workers. The activities include:
   - Women Empowerment Program (Micro credit, monthly meeting, training on gender)
   - Scholarship for rural children.
   - Anti-trafficking Center (outreaching, sheltering, data gathering, disseminating data, networking). It also includes raising awareness through socialization to schools and parochial. In Ruteng they also give assistance to victims by providing a safe house, repatriation and

[9] Good Shepherd Sisters (2014). Final Report.

reunification. Furthermore, there is health assistance for ex foreign workers who have returned home, and they work together with the government to provide HIV/AIDS tests.

3. **Batam**: main activities are around the crisis centre, it serves as a temporary shelter for women and girls in crisis situation. The activities include:
   - Community anti-trafficking program (teenage folk theatre, outreaching, data gathering, networking).
   - Crisis Center (sheltering).
   - Reunification

Capacity building for teachers of Good Shepherd Sister's teachers who taught in slum area. This activity is conducted to make teachers aware of trafficking and capable to facilitate discussion on human trafficking with parents of their students.

## 2.3 Contracting details

When did cooperation with this partner start: 1st July 2009.

What is the MFS II contracting period: 5-1-2013 to 4-1-2014

Did cooperation with this partner end: No

If yes, when did it finish: Not applicable

What is the reason for ending the cooperation with this partner: Not applicable

Is there expected cooperation with this partner after 31st of December 2015: Yes.

## 2.4 Background to the Southern Partner Organisation

**History**

The Good Shepherd Congregation was founded in 1835 in Angers (France) by Zr. Mary Euphrasia Pelletier. It is an international congregation with about 5,000 members and it operates in 73 countries on five continents. The Good Shepherd Sisters in Indonesia are founded in 1927 and are active in 8 different locations in Indonesia: Jakarta, Tangerang, Bogor, Bantul (near Yogyakarta) and Yogyakarta on Java, Marau (Kalimantan near Pontianak), Ruteng (Flores) and Batam (Riau Islands).[10]

For the detailed description of the history of the organization please see appendix A, where the historical time line of GSS is described as developed during the baseline workshop.

**Vision**

The vision of Good Shepherd Sisters is to"make visible the merciful God, the very best friend of each person who is wounded, marginalized, and morally fragile". [11]

**Mission**

Good Shepherd Sisters mission is: *"We are committed to reaching out each person with respect to living values and human dignity. We also bring the spirit of reconciliation be with our selves, other person, nature, and the almighty God."* Their goal is to bring: *"Services to those who are marginalized and broken, especially women and children."*[12]

[10] Oteman, M. (2012) External Evaluation of Good Shepherd Sisters
[11] Good Shepherd Sisters (2011) Project Proposal Anti-Trafficking Phase 2
[12] Good Shepherd Sisters (2011) Project Proposal Anti-Trafficking Phase 2

**Strategies**

For this project Good Shepherd Sisters formulated the following overall objective: *"Our purpose is to provide potential human trafficking victims information through various sources before they are trapped to migrate to other areas for anticipation of better future. Through community and religious networks we want to disseminate information about complexity of this issue so that this knowledge should be public and subsequently in long term we want to decrease human trafficking through community involvement by building sustainable way to prevent human trafficking."*[13]

The activities of Good Shepherd Sisters are dedicated to one of the following goals[14]:

To prevent people in sender area to be victim of trafficking
To provide direct services for victims of trafficking
To promote the importance of respecting human dignity that has been neglected by people in globalized world.

**Unit of analysis**

The unit of analysis is decided as GSS but the field work has been carried out at GSSWC, which is part of GSS Indonesia. GSS Indonesia is working in 9 Communities in 8 districts, while GSSWC is only working in 3 Communities in 3 districts. GSSWC received funds directly from MM not through GSS Indonesia, but is not a separate legal entity. The focus of this baseline has been on GSSWC.

[14] Good Shepherd Sisters (2011) Project Proposal Anti-Trafficking Phase 2

# 3 Methodological approach and reflection

## 3.1 Overall methodological approach and reflection

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), **'process tracing'** is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

## 3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012[15].

[15] The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

## 3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: **To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?** and the fourth evaluation question: **"What factors explain the findings drawn from the questions above?"**

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

### 3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

### 3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop

have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

### 3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

**Use of the 5 core capabilities framework and qualitative approach:** this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

**Using standard indicators and scores**: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

**General causal map:** whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

**Using process tracing for dealing with the attribution question:** this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified

organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
  - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs.In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
  - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

**Utilisation of the evaluation**

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

**Design:** mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

**Complexity and inadequate coordination and communication:** many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

**5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process:** The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

# 4 Results

## 4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of ECPAT that have taken place since 2011 are described. The information is based on the information provided by Mensen met een Missie.

Table 1
*Information about MFS II supported capacity development interventions since baseline*

| Title of the MFS II supported capacity development intervention | Objectives | Activities | Timing and duration | Budget |
|---|---|---|---|---|
| MM Capacity Scan by Independent consultant in 2012 | Evaluate the organization's capacity development needs and highlight opportunities for growth | Capacity scan, evaluation report and recommendations for follow-up. Basis for collective as well as individual capacity building trajectories. | July-August 2012 | 2000 Euro |
| Capacity building on Anti-trafficking | Highlight Anti-trafficking mission of GSS in light of the organization | Discussion and workshop | August 2012 | 700 Euro |
| Training on law enforcement | Increasing knowledge on the processes of law enforcement | 3 day training and exchanging knowledge | 5-8 Februari 2012 | 6320 Euro |
| Project Cycle Management training | Increase knowledge on project cycle management | One week training on PCM | Late 2014 | 18000 Euro (for all partners in MFSII program – not exclusively ECPAT) |

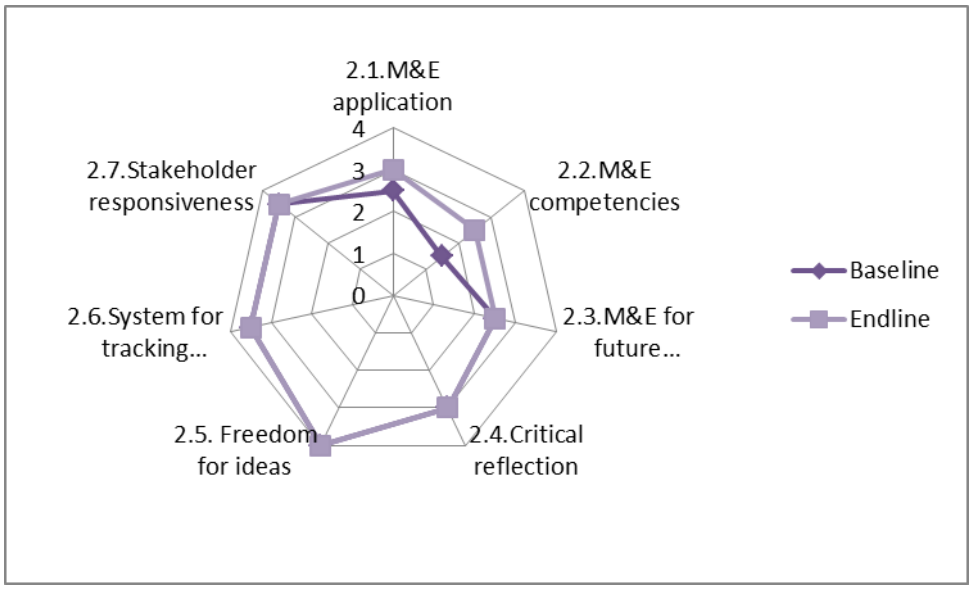
## 4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities. This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also annex 3.

### 4.2.1 Changes in the five core capabilities

**Capability to act and commit**

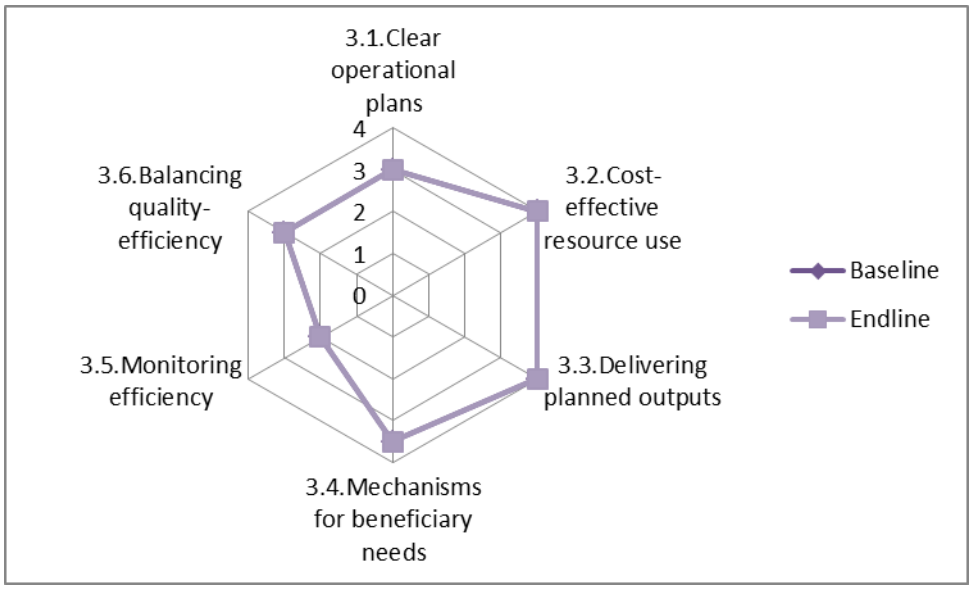


**Summary Capability to act and commit**

Mostly GSSWC is still in the same situation as it was during the baseline evaluation. The organization has a capable and dedicated team of staff and project leaders, although there is still a requirement to further enhance staff skills, particularly in the area of anti-trafficking. However, training has been provided in terms of community empowerment, working with victims of violence, networking, anti-trafficking training for religious leaders, finance management, and law in handling trafficking that funded mostly by MM, with a small number of training contributed independently by a consultant that came from the volunteer organisation. The staff is very motivated to do the work, mainly because of acting from their faith, even though financial benefits are minimal. However, they work under difficult conditions and a high workload. The leadership model in GSSWC is not hierarchical and there is no single person making the decisions, but decision-making can be inefficient and unclear. There have been no changes to the organizational structure of GSSWC and donors often don't understand the difference between GSS Indonesia Province and GSSWC as in the baseline. The GSS Indonesia Province has developed the strategic plan and this is adopted by the GSSWC. They discuss the vision, program, ideas, and strategies together with the project implementing persons, and day-to-day activities are based on the vision and mission of the organisation, but a strategic plan developed independently by GSSWC is lacking. It mostly refers to the GSS Indonesia Province strategic plan. However, the strategic plan for GSSWC is being developed for the period 2014-2020. GSS is still mainly depending on Mensen met een Missie (MM) for financial support, and generally they are lacking procedures to secure funding.

Score: From 2.8 to 2.9 (very slight improvement)

**Capability to adapt and self-renew**

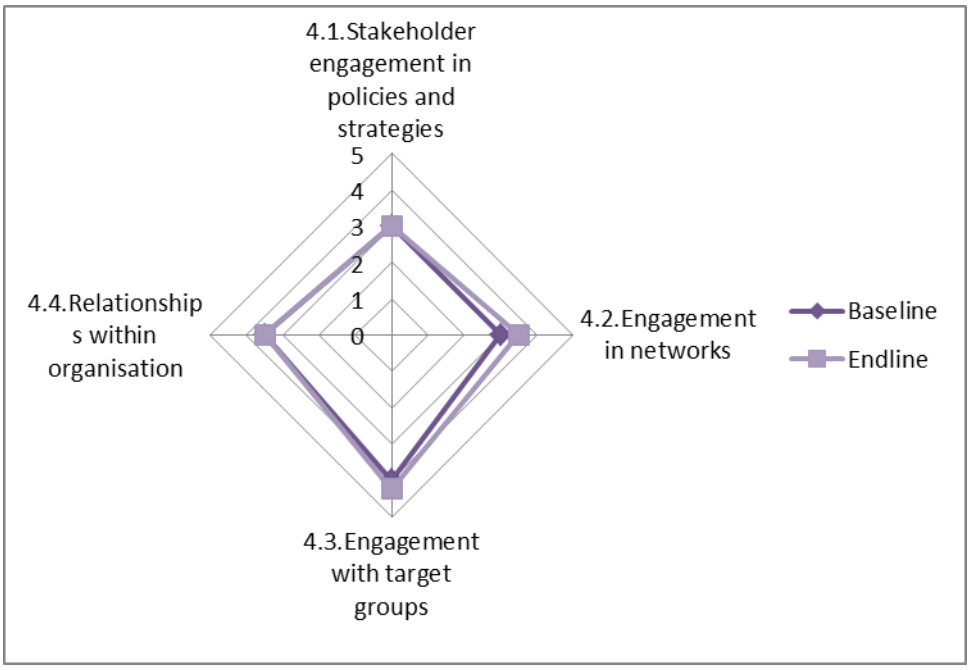


There is still no comprehensive monitoring and evaluation system in place and the monitoring and evaluation is mainly focused on activities and outputs and mostly at the project level. This is a small organization taking on a tremendous and controversial topic in a sometimes hostile atmosphere. The issue taken care by the organization (trafficking, unwanted pregnancy or single mother) are uncommon issues discussed inside the church and to some extent might not conform to the church values. Learning and adaptation about this process and what works best is a reflective and iterative process, which the organization is well aware of. This learning is not always evaluated and / or planned systematically but it is recognized and receives sufficient follow-up. The main improvement in regard to this capability is that there is now a person responsible for monitoring and evaluation, and the position is embedded to the roles of program manager. This person requests bimonthly reports from the different regions and there is a special monitoring and evaluation meeting once or twice a year. However, monitoring and evaluation mainly remains in the hands of this monitoring and evaluation officer and there is a need to enhance the capacity and responsibility of the regions in monitoring and evaluation. At GSS the different communities of sisters have a meeting every 2 weeks. For GSSWC the internal contacts are planned more informally. During these meetings work related issues are discussed. For now only one M&E person (the program manager) member tries to contact the project every month to follow the M&E developments.

In general, GSS is a very participative organization and all feedback from staff and others is welcome and is taken seriously. The leaders are very open to input, and let people know what they have done with it. The strength of the GSSWC is their network with all relevant local stakeholders, which includes beneficiaries but also locations and connections such as hospitals, law enforcement agencies, local government, airport customs, ports, and shelters. GSS works closely together with the diocese and this has resulted in a good work atmosphere and mutual strengthening, which also supports the organisation in tracking the environment. There is no systematic assessment of services in place for future strategies, since the organisation mainly focuses on monitoring of activities and outputs at the project level, not outcomes and impact. .

Score: from 2.9 to 3.1 (very slight improvement)

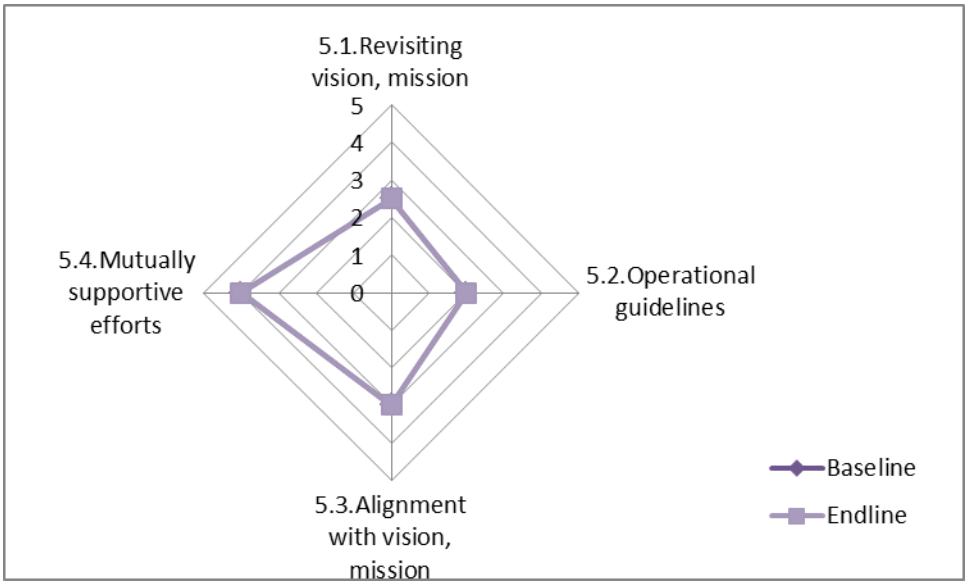
**Capability to deliver on development objectives**



The endline showed the same quality as the baseline. The GSSWC continues to work according to operational plans, but their activities cannot always be planned. For example when confronted with a victim of abuse, they have to adapt to the situation and environment at hand. The number of victims cannot be predicted beforehand. They have guidelines on how to work with vulnerable people. It may not have been formalized into protocols, but they all know what to do. Furthermore, each project has an operational work plan and budget that is used for day to day operations. Often however, there is not enough funding and they must choose which activities can be implemented or look for help from other people. Staff compensation in terms of salary remains low. Office facilities are limited which forces staff members to bring their own equipment, like computer or vehicles, but they can get reimbursement for transportation costs. In this way organizational costs are kept low and the staff therefore feels that they work cost-effectively. Moreover, the implementation of program activities are supported by many volunteers. GSS continuous to deliver outputs on time and presents the results in reports managed by the program managers. The organization makes a point of staying lean and adaptive, and may alter plans, outputs and activities if they feel that this is in the beneficiaries' best interest.

Close communication and involvement of the beneficiaries remains key to GSSWC's working approach that has remained unchanged over the last two years. Beneficiaries are included in the formulation and design of programs, but also in the assessment of their impact through active discussions. They also gather information on delivered services for beneficiaries need through surveys in which questionnaires are disseminated through the parish church. Similar to M&E there is no formal system that allows GSSWC to monitor its efficiency. GSSWC adopts a very flexible way of managing programs and can change directions during their implementation. This makes monitoring of efficiency difficult.

Score: From 3.2 to 3.2 (no change)



**Capability to relate**

The network of the GSSWC can be considered selective with a strong focus on Catholic partners like dioceses, parishioners, bishops, members of different church commissions and congregations, and local volunteers. However, they do not engage external groups in developing GSSWC policies and strategies however. GSS realizes that they need to invest more in external partners on the level of developing their own policies and strategies The GSSWC works together with institutions that are relevant to their beneficiaries. Their network is well established, extending all over Indonesia. The sisters make regular visits to their target groups. There is a monthly meeting of the single mother community in Jakarta, the sisters visit victims of trafficking in Bambu Apus every week, and they have daily interaction in their own shelters. There is an open atmosphere and everyone is free to speak their mind. This can be done informally and if necessary over the phone, but there are also more formal opportunities to do so in the form of regular meetings.

Score: From 3.4 to 3.6 (very slight improvement)

**Capability to achieve coherence**

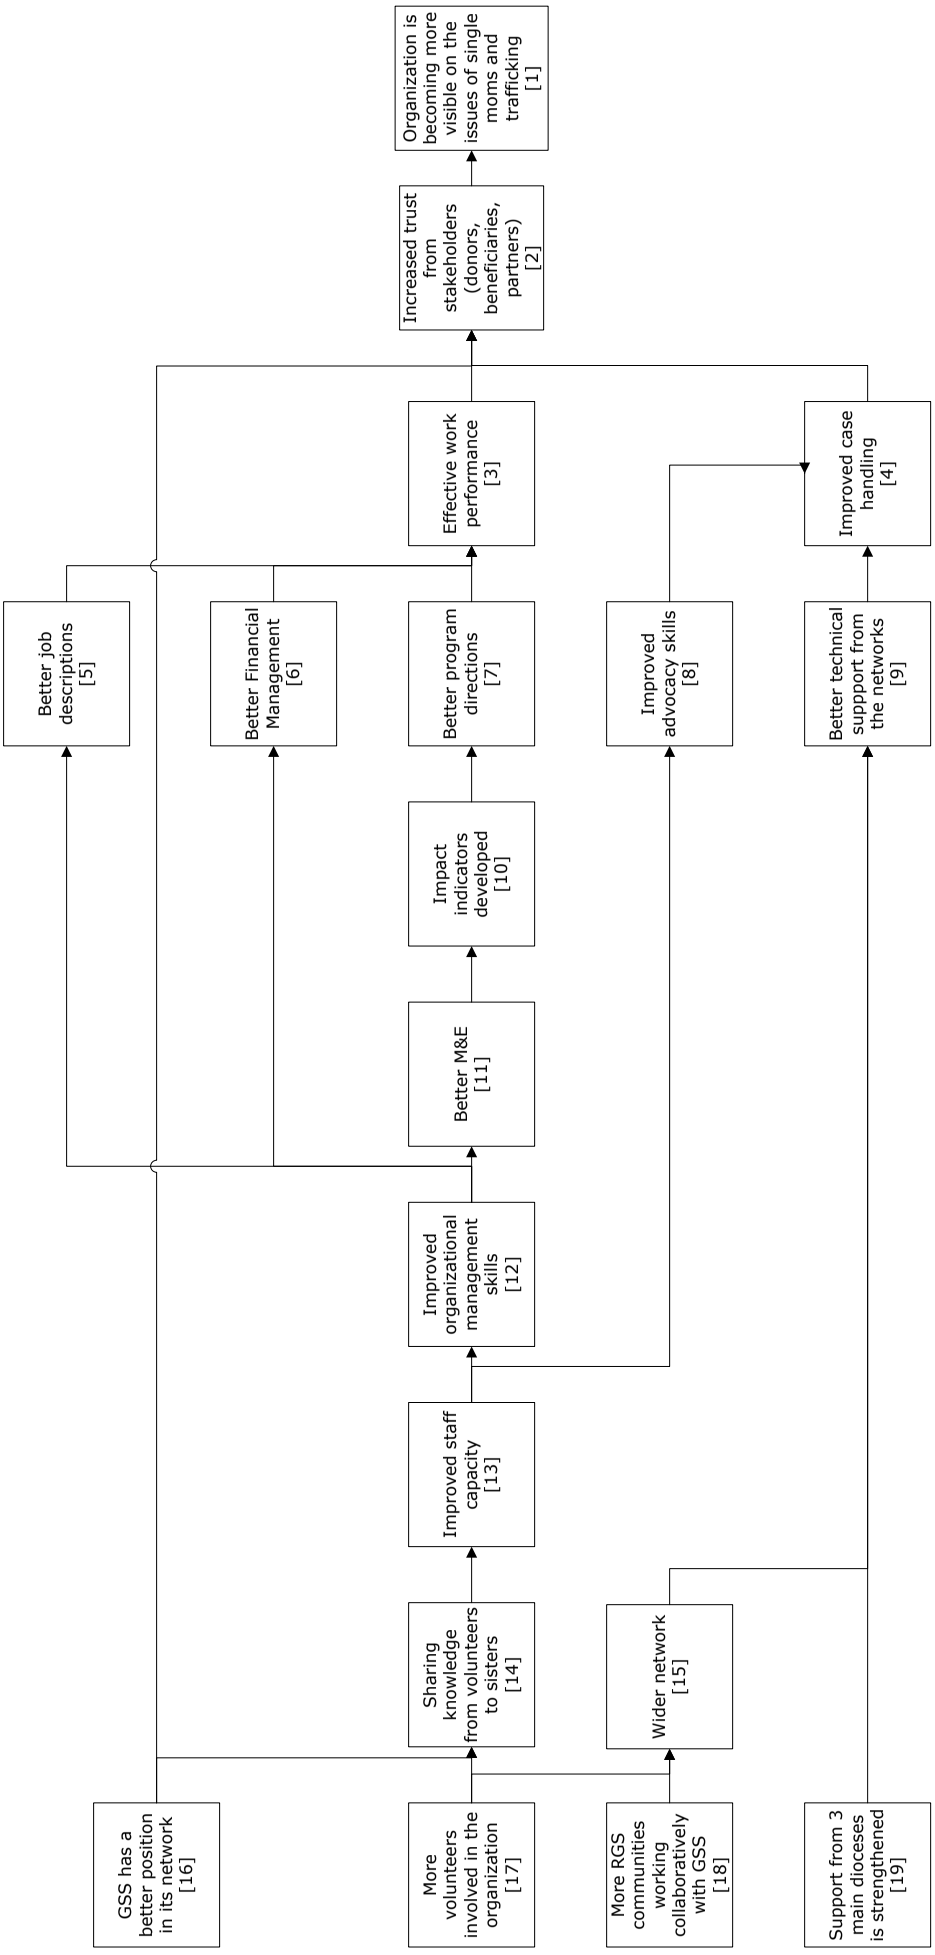
The end line showed the same quality as the baseline. GSSWC is part of an GSS Indonesia Province which falls under an international congegration. The vision and mission are decided at the international level, and are then specified according to the situation in Indonesia. The program manager and coordinator discuss the vision and mission every year before starting to plan for a new program, and the projects are in line with the vision and mission and also contextualized. In one place it is rescue, in another it is prevention. So the strategies depend on location, context and how the project coordinators form the link among them. Efforts in one project complement and support efforts in other projects  for example the program on economic empowerment supports the program aimed at single mothers, which in turn supports the anti-trafficking program. In terms of having operational guidelines, GSSWC as a number of guidelines in place, for example on how to work with vulnerable groups. However, guidelines will be different between the three regions because of their different situation, and they will not cover all activities.

Score: From 2.9 to 2.9 (no change)

### 4.2.2 General changes in the organisational capacity of the SPO

During the end line workshop at GSS, a discussion was held around what staff perceived as the key changes in in the organization since the baseline. This then led to a discussion on what were the key organizational capacity changes and why these changes have taken place according to staff present at the end line workshop. The discussion resulted in a 'general causal map' which is described below. The general causal map provides a comprehensive picture of organizational capacity changes that took place since the baseline, based on the perspective of GSS staff present at the end line workshop.

Since the baseline in 2012, several key organisational capacity changes have occurred within GSS. First of all, the organization shifted its' focus more towards the issues of single mothers and trafficking.Globally, there has been a movement within the churches to have emphasise these issues more. The movement is mostly driven by female religious leaders. GSS has also been known as the organisation that consistenly workson these issues.



With this new focusthe organization has become more visible in dealing with the issues of single moms and trafficking [1]. According to GSS staff present at the endline workshop, increased trust of stakeholders and beneficiaries in GSS to deal with these issues [2], has led to an increase in sponsored activities but also the spread of GSS's reputation in these issues.

The increase in stakeholder trust came about from three main developments:

1. First of all GSS's better positioning in the network [16] has allowed them to reach out to new partners, form new alliances and overall streamline operational processes.
2. Secondly, an increase in effective work performance [3].
3. Thirdly improved case handling and quality of work [4] played an important role in partners and beneficiaries development of faith in the organization.

The increase in effective work performance [3] can be related to a greater focus on specifying the work at hand. This was achieved by providing better job descriptions [5] on the one hand, and offer better overal program directions [7] on the other. The former was the direct result of a general improvement in organizational management skills and attitude [12], whilst the latter resulted from the development of clear indicators [10] which came about from improved monitoring and evaluation (M&E) practices [11]. These M&E practices were also part of overall improved organizational management skills.

These skills themselves were developed alongside a general improvement in staff capacity [13]. Staff and volunteers of GSS now have better advocacy, counseling and facilitation,and organisational management skills (financial, ME and human resources). Improved staff capacity [13] came about from an increasing degree of sharing knowledge between staff members, particularly from the field volunteers to the sisters responsible for running the programs. Narrowing the knowledge gap between field and program staff was a good starting point to specify and focus program activities to become more practice oriented.

Organization is becoming more visible on the issues of single moms and trafficking [1]
Increased trust from stakeholders (donors, beneficiaries, partners) [2]
Effective work performance [3]
Improved case handling [4]
Better job descriptions [5]
Better Financial Management [6]
Better program directions [7]
Improved advocacy skills [8]
Better technical suppport from the networks [9]
Impact indicators developed [10]
Better M&E [11]
Improved organizational management skills [12]
Improved staff capacity [13]
Sharing knowledge from volunteers to sisters [14]
Wider network [15]
GSS has a better position in its network [16]
More volunteers involved in the organization [17]
More RGS communities working collaboratively with GSS [18]
Support from 3 main dioceses is strengthened [19]

The need to share knowledgefrom volunteers to the sisters resulted from three developments. Firstly, GSS has a better position in its network. By involving Catholic Church especially diocese, enabled GSS has a better position in networking. The diocese has its power and it encouraged more Religious of Good Shepherd (RGS) communities to join and to involve GSS in serving people to decrease number of trafficking. RGS is one of congregation (Roman Catholic Religious Institute). It is abbreviated from Religious of Good Shepherd. When the human resource was proper in quality and quantity, it enabled knowledge sharing from volunteers to sisters. [14]. Secondly, an overal increase of volunteers in the organization and work activities occurred, which is made easier to share knowledge and information between volunteers and sisters. Thirdly, more RGS communities now work together with GSS, which calls for increased coordination and communication, and thus also sharing of information and knowledge.

The third and final big factor influencing the increased trust of shareholders in GSS came about from their ability to handle cases better [4]. For instance GSS has succesfully supported the establishment of Perdes (Village Regulation) in Ruteng to prevent traficking. This improvement resulted from an overall improvement in the organizations advocacy skills [8], which came along with the overall increase in staff capacity [13] and knowledge exchange with partner organizations and volunteers [14]. The second big reason why cases were handled better was that over the last two years the techical support from within GSS networks have greatly increased. This has enabled GSS to tap the expertise and in–depth knowledge of partners in the network if required.

The latter came about from more intensive networking which resulted in a wider overal network [15] on the one hand, but also the internal strengthening of GSS through the combination of efforts among three dioceses (church administrations) in Jakarta, Semarang and Ruteng [19].

On the whole, improved staff capacity as well as improved networking have been the main underlying reasons, leading to changes that led to improved trust from stakeholders, which has helped the organisation to become more visible the issues of single mothers and trafficking.

# 5 Discussion and conclusion

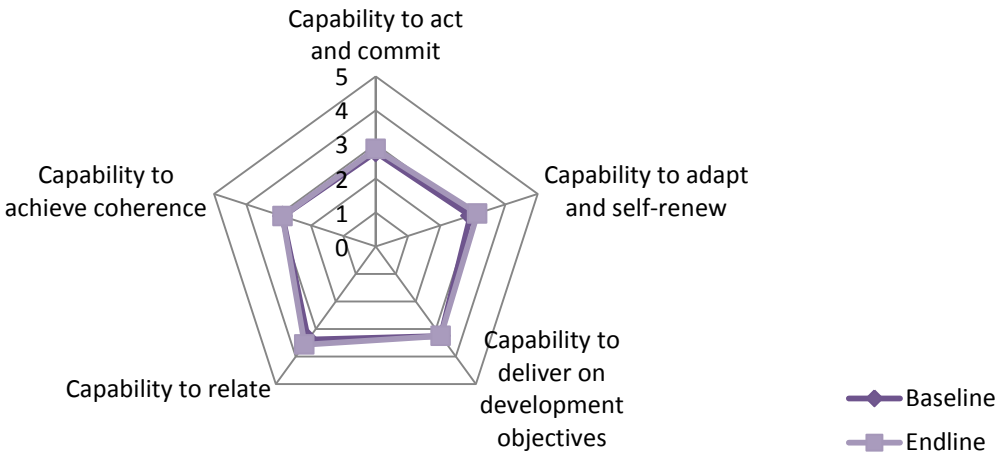
## 5.1 Methodological issues

**General: Applied to all or most SPOs**

With regard to the methodology, Indonesia has made some data collection adjustment based on the context. The first adjustment was related to the type of instrument used. To assess the organizational capacity, the study has provided self-assessment, observation and interview sheets. These all were used during the baseline with all SPOs. During the end line the team used self-assessment, interview and observation sheets. However the evaluator applied interview sheets as self-assessment—where participants were asked to fill these sheets by themselves. For the participants who did not attend the workshop, the interviews were done separately using the interview sheet and the results from the interview were included in the subgroup interview sheet that was already filled by the staff member. Were combined into the relevant sub categories in the interview sheet. Interview sheets were also applied for interviews with the CFAs, partners and consultants.

The baseline study showed that having two similar instruments (self assessments, and interview sheets) did not have any effect in relation to obtaining adequate and quality data.

To have some clarification post visit to all SPOs, the evaluator used email and phone interviews.



**Good Shepher's Sister (GSS)**

Only three people who have strong knowledge of GSS and its relation with MM funding attended the endline workshop, they are the Coordinator of GSSWC, Program Manager Tangerang District and Field Staff of Tangerang District. These three people are the only people at headquarters to organise all the activities. The interview with one partner, a leader of the Diocese in Ruteng District, was not conducted was difficult to contact. The other partner, a key person who was actively involved in the program in Tangerang District was contacted to attend the endline workshop but she cancelled the attendance due to her other commitments. She was interviewed by email and the evaluator got her response. An interview with the organizational development consultant of the organization (financial consultant) was also conducted. In the GSS, there is no particular staff assigned for monitoring and evaluation, therefore no interview for this position was conducted. However, the information related to M&E was obtained from the Program Manager who has basic research and monitoring experience. The evaluator sent out all the interview sheets to all three working areas and, two out of three self-assessment sheets that were sent to Tangerang District were returned back before the field visit, but no response was obtained for two others districts.

## 5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Overall the changes in relation to the five capabilities have remained small. Out of the five, the capability to adapt and self renew has shown the greatest change. Below the changes in each of the capabilities are further explained, by referring to the specific indicators that changed.
