

WAGENINGEN EVALUATING PROGRAMS FOR  
ANALYTICAL LABORATORIES

# International Manure and Refuse Sample Exchange Program

Quarterly Report 2009.1

January - March 2009

WAGENINGEN UNIVERSITY  
ENVIRONMENTAL SCIENCES

# INTRODUCTION

Dear WEPAL-participants,

In this report for the first ringtest in 2009 WEPAL introduces a new method of statistical evaluation. There was no problem with the old statistical method to calculate the consensus value. The calculated mean was (and still is) reliable. The removal of outliers however had too much influence on the calculation of the standard deviation. In a number of datasets the standard deviation is underestimated by the old method. We have tested several other statistical routines which should give a better estimate of the variation of the data. The aim of our study was to find a method which is not influenced by the presence or removal of outliers.

The new statistical model (Cofino NDA) that is chosen to calculate the mean and standard deviation uses probability functions. It calculates a best fit based on the observed values. The model is tested on simulated data sets and datasets of several interlaboratory studies. It is demonstrated that the model is robust and insensitive to outliers. It can cope with asymmetric, strongly tailing and multimodal distributions. A publication describing the procedure in more detail with the results of the tests is in preparation.

This year we will report both new and old statistics. So you can see what the differences are between the two methods. In general you will see that the new NDA mean and old median and mean are similar. The differences between the two methods can be observed in the standard deviation. In the NDA method they are not influenced by the presence or removal of outliers. Marking of outliers (\*\*) and stragglers (\*) is based on the old statistics. All results, including marked values, are used in the new NDA method.

The Z-scores are now calculated with the NDA standard deviation. Because in a number of cases the NDA standard deviation is higher than the 'old' standard deviation the Z-scores will be lower than in the past.

Early May we will move to our new building. Our telephone numbers, email and postal address will remain unchanged. Only our visiting address will change. Please note that if you send your mail by courier you must change the address.

WEPAL has a webpage where you can check if we have received and processed your data. We have also added the number of results. This way you can also see if all your results were processed correctly. Because you can see the status of the results that you sent us yourself it is no longer necessary to ask for a confirmation of receipt. You can also spare yourself and us the extra work for sending and processing extra copies. This information is published on "log received" page of the WEPAL website [www.wepal.nl](http://www.wepal.nl). Please note that we use your client number in this table, not your labnumber (or code number).

The WEPAL programs are organised to help you to improve the quality of your results. When you have ideas or remarks on the programs that can help us to improve them please feel free to contact us. We are always looking forward to hear from you,

Yours sincerely,

Bram Eijgenraam  
Manager WEPAL

Calculated 02-04-2009 (13:59)

## IMPORTANT INFORMATION

The results of the April - June 2009 period will be processed in the beginning of July 2009. Participants are kindly requested to take care that the results of this series are in Wageningen **before the first of July 2009**. All results, which are received later, will not be reported.

The 2009.3 samples will be mailed at the end of May 2009.

# GENERAL INFORMATION

## Accreditation

### Accreditation

The Wageningen Evaluating Programmes for Analytical Laboratories organisation is accredited for the organisation of Interlaboratory Studies by the Dutch Accreditation Council RvA since April 26, 2000. The accreditation is based on the ILAC-requirements (Guidelines for the requirements for the competence of providers of proficiency testing schemes, ILAC-G13: 2000). In the following table the scope is given for all WEPAL programs.

**Table 1** *Scope of the WEPAL programs.*  
**IPE, International Plant-analytical Exchange Program**  
 (Parameters in bold are in the scope of the accreditation)

| Group                               | Parameter  |
|-------------------------------------|--|
| Inorganic Chemical Composition      | Ag, <b>As, B, Ba, Be, Bi, Br, Ca, Cd, Cl, Co, Cr, Cs, Cu, F, Fe, Ga, Hg, I, K, Li, Mg, Mn, Mo, N - Kjeldahl, N - NH<sub>4</sub>, N - NO<sub>3</sub>, Na, Ni, P, Pb, Pd, Pt, Rb, Rh, S, Sb, Se, Sn, SO<sub>4</sub>, Sr, Ti, V, Zn</b> |
| Real totals                         | <b>Al, C - elementary, N - elementary</b> , Si   |
| Acid extractable (So-called totals) | <b>Al</b> , Si   |
| Other determinations                | 13C, 15N, delta 13C, delta 15N   |
| Nutritional values                  | ADF-ash-containing, ADF-ash-free, Crude fibre, NDF-ash-containing, NDF-ash-free, Polysaccharides (starch), TDF, TDF-non-soluble, TDF-soluble, <b>Total ash</b> , Total Disaccharides, Total fat, Total monosaccharides               |

**ISE, International Soil-analytical Exchange Program**  
 (Parameters in bold are in the scope of the accreditation)

| Group  | Parameter   |
|--|---|
| Real totals  | Ag, <b>Al, As, B, Ba, Be, Bi, Br, C - elementary, Ca, Cd, Ce, Co, Cr, Cs, Cu, F, Fe, Ga, Ge, Hg, I, K, La, Li, Mg, Mn, Mo, N - elementary, Na, Nb, Nd, Ni, P, Pb, Pd, Pt, Rb, Rh, S, Sb, Sc, Se, Si, Sn, Sr, Te, Th, Ti, Tl, U, V, W, Y, Zn, Zr</b>   |
| Acid extractable (So-called totals)  | Ag, <b>Al, As, B, Ba, Be, Bi, Br, Ca, Cd, Ce, Co, Cr, Cu, F, Fe, Ga, Hg, I, K, La, Li, Mg, Mn, Mo, N, Na, Nb, Nd, Ni, P, Pb, Pt, Rb, S, Sb, Sc, Se, Si, Sn, Sr, Te, Th, Ti, Tl, U, V, Y, Zn, Zr</b>   |
| Aqua Regia (ISO 11466)   | Ag, <b>Al, As, B, Ba, Be, Bi, Br, Ca, Cd, Ce, Co, Cr, Cu, F, Fe, Ga, Hg, I, K, La, Li, Mg, Mn, Mo, N, Na, Nb, Nd, Ni, P, Pb, Pt, Rb, S, Sb, Sc, Se, Si, Sn, Sr, Te, Th, Ti, Tl, U, V, Y, Zn, Zr</b>   |
| Extraction with boiling 2M HNO <sub>3</sub>                                | <b>Cd, Co, Cr, Cu, Hg, Mo, Ni, Pb, Tl, Zn</b>   |
| Extraction with 0.1M NaNO <sub>3</sub>                                     | <b>Cd, Cu, Ni, Pb, Zn</b>   |
| Extraction with 0.01M CaCl <sub>2</sub> 1:10                               | Al, B, Cd, CN, Co, Cr, Cu, Fe, <b>K, Mg</b> , Mn, <b>N - NH<sub>4</sub>, N - NO<sub>3</sub></b> , N total soluble, Na, Ni, P, Pb, SO <sub>4</sub> , Zn  |
| Extraction with 1M NH <sub>4</sub> NO <sub>3</sub> 1:2.5 (w/v) (DIN 19730) | As, Cd, Cr, Cu, Hg, Ni, Pb, Tl, Zn  |

### MARSEP, Manure and Refuse Sample Exchange Program

(Parameters in bold are in the scope of the accreditation)

| Group                               | Parameter  |
|-------------------------------------|--|
| Real totals                         | Ag, Al, As, B, Ba, Be, Bi, Br, C, Ca, Cd, Co, Cr, Cu, F, Fe, Ga, Hg, I, K, Li, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Se, Si, Sn, Sr, Ti, Tl, V, Zn   |
| Acid extractable (So-called totals) | Ag, <b>Al, As</b> , B, Ba, Be, Bi, Br, C, <b>Ca, Cd</b> , Cl, <b>Co, Cr, Cu</b> , F, <b>Fe</b> , Ga, <b>Hg</b> , I, <b>K</b> , Li, <b>Mg, Mn, Mo</b> , <b>N</b> , N - NH <sub>4</sub> , N - NO <sub>3</sub> , <b>Na, Ni, P, Pb</b> , S, SO <sub>4</sub> , Sb, Se, Si, Sn, Sr, Ti, Tl, V, <b>Zn</b> |
| Other determinations                | <b>AOX, loss-on-ignition</b>   |

The selection of parameters included in the scope of accreditation is based on the information that can be given about the homogeneity of the parameters in the samples. This information is based on the relation between the Coefficient of Variation as given in the Annual Reports and the concentration in the different samples used in the WEPAL-programs during the last years. Only in case of a clear and consistent pattern, conclusions can be drawn concerning homogeneity of the material. In the case of a large variation in CV values no distinction can be made between inhomogeneity of the material and the variation in the analytical performance caused by the participating laboratories. These parameters are not (yet) included in the scope of the accreditation.

Some aspects of the proficiency testing scheme may from time to time be subcontracted. When subcontracting occurs it is placed with a competent subcontractor. WEPAL is responsible to the scheme participants for the subcontractor's work.

## Homogeneity of the distributed samples

### Homogeneity tests

WEPAL has developed special equipment for the production of representative subsamples (Houba, 1993) from a bulk material. The proper functioning of this equipment is tested by a homogeneity test in the final subsamples. To perform this test, samples are collected at regular intervals during the preparation of the the samples. The collected samples, with a minimum of 10, are analysed in duplicate measurements under repeatability conditions. A selection of critical parameters is chosen for the tests. The results of the homogeneity tests are published in the annual reports.

### Check of results

Before distribution of the periodic reports to the participants, a final check is made based on the results found by the participants. This check is made for all reported parameters. The Coefficient of Variances and concentrations found in the periodic reports are compared with the patterns as found in the latest Annual Report (part B). The expected pattern is a high CV at a low concentration and a gradually decreasing CV at higher concentrations till a more or less constant level of CV-values is reached (Houba et al., 1986). Deviations from this expected pattern are mentioned in the periodic reports. This might be an indication of inhomogeneity of the material for the certain parameter.

*All data of this period are compared with the general patterns as published in the latest year report. No deviating values were found.*

## ***The quarterly report***

In order to evaluate the accuracy and precision of the analytical procedures used, four proficiency testing programs have been established. At this moment the WEPAL Exchange Programs comprises approximately 600 laboratories in many countries. The participating laboratories receive four air-dried samples every three months and analyse the samples according to their own procedures. The results of the determinations are collected and processed at Wageningen University and published every three months. The participating laboratories are informed of the results in the third week of the next three-month period. Each participant can compare his results with those of all the other members of the exchange program. WEPAL will not comment on results unless asked to do so.

## **Reporting of data**

The analysed components must be reported in oven-dry (105 °C) material. For this purpose the moisture content has to be determined separately and the analytical results have to be recalculated (see the form to report the results). To get reproducible results of these moisture contents we recommend you to dry the material during at least 3 hours at 105 °C and let cool down in a desiccator before weighing.

## **New statistics: normal distribution approximation (NDA)**

Interlaboratory studies like the WEPAL proficiency testing ringtests frequently give rise to datasets that have complex distributions including excessive tailing and multiple modes. Consequently, sophisticated statistical methods are required to obtain meaningful assessments. The strategy that was used until now makes use of an outlier test followed by straightforward statistics. Problem with this strategy is that removal of outliers causes an underestimation of variance of the dataset. Therefore a methodology is needed that does not rely on arbitrary outlier removal or subjective manual interpretations. Ideally the new methodology must provide the characteristics of the highest mode of the dataset.

A new model is chosen to calculate population characteristics (mean and standard deviation) from experimental datasets (Cofino 2000). The model uses an estimate for the probability density function (pdf) of the measurement process and calculates a best fit based on all observed values. The implementation of the model that is used does not require uncertainty estimates for all data points. Instead it uses a normal distribution approximation (NDA) for the pdf of the individual data points. In essence, the pdf's of the individual datapoints are superposed on each other to create a continuous pdf representing the entire distribution (all datapoints).

With the mathematical model coefficients can be obtained by looking for the combination of data points that has the highest probability in the basis set. This maximization amounts to the identification of the first mode of the dataset. The coefficients can be used to calculate the weighted mean and standard deviation. Subsequent calculations give additional modes of the distribution and for each mode the expectation value (mean), the standard deviation and a percentage indicating the fraction of observations encompassed. In this report only mean and standard deviation for the first mode (combination with the highest probability in the dataset) are given.

The model is tested on simulated data sets and datasets of several interlaboratory studies. It is demonstrated that the model is robust and insensitive to outliers. It can cope with asymmetric, strongly tailing and multimodal distributions. Publications describing the procedure in more detail and results of the tests are in preparation.

With the NDA model mean and standard deviation are calculated using all reported data when at least 8 results are left after removal of reported 'lower than' (<) and 0 (= zero) values. No outliers are removed.

**Table 2.** The model summarised

- Each observation is attributed an 'Observation measurement function' (OMF,  $\phi_i$ )
- An OMF is defined as the square root of the probability density function appropriate for the observation. If normal distributions are used:  $\phi_i = \sqrt{N(\mu_i, \sigma_i^2)}$
- The set of  $\phi_i$  's constitutes a basisset in which the population measurement function  $\Psi$  is constructed:  $\Psi_i = \sum c_{ik} \phi_k$
- The coefficients are obtained by finding the combination which renders highest probability density (maximise  $\int \Psi^2 dx$ ,  $x$  being concentration). Mathematically this amounts to solving the eigenvector-eigenvalue equation  $Sc = \lambda c$ ,  $S_{ij}$  being an overlap integral defined as  $\int \phi_i \phi_j dx$ ,  $0 \leq S_{ij} \leq 1$
- Mean and standard deviation of  $\Psi_i$  are calculated from the first and second moment of the probability density function  $\Psi_i^2$

$$\bar{m}_i = \frac{\int x \Psi_i^2 dx}{\int \Psi_i^2 dx},$$

$$s_i^2 = \frac{\int x^2 \Psi_i^2 dx}{\int \Psi_i^2 dx} - \bar{m}_i^2$$

- The variance calculated by the model represents the sum of the estimates for the within-laboratory and between-laboratory variances, i.e.  $s_i^2 = s_{\text{between labs},i}^2 + s_{\text{within labs},i}^2$
- When the NDA approximation is used,  $s_i^2$  estimates the between-laboratory variance

## Old statistics: Calculation of median and MAD.

Starting with the first proficiency tests in 2009 a new statistical method was chosen. For reasons of continuity the statistical results of the old method will be reported in 2009. The old statistical method was preferred because strange values had less influence on the estimated central value (location) and the spread of this value (scale). Therefore estimators for location and scale were used which give less weight to observations in the tails (van Montfort, 1996). For each element a median value ( $\mu_1$ ) and a median of absolute deviations (MAD,  $\sigma_1$ ) are calculated using all reported data except the reported '<' and 0 (= zero) values. The median is the middle observation of the sorted array of observations in the case of an odd sample size. Otherwise it is the mean of the two middle observations. Using the median instead of mean, extreme data are of less influence. MAD is the median of the absolute values of the observations minus their median. In case more than 7 data are reported, the values with  $|(x - \mu_1)| / (f \cdot \sigma_1) > 2$  are marked with a double asterisk (\*\*). The factor  $f$ , aiming at 5% (singly or doubly) asterisked data in a sample of size  $n$  ( $n > 7$ ) from a Gaussian distribution, is approximated by  $(0.7722 + 1.604 / n) \cdot t$ , where  $t$  is the 2½ percent point of Student's  $t$  with  $(n - 1)$  degrees of freedom. A second median ( $\mu_2$ ) and a second MAD ( $\sigma_2$ ) are computed then leaving out the items labelled \*\*; included values with  $|(x - \mu_2)| / (f \cdot \sigma_2) > 2$  are marked with a single asterisk (\*). Finally a third median and MAD are calculated, discarding both \* and \*\*.

In the case of small results which are heavily rounded the MAD often becomes 0 (= zero). This is very unsatisfactory because all results other than the median are marked as outlier. Therefore no results are marked as outlier in cases where  $MAD = 0$ . Mean and standard deviation are only calculated when at least 8 results are left after removal of outliers (\*\*) and stragglers (\*).

## Rounding of results

Rounding interval is based on the first decimal value lower than  $sd / 2$  (standard deviation divided by 2). If no standard deviation is available (less than 8 results) the MAD is used. At least three significant digits are shown as a minimum. If no standard deviation and MAD are available rounding is also based on three (most) significant digits. For the statistical results (mean, standard deviation, median and MAD) one extra digit is shown.

Note that larger results are also rounded (e.g. 1809 may be rounded as 1810).

## Z-score

For all analytical data a Z-score is calculated according to the formula:

$$Z\text{-score} = \frac{X - X_{\text{mean}}}{S_d}$$

in which:

X = the reported value

X<sub>mean</sub> = the mean of all values calculated with the NDA model

S<sub>d</sub> = standard deviation calculated with the NDA model

## Method Indicating Code (MIC)

In order to evaluate the analytical results for each reported element (see **Table 3** for the different element groups), a Method Indicating Code (MIC) is used. Details of the analytical procedures used by the individual participants are indicated by four characters, added at the end of each row with results. The first character indicates the method of extraction or digestion according to the codes explained in **Table 4**. The last three characters (see **Table 5**) indicate the method of detection of the element in the extracts or digests. In this way it is possible for all participants to compare the results of their analytical procedures more specifically with the results of other participants. This could be a further valuable tool in judgement of the individual results.

**Table 3** *Used abbreviations in errors and z-scores*

| Method | Abbreviation | Digestion/extraction procedure      |
|--------|--------------|-------------------------------------|
| 1      | RT           | Real Totals                         |
| 2      | AE           | Acid Extractable (So-called totals) |
| 3      | OD           | Other Determinations                |

**Table 4** *Digestion/extraction and other procedures*

| Code | Procedure   |
|------|---|
| A    | Dry ashing and uptake of the ash in HCl   |
| B    | Dry ashing and uptake of the ash in HNO <sub>3</sub>  |
| C    | Digestion with a mix. of conc. HCl (ISO 11466) using boiling under reflux                       |
| D    | As C using a microwave system   |
| E    | Digestion with (conc) HNO <sub>3</sub> under pressure   |
| F    | As E using a microwave system   |
| G    | Digestion with HNO <sub>3</sub> /HF/HClO <sub>4</sub> under pressure                            |
| H    | Melt with LiBO <sub>2</sub>   |
| I    | Digestion with HNO <sub>3</sub> and H <sub>2</sub> O <sub>2</sub>                               |
| K    | Dry ashing and digestion of the ash with HNO <sub>3</sub> under pressure                        |
| L    | As K using a microwave system   |
| M    | Digestion with H <sub>2</sub> SO <sub>4</sub> /H <sub>2</sub> O <sub>2</sub> , Se as a catalyst |
| N    | Extraction with 2 M HNO <sub>3</sub> 1:10 at 100°C  |
| O    | Digestion with KMnO <sub>4</sub> at 70 °C   |
| P    | Extraction with KCl 2 N 1:20  |
| Q    | Digestion with conc HNO <sub>3</sub>  |
| R    | (for AOX and Mo) method according to DIN 38414S18   |
| S    | Digestion with conc H <sub>2</sub> SO <sub>4</sub>  |
| T    | Using aqua regia; (EN 13346 for sludges) and (EN 13657 for waste)                               |
| Z    | Others (give short description)   |

**Table 5** *Methods of detection*

| Code | Method   |
|------|--|
| AA   | AAS Flame without preconcentration   |
| AAA  | without background correction using air acetylene                                      |
| AAB  | without background correction using N <sub>2</sub> O acetylene                         |
| AAC  | with deuterium background correction using air acetylene                               |
| AAD  | with deuterium background correction using N <sub>2</sub> O acetylene                  |
| AAE  | with Zeeman background correction using air acetylene                                  |
| AAF  | with Zeeman background correction using N <sub>2</sub> O acetylene                     |
| AAG  | with pulsed hollow cathode lamp background correction using air acetylene              |
| AAH  | with pulsed hollow cathode lamp background correction using N <sub>2</sub> O acetylene |
| AB   | AAS Flame with preconcentration  |

| Code | Method  |
|------|---|
| ABA  | without background correction using air acetylene                           |
| ABB  | without background correction using N2O acetylene                           |
| ABC  | with deuterium background correction using air acetylene                    |
| ABD  | with deuterium background correction using N2O acetylene                    |
| ABE  | with Zeeman background correction using air acetylene                       |
| ABF  | with Zeeman background correction using N2O acetylene                       |
| ABG  | with pulsed hollow cathode lamp background correction using air acetylene   |
| ABH  | with pulsed hollow cathode lamp background correction using N2O acetylene   |
| BA   | AAS ETA without preconcentration  |
| BAA  | without background correction without chemical modifier                     |
| BAB  | without background correction with chemical modifier*                       |
| BAC  | with deuterium background correction without chemical modifier              |
| BAD  | with deuterium background correction with chemical modifier*                |
| BAE  | with Zeeman background correction without chemical modifier                 |
| BAF  | with Zeeman background correction with chemical modifier*                   |
| BAG  | with pulsed hollow cathode lamp without chemical modifier                   |
| BAH  | with pulsed hollow cathode lamp with chemical modifier*                     |
| CA   | Flame emission  |
| CB   | ICP AES (different wavelengths possible; indicate wavelength)               |
| CC   | other excitation source (dif. wavelengths possible; indicate wavelength)    |
| D    | ICP MS  |
| E    | Spectrophotometry   |
| F    | Hydride technique (similar techniques using analyte volatilization;specify) |
| G    | Cold vapour technique   |
| H    | Ion selective electrode   |
| IA   | Direct voltammetry  |
| IB   | Stripping voltammetry   |
| JA   | Gas chromatography  |
| JB   | Liquid chromatography   |
| JC   | Ion chromatography  |
| KA   | X ray fluorescence with material melted                                     |
| KB   | X ray fluorescence with material pressed                                    |
| L    | Neutron activation analysis   |
| M    | Near infrared   |
| O    | Titrimetric/coulometric   |
| P    | Gravimetric   |
| Q    | Turbidimetric or Nephelometric  |
| Z    | Others  |

International Soil-Analytical Exchange

Fee € 525,- (EUR) per year

In this period 265 participants

International Plant-Analytical Exchange

Fee € 525,- (EUR) per year

In this period 227 participants

International Sediment Exchange for Tests on Organic Contaminants

Fee € 870,- (EUR) per year

In this period 86 participants

International Manure and Refuse Sample Exchange Program

Fee € 715,- (EUR) per year

In this period 43 participants

International Biomass Exchange Program

Fee € 600,- (EUR) per year

In this period 13 participants
