

Government's role in pro-poor partnerships: from implementing to monitoring

Hans Nijhoff, Ted Schrader

WI project group (KB7) and LEI (BOCI), in 2008 / 2009:

- Desk research, background documents
- Expert meetings in the Netherlands
- In-depth interviews with stakeholders in Uganda, Kenya, Zambia, Tanzania (Ethiopia, other)
- Seminar / International conference, Netherlands

New role of government

From program planning & management to outsourcing & monitoring. From a command-based to a market-based approach. Lessons learnt are:

- Maintain direct benefit structures (salaries, vehicles, computers): without these there is no incentive
- Shift focus towards different benefits: gaining the trust from the rural electorate

Required capacities

- 1. Project identification, ToR writing, outsourcing
- 2. Partnership building & maintaining
- 3. Project monitoring, measuring intervention impact
- 4. Project comparing, new program proposal writing
- 5. Comparative research, action learning

Economic crises have typically led to declining public investment in agriculture. Only a healthy agricultural sector and a growing non-farm economy may get SSA back on the WFS target path.

Innovative PPPs and new role for government required:

- Key factors for private-public partnerships (PPPs)?
- How can government become modern player?
- What role for donors to support this?
- Risk management policies to facilitate investments
- How make use of growing interest by MNCs?
- What new roles may government / donors play?

Success & failure factors of PPPs:

Critical success factors:

- Political will / government support
- Internal PPP champion (push or pull)
- 3. Transparency, accountability (in/out)
- Agreeing on shared objectives
- Relationship management

Key constraints:

- 1. Too complex (too many goals and actors)
- 2. Lack of political will to include private sector
- 3. Negative perceptions across the sector
- Lack of mechanisms to manage risk & liability
- 5. High costs for creating and sustaining

A. Risk management policy framework (lead LEI)

- 1. Scope & importance of commodity risk problems, and formulate risks in value chains
- 2. The role of government in the design and use of marketbased price risk management tools
- 3. Required donor interventions for strengthening the government agencies to play this role

B. Sustainable sourcing arrangements (lead WI)

- 1. How important are private (MNC) investments in SSA agriculture to rural poverty alleviation?
- 2. What private-public partnership mechanisms are required for this private sector to invest (more)?
- 3. What are the pros & cons of contract farming as a marketbased instrument for sustainable sourcing?
- 4. How will development impact be assessed?
