Interactive design of landscapes

Author

W.J.M. Heijman (Wageningen, the Netherlands)

Wageningen, January 17, 2008

Introduction

- 1. Definition
- 2. External shocks
- 3. Two possible reactions
- 4. Supply of rural services
- 5. Landscape
- 6. RITA
- 7. Project 'Friese meren'
- 8. Conclusions

4. Alternative landscape functions

- 1. Organic Production
- 2. Quality Production
- 3. Agro-tourism
- 4. Short chains
- 5. New Economic Activities
- 6. Diversification
- 7. Nature and Landscape Management
- 8. Cost Reduction
- 9. Off farm jobs
- 10. Care Farms

5. Landscape

- The landscape is the carrier (or substrate) of functions
- When the function changes the landscape also have to change and the other way round
- Rural resilience refers to the ability to adapt the landscape to changing circumstances
- Social capital is important

5. Landscape

- Landscape planning should be based on all the necessary information
- All necessary information is not available on the central level
- Therefore: interactive decentralised planning with the help of stakeholders is preferred

6. RITA

- “Regionaal Interactief Transdisciplinair Afwegingsmodel”
- ‘Landscape Economics’

Two steps:

1. Maximising individual utility functions,
 2. Aggregation of individual maxima
- Optimum landscape

6. RITA (Step 1)

$$\text{Max} \quad U_s = U_s(x_1, x_2, x_3, \dots, x_i, \dots, x_n),$$

S.T.

$$p_1 x_1 + p_2 x_2 + p_3 x_3 + \dots + p_i x_i + \dots + p_n x_n \leq B,$$

$$x_1 + x_2 + x_3 + \dots + x_i + \dots + x_n \leq C,$$

$$x_i \geq D_i, \quad (i \in I^+)$$

$$x_i \leq E_i, \quad (i \in I^-)$$

6. RITA (Step 2)

$$U = \sum_{s=1}^m \omega_s U_s, \quad \sum_{s=1}^m \omega_s = 1.$$

- Establishing the functional form of the utility function and the weights are crucial

Theoretical model

- <m:\werk\ruimte\landscapeeconomics.xls>

7. Project 'Friese meren'

Stakeholders:

- Government
- Nature Conservation Organisations
- Recreation Sector
- LTO
- Polder Board (Waterschap)

7. Project 'Friese meren'

Variables:

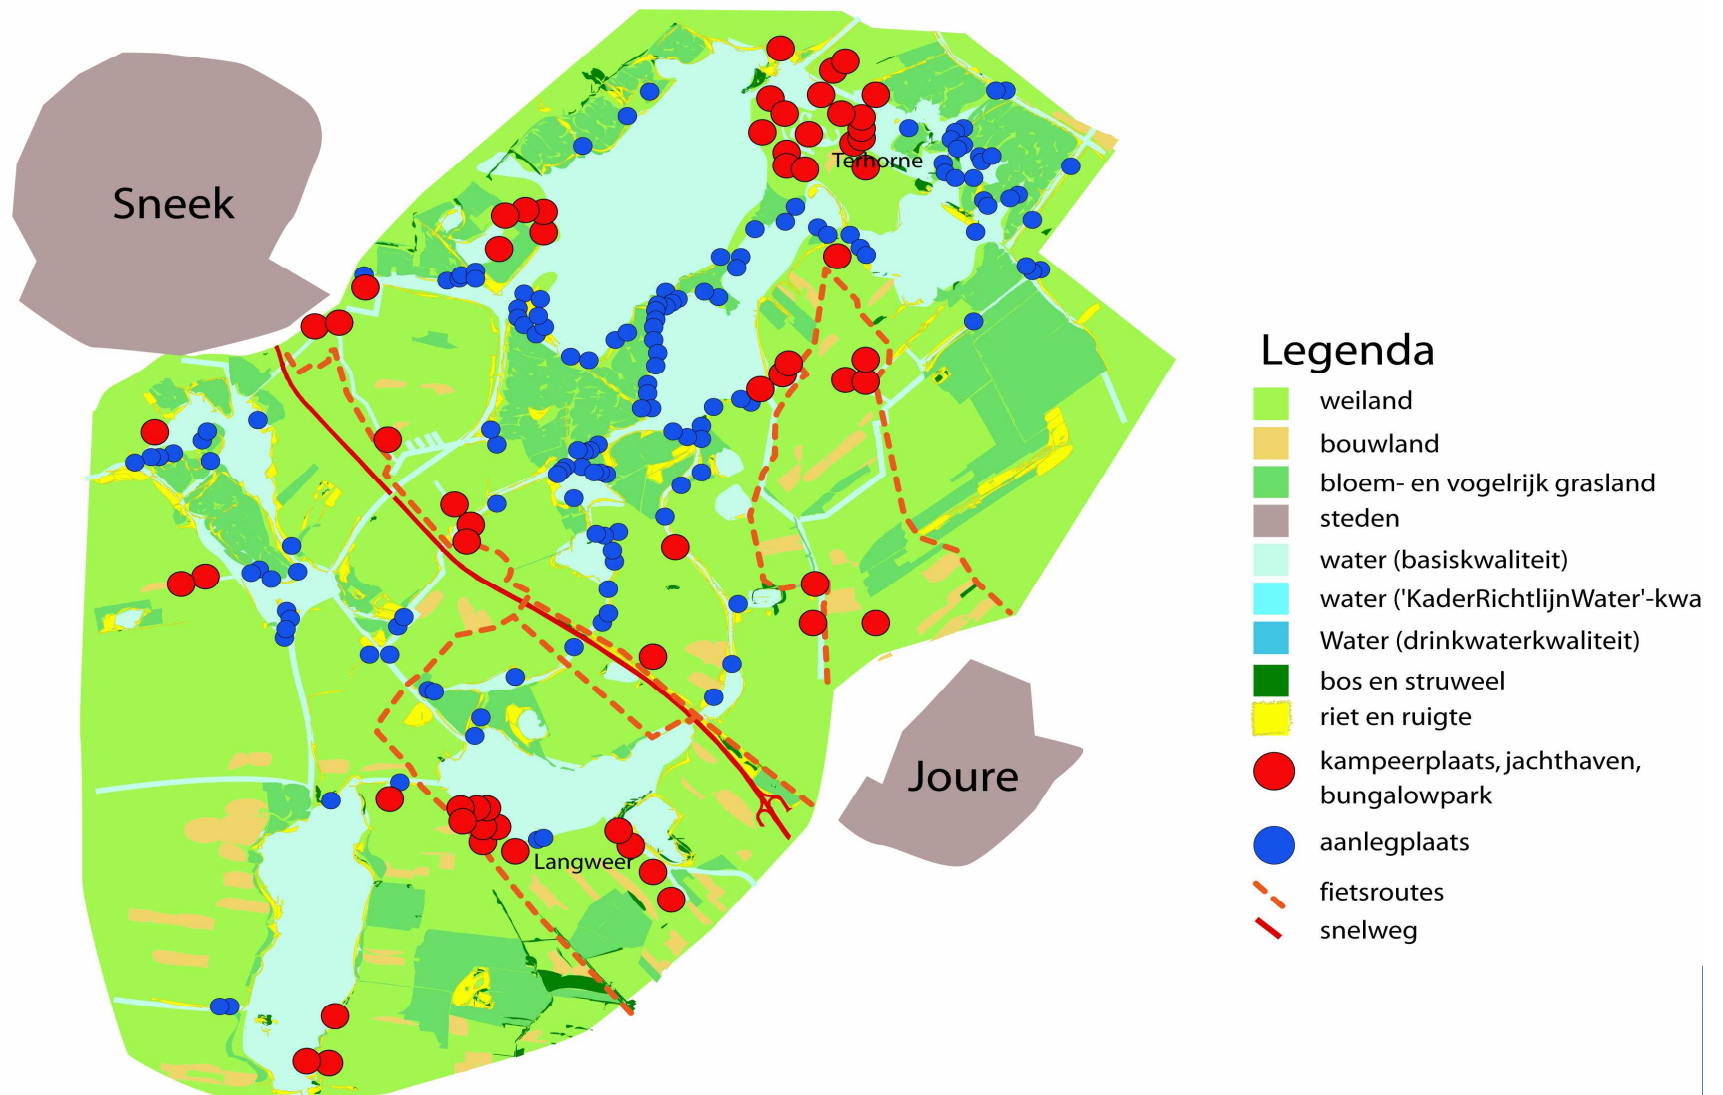

- Nature
- Water Quantity
- Bicycle Tracks
- Landing Stages
- Marina's
- Water Quality

■ sels.doc

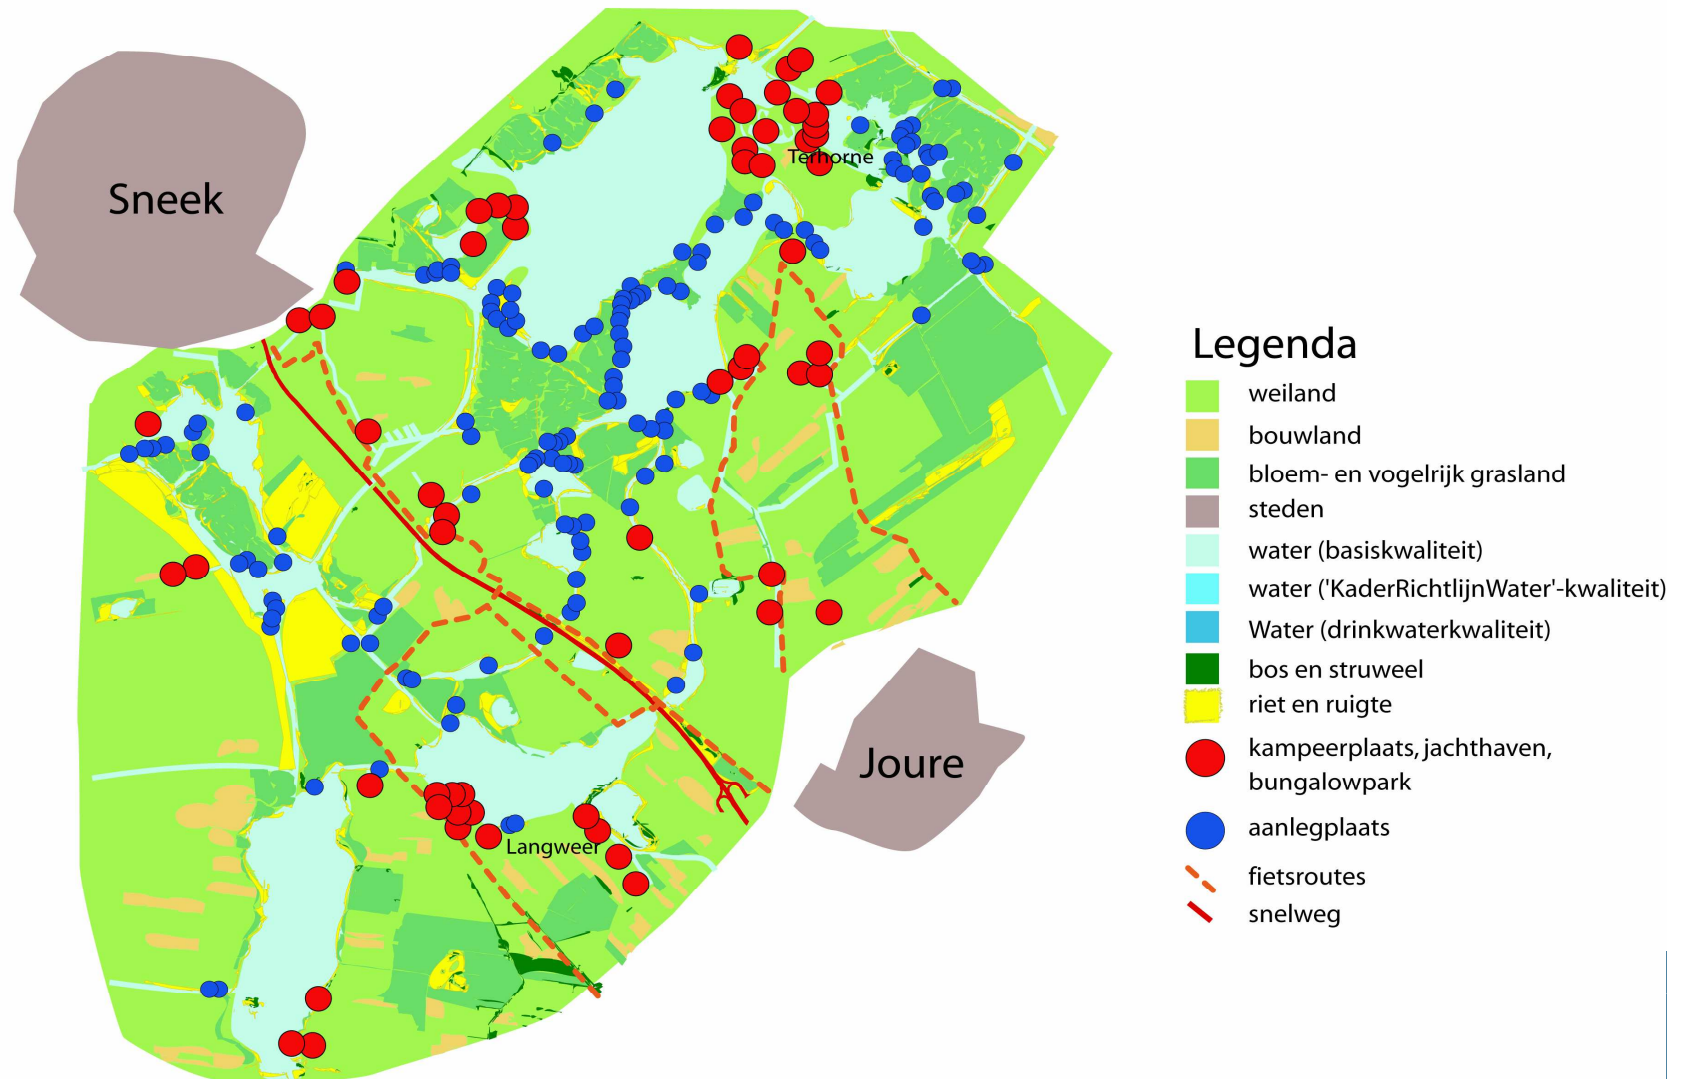

'Friese Meren'-project: Present Situation

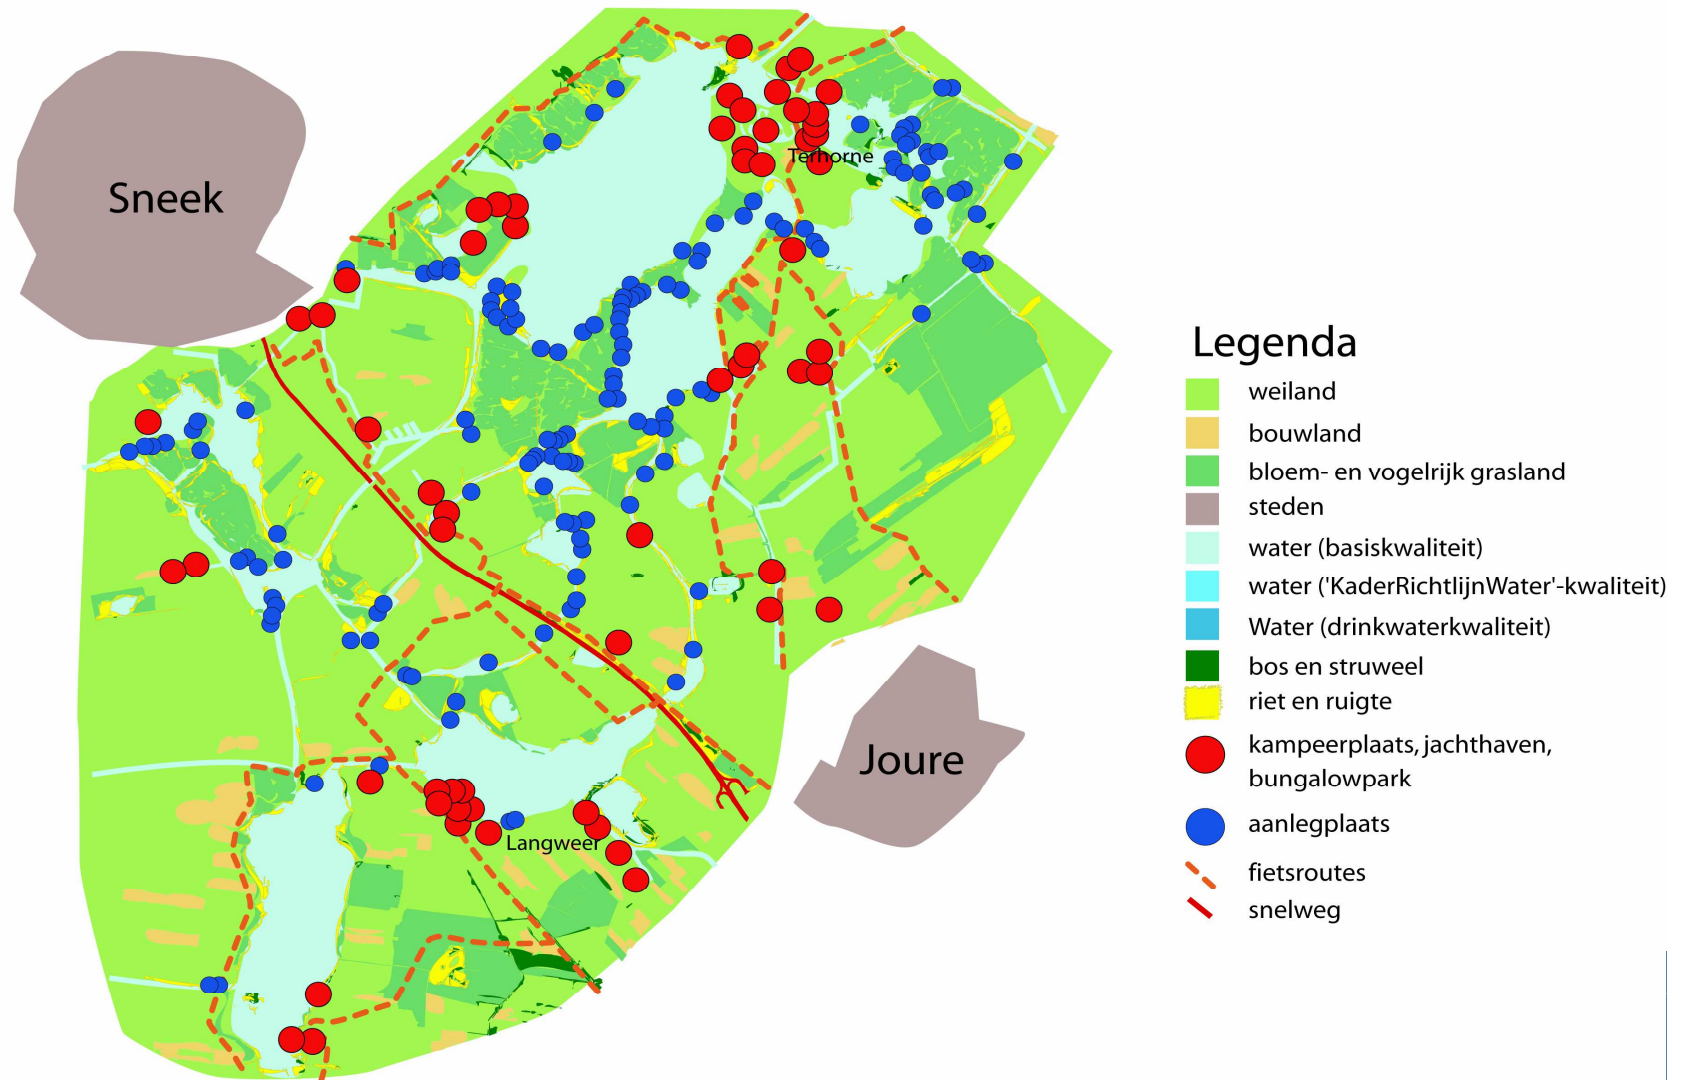

'Nature Conservationist's preferred Landscape

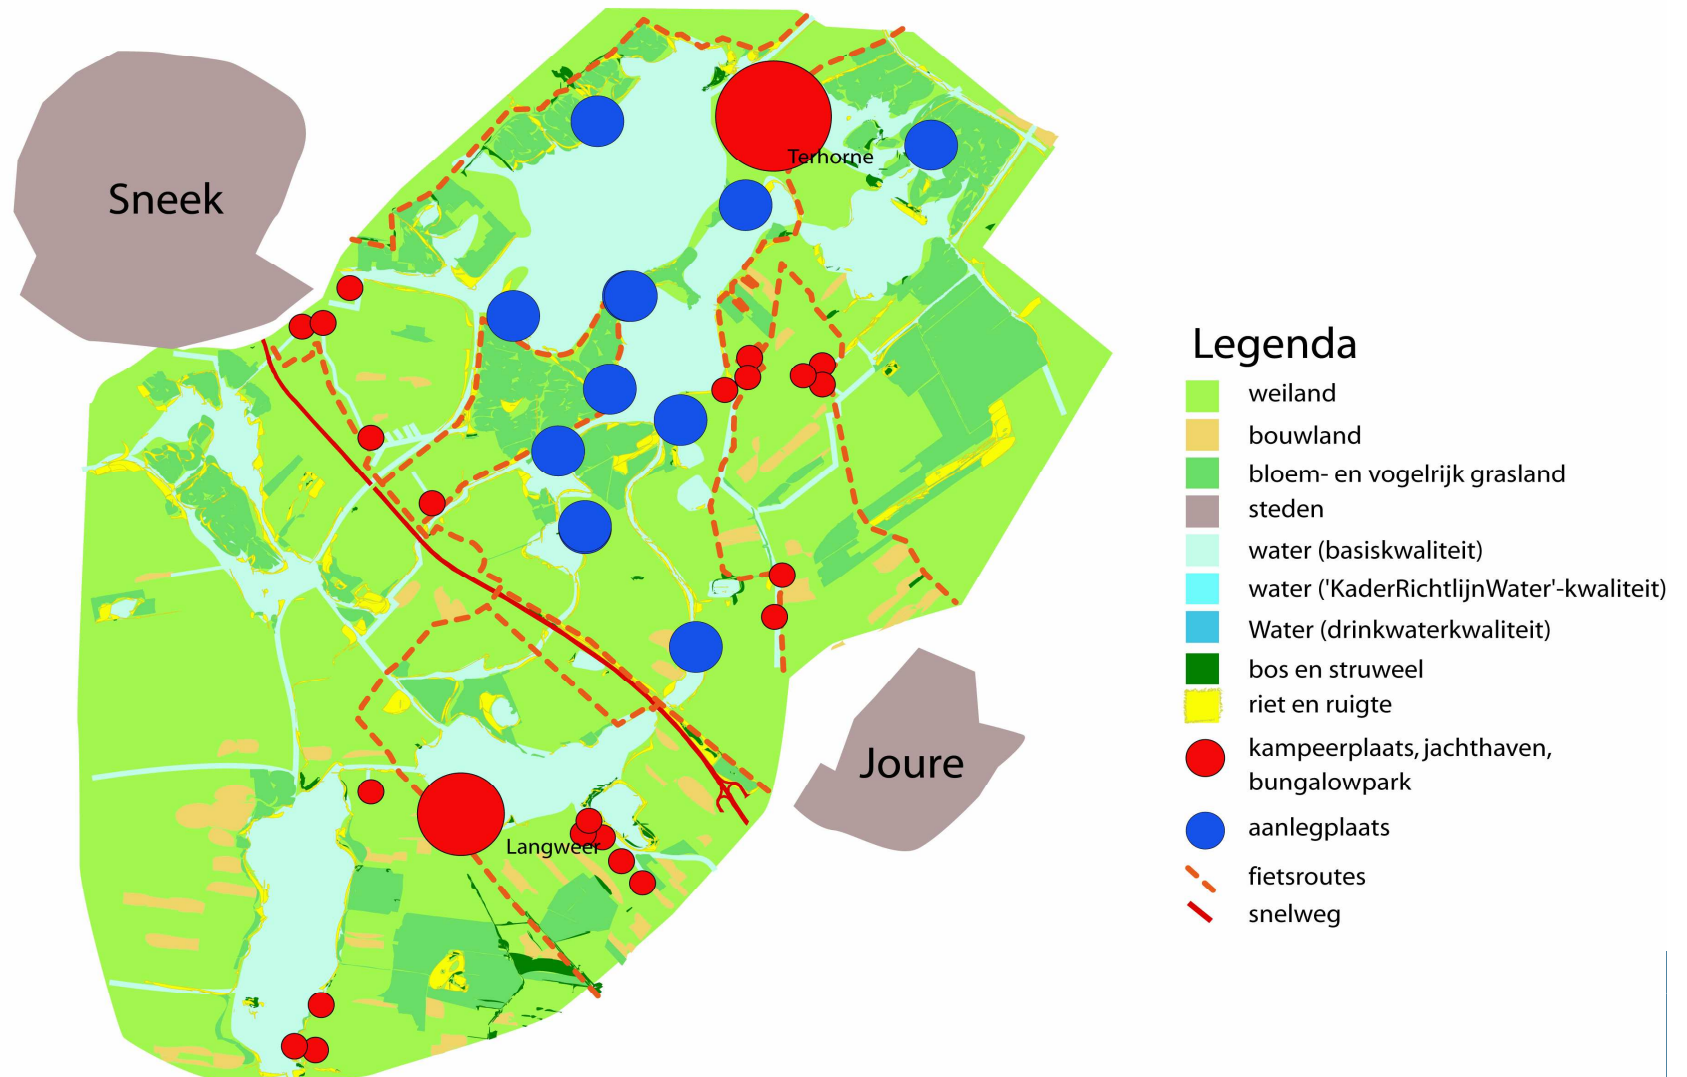

Recreationist's Preferred Landscape

Non-preferred Landscape

8. Conclusions

- In order to respond to global free trade in agriculture regions have to specialise in either large scale agricultural production or rural services
- The basis for rural services is formed by landscape and nature, which are public goods
- Rural resilience is reflected in the capacity to change the landscape in order to cope with the external shocks of global free trade in agricultural products and climate change

8. Conclusions

- Private rural services are linked to the public rural services (landscape, nature, water storage),
- Decentralised interactive planning is necessary,
- RITA is a workable model for this
