

Modelling as a tool to improve understanding of complex systems: Examples from Meat quality, Meat Safety and Animal Welfare

Karel de Greef et al.

QPC Module VI (modelling and meta-analysis)

&

Livestock Research of Wageningen UR

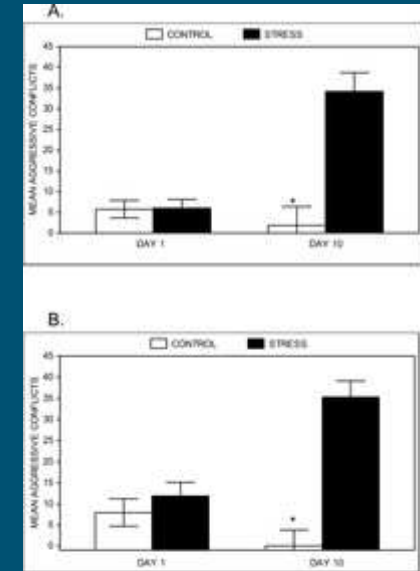

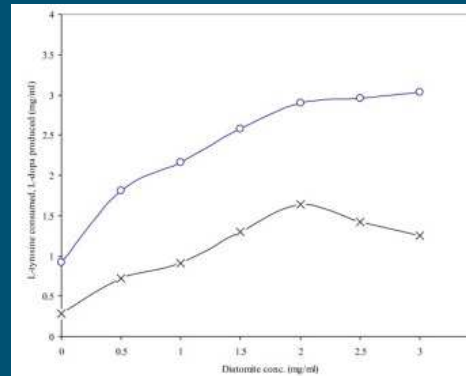

Modelling and Meta-anaysis

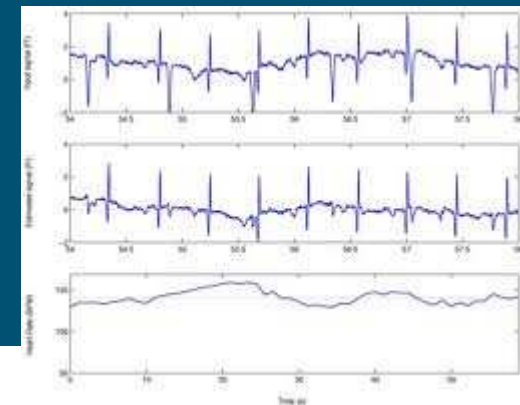

- **Modelling**: integrating existing data or knowledge into a 'representation of the real world'
- **Meta-analysis**: re-analysis of several studies together
- **Both:**
 - better use of existing information
 - Helps in conceptual thinking

Two types of questions

- What happens if (cause and effect)
= The effect of x on y

- What's happening? (descriptive)

Modelling and Meta-analysis

Applied on three themes

- Meat Quality
- Meat Safety
- Animal Welfare

Today: not “a full overview of the results”

but “an illustration of added value of Modelling
& Meta-analysis”

Demo that Meta-analysis and Modelling have added value

Major contributors

- *Pre-thinking & module-building:* Claudia Terlouw
- *Meat Quality:* Andrea Wilson; Lutz Bunger; Laszlo Trefan; Catherine Larzul, Btissam Salmi
- *Meat Safety* Declan Bolton, Claire Ivory, Francis Butler, Ilias Soumpasis
- *Animal Welfare*
- *Karel de Greef*, Marie-Christine Salaun, Ludovic Brossard, Xavi Averos, Sandra Edwards, Helen Edge, Jessica Cornelissen
- *Database and website:* Jesper Blom-Hanssen; Chris-Claudi Magnussen; Torben Kvamm

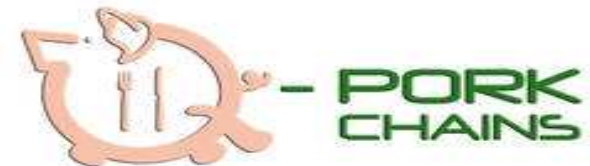

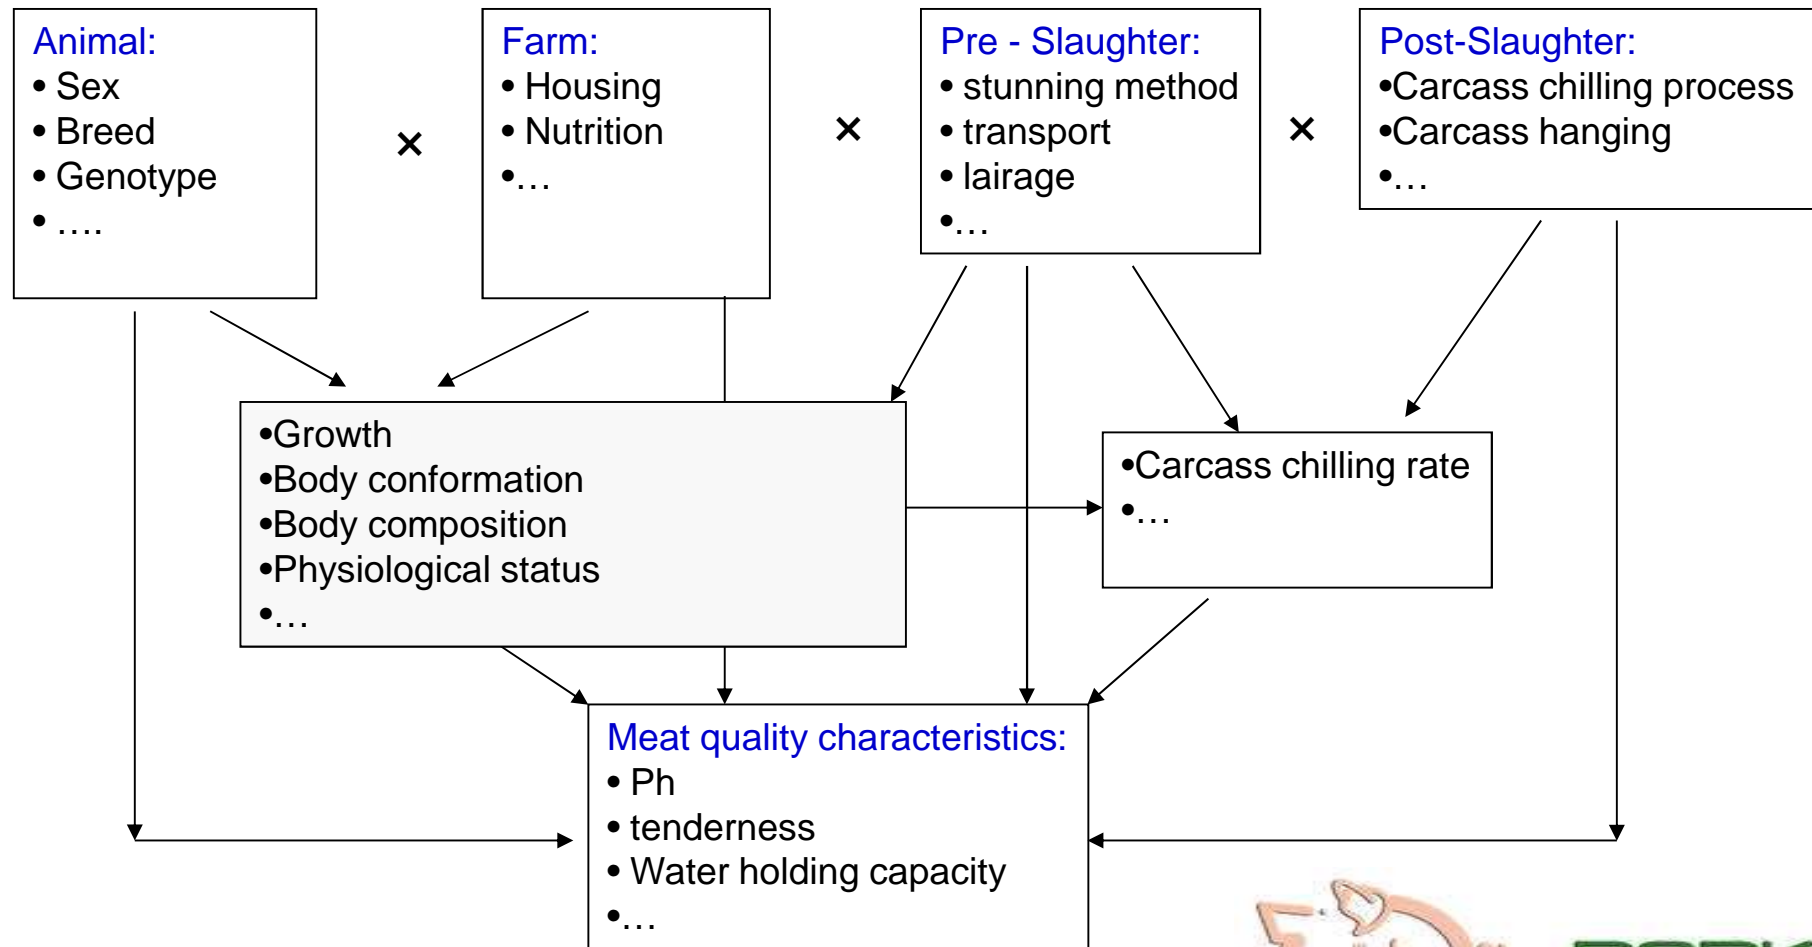

Meat Quality

SAC and INRA (+DMRI)

*Andrea Wilson; Lutz Bunger; Laszlo Trefan;
Catherine Larzul, Btissam Salmi*

*Jesper Blom-Hanssen; Chris-Claudi Magnussen;
Torben Kvamm*

Objective: combine existing information to develop prediction models for **pork quality** accounting for a wide range of factors

Input for meta-analysis: Vitamin E studies

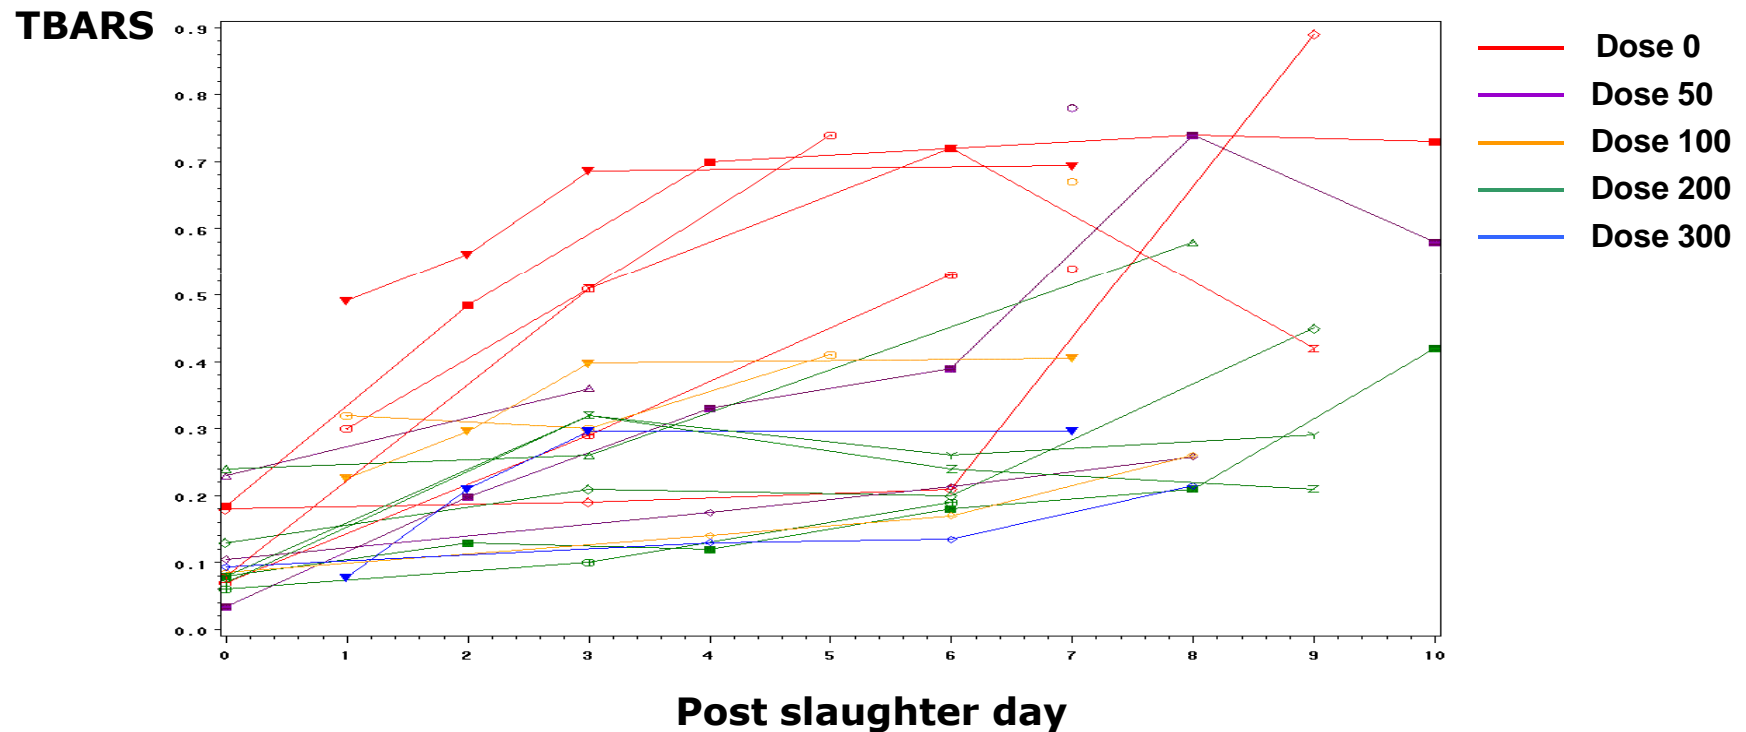

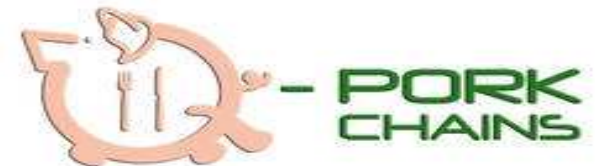

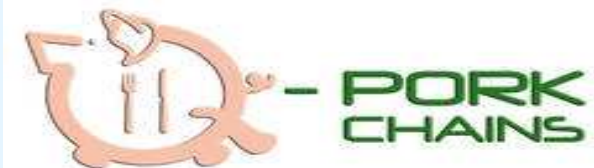

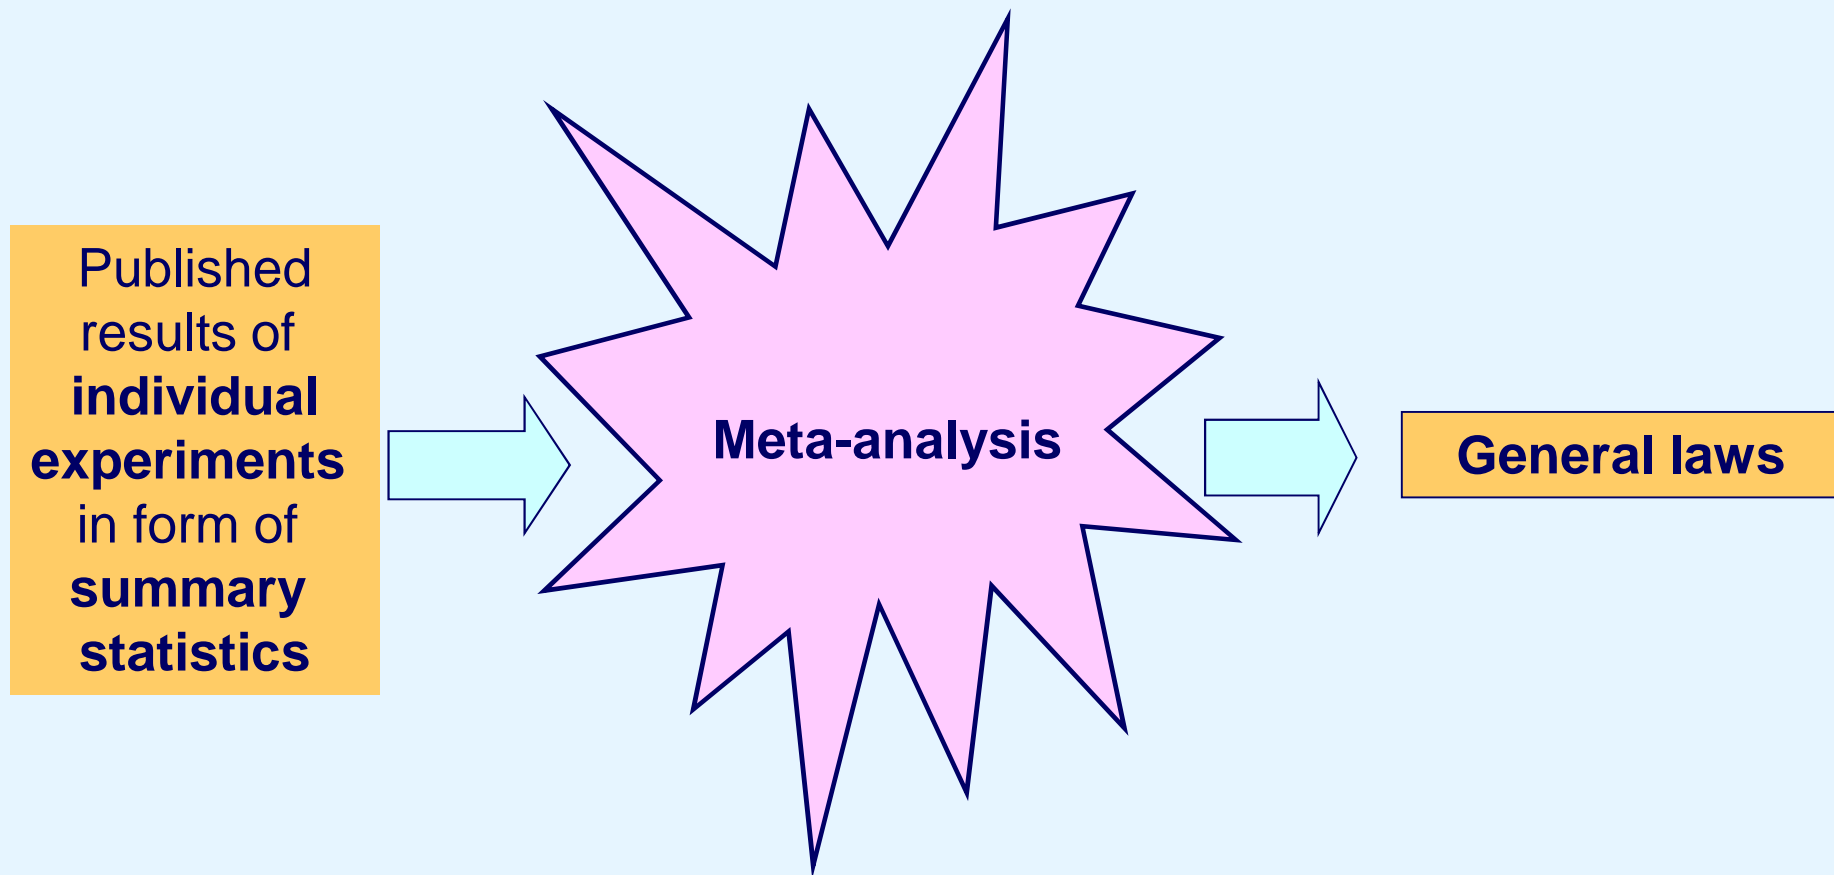

Figure1: Least square (LS) means of TBARS changes over time for various doses of vitamin E from 10 different experimen

Meta-analysis (MA)

Input for meta-analysis: Vitamin E studies

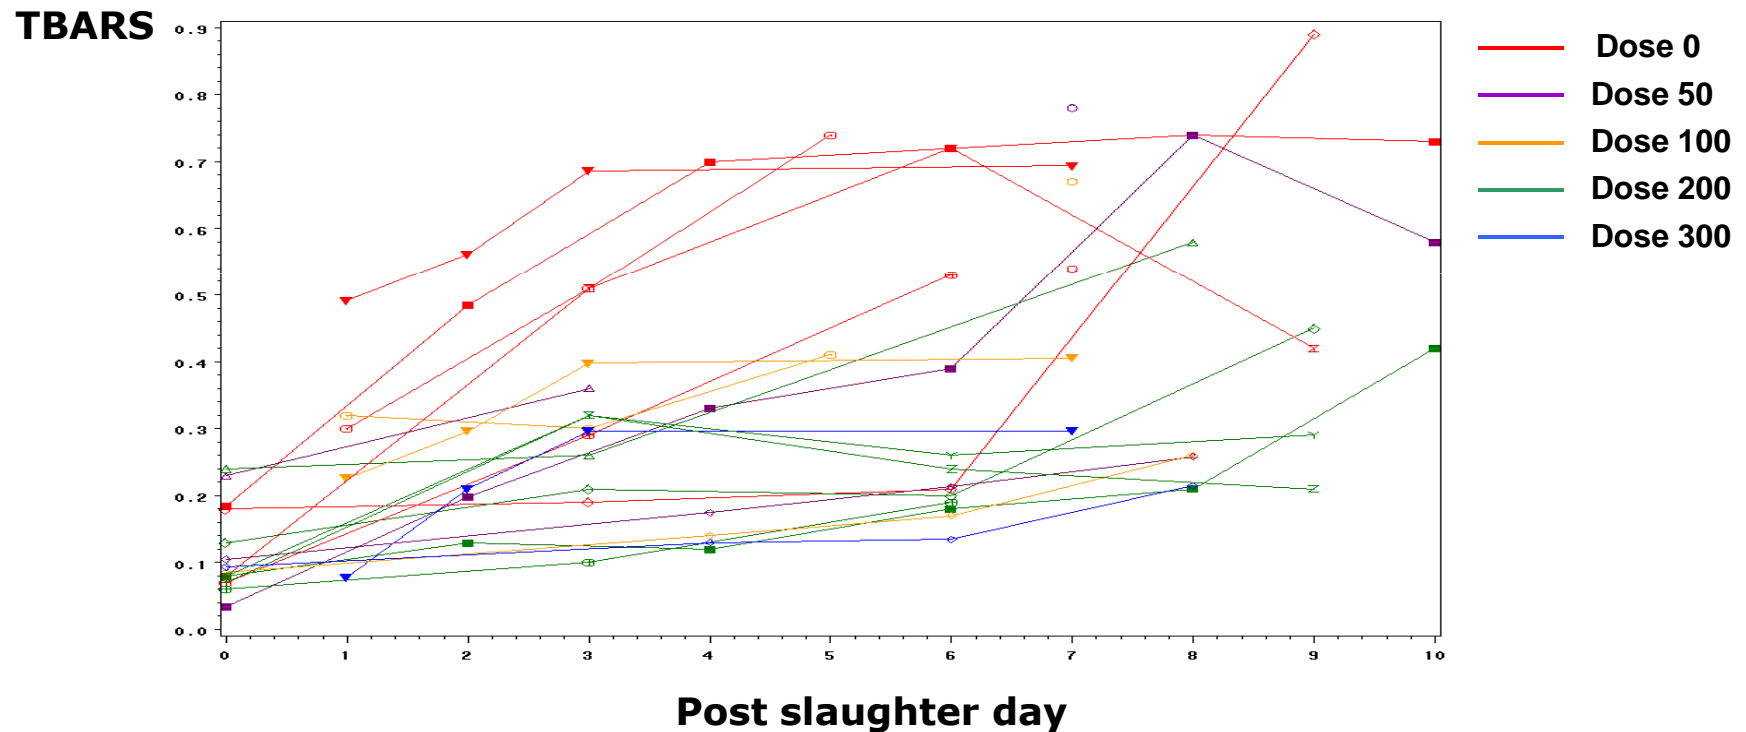

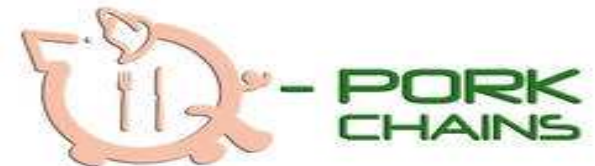

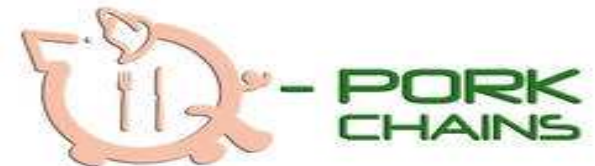

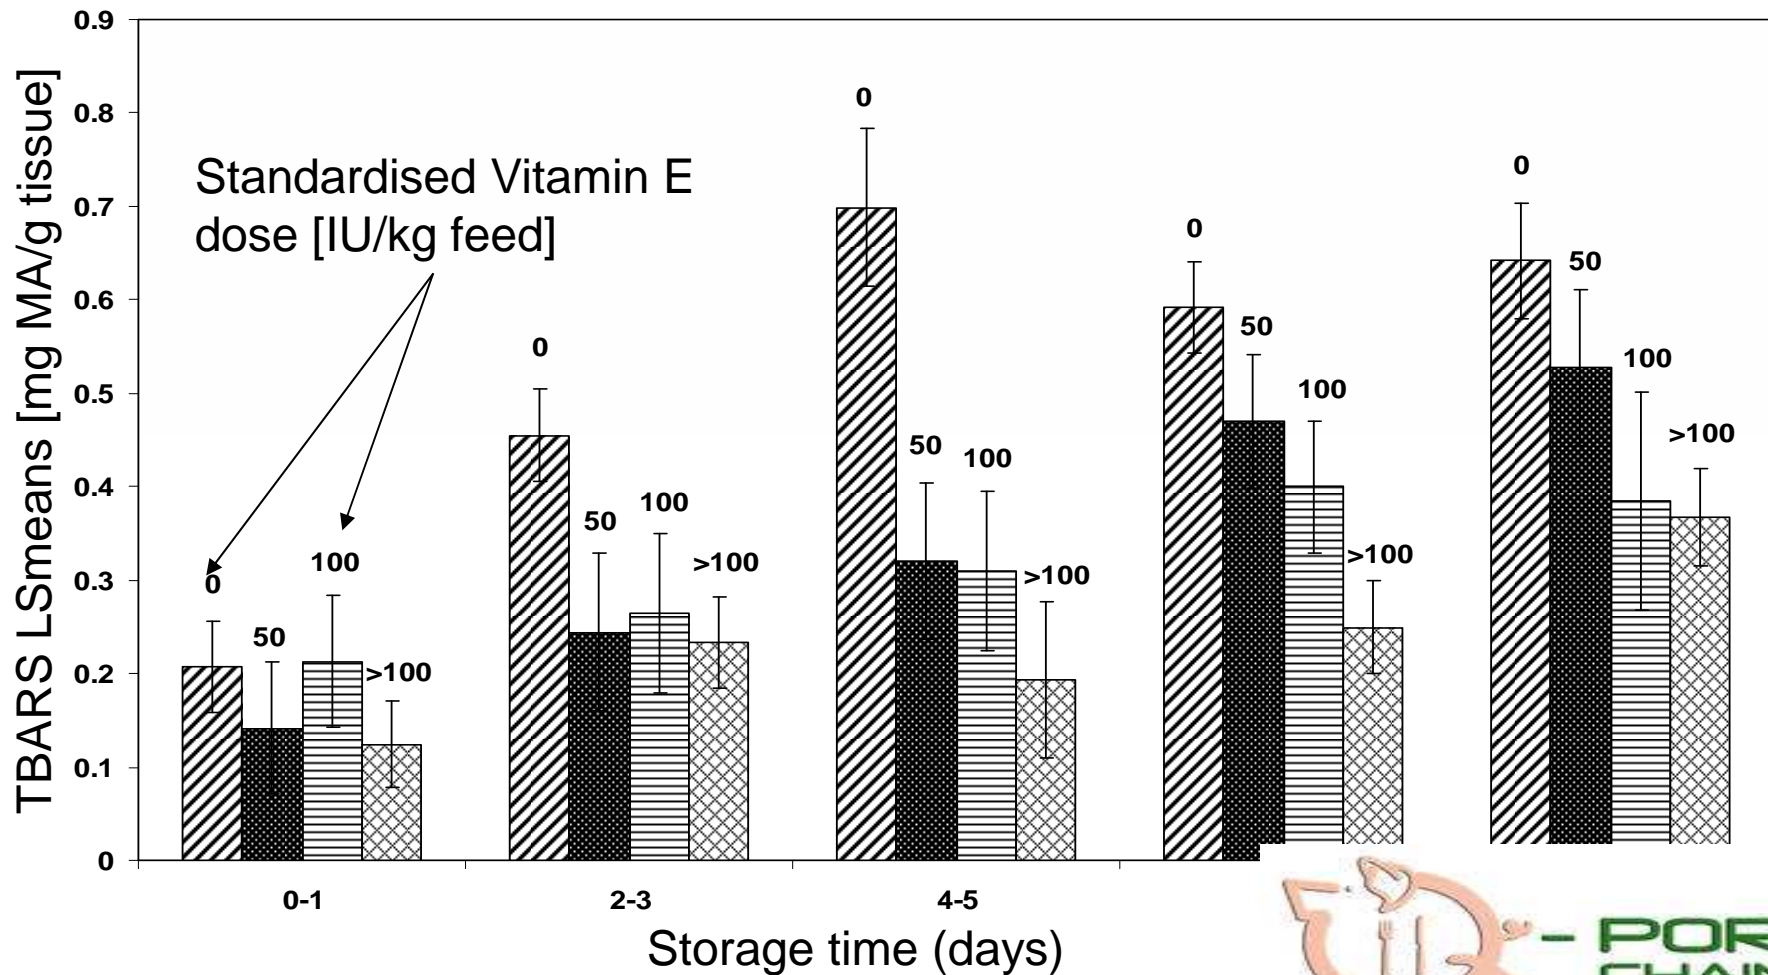

Figure1: Least square (LS) means of TBAS changes over time for various doses of vitamin E from 10 different experiments

Meta-analysis results: Effect of dietary vitamin E supplementation on lipid oxidation

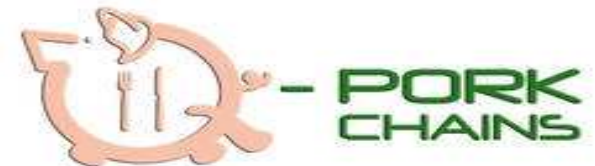

Linear Mixed Models:

$$\text{TBARS}_{ijk} = \beta_1 \text{TOC_cont}_{ij} + \beta_2 \text{Tsupp}_{ij} + \text{StoreTime}_k + e_{ijk} \quad (\text{A})$$

$$\text{TBARS}_{lmn} = \text{Dose}_m + \text{StoreTime}_n + e_{lmn} \quad (\text{B})$$

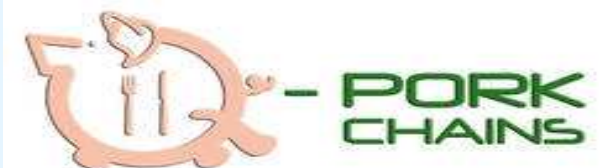

TBARS is the abbreviation for Thiobarbituric Acid Reactive Substances, substances formed as a byproduct of [lipid peroxidation](#) (i.e. as degradation products of fats) which can be measured by the [TBARS assay](#) using a specific reagent. [WIKI](#)

Linear Mixed Models:

$$a^*_{ijkl} = \beta_0 \text{TOC_cont}_{ij} + \beta_1 \text{Time}_{ijk} + \beta_2 \text{Time}^2_{ijk} + \beta_3 \text{Time}^3_{ijk} + \text{StoreLight}_l + e_{ijkl} \quad (1)$$

$$a^*_{mnpq} = (\text{TOC_cont} * \text{StoreTime})_{mnp} + \text{StoreTime}_p + \text{StoreLight}_q + e_{mnpq} \quad (2)$$

“What happens if we change the husbandry conditions?”

→ ***Focus on the animal!***

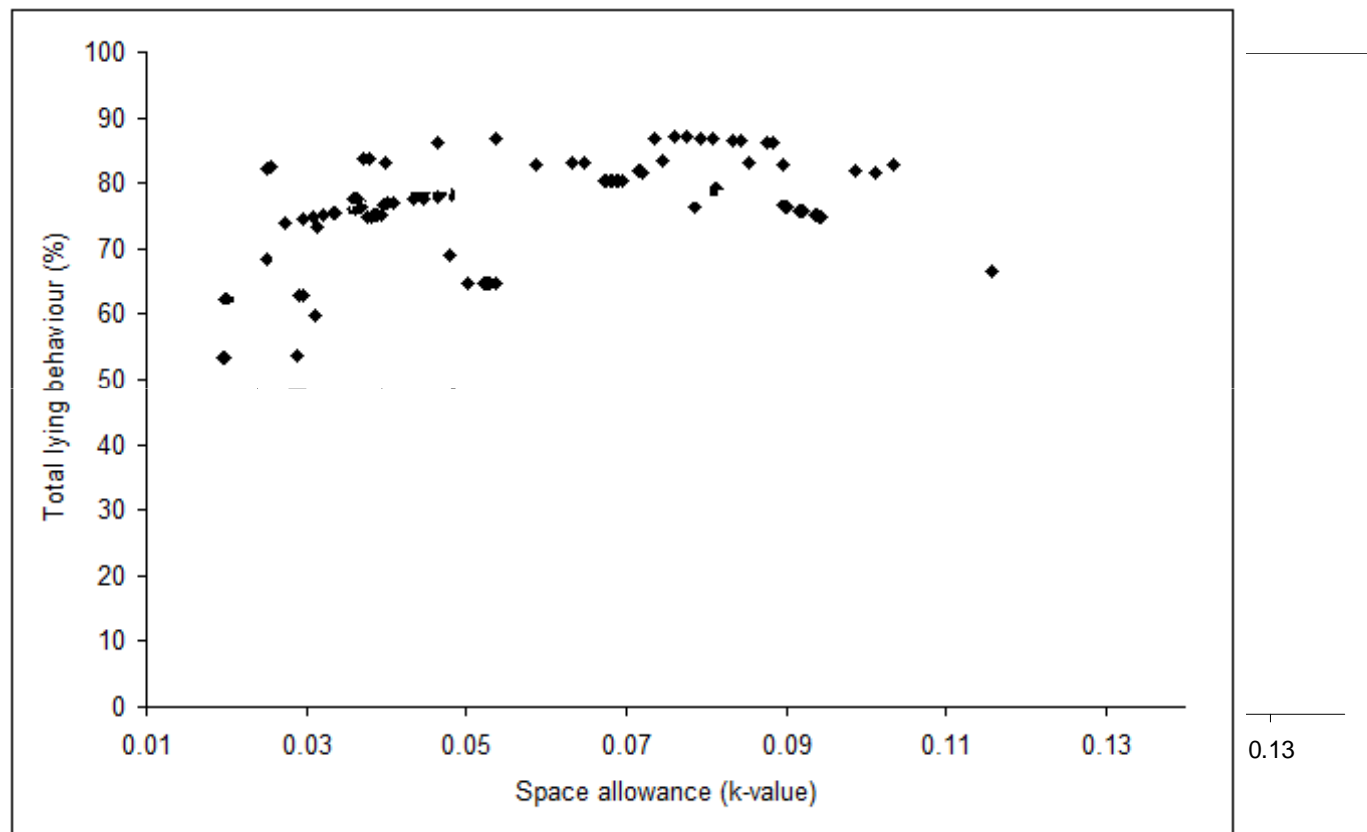

Animal welfare - from a strict animal science entry

Modelling and quantification of

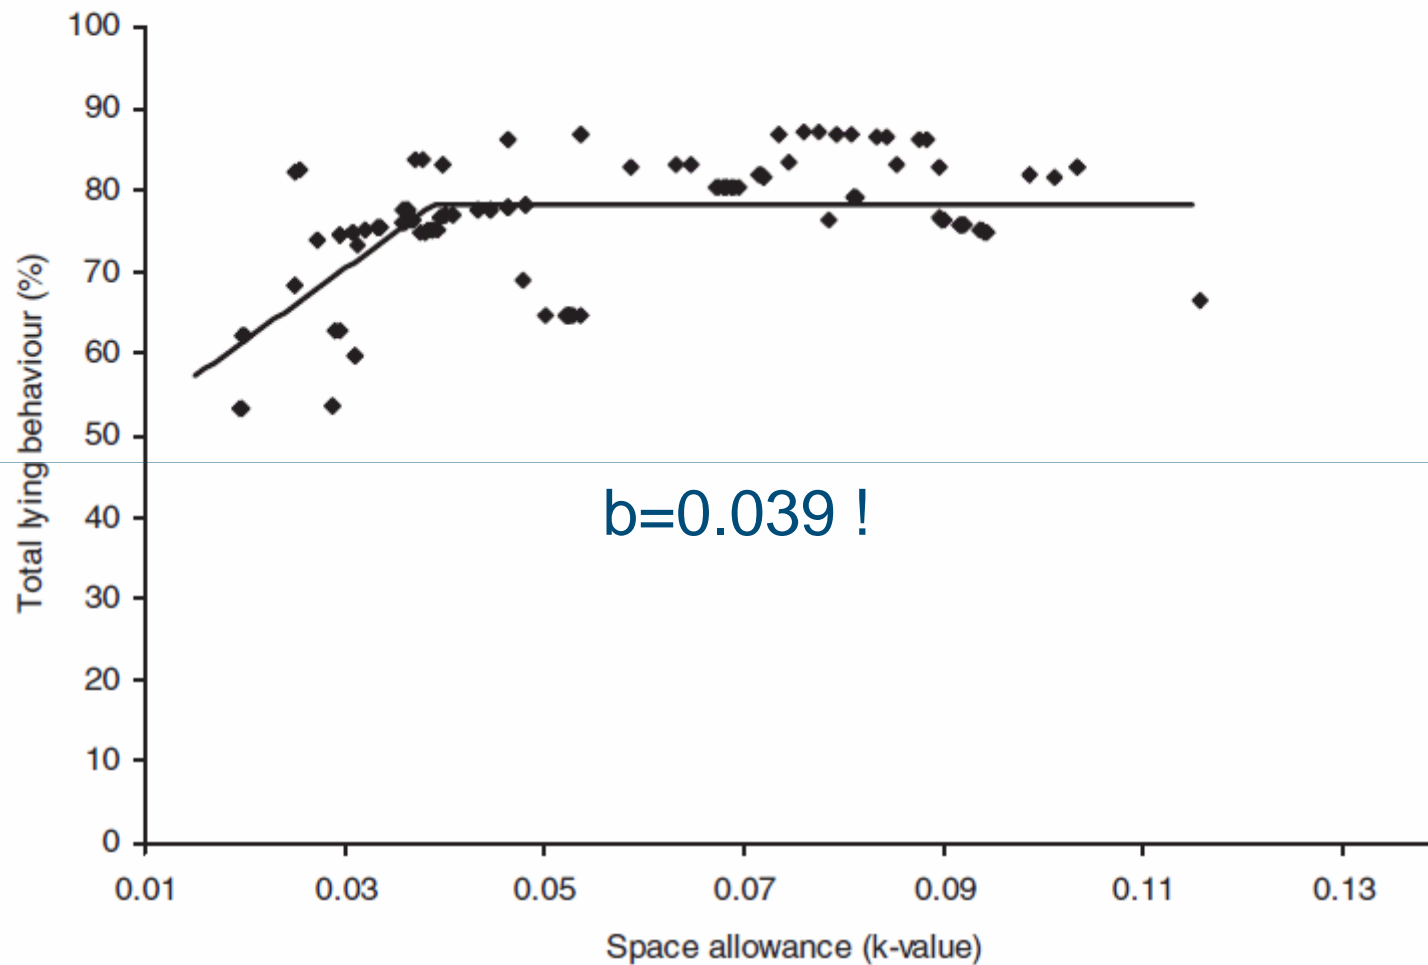

“ Effects of husbandry factors on animal welfare ”

Using meta-analysis

Modelling at its simplest

The animal

Modelling husbandry impacts on animal welfare

Cause: (horizontal axis)

- **Husbandry factors as influencing factors**

Effect: (vertical axis)

- **Behaviour traits as welfare indicators**

+ statistics

**For * Space allowance ; * environmental enrichment ;
* feeding conditions**

Animal component of the Welfare model:

Aims :

Quantify the effect of individual (genotypic/phenotypic) traits, and of factors related to housing and feeding conditions, on different welfare indicators (behaviour, body score) and performance

Methods : Meta-analysis of scientific literature

Factors tested:

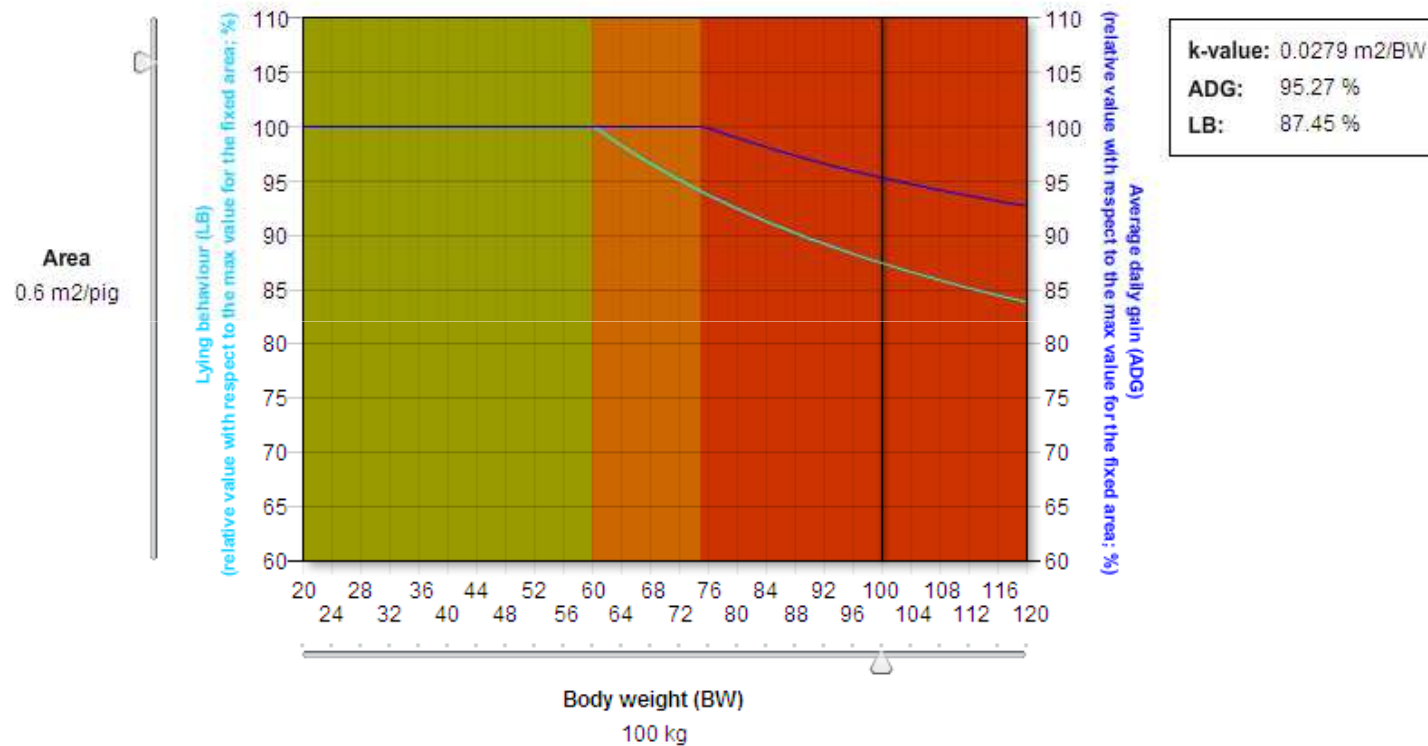

- Pen design : space allowance, group size, floor characteristics, temperature
- Enrichement : straw bedding, recreative object
- Feeding : nutrient content, feeder design, feed allowance
- Pigs' traits : sex, initial bodyweight, genetic

Results : 3 scientific paper in peer-reviewed journals

Animal component of the Welfare model:

Effect of space allowance on performance and behaviour

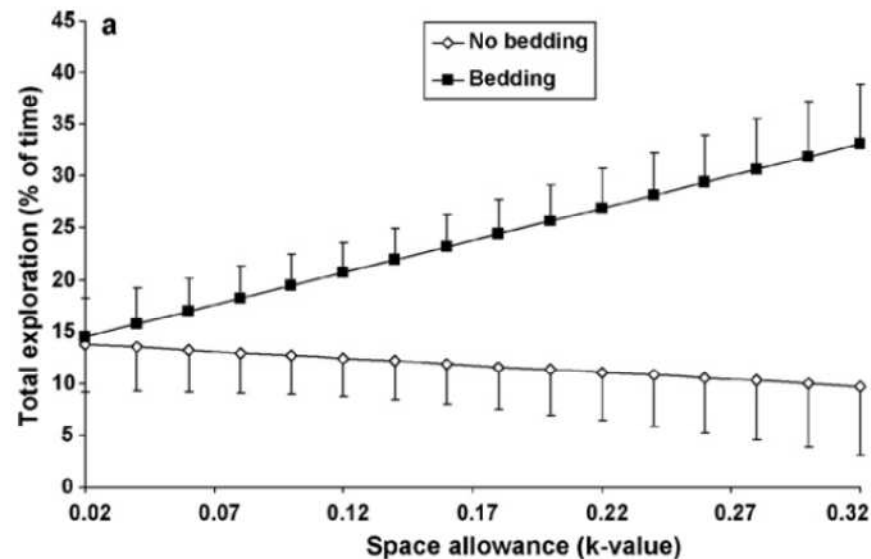

<http://www.gpc-models.dk>

Optimal space allowance is larger for welfare than for performance

Animal component of the Welfare model

Interaction : Enrichement x Space allowance

The effect of space allowance on investigatory behaviour depends on the presence of bedding

The Animal Welfare Model

- Identified four key interest perspectives
 - Animal
 - Farmer
 - Consumer
 - Citizen
- Not easy to combine into one model
 - but is not impossible (*Agent based modelling*)
- Meta-analysis is very well possible
 - Valuable to science and practice

Modelling and Meta-analysis

Applied on three themes

- Meat Quality
- Meat Safety
- Animal Welfare

Lessons learned

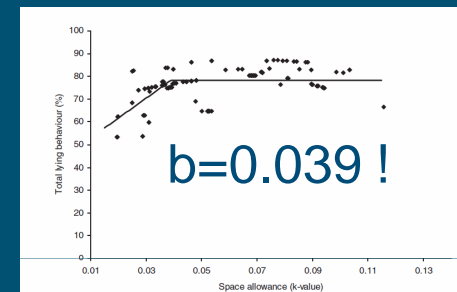

Lessons learned

1) Good meta-analysis requires elegant statistics

2) Even simple modelling is valuable

1) In data: to bring order

2) In idea's: to demonstrate knowledge

3) Some factors are difficult to combine
→ new approaches needed

[animal welfare: human & animal-technical] -> CAS and ABM

Message

Take time to integrate the knowledge that you have
More efficient and more understanding

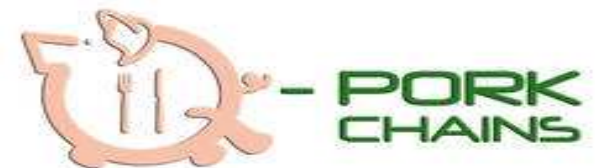

Hire young quality scientists for this

Btissam, Claire, Ilias, Laszlo, Xavi,
