Summary

This report contains the results of the ongoing monitoring program on the incidental bycatch of cetaceans in Dutch pelagic fisheries under EU Council Regulation 812/2004 for the period June 2004 till December 2005. The regulation requires 10% observer coverage in ICES area's VI, VII and VIII in the period 1 December – 31 March. In the Dutch situation the monitoring is integrated with the collection of discards data under the EC Data Collection Regulations 1543/2000 and 1639/2001.

In 2004 and 2005, during 8 fishing trips, lasting 122 days in total, 274 hauls were observed. (In fact 299 hauls were covered, but parts of the trips were in areas not covered by the EU regulation observer scheme). The period of this report covers the whole season of 2004/2005 and part of the season 2005/2006 (due to the obligation to report over the period 1 June 2004 - 31 December 2005, as mentioned in the EU Council Regulation 812/2000).

The period of 1 December 2004 – 31 March 2005 was covered as follows: 1 trip of 17 days, was targeting herring (*Clupea harengus*) and horse mackerel (*Trachurus trachurus*) in the Channel; two trips of 32 days each, were targeting horse mackerel and mackerel (*Scomber scombrus*) west of Ireland; two trips of 49 days each were targeting blue whiting at Porcupine Bank and deep water west of Ireland. With a total 834 days for the whole fleet in the area, the coverage was 11.8%.

In the second season, 1 December 2005 – 31 March 2006, three trips (21 days) for herring and horse mackerel were carried out in the Channel in December. For that part of the season the coverage was 31.2 % (total number of fleet days was 77).

Two bycatch incidents have been recorded during a trip for horse mackerel and mackerel. In these incidents, three common dolphins were accidentally caught, 1 female in a haul at the end of January and two males in a haul in the first week of February. Both incidents occurred after a haul in the morning. In the first incident, the catch consisted of 15 tonnes mackerel with 18% horse mackerel; the second haul consisted of 35 tonnes horse mackerel (1 % mackerel).

The number of recorded bycatch incidents is too low to make a reliable estimate of the annual mortality. The observed bycatch rate of 0.05 dolphins per day, suggests a yearly number in the order of magnitude of tens. Comparison with earlier observer projects from the period 1993-1996, indicates a large inter-annual variability: in some years the bycatch numbers can be as high as several hundreds.

The EU Council Regulation itself indicates that a clear season and area of bycatch, apparently across a number of fisheries, is recognized. It is therefore recommended to report in the future under the EU Council Regulation 812/2004 by season, and not by year.

Samenvatting

Dit rapport bevat de resultaten van het doorlopende waarnemersprogramma naar de bijvangst van dolfijnen in de Nederlandse pelagische visserij onder EU Verordening 812/2004 in de periode juni 2004 tot en met december 2005. De verordening vereist dat 10% van de vlootinspanning gedekt wordt in de ICES gebieden VI, VII en VIII in de periode van 1 december tot en met 31 maart. In de Nederlandse situatie, is het waarnemersprogramma geïntegreerd met het verzamelen van vangst- en discard- gegevens onder EU Verordeningen 1543/2000 en 1639/2001.

In de jaren 2004 en 2005 zijn waarnemingen uitgevoerd van in totaal 274 trekken, uitgevoerd tijdens 8 visreizen van in totaal 122 dagen (de totale lengte van deze reizen bedroeg 180 dagen en 299 trekken, maar een deel van de reizen viel buiten het in de verordening bepaalde gebied en tijdsbestek). Dit rapport dekt het seizoen 2004/2005 en een gedeelte van het seizoen 2005/2006 (dit is een direct gevolg van de verplichting te rapporteren over de periode 1 juni 2004 - 31 december 2005 in EU verordening 812/2004). De periode van 1 december 2004 tot en met 31 maart 2005 werd als volgt gedekt: een reis, van 17 dagen, was gericht op haring (*Clupea harengus*); twee reizen, van 32 dagen elk, was gericht op horsmakreel (*Trachurus trachurus*) en makreel (*Scomber scombrus*); twee reizen, van 49 dagen elk, was gericht op blauwe wijting bij Porcupine Bank en in diep water ten westen van Ierland. De dekking ten opzichte van de hele vloot in het gebied (834 dagen) was 11.8%.

Tijdens het tweede seizoen, 1 december 2005 – 31 maart 2006, werden alleen in de maand december reizen uitgevoerd. De waarnemingen werden uitgevoerd tijdens drie visreizen op haring en horsmakreel met een dekking van 21 dagen. Voor dat deel van het seizoen, was de dekking 31.2 % (op een totaal van 77 vlootdagen in het gebied).

Er werden twee bijvangst incidenten gerapporteerd tijdens een reis op horsmakreel en makreel. Hierbij werden respectievelijk een vrouwelijke gewone dolfijn en twee mannelijke gewone dolfijn gevangen. Beide trekken vonden plaats in de ochtend, voor het grootste gedeelte in het donker. Voor de trek van het eerste incident werd gehaald tijdens de schemer, terwijl de vangst bestond uit 15 ton makreel met 18% horsmakreel. Bij het halen van het tweede incident was het al licht. De vangst bestond uit 35 ton makreel (1% horsmakreel).

Het aantal gerapporteerde bijvangst incidenten is te laag om een betrouwbare schatting te maken van de jaarlijkse mortaliteit. De waargenomen bijvangst van 0.05 dolfijn per dag, duidt op een getal in de orde van grootte van enkele tientallen per seizoen. Een evaluatie met behulp van gegevens van waarnemerprojecten in de periode 1993-1996, wijst op een grote variatie tussen de jaren: in sommige jaren kan het aantal bijgevangen dieren in de honderden lopen. Een verschuiving van de visserij inspanning van horsmakreel en makreel naar blauwe wijting, maakt een feitelijke afname aannemelijk aangezien er in de blauwe wijting visserij nog nooit bijvangsten zijn waargenomen .

De inhoud van EU Verordening 812/2004 geeft aan dat er sprake is van een seizoen van december tot en met maart. Het zou daarom voor de hand liggen om de rapportage over de voortgang van het waarnemersprogramma, in de toekomst per seizoen te laten plaatsvinden en niet per jaar.

1. Introduction

Council Regulation No 812/2004¹ is obliging Member States to monitor bycatches of cetaceans in certain fisheries, certain periods of the year and in certain European Waters and to report on the results of the monitoring to the European Commission. In the Netherlands, the monitoring was commissioned by the Ministry of Agriculture, Nature Conservation and Food Quality to the Netherlands Institute for Fisheries Research and started on 1 January 2005.

The aim of this study is to assess the incidental bycatch of cetaceans in the Dutch pelagic fisheries. This report covers the ongoing monitoring of Dutch pelagic fisheries over the period July 2004 – December 2006. Under the regulation 10% of the fleet effort in the period of 1 December till 31 March in ICES area VI, VII and VIII has to be covered. Hence this report deals with one full season, December 2004 – March 2005 and part of the next season, December 2005. In the Dutch situation the monitoring is integrated with the collection of discards data under the EC Data Collection Regulations: C.R. 1543/2000² and C.R. 1639/2001³ amended by C.R. 1581/2004⁴.

Earlier studies on the incidental bycatch of cetaceans have been reported by Couperus (1995 and 1997), covering the period 1992-1996.

1.1 Description of the fleet

A description of the Dutch pelagic fleet is given in Couperus et al. 2004. However, an important feature of the pelagic fishery is that it changes rapidly over time. These changes are caused by developments in the fish market, quota regulations and variation in the stock distribution and migration patterns over time. Compared to 2002, the number of Dutch freezer trawlers has decreased from 16 (and one pair) to 14 and one pair in 2005. Landings from Mauritanian waters decreased from 41% in January 2003 to 29% in 2004 and 23% in 2005 (data from the national logbook database). Landings in 2002 were more or less equally divided between horse mackerel, herring and blue whiting and a small part mackerel. In 2004, blue whiting became more important and in 2005 the landings were dominated by blue whiting (Figure 1).

¹ Council Regulation (EC) No 812/2004 of 26.4.2004 laying down measures concerning incidental catches of cetaceans in fisheries and amending Regulation (EC) No 88/98

² Council Regulation (EC) No 1543/2000 of 29 June 2000 establishing a Community framework for the collection and management of the data needed to conduct the common fisheries policy

³ Commission Regulation (EC) No 1639/2001 of 25 July 2001 establishing the minimum and extended Community programmes for the collection of data in the fisheries sector and laying down detailed rules for the application of Council Regulation (EC) No 1543/2000

⁴ Commission Regulation (EC) No 1581/2004 of 27 August 2004 amending Regulation (EC) No 1639/2001 establishing the minimum and extended Community programmes for the collection of data in the fisheries sector and laying down detailed rules for the application of Council Regulation (EC) No 1543/2000

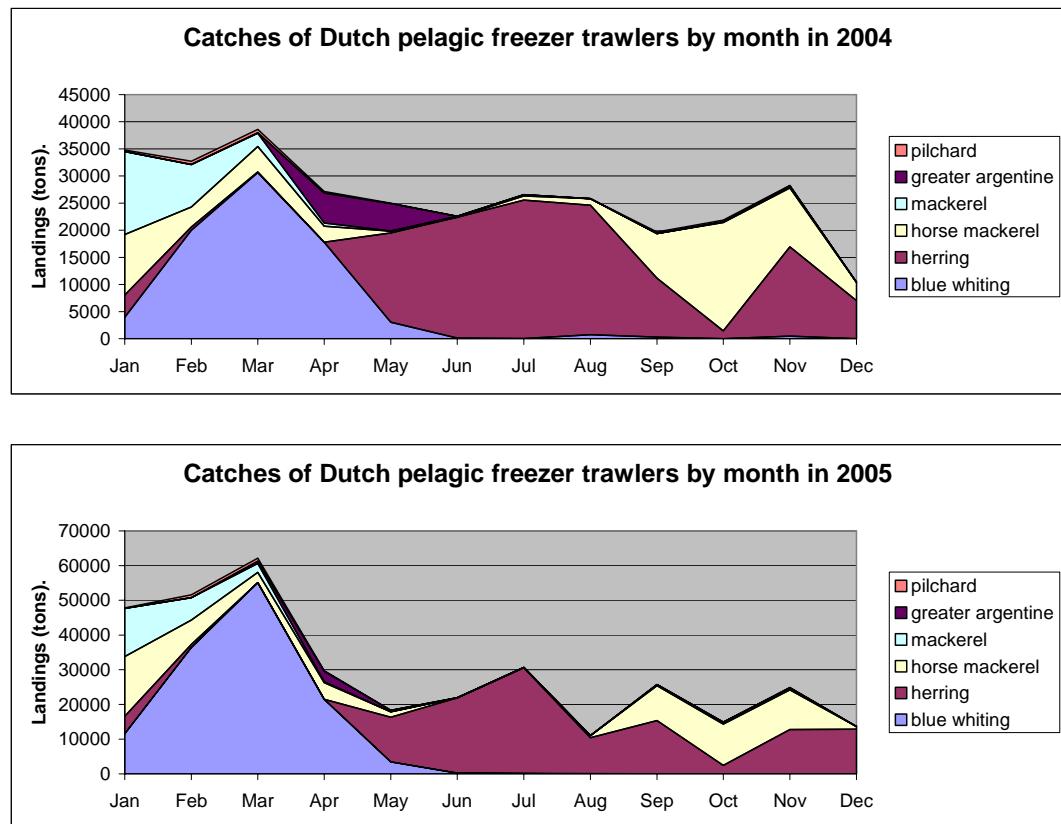

Figure 1. Registered landings from European waters by Dutch freezer trawlers in 2004 and 2005.

1.2 Fishing effort in 2004 and 2005

The changes in target species mentioned above, caused changes in distribution of the effort. In 2005 the effort was more concentrated off the west of Ireland compared to the preceding years. Annex 1 and 2 show the “fish calendars” of 2004 and 2005.

2. Methods

2.1 Observer effort

The monitoring is integrated with the collection of discards data under the EC Data Collection Regulations 1543/2000 and 1639/2001 (EC 2000, 2001). In this programme the observer effort is spread quasi random over the year. Internally the observers and the observer trips are scheduled equally over the year and join the first trawler that comes in. However, the choice of area and target species are often last minute decisions and may even alter during the trip itself. Therefore it is impossible to foresee or plan the exact effort in the area that has to be monitored under the EC Regulation No 812/2004.

In total, 8 trips have (partly) covered the study area and period. Of these, 6 trips (partly) covered season 2004/2005. Part of the 2 remaining trips fell in December, thus covering part of the 2005/2006 season. Table 2 provides the period and target species covered in this observer programme.

*Table 1. Period, target species and ICES area's covered during the trips conducted in this observer programme. *Number of days of the observed fishing trip; **number of days within the period and area to be covered under EC regulation No 812/2004: 1 December till 31 March, area VI, VII and VIII.*

8	28/11 to 15/12/2005	18	15	herring	mackerel	VIIId

According to the national logbook database, the number of fleet days in area VI, VII and VIII during season 2004/2005 was 834. With 98 observer days the coverage was 11.4%. The overall coverage during the period was still 10.4%, showing that most of the fleet have been operating in area VI, VII and VIII. The coverage for the month December 2005 was 31.2 % (table 3).

Table 2. Observer coverage by area and by total fleet effort.

2.2 Registration of bycatch

For each tow, the observer was present on the bridge during shooting and hauling. Position and time were noted at the beginning of each haul. The time was noted again when hauling started. The rear window of the bridge gives a good view on the rear deck, so that possible bycatch of cetaceans can be recorded from there. Of any bycatch, length and sex were recorded. If the crew agreed, the animals were labelled and frozen for further examination at RIVO.

3. Results

3.1 Haul information and bycatches

In total 299 hauls have been observed during the 8 observer trips. Figure 2 shows the plotted positions of all these hauls.

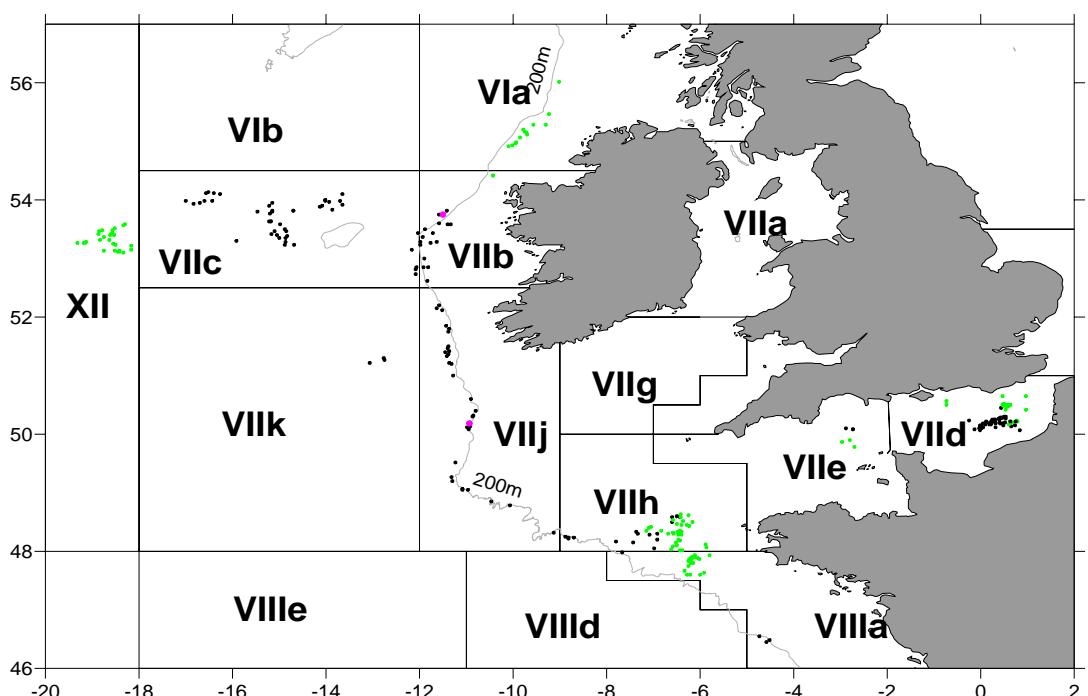

Figure 2. Map with plotted position of the observed trawl hauls during the 8 trips dealt with in this report. The black dots refer to hauls within the period-area which falls under EU council regulation No 812/2004. The pink dots refer to bycatch incidents within the period-area. The green dots refer to hauls outside the period-area of the council regulation.

Of these hauls, 174 were from 1 December till 31 March in area VI, VII and VIII. In the hauls that fell outside the area and period dealt with here, no bycatch incidents were observed.

Incidental catches of cetaceans were observed in two hauls; both during trip 2 (haul numbers 20 and 42). In these incidents three short beaked common dolphins (*Delphinus delphis*) have been caught. Thus, the bycatch rate by haul in the area and period covered here is approximately 1.7 dolphins per 100 hauls. Table 4 provides data on species, length en sex of the specimens.

Bycatches occurred in trawl hauls which were carried out in darkness. In haul 20, the gear had been hauled up at 08.00 o'clock (Dutch time) at dawn. In haul 42 the net was hoisted up at 09.10, during daylight. In both incidents the animals were discovered when the

entrance of the fish pump was disconnected from the codend after the catch had been pumped on board. The animals were dead.

The catch in haul 20 consisted of 15 tonnes of mackerel with 18% horse mackerel. The catch in haul 42 consisted of 35 tonnes of horse mackerel with 1 % of mackerel.

Table 4. Catch data of the three bycaught common dolphins.

bycatch no.	trip no.	haul no.	date	latitude	longitude	sex	length (cm)
1	2	20	30-01-2005	53°45N	11°30W	V	200
2	2	42	06-02-2005	50°11N	10°56W	M	208
3	2	42	06-02-2005	50°11N	10°56W	M	210

4. Discussion

The number of reported bycatches was too small to necessitate further analysis. The bycatch rates will be compared to rates from an earlier project in the 90ies and be evaluated in the light of developments in the fishery.

Table 5 shows the bycatch rates from observer trips in the 90ies and the season 2004/2005. The catch rate, for example of dolphins per day, is highly variable due to the low number of incidents. The highest rate from the observer trips is found in 1995, but we know from accounts of skippers and dolphin specimens that have been brought ashore, that the number of bycatches in 1994 was probably much higher than in 1995 (Couperus 1995). However, from the number of days in the area (834 in 2004/2005) one may carefully conclude from these figures that the number of bycaught animals is in the range of tens per year and in some years in the range of several hundreds.

*Table 5. Bycatch rates by haul and day between 1 January and 31 March in 1993-1996 and between 1 December and 31 March in the season 2004/2005 in ICES area's VI, VII and VIII. Data from the period 1993-1996 are from 6 observer trips reported in Couperus (1994), Couperus (1995), and Couperus (1997). Dolphin species involved were Atlantic white-sided dolphin (*Lagenorhynchus acutus*; n=7), short beaked common dolphin (*Delphinus delphis*; n=6) and long-finned pilotwhale (*Globicephala melas*; n=1).*

	haul s	days s	Inci dent s	dolphin s	inc/ haul	dolphins/ haul	inc/day	dolphins/da y
1993	75	25	0	0	0.00	0.00	0.00	0.00
1994	105	48	5	6	0.05	0.06	0.10	0.13
1995	37	13	1	3	0.03	0.08	0.08	0.23
1996	47	26	4	5	0.09	0.11	0.15	0.19
04/05	143	63	2	3	0.01	0.02	0.03	0.05

Has the rate of bycatch increased or decreased? In the 90ies, bycatch incidents within the study area have been found to be related to the target species. Incidental bycatches are exclusively encountered on observer trips heading for horse mackerel and mackerel, along the shelf edge, west of Ireland. In the blue whiting fishery, generally in deeper waters west and northwest of Porcupine Bank, no bycatch incidents have been recorded both in the 90ies and in this study. Apart from chance this may explain the relatively low rates in 1993 and 2004/2005, because the observer effort in both years was concentrated on the blue whiting fishery. In addition, in the 2004/2005 season 15 days of effort was spent on a mixed fishery for herring and horse mackerel in the Channel. The increased observer effort in the blue whiting fishery reflects the increased fishery effort for this species (See figure 1). Therefore it seems likely that the number of cetacean bycatches have decreased compared to the period 1993-1996.

The two incidents in this study seem to fit in this picture. However, there are a few observations which are worth to mention.

According to Couperus (1997) 90% of the incidental bycatches in Dutch pelagic fisheries occurred in the period January – April, along the shelf edge, west of Ireland. The most frequently caught species was the Atlantic white-sided dolphin (85%), followed by common dolphin (7%), long-finned pilot whale (7%) and bottlenose dolphin (1%). This figure was based on specimens brought ashore and voluntary accounts of crewmembers. In contrast, the number of recorded common dolphins (6) in six observer trips during the same years was similar to the number of white-sided dolphins (7). Strikingly, in the two recorded incidents in this observer study, again common dolphins were caught.

Both bycatch incidents occurred earlier in the season compared to the observations in the 90ies (Couperus 1997) when – with a few exceptions - the bycatches started in the second half of February. While the freezer trawlers west of Ireland were targeting horse mackerel, the start of the bycatches seemed to be related with the occurrence of mackerel. The latter species had been overwintering north of the North Sea and migrates in January and February southwards along the shelf edge. During the observer trips in the 90ies, mackerel was absent from the catches in January and the first half of February. Hence the observation of bycatch incidents at the end of January and the beginning of February seems to suggest that something has changed. In both catches mackerel, together with horse mackerel, were present. Mackerel apparently had arrived earlier in the area than was normal in 1994-1996, which is possibly related to the timing of the two incidents.

How high are the observed bycatch rates in comparison to other fisheries in the region? The ICES Working Group for Marine Mammal Ecology (WGMME) collected rates for some fisheries in the area (ICES 2006). The UK bass fishery which operates in the western approaches of the Channel was reported to have a catch rate of 0.66 dolphins/haul in 2004-2005 with an estimated total mortality of 145 specimens (Northridge, Mackay et al. 2005) for the whole fleet. The Irish pair pelagic trawl fishery for albacore revealed high catch rates in 1998, 1999 and 2002 (respectively 0.31, 0.44 and 0.14), but much lower rates in 2003 and 2004 (0.02 and 0.06), which was explained by some improvements in avoidance techniques by the Irish fleet (ICES 2006).

In 2004 - 2005 a European pilot project PETRACET was carried out. It assessed the impact of pelagic trawling in winter in area VII and VIII (ICES 2006). In 2004 and 2005, 952 tows were observed (amongst it hauls from a Dutch freezer trawler trip in March 2004). Of these, 371 were targeting anchovy, 295 bass, 44 horse mackerel, 92 mackerel and 150 tuna. Of these 21 tows had some bycatch in which 93 dolphins were involved, mainly (96%) common dolphin. The main bycatch was concentrated on a few occasions in the bass and tuna fishery. For example, from the French bass fishery in 2004 and 2005, 1 trip with 5 incidents has been recorded, with one incidental catch of 44 dolphins at once. The UK bass fishery was not included in PETRACET, but was assessed during the main period by a national project. Extrapolation of the observed hauls, together with the observations in the UK bass fishery, resulted in an annual bycatch of less than 1000 dolphins in ICES area's VII and VIII, which is supposed unlikely to exceed 1.7% of the population estimate (roughly 500.000) given by ICES (2006). However, it was noted that the PETRACET project covered only trawl fisheries, whereas it is known that dolphins are caught in other fisheries in the area. Moreover, the estimate was based on a 12 month period and does not reflect any inter-annual changes, which may be substantial. In the Irish pelagic trawl fishery and the UK bass fishery a more than ten fold difference was observed over five years of sampling. Given the findings in the 90ies, the same may be true for the Dutch pelagic fishery. Similar as in the Irish tuna fishery, Couperus (1994) found in the Dutch pelagic fishery that the total number of bycatches was greatly influenced by a few incidents in which tens of dolphins were involved.

It seems not possible to estimate the bycatch rate with any accuracy with the current observer effort, due to the high number of hauls without bycatches. At present, the bycatch rate found so far in the Dutch pelagic fishery is relatively low, compared to some other fisheries in the region. The total mortality caused by Dutch pelagic freezer trawlers in the 2004-2005 season is in the order of magnitude of several tens. However, data from the 90ies suggest that the bycatch rate may vary, partly induced by changes in the quota's of pelagic target species.

There is a clear season and area during which the probability of bycatch is increased, apparently across a number of fisheries. It is therefore recommended to report in the future under the EU council regulation 812/2004 by season, and not by year.

Bycatch rates in the ICES WGMME are generally expressed as dolphins or incidents per haul, which enables comparisons between observed rates in different fisheries. However, direct extrapolation to the national fleet(s) is difficult because the official records of the fishery effort and landings, is expressed as days at sea and not as number of hauls per day or hours of hauling. It should be emphasized that, in the pelagic fishery, the search of fish concentrations is also part of the effort.

5. Acknowledgements

I would like to thank the skippers and crew of the sampled vessels for their co-operation with the project. I would also like to thank Ronald Bol, Mario Stoker, Martien Warmerdam, Arie Kraayenoord en Anne van Duyn for their hard work on board of the vessels.
This project is funded under EU Regulation 812/2004; collection of fisheries data under the Common Fisheries Policy.

2. Fishing days 2005
3. Trawl list

Annex 1

Fishing days by ICES area in 2004. her=herring; hor=horse mackerel; bw=blue whiting; mac=mackerel; arg=greater argentine; hke=hake. Codes between brackets refer to much less important target species. Cells with bold borders indicate the area and period of this monitoring programme. Data from the national logbook database.
