# The inside-out research library: managing research output beneficially

Peter van Boheemen at Elag 2013, Ghent

# Overview

- Unanswered questions
- Needs
- What to do to fulfill these Needs

# Questions and no answers

# I want to search the catalogue to find everything our university has ever published

We don't have that. Most staff write articles in journals and we only catalogue the journal

# I want to search the catalogue to find all monographs our university has ever published

We do not collect all of that systematically, except for dissertations!

# I want to search the catalogue to find all dissertations our university has ever published

We can not distinct them from dissertations from other universities

# Questions and no answers

# I want to search the repository to find everything our university has ever published?

The repository only covers output published after 1993

# I want to search the repository to find everything our university has ever published since 1993?

The library can not guarantee this is complete. Researchers are asked to register publications in the repository.

# What are the most highly cited journal articles in the repository?

We do not record that kind of meta data in the repository.

### Needs

- We need better coverage of local output
- Libraries should care about meta data of local output
- We need more and better local meta data
- We need to get rid of these silo's of meta data

# We need better coverage of local output

# We need to get rid of meta data silo's

- We carefully register meta data of publications in our catalogue, following internationally accepted strict rules
- We are doing this in thousands of places in the same way
- We are not registering specific local meta data
- We may do this in our catalog, but we leave that up to unqualified research staff in a separate repository.
- So we often end up with 2 incomplete registrations

#### Psychologisation in times of globalisation

Jan De Vos UGent (2012) Concepts for Critical Psychology.

Mark

#### abstract

Today more than ever, our understanding of ourselves, others and the world around us is described in psychological terms. Psychologists deeply influence our society, and psychologicaldiscourse has invaded companies, advertising, culture, politics, and even our social and family life. Moreover, psychologisation has become a global process, applied to situations such as torture, reality TV and famine. This book analyses this 'overflow of psychology' in the three main areas of science, culture and politics. The concept of psychologisation has become crucial to current debates in critical psychology. De Vos combines these debates with insights from the fields of critical theory, philosophy and ideology critique, to present the first book-length argument that seriously considers the concept of psychologisation in these times of globalisation. The book contains numerous real-world examples making it an accessible and engaging analysis that should be of interest to researchers, postgraduates and undergraduate students of psychology and philosophy.

"October 2003."

Bibliography Includes bibliographical references (leaves 23-26).

Abstract Price dispersion among commodity goods is typically attributed to consumer search costs. We explore the magnitude of consumer search costs using a data set obtained from a

major Internet shopbot. For the median consumer, the benefits to searching lower screens are \$2.24 while the cost of an exhaustive search of the offers is a maximum of \$2.03. Interestingly, in our setting, consumers who search more intensively are less price sensitive than other consumers, reflecting their increased weight on retailer differentiation in delivery time and reliability. Our results demonstrate that even in this nearly-perfect market, substantial price dispersion can exist in equilibrium from consumer non-price attributes.
