REPORT 86.88 (APS 5)

Pr.nr. 505.0720

Project: Development of spectroscopic methods of analysis.

Subject: Application of decision criteria based on "Adequate peaks" for identification of anabolics in real samples.  
(APS series, part 5).

Preceeding reports: 86.47 (APS 1), 86.48 (APS 2), 86.49 (APS 3) and  
86.87 (APS 4).

---

Aim

Demonstration of the applicability of a new approach for identification of chemical compounds in real samples by infrared spectroscopy.

Summary

Infrared spectra of real samples suspected to contain anabolics were made, using a Bruker IFS-85 FTIR spectrometer and a Barnes diffuse reflection attachment.

Identification of compounds is performed with the help of so-called "Adequate Peaks Tables". Therefore a library of adequate peak table files of anabolics and related compounds was set up (see APS 3, RIKILT Report 86.49). The selection of the adequate peaks is carried out according to objective criteria (see APS 2, RIKILT Report 86.48). The presence of a compound in a sample is proved by searching to what extent the adequate peaks of that compound are present in the spectrum of the sample. This search is also carried out according to objective criteria.

The method is applied to a number of injection solutions (cases 1-6) or implantation sites found in cows, and suspected to be application sites of anabolics (cases 7-18).

However, the method is not restricted to this kind of compounds and samples.

Conclusion

The method described offers a new and efficient approach for unambiguous identification of chemical compounds in real samples, by objective, digitalized criteria.

## 1. CASES 1-6

Six samples of solutions, suspected to be injection solutions for illegal administration of anabolics for cattle, have been analysed. By a method consisting of extraction, HPLC separation and purification, followed by bi-dimensional HPTLC separation, purification and detection, the presence of medroxyprogesterone acetate (MPA) was detected.

This had to be confirmed by infrared spectrometry.

### Procedure

0.5 ml of injection solution was mixed with 5 ml of hexane. The analyte was extracted 5 times with 1 ml of acetonitrile. The collected acetonitrile extracts were evaporated to dryness under a stream of nitrogen. The residue was dissolved in 400 µl methanol/water (60:40 v/v), filtered over a membrane filter and chromatographed by HPLC.

### Chromatographic conditions

The HPLC-column, Hypersil ODS with the length of 15 cm and a diameter of 4.5 mm, was used for cleaning the extract.

Gradient-elution was used.

### Injection volume

The fraction with retention time characteristic for medroxyprogesterone acetate, as determined by a medroxyprogesterone acetate reference solution, was collected and evaporated to dryness under a nitrogen stream.

### IR procedure

The residue is redissolved in some methanol and transferred into a few milligrams of potassium bromide. After drying, the mixture is ground and transferred into a sample microcup of the Barnes diffuse reflection apparatus.

### Infrared conditions

Bruker IFS-85 Fourier Transform Infrared Spectrometer.

Barnes diffuse reflection attachment.

Resolution: 2 cm<sup>-1</sup>.

Number of scans: 100.

Reference spectrum: KBr under the same recording conditions.

The "double beam" spectrum was corrected for water vapour.

No background correction was performed.

The sample spectra (case 1-6) and the reference spectrum of medroxy-progesterone acetate are presented in the Annex.

#### Results

IR investigation, using the "Adequate Peak Search", confirmed the presence of medroxyprogesteron acetate in all cases, see Table 1. The complete search data, from which Table 1 is taken, are reported in the Annex. In the listings the best score is indicated by --• and the second best score by --••.

The presence of MPA is confirmed in all cases.

Table 1. Score list of the Adequate Peaks Search for 6 samples of injection solutions.

Case	Filename	Best score = MPA	Second best score
1	MON 42073	100	45
2	MON 42093	90	37
3	MON 42095	100	42
4	MON 42096	100	40
5	MON 42097	100	42
6	MON 42098	100	40

#### 2. CASES 7-15

In the slaughter-house administration sites were found in the neck musculature of 9 cows. Implants, consisting of small tablets, proved to be present.

The samples were investigated by IR, and confirmation of the presence of anabolics, using the criteria based upon adequate peaks, was performed.

#### Procedure

One tablet was isolated out of the site of implantation. It was cleaned by rinsing with hexane. Then the tablet was ground and extracted with diethylether.

The ether was evaporated, and the residue was redissolved in methanol/water (60/40 V/V). A part of the solution was chromatographed by HPLC, and a fraction in which the anabolic esters are expected, was isolated. After evaporation of the solvent, the residue was dissolved in 100 µl methanol and transferred into a few milligrams of potassium bromide. The methanol was evaporated and the mixture was ground and then transferred into a sample cup of the Barnes diffuse reflection attachment. An infrared spectrum was recorded as described for cases 1-6. The spectra of the 9 samples were investigated using the "Adequate Peaks Search" method. The spectra and the search reports are presented in the Annex.

Again, in these listings the best score is marked by --•, and the second best score by --••.

### Results

In Table 2 some data from the Adequate Peaks Search data, relevant here, are collected.

A first screening test by HPLC/HPTLC had given the impression that medroxyprogesterone acetate (MPA) was present. This was, however, not confirmed by IR. Neither did related compounds as megestrol acetate (MGA) and melengestrol acetate (MGLA).

Further HPLC/HPTLC analysis pointed out that trenbolone acetate (TBA) should be present. IR investigation, using the "Adequate Peaks Search", confirmed this conclusion in all cases, see Table 2.

For all samples the presence of TBA was also confirmed by GC-MS.

Table 2. Score list of the Adequate Peaks Search for 10 samples of implanted tablets.

Case	Filename	Score TBA	Second score	Score MPA	Score MGA	Score MGLA
7	MON 42123	80	30	0	9	21
8	MON 42124	90	28	0	9	26
9	MON 42125	70	27	0	9	21
10	MON 42126	100	38	18	18	30
11	MON 42127	70	33	9	13	13
12	MON 42128	80	28	9	9	26
13	MON 42129	80	26	0	9	26
14	MON 42130	50	42	9	13	21
15	MON 42144	80	30	9	9	8

The infrared spectra of the samples (case 7-15) and the reference spectra of MPA, MGA, MGLA and TBA are presented in the complete Adequate Peaks Searches.

### 3. CASES 16-18

Three samples of meat, suspected to be administration sites of illegal anabolics, were sampled by the veterinarian authorities. From the samples the suspected administration sites were isolated and analysed by a standard procedure, based upon HPLC separation and UV detection, followed by HPTLC separation and detection of relevant fractions. The results were as follows.

Case 16: dienestrol (DE) positive

Case 17: estriol (E3) positive

Case 18: methyl testosterone (MT) positive

The remaining extracts were used for FTIR investigation.

#### Procedure IR investigations

Case 16. The residue of the meat extract was dissolved in 2 ml methanol. 2 mg of hexane was added to extract fats; this procedure was repeated twice. The methanol phase was evaporated and redissolved in 100 µl methanol. The solution was powdered with 5 mg of KBr. The mixture was transferred to a Barnes diffuse reflection sample microcup, and a DRIFT spectrum was scanned with 2000 scans.

Case 17 and 18. The residues of the HPLC fractions were dissolved in 100 µl methanol, powdered with 5 mg of KBr and a DRIFT spectrum with 1000 scans was recorded (spectrum 17 and 18).

In the spectra matrix interferences were quite obvious.

#### Results

The Adequate Peaks Searches were applied on the spectrum obtained; the results are collected in Table 3.

Table 3. Score list of the Adequate Peaks Search for 3 samples of administration sites.

Case	Conditions	Filename	Score
16	2000 scans	MON42156	DE: 76
17	1000 scans	MON42181	E3: 10
18	1000 scans	MON42182	MT: 75

In case 16 the presence of dienestrol is confirmed.

In case 17 the amount of estriol, if present, is too less for confirmation.

In case 18 the presence of methyl testosterone is confirmed.

#### 4. CONCLUSION

The Adequate Peaks Search offers a reliable method for unambiguous confirmation of the presence of anabolics.

False positive results are excluded to the highest possible degree.

The method does not judge about the absence of an analyte.

In case of the presence of implanted tablets (case 7-15), infrared spectroscopy offers the easiest and quickest method of analyses. In less than half an hour a complete confirmation analysis can be performed.
