

Pesticides in surface water: Procedure for the use of monitoring results in Product Stewardship and authorisation

May 14th 2013, Rik de Werd

Outline

- Motivation
- Explanation of the procedure
- Testing phase & implementation
- Summarising conclusions

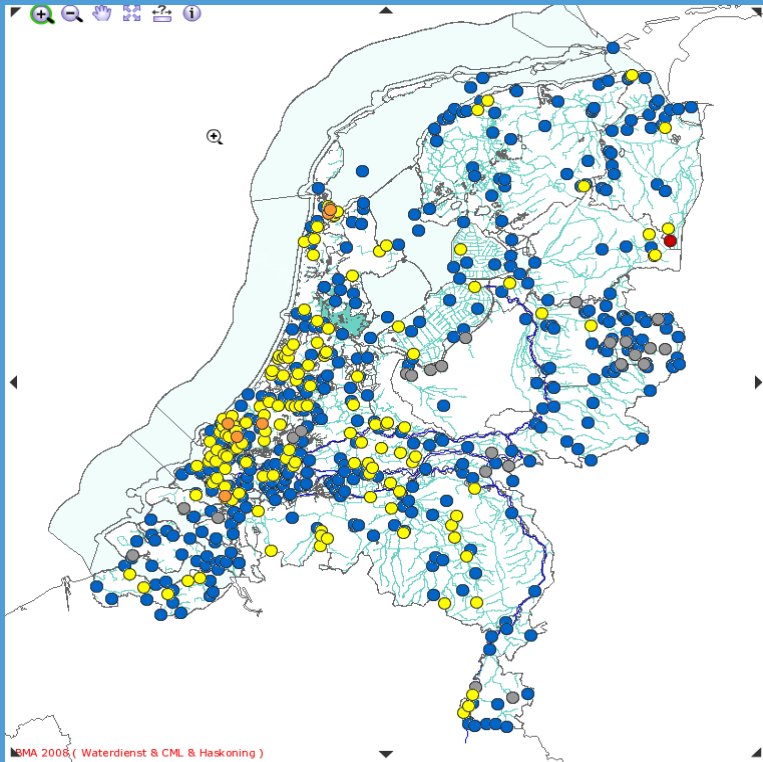

Note:

- This presentation describes a proposed method
- Changes might occur before formal implementation

Motivation: frequent EQS exceedances

*% exceeding measurement per location
data 2011, MAC-EQS (Pesticides' Atlas)*

- Pressure to meet WFD goals

- European Water Framework Directive
- EU Sustainable Use Directive

Boundary conditions for the new procedure

- Exceedances in WFD Water bodies —————>
obliged authorisation adjustments possible
- Plausible relation needed between a registered use and standard exceedances
- Responsible role authorisation holders (Syngenta, BASF, etc.)

Procedure overview:

3 main steps

Monitoring (*water authorities*)

1

yearly: Identification and
ranking of problematic
substances

Deltaris / Pesticides' Atlas

2

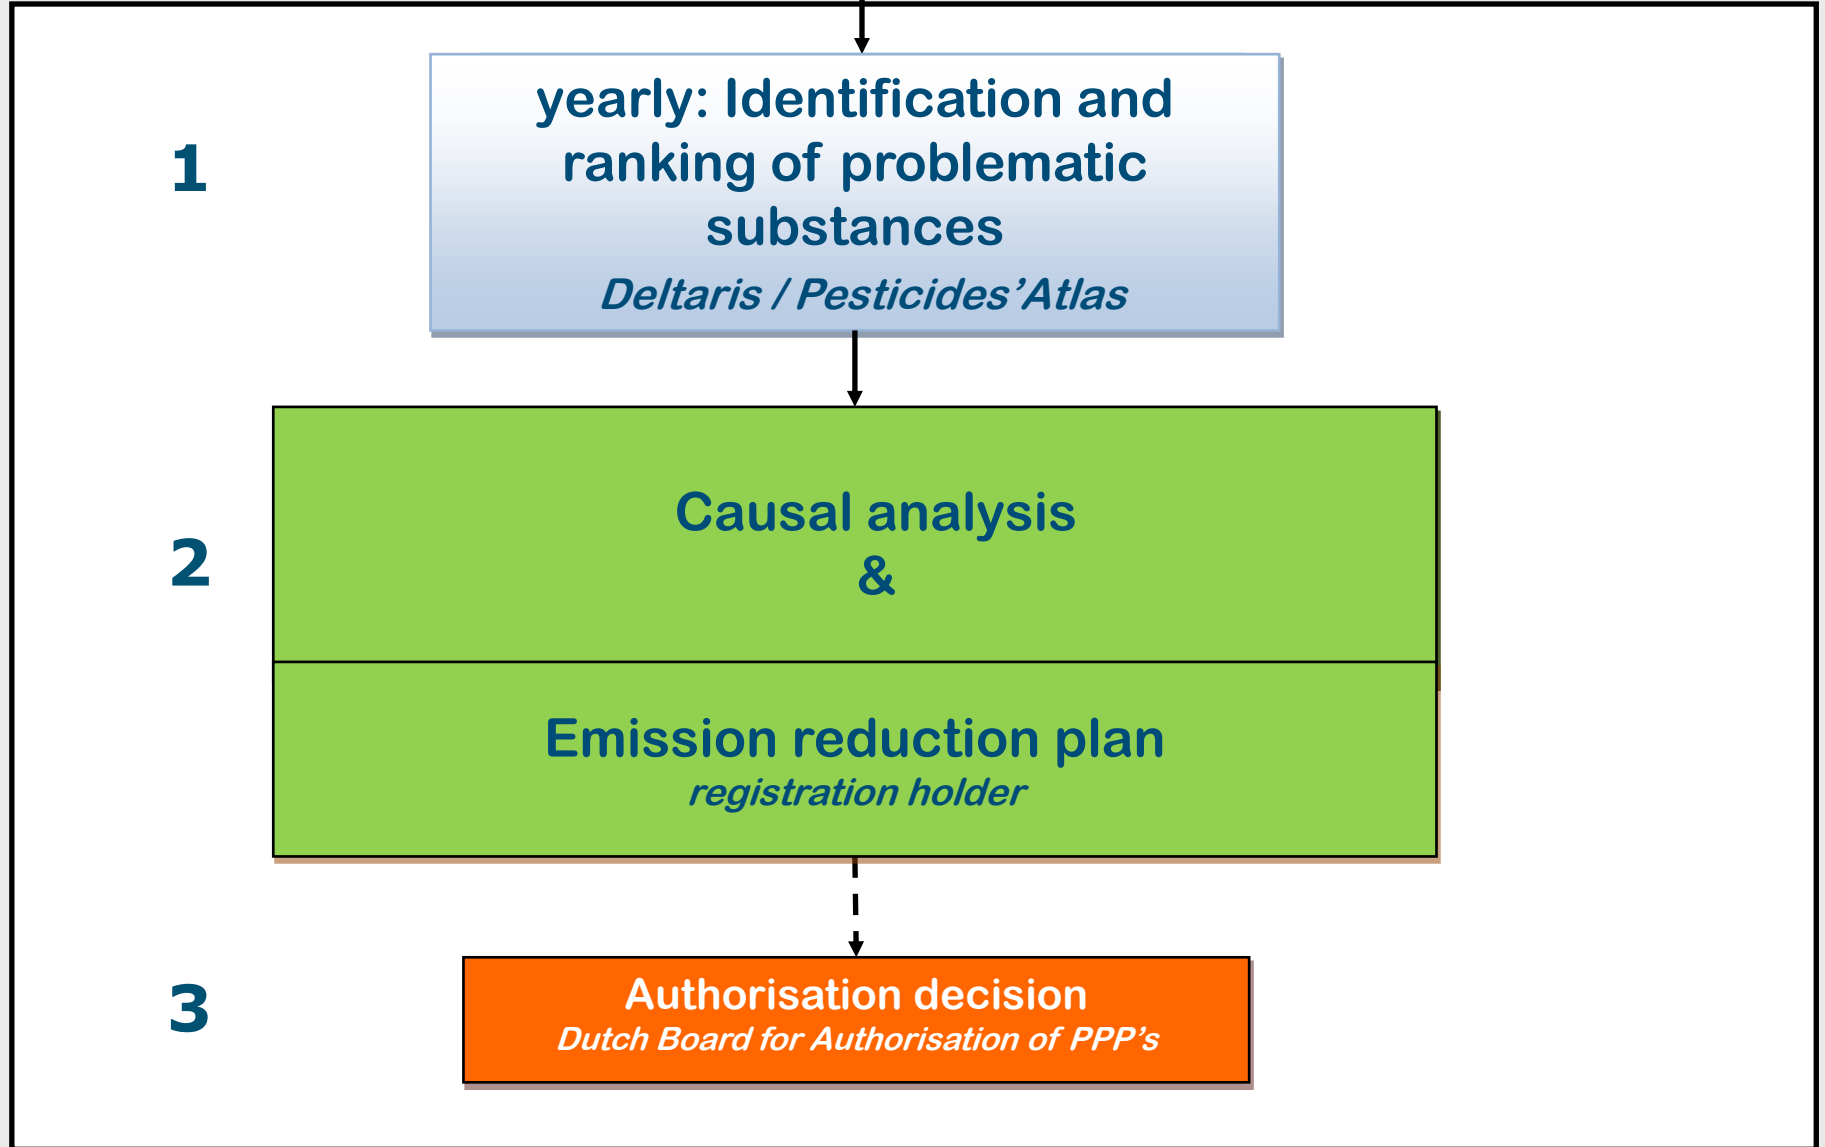

Causal analysis
&

Emission reduction plan
registration holder

3

Authorisation decision

Dutch Board for Authorisation of PPP's

1: Identification 'problematic substances'

- Pesticides' Atlas = source monitoring data
 - National database monitoring results
 - Mostly monitoring by regional water authorities
- AA-EQS & MAC-EQS exceedances relevant
- Exceedance in WFD water body is selection criterion
- Three most recent years
- Substance list yearly updated

Ranking

- Weighing includes exceedances outside WFD Water bodies (in smaller water bodies)
- WFD Priority substance: always prioritised (only few relevant in NL; e.g. isoproturon)
- Exceedances weighed by:
 - Water body type (Official measuring location for WFD, WFD water body, ditch, etc.)
 - Height of exceedances
 - % locations with exceedance

Example substance list (2008-2010)

pnts awarded	substance					
	no.	name	authorizat ion	type	parent compund / metabolite	prior subst.
191	113	isoproturon	yes	PPP	parent	1
23	79	diuron	no	PPP + OA	parent	1
17	50	chloorpyrifos	yes	PPP	parent	1
4	104	hexachloorbutadien	no	PPP	parent	1
9449	231	imidacloprid	yes	PPP + B	parent	2
7610	900	terbuthylazin, desethyl-	yes	PPP	metabolite	2
4255	149	pirimifos-methyl	yes	PPP	parent	2
4215	42	carbendazim	yes	B + PPP	parent + met	2

2: Causal analysis & emission reduction plan

For which substances on the list?

Voluntarily by authorisation holders:

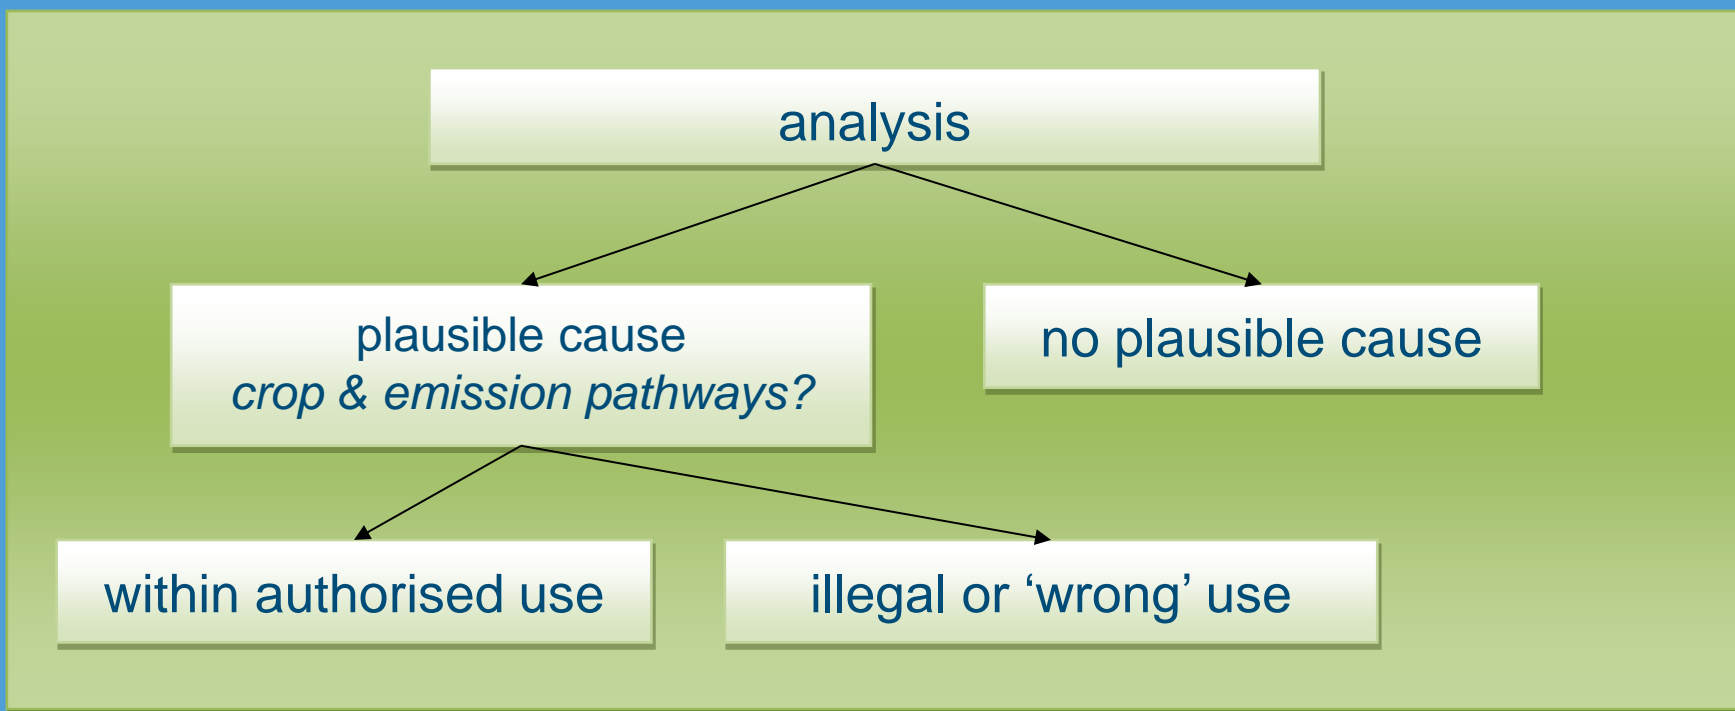

Or mandatory

- Yearly meeting government – authorisation holders to decide which substances to take action upon
 - Highly ranked substances: interim re-authorisation possible
 - In regular re-authorisation (regularly every 10 years)
 - For new authorisations for substance already on the market (if standard exceeding).
- Results included in 'draft registration report'

2: Causal analysis:

- Responsible use (crops) and emission pathways?
- Relation authorised use --- exceedances?

3 or 5 phases:

National scale

- 1 Compilation 'standardised' factsheet
- 2 Expert consultation & analysis

Optional: further analyses

- 3 Addition factsheet
- 4 Expert consultation & analysis

5 Final conclusions

Subjects:

- 1 Substance properties
- 2 Dutch Registration
- 3 Agricultural use data
- 4 Emissions to surface water
- 5 Surface water monitoring results

Standard sources for Phase 1 Fact sheet:

- Substance properties: Registration report / registration holder
- Authorised use NL: Authorisation board / registration holder
- Agricultural use data: Statistics Netherlands & LEI - WUR
- Calculated emissions to surface water:
 - Dutch National Environmental Indicator (NMI)
 - Registration report (optional)
- Measurements (Pesticides' Atlas)

Expert consultation

- Who? Companies (registration holder, advisory company), research, water authorities, etc.
- Why?
 - Additional or better information
 - Create support for outcome
- How?
 - Digital Crop Protection Platform for expert consultation and expert interaction (transparency)

Phase 5: Final conclusions of the causal analyses

- Level of detail in conclusion varies strongly with available information
- Contribution of wrong use to exceedances is described if data available
- Summarised in a table

Example conclusions table (fictional):

	% Use	Spray drift	Surface run off	Lateral leaching	Point source pollution	Etc .
Cut flowers covered	30%	Not applicable	Not applicable	Plausible cause	Plausible cause: discharge of nutrient solution	
Seed potatoes	20%	Not a plausible cause	Not a plausible cause	Not a plausible cause	Not a plausible cause	
Lilies	Etc.	Possibly a cause	No data available	Possibly a cause	Plausible cause	
Sugarbeet (seed coating)		Not a plausible cause	Not a plausible cause	Not a plausible cause	Not a plausible cause	
Etc.						

Emission reduction plan

- Must connect to the outcome of causal analysis
- May consist of use restrictions, awareness campaigns, technical solutions, etc.
- Time frame depends on necessary measures

- Effectiveness:
 - monitoring and yearly update of responsible authorities.
 - Authorities decide whether enough progress is made. If not, the ERP may need to be adjusted

Experiences causal analysis

Realistic test cases with *Syngenta, Bayer, BASF & Certis*

- Procedure is transparent and proves to be applicable.
- Model or national information is amended with valuable information from 'the field'.
- Factsheet & expert consultation prevents narrow focus, but is time consuming and added values sometimes limited
- Limitation on emission pathway data becomes clear (e.g. point source pollution)
- Results analyses useful for evaluation emission reduction plans

Implementation

- Emission reduction plans included in Dutch National Action plan for Sustainable Use Directive
- Causal analysis and Emission reduction plans included in Dutch national policy note on Sustainable Crop Protection
- Formal implementation expected in 2013
- Board for Authorisation already makes use of monitoring data in authorisation procedures (new authorisations for substances already on the market)

Summarising conclusions

- Procedure for formal feedback of PPP monitoring results from surface water is ready to use
- Transparent causal analysis with expert consultation in combination with fact-finding
- Use of monitoring data, PPP use data, emission calculations and more
- Important role for authorisation holders
- The methodology will be applied in authorisation procedures, but can also be used on voluntary basis
- Formal implementation expected this year

Thank you!
