**THE LOGANIACEAE OF AFRICA XII
A REVISION OF *MITREOLA* L.**

A. J. M. LEEUWENBERG

*Laboratory of Plant Taxonomy and Plant Geography,
Agricultural University, Wageningen, The Netherlands*

(Received 3-IX-1974)
Published 31 Januari 1975

INTRODUCTION

The present publication is a revision of all species of *Mitreola* based on the material available in many European, one African, and some American herbaria, among which all type specimens. As the delimitation of the species could be well fixed on the basis of this material alone no specimens were requested on loan from other herbaria. Almost all specimens examined are cited. The present author supposes that studies of the entire material may yield more information on distribution but very probably not on the delimitation of the species.

HISTORY OF THE GENUS

LINNAEUS described *Mitreola* accurately in his *Hortus Cliffortianus* (1737), based on a specimen preserved in the Gronovius herbarium, which he cited. This is still well preserved in the British Museum and agrees completely with the description according to the present author. In his *Species Plantarum* (1753), however, LINNAEUS reduced *Mitreola* to a synonym of *Ophiorrhiza*, citing his first publication with *O. mitreola*. Afterwards he mentioned *Mitreola* again in his not well known *Opera Varia* (1758).

In his later publications (1759, 1762, 1764, 1767, 1774), however, he maintained the opinion published in his far better known *Species Plantarum*. The existence of LINNAEUS's two different opinions concerning this taxon resulted in the nomenclatural history described below.

Not aware of LINNAEUS's publications, WALTER (1788) described two species, without placing them in a genus, as *Anonymos petiolata* and *A. sessilifolia*. These GMELIN (1791) shortly afterwards transferred to the genus *Cynoctonum* newly proposed by him.

443819

Falling back on the earliest generic name G. DON (1838) made the combination *Mitreola sessilifolia*, incorrectly placing *Ophiorrhiza mitreola* L. and *Cynoctonum petiolatum* J. F. GMEL. in its synonymy. Without being aware of DON's book BENTHAM and GRAY (1841) repeated this transfer, making the combination *Mitreola petiolata* as well. They realised themselves that both *Ophiorrhiza mitreola* and *Cynoctonum petiolatum* are names for one and the same species.

BENTHAM (1856) followed TORREY and GRAY in the nomenclature and described a third species, *M. pedicellata*.

Presently, when LINNAEUS'S Species Plantarum (1753) internationally had been accepted as the starting point of botanical nomenclature, BRITTON (1894) rejected *Mitreola* as genus name but used the earliest epithet for the first species known, resulting in the new combination *Cynoctonum mitreola*. In accordance with him B. L. ROBINSON (1910) transferred *M. pedicellata* to *Cynoctonum* and LEENHOUTS (1962) described the new species *C. sphaerocarpum*.

This state of affairs should be considered in connection with the fact that many authors did not know LINNAEUS'S Opera Varia (1758) and that others regarded them as a neglectable uncritical publication of no weight in which ideas were upheld that LINNAEUS had rejected five years before. In fact, it was a reprint of his Syst. Nat. ed. 4. 1744. This rejection was, moreover, confirmed in many of his later publications some of which had been consulted.

Recently DANDY (1967) considered the Opera Varia of interest and saw to them that they received international recognition. This resulted in the reinstalment of *Mitreola* as a genus and consequently to the combination *M. sphaeroarpa* (Leen.) Leen. (1972).

Meanwhile JOVET (1934) described two new species from Madagascar in *Mitreola* one of which is maintained in the present revision.

The last species discovered is *M. reticulata* Tirel (1969).

The genus was placed by G. DON (1838) in the *Spigeliaceae*, a family which soon afterwards was reduced to a tribe of the *Loganiaceae* by DE CANDOLLE (1845). In this the latter author was followed by most authors. The only ones following G. DON are HUTCHINSON (1959) and DANDY (1967). Beside the latter opinions, the only worth noting here is SPANOGHE'S (1841), who described *Mitreola petiolata* as *Selenocera secundiflora* in the tribe *Hedyotideae* of the *Rubiaceae*. BENTHAM and HOOKER f. cited him, apparently without seeing the specimen or they would certainly have recognized the true identity of the plant.

RELATIONSHIP TO OTHER GENERA

The genus *Mitreola* belongs to the tribe *Spigeliae* of the *Loganiaceae*, showing the greatest resemblance to *Mitrasacme* in the shape of the fruit. The latter genus, however, has a 4- instead of a 5-merous flower and an induplicate-valvate instead of an imbricate aestivation. Besides, the two genera show other conspicuous differences, unfortunately difficult to define, in habit, in the inflorescence, and in the shape of the corolla.

Mitreola can be distinguished from the other genera of the *Spigelieae* as follows:

1. Capsule 2-horned; ovary often halfinferior; style cleft from the base at anthesis or shortly after 2
- Capsule bilobed with rounded lobes or ellipsoid; ovary superior; style not cleft 3
2. Flowers 4-merous; internodes of inflorescence much longer than the flowers or inflorescence one-flowered; leaves often rosulate. Asia, Australia **Mitrasacme**
Flowers 5-merous; internodes of inflorescence shorter than the flowers, sometimes elongate after anthesis and then slightly longer than the fruits; leaves not rosulate **Mitreola**
3. Capsule bilobed, leaving a basal cupula after shedding of valves; inflorescence usually cincinnous; aestivation valvate. America (only *S. anthemia* L. naturalized in Africa and Asia) **Spigelia**
Capsule ellipsoid; valves not shedding; flowers solitary; aestivation imbricate; repeatedly dichasially branched procumbent herb with linear leaves. America **Polypremum**

GEOGRAPHICAL DISTRIBUTION

The small genus *Mitreola*, in which 6 species are maintained here, is widely distributed, but the distribution of the individual species is very different and raises many questions about its possible origin. Three species are local endemics: *M. reticulata* is only known from North Vietnam, *M. sphaerocarpa* only from Mt. Kinabalu in Sabah, and *M. turgida* from a small area around Majunga in northern Madagascar. Two species have a wider distribution: *M. pedicellata* is known from Nepal, northern India, Bhutan, and China, whereas *M. sessilifolia* occurs in the southern United States. The sixth and last species, *M. petiolata* is very widely distributed. Its area is much larger than that of all other species together. It occurs in moist open places which may dry up in the dry seasons between the vegetation periods of this annual herb. *M. petiolata* is common in America from the south-eastern and southern United States to Rio de Janeiro, Brazil, in tropical Asia, Nepal, and northern Australia, but is rare in West Africa. In none of the countries where it occurs it can be definitely said to be introduced. It is possible, however, that it had the opportunity to enlarge its area as a weed in rice fields especially in tropical Asia, but the records from Africa give the impression of being due to natural occurrence. They are all quite far from the coast.

Type species: *Ophiorrhiza mitreola* L. (= *M. petiolata* (J. F. Gmel.) Torr. et Gray).

Heterotypic synonyms: *Cynoctionum* J. F. Gmel., Syst. 2: 443. 1791, not E. Mey.; Britton, Mem. Torr. Bot. Cl. 5: 258. 1894; B. L. Robinson, Proc. Amer. Acad. Arts Scie. 45: 396. 1910; Britton & Brown, Ill. Fl. N.E. U.S. & Canada 2: 730. 1913; Britton & Milspaugh, Bahama Fl. 329. 1920; Gleason, New Britton & Brown, Ill. Fl. N.E. U.S. & adj. Canada 3: 54. 1952; Leenhouts in Fl. Males. 1. 6: 375. 1962; Gleason & Cronquist, Man. Vasc. Pl. N.E. U.S. & adj. Canada 547. 1963. Type species: *Cynoctionum sessilifolium* J. F. Gmel. (= *M. sessilifolia* (J. F. Gmel.) G. Don).

Selenocera Zipp. ex Span., Linnaea 15: 316. 1841. Type species: *S. secundiflora* Zipp. ex Span. (= *M. petiolata* (J. F. Gmel.) Torr. et Gray).

Parophiorrhiza C. B. Clarke in Hooker f., Fl. Br. Ind. 3: 85. 1880. Type species: *P. khasiana* C. B. Clarke (= *M. pedicellata* Benth.).

Herb, annual and erect or perennial and creeping at the base. Leaves opposite, petiolate or sessile, those of a pair equal or subequal (*M. pedicellata*); stipules well developed or reduced to a transverse ridge. Inflorescence terminal and/or axillary, usually long-pedunculate, dichasial with long cincinnat branches. Flowers shortly pedicellate to sessile, 5-merous. Calyx mostly almost parted to the base, glabrous or minutely papillose outside, glabrous inside; lobes ovate to oblong or triangular, green in the central part, diaphanous whitish at the edges, acute or less often obtuse, entire, erect, persistent under the fruit, without colleters. Corolla urceolate, longer than the calyx, outside and inside on the lobes papillose, in the throat with hairs in a penicillate or pilose ring; tube mostly contracted at the mouth, mostly slightly longer than the lobes; lobes oblong or triangular, acute or less often obtuse, entire, erect, imbricate in bud. Stamens included, inserted just above the corolla base; filaments glabrous, about as long as the anthers or less; anthers suborbicular, ovate or elliptic, 0.2–0.4 mm long, glabrous, introrse, apiculate to retuse at the apex, mostly deeply cordate at the base; cells parallel, discrete, dehiscent throughout by a longitudinal slit. Pistil glabrous; ovary halfinferior, globose or nearly so, with an indented line turning deeper at anthesis, 2-celled; style short or very short, longitudinally cleft at anthesis by the enrolling carpels; stigma subcapitate or bilobed, wider than the style, mostly torn when the corolla is shed. In each cell one orbicular peltate placenta with about 30 ovules outside. Fruit capsular, 2-horned or bilobed; both carpels dehiscent along the ventral suture; horns or lobes erect, divergent, or curved inwards, very variable in length even in a single species. Seed verrucose, reticulate, or smooth, about subglobose or ellipsoid, with fleshy endosperm.

KEY TO THE SPECIES

1. Annual herbs; stems erect; fruit wall mostly not bumpy; seeds mostly smooth 2
Perennial herbs; stems often creeping and rooting at the base; fruit wall bumpy by the seeds; seeds verrucose or reticulate 4
2. Capsules 5–6 mm long, glabrous, longitudinally veined. Madagascar 6. *M. turgida*
Capsules 2–3.5 (–5) mm long, pubescent, papillose, or glabrous, not or sometimes obscurely veined 3
3. Leaves sessile, 6–27 mm long, mostly suborbicular or ovate; last branchings of inflorescence congested; flowers and fruits longer than the internodes in between. S.E. United States 4. *M. sessilifolia*
Leaves petiolate, often larger; inflorescence lax or rather so; flowers and fruits mostly shorter than the internodes 2. *M. petiolata*
4. Leaf-bearing portion of plant several times dichasially branched; inflorescence congested; seeds reticulate; fruit 2-lobed. N. Vietnam 3. *M. reticulata*
Leaf-bearing portion of plant unbranched or irregularly branched mostly at the base; inflorescence lax; seeds verrucose; fruit 2-lobed or not 5
5. Fruit subglobose; both portions apiculate. Borneo 5. *M. sphaerocarpa*
Fruit mitre-shaped; both portions acuminate. Nepal, India, China 1. *M. pedicellata*

1. ***Mitreola pedicellata*** Benth., Journ. Linn. Soc. 1: 91. 1856; C. B. Clarke in Hooker f., Fl. Br. Ind. 4: 79. 1883; Hemsley, Journ. Linn. Soc. 26: 117. 1889; Solereder in Engler & Prantl, Nat. Pflanzenf. 4 (2): 35. 1892. **Fig. 1, p. 6**

Type: India: Sikkim, Tista R., near Tumlong, Hooker 11 May 1849 (K, holotype).

Homotypic synonym: *Cynoctionum pedicellatum* (Benth.) B. L. Robinson, Proc. Amer. Acad. Arts Scie. 45: 396. 1910; Leenhouws in Fl. Males. 1.6: 377. 1962 and 960. 1972.

Parophiorrhiza khasiana C. B. Clarke in Hooker f., Fl. Br. Ind. 3: 85. 1880.
Type: India: Sikkim, Khasi-Jaintia Hills, C. B. Clarke 15181 (K, holotype).

Mitreola darrisii Léveillé, Fl. Kouy-Tchéou 1: 262. 1914. Type: China: Kweichow, Tong Tcheok, Esquirol 3263 (E, holotype).

Perennial herb 5–35 cm high. Stem often creeping at the base and there often with adventitious roots, nearly terete to faintly quadrangular, glabrous. Leaves opposite, those of a pair equal or subequal, petiolate; petiole 3–25 mm long, glabrous or sometimes with a few hairs; blade membranaceous when dry, very variable in shape and size, ovate to narrowly elliptic, 1.2–5 × as long as wide, 1.4–17 × 1.2–4.5 cm, rounded to long-acuminate at the apex, cordate to cuneate at the base or even decurrent into the petiole, entire, glabrous on both sides or

FIG. 1. *Mitreola pedicellata* Benth.: 1-4. habit, $\frac{1}{2} \times$; 5. flower, $18 \times$; 6. fruit, $18 \times$; 7. seed, $36 \times$ (1. Tsiang 5011; 2. Stainton a.o. 273; 3. Ten 72; 4-7. Cavalrie & Fortunat 2016).

sparserly pubescent or pilose above and more or less sparsely pilose beneath. *Inflorescence* terminal and axillary, lax, long-pedunculate, $3-13 \times 1-9$ cm, glabrous. Peduncle $1-3 \times$ as long as the remaining portion of the inflorescence. Bracts small, narrowly triangular to almost linear, about as long as the sepals. *Flowers* 2–3.1 mm long. *Calyx* 1.2–1.7 mm long, papillose to almost glabrous on both sides; lobes triangular, $1-1.7 \times$ as long as wide, acute or less often obtuse. *Corolla* white, 1.7–2.8 mm long, inside sometimes also pilose in the tube; tube $0.7-1.3 \times 1.5-1.7$ mm; lobes triangular, $0.8-1.5 \times 0.6-1.3$ mm. *Stamens* inserted at 0.2–0.8 mm above the corolla base; filaments 0.5–0.8 × as long as the anthers; anthers orbicular or nearly so, mostly deeply cordate at the base. *Ovary* subglobose, $0.8-1.2 \times 1-1.2$ mm; style 0.3–1 mm long. *Capsule* 2-lobed or mitre-shaped, laterally compressed, $2-3 \times 2-3 \times 1-1.5$ mm; lobes or horns erect or divergent and $0.1-0.5 \times$ as long as the fruit; wall bumpy by the seeds. *Seed* obliquely ellipsoid, obliquely tetrahedral, or obliquely hemispherical, verrucose, $0.4 \times 0.3-0.4 \times 0.3$ mm.

Distribution: Nepal, northern India, Bhutan, southern China.

Ecology: Moist places in mountains.

Nepal: Boubkare, near Kali R. (fl. Apr.) Dobremez 13 (BM); near Pokhara (fl., imm. fr. Apr.) Stainton a.o. 2443 (BM, E, UPS); Bhim Khola, E. of Kutharpeket (fl., fr. Apr.) Stainton a.o. 273 (BM, UPS).

Type: Java: between Tegalombo and Slahung, Backer 3400 (L, lectotype). Homotypic synonym: *Cynoctionum mitreola* var. *lilacina* (Backer ex Cammerl.) Bakh. f. in Backer, Bekn. Fl. Java (em. ed.) 7. fam. 170: 4. 1948.

M. tracyi Gandoer, Bull. Soc. Bot. France 70: 921. 1923. Type: U.S.A.: New Orleans, Louisiana, Tracy 7535 (LY, lectotype; isotypes: BM, GH, NY, S, W).

Cynoctionum succulentum R. W. Long, Rhodora 72: 29. 1970; R. W. Long & O. Lakela, Fl. Trop. Florida 691. 1971, syn. nov. Type: Florida: near Manatee, J. H. Simpson 11 June 1890 (GH, holotype).

Erect annual herb 5–80 (–100) cm high, simple or branched from the base. Stem quadrangular to narrowly 4-winged, glabrous; stipules broadly triangular, 1–1.5 mm long. Leaves petiolate; petiole (0.2–) 0.5–3 cm long, glabrous or nearly so; blade membranaceous when dry, ovate, narrowly ovate, or elliptic, 1.2–3 × as long as wide, 1.2–10.5 × 0.5–4.5 cm, acute or obtuse at the apex, cuneate or rounded at the base or decurrent into the petiole, very sparsely appressed-pubescent to glabrous on both sides, ciliate at the entire margin. Inflorescence partly terminating the stem and the few-leaved branches, partly in the highest leaf-axils, widely branched; the ultimate branches 2–15 cm long, slender, glabrous or shortly ciliate under the nodes. Distance between two flowers or two fruits mostly longer than the flowers and fruits themselves. Bracts narrowly triangular or narrowly elliptic, 1.5–3 mm long. Flowers shortly pedicellate to subsessile. Calyx obconical, 1.2–2 mm long, glabrous; lobes ovate or triangular, 0.8–1.5 × 0.5–1.2 mm. Corolla white or less often mauve, 1.5–2.5 mm long; tube 1–1.3 × 1–1.3 mm, glabrous inside; lobes 1–1.2 × 0.4–0.5 mm.

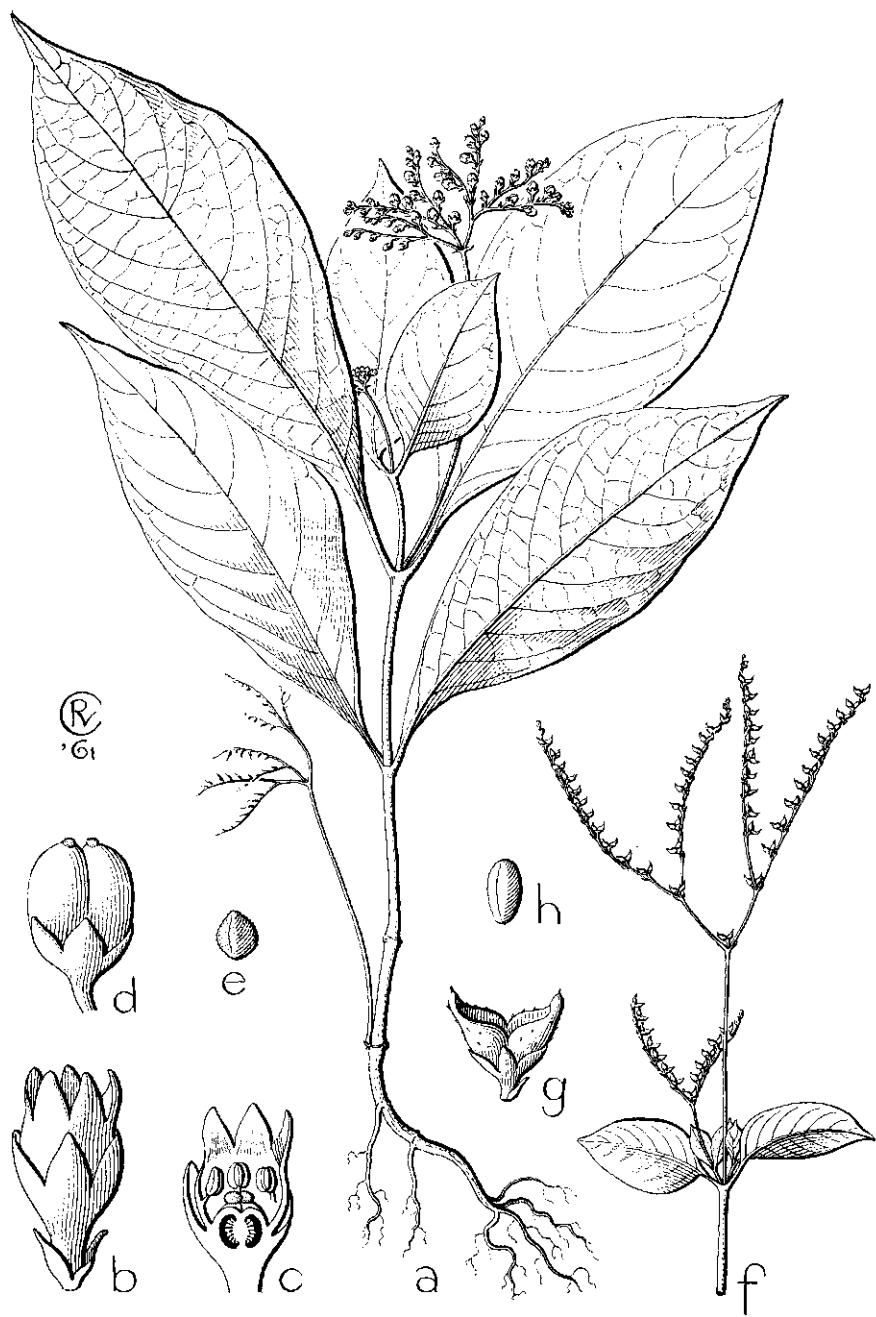

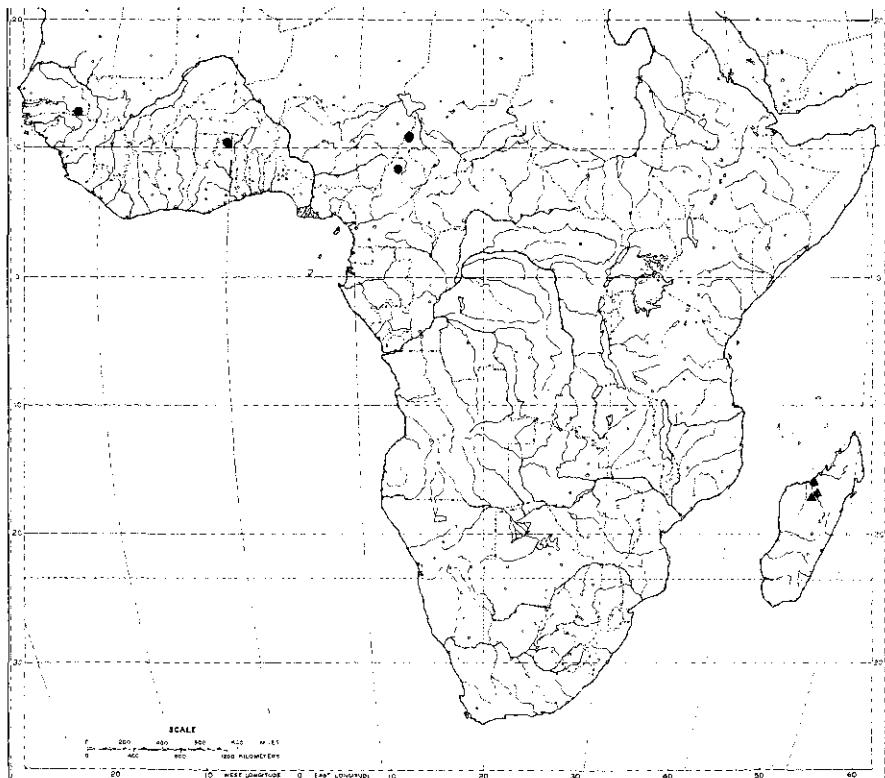

FIG. 3. a-e. *Mitreola sphaerocarpa* (Leenh.) Leenh.: a. habit, $\frac{3}{4} \times$; b. flower, $8 \times$; c. longitudinal section of flower, $8 \times$; d. fruit, $4 \times$; e. seed, $20 \times$ (a. combined from Clemens 29469 and Jaheri 286; b-e. Clemens 29469). f-h. *Mitreola petiolata* (J. F. Gmel.) Torr. et Gray: f. habit, $\frac{3}{4} \times$; g. fruit, $4 \times$; h. seed, $20 \times$ (f-h. Hoogland 4365) (from Flora Malesiana 1. 6. 1962).

Stamens inserted at 0.1–0.5 mm from the corolla base; anthers 0.3–0.4 × 0.2–0.4 mm. *Pistil* 1–1.4 mm long; ovary subglobose, 0.7–0.8 mm in diameter, slightly laterally compressed. *Capsule* 2-horned, 2–3.5 (–5) mm long, ciliate on midrib and along the margins or entirely appressed-pubescent to papillose, not or sometimes obscurely veined, usually not bumpy; the horns shorter to longer than the remaining portion of the fruit, divergent, erect, or curved inwards. *Seed* 0.5–0.7 mm long, mostly shining, dark brown (when mature); either ellipsoid, smooth, and with a longitudinal indented line; or depressed-subglobose, reticulate, with a flat or concave side, and with a rather large hilum; or with an intermediate shape, obscurely verrucose, and with a short indented line.

Distribution: SE. United States, tropical America, West tropical Africa, Nepal, tropical Asia, N. Australia.

Ecology: Forest edges, along roads, on grassy plains, sometimes as a weed on fields; often moist sandy or rocky places, light shade; alt. up to 1000 m; obviously bound to areas subject to a dry season. Flowering at the end of the rainy season.

MAP. 1. • *Mitreola petiolata* (J. F. Gmel.) Torr. et Gray; ▲ *Mitreola turgida* P. Jovet.

Australia: Arnhem Land (fr.) F. Mueller 29 July 1856 (GH, K, 2); sin. loc., herb. Torrey s.n. (NY, 2).

Remarks. Some vigorous young specimens of *M. petiolata* collected in Florida have led to the establishment of *Cynoctonum succulentum* as a distinct species. They have still incompletely developed inflorescences and their basal leaves are still present. Other samples of similar specimens are Proctor 7649 from Jamaica and Sintenis 960 from Puerto Rico.

The seeds of *M. petiolata* show three different forms, the third of which may be considered as intermediate between the others:

1. Subglobose, reticulate, with a flat or concave side and a rather large hilum.
2. Ellipsoid, smooth, with a longitudinal indented line.
3. Intermediate in shape, obscurely verrucose, with a short indented line; resembling those of *M. sessilifolia*.

Shape 1 is found in all extra-American, most South American, all Trinidad, and many Central American specimens.

Shape 2 is found in all North American, Antillean (except Trinidad), and some Central American specimens.

Shape 3 is found in material from northern South and Central America.

The shape of the seeds does not show any correlation with characters of other parts of the plants. Therefore it is here regarded as being without taxonomic significance. It may be supposed that the species originated somewhere in tropical America and was spread to other regions by human activities. The weedy character of the plants collected in Asia may support this supposition. It is striking that the seeds of the extra-American collections are always smooth.

The category of the shape of the seeds is indicated here with the citation of herbarium specimens, where observed. This may permit later authors to go into the matter more deeply.

FIG. 4. *Mitreola reticulata* Tirrel: 1. branch, $\frac{3}{4} \times$; 2. base of stem and roots, $\frac{3}{4} \times$; 3. stipule, $6 \times$; 4. hairs of stipule, $50 \times$; 5. flower, $6 \times$; 6. opened corolla with pistil, $6 \times$; 7. fruit, $6 \times$; 8. opened fruit with placenta, $6 \times$; 9. seed, $40 \times$ (1, 3-6. Pételot 6698; 2, 7-9. Bon 2417) (from Fl. Camb., Laos & Vietnam 13. 1972).

3. **Mitreola reticulata** Tirel, Adansonia ser. 2. 9: 119, pl. 1. 1969; in Flore du Cambodge, du Laos et du Vietnam 13: 77, pl. 13. 1972; Leenhouerts in Fl. Males. 1. 6 (6): 960. 1972.

Fig. 4, p. 20

Type: North Vietnam: Hoa Binh Prov., Muong Thon, Pételot 6698 (P, holotype; isotypes: GH, K, L).

Perennial herb 50 cm high. Stem creeping and rooting at the base, several times dichasially branched. Leaves: petiole glabrous, 3–12 mm long; blade membranaceous when dry, narrowly ovate or elliptic, about 3 × as long as wide, 4–9 × 1.5–3 cm, long-acuminate at the apex, decurrent into the petiole, glabrous on both sides. Inflorescence terminal, congested; peduncle 1–2.5 cm long. Calyx 1.5 mm long. Corolla white (?), 2.6 mm long, penicillate in the throat; tube 1.6 mm long; lobes 1 × 0.8 mm. Stamens inserted at 0.8 mm from the corolla base; filaments 0.5 × as long as the anthers; anthers 0.4 mm in diameter. Ovary subglobose; stigma sessile, bilobed. Capsule 2-lobed, 2 × 2 × 1 mm, bumpy by the seeds; lobes apiculate. Seed obliquely hemispherical or obliquely tetrahedral, 0.4–0.5 × 0.4–0.5 × 0.3–0.4 mm, reticulate, with a large hilum.

Distribution: Only known from two collections of North Vietnam.

Ecology: Moist places on limestone.

North Vietnam: type (see above); Ha Dong Prov., Ban Phet Mts., Bon 2417 (P, paratype).

4. **Mitreola sessilifolia** (J. F. Gmel.) G. Don, Gen. Syst. 4: 171. 1838 (p.p., excl. syns. *Ophiorrhiza mitreola* and *Cynoctonum petiolatum*); Torrey & Gray, Fl. N. Amer. 2: 45. 1841 (unnecessary new combination); De Candolle, Prod. 9: 9. 1845; Bentham, Journ. Linn. Soc. 1: 91. 1856; Solereder in Engler & Prantl, Nat. Pflanzenf. 4 (2): 35. 1892.

Basionym: *Cynoctonum sessilifolium* J. F. Gmel., Syst. 2: 443. 1791 (*Anonymos sessilifolia* Walt., Fl. Carol. 108. 1788); Britton & Milspaugh, Bahama Fl. 329. 1920 (in obs.); Small, Manual S.E. Fl. New York 1046. 1933; Fernald in Gray's, Manual Bot. 8th ed. 1153. 1950.

Type: U.S.A.: Carolina: sin. loc., Th. Walter 685 (BM-WALT, on p. 117 of his book-shaped herbarium).

Misapplied name: *Ophiorrhiza mitreola* Elliott, Sketch Bot. S. Carol. and Georgia 1: 237. 1821, not L. Homotypic synonym: *Ophiorrhiza croomii* Curtis, Plants around Wilmington, N. C., Boston Journ. Nat. Hist. 1: 105, 128. 1835.

Heterotypic synonyms: *Mitreola sessilifolia* var. *angustifolia* Torr. et Gray, Fl. N. Amer. 2: 45. 1841; De Candolle; Prod. 9: 9. 1845; R. W. Long & O. Lakela, Fl. Trop. Florida 691. 1971. Type: U.S.A.: Florida: sin. loc., herb. Chapman s.n. (GH, holotype; isotypes: K, OXF, P). Homotypic synonym: *Cynoctonum angustifolium* (Torr. et Gray) Small, Bull. Torr. Bot. Cl. 23: 129. 1896; Manual S. E. Fl. New York 1046. 1933.

Cynoctonum sessilifolium var. *microphyllum* R. W. Long, Rhodora 72: 27.

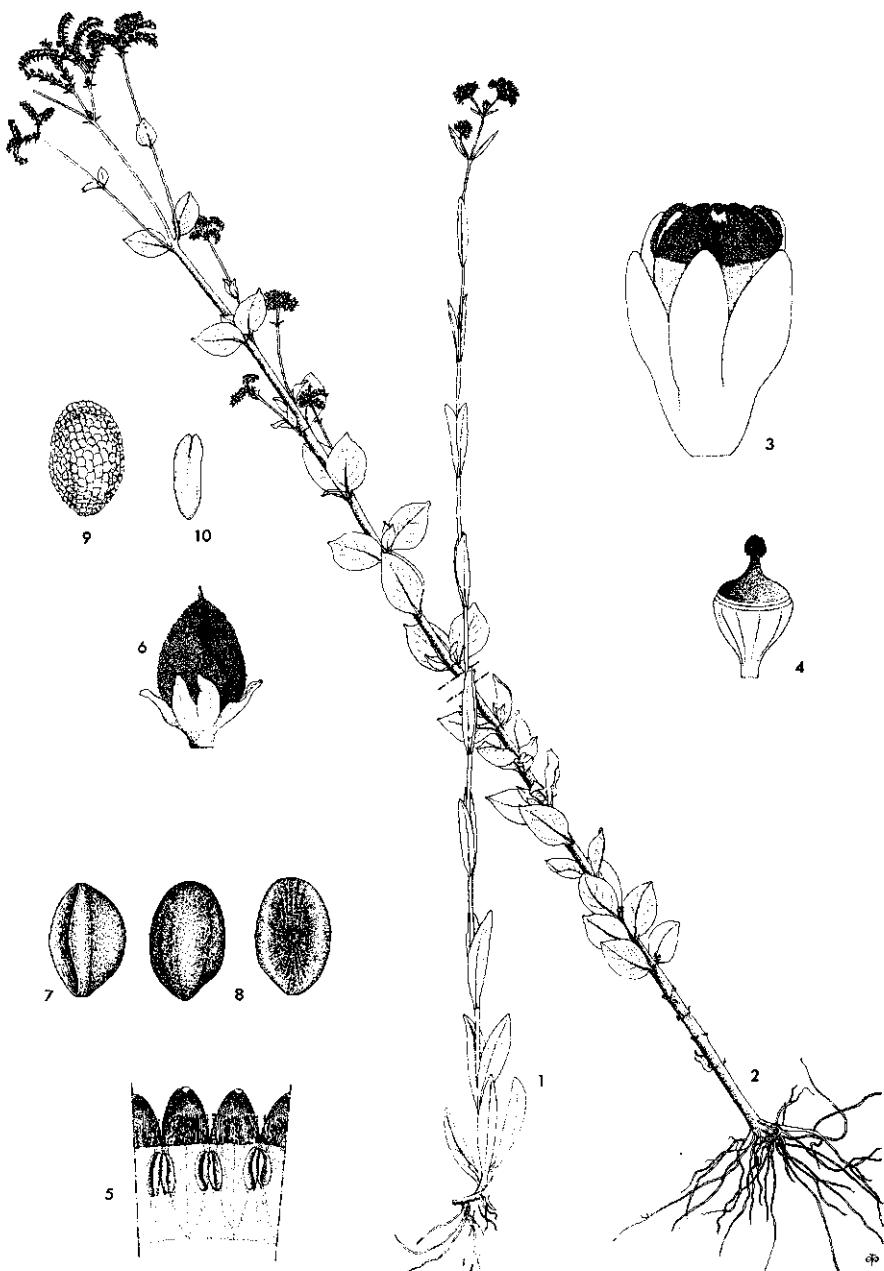

FIG. 5. *Mitreola sessilifolia* (J. F. Gmel.) G. Don: 1-2. habit, $\frac{1}{2} \times$; 3. flower, $15 \times$; 4. pistil, $12 \times$; 5. opened corolla with stamens, $12 \times$; 6. fruit, $6 \times$; 7-8. seeds, $45 \times$; 9. endosperm, $45 \times$; 10. embryo, $45 \times$ (1. A. H. Curtiss 5752; 2-5. Perdue 1732; 6. Vinzent 112; 7-10. Hitchcock 214).

1970; R. W. Long & O. Lakela, Fl. Trop. Florida 691. 1971, syn. nov. Type: U.S.A.: Florida: Bevraud County, 6 km W. of Melbourne, R. Kral 7961 (GH, holotype; isotype: NY).

Slender erect annual herb 10–50 cm high. Stem quadrangular, glabrous, mostly unbranched. *Leaves* sessile, suborbicular, ovate, or elliptic, 1.3–2 (–4) × as long as wide 0.6–2.7 (–3.7) × 0.4–2.1 cm, acute or less often obtuse or apiculate at the apex, rounded or cuneate at the base, glabrous, minutely ciliate. *Inflorescence* terminal and often also axillary, especially in the last branchings congested, 1–4 × 1.5–3 cm. Distance between two flowers or fruits shorter than the flowers and fruits themselves. Bracts somewhat shorter and narrower than the sepals. *Flowers* sessile. *Calyx* 1.8–2.2 mm long, papillose outside, glabrous inside; lobes triangular to oblong, 2–3 × as long as wide, 1.2–1.6 × 0.5–0.8 mm, acute. *Corolla* white, 2–3 mm long, inside penicillate in the throat; tube 1–1.6 × 1–1.4 mm, glabrous inside; lobes triangular to oblong, 0.8–1.4 × 0.5–0.6 mm, acute. *Stamens* inserted at 0.5 mm from the corolla base; filaments as long as the anthers; anthers elliptic, 0.3 × 0.15–0.2 mm, deeply cordate at the base. *Ovary* subglobose, laterally compressed, 0.6–1 × 0.7–1 × 0.4–0.5 mm; style about 0.5 mm long. *Capsule* 2-horned, laterally compressed or not, 2–3 × 2–2.5 × 1.5–2 mm, papillose, not veined; horns erect, divergent, or curved inwards; wall smooth. *Seed* dark brown, shining, obliquely ellipsoid, about 0.4 × 0.3 × 0.2 mm, smooth, obscurely verrucose, or sometimes reticulate, indented at one side.

Distribution: SE. United States.

Ecology: Grassy open moist places, on sand or peat. Alt. 0–250 m.

United States: Virginia: 2 km SE. of Triplett (fl.) J. B. Lewis 24 Aug. 1942 (GH). N. or S. Carolina: Thomas Walter 685 on page 117 of his herb. (BM-WALT, type). N. Remarks: G. DON published the combination *Mitreola sessilifolia* three years before TORREY & GRAY, correctly citing the basionym *Cynoctonum sessilifolium*.

The leaves of *M. sessilifolia* are usually up to twice as long as wide, but in some specimens they are up to 5 times as long as wide. A specimen with narrow leaves (4–5 × as long as wide) has been described as *M. sessilifolia* var. *angustifolia*. Several specimens, however, have leaves about 3 × as long as wide or vary between 2–3 × or 3–4 × and therefore this variety seems untenable. The

same seems to hold for var. *microphylla* (*Cynoctonum sessilifolium* var. *microphyllum*) as there is a continuous range of variation in leaf size. Moreover, the size of the leaves in the type of *M. sessilifolia* varies within the range "reserved" for the latter variety (mostly 1–1.5 cm long).

The letter "i" is added after the symbols of the herbaria cited for specimens with intermediate and an "n" for those with narrow leaves.

The seeds are usually smooth or obscurely verrucose. Reticulate seeds had been observed only in three specimens with narrow leaves (Curtiss 5172, 5752, and Godfrey 55710). The latter fact may indicate that there is introgression with *M. petiolata*. The verrucose seeds of the small specimen, Brace 7115 of *M. petiolata* from the Bahamas which resemble *M. sessilifolia* very much also points to this possibility.

5. ***Mitreola sphaerocarpa* (Leenh.) Leenh.** in Fl. Males. 1. 6: 960. 1972.

Fig. 3, p. 11

Basionym: *Cynoctonum sphaerocarpum* Leenh., Bull. Jard. Bot. Brux. 32: 417. 1962 and in Fl. Males. 1. 6: 377, f. 37, a–e. 1962.

Type: Sabah: Mt. Kinabalu, Tenompok, in Minitindok Gorge, J. & M. S. Clemens 29649 (L, holotype; isotypes: A, BM, K).

Perennial herb about 20–30 cm high. Leaves: petiole 1–1.5 cm long; blade elliptic, 6–14 × 3–6 cm, acute to acuminate at the apex, cuneate at the base or decurrent into the petiole. Calyx 1–1.3 mm long. Corolla white, 2 mm long. Stigma subsessile, very soon cleft after fecundation. Fruit broadly ovoid, bilobed, not or slightly split at the apex, about 3 mm in diameter. Other characters as in *M. pedicellata*.

Distribution: Only known from two collections from Sabah (one seen) and one from Sarawak.

Ecology: Mountains. Alt. about 100–1500 m.

Sabah: type (see above); Sarawak: G. Api, ulu Melinau (fl., fr. Sept.) P. Chai S 30397 (L).

Remarks: *M. pedicellata* and *M. sphaerocarpa* are very closely allied. They differ exclusively in the shape of the fruit, as stated under heading 5 of the key. Moreover, as they are geographically well separated, *M. sphaerocarpa* is maintained here as a distinct species. More collections should be made for additional evidence.

6. ***Mitreola turgida* P. Jovet**, Bull. Mus. Hist. Nat. Paris ser. 2. 6: 296, pl. 2. 1934.

Fig. 6, p. 26; Map 1, p. 12

Type: Madagascar: Mahvarem, near Majunga, Perrier de la Bâthie 9057 (P, lectotype; isotypes: BM, L).

Heterotypic synonym: *M. perrieri* P. Jovet, l.c. p. 292, pl. 1. Type: Madagascar: Ouest Moratraita, right bank Betsiboka R., near Maevatanana, Perrier de la Bâthie 847 (P, holotype).

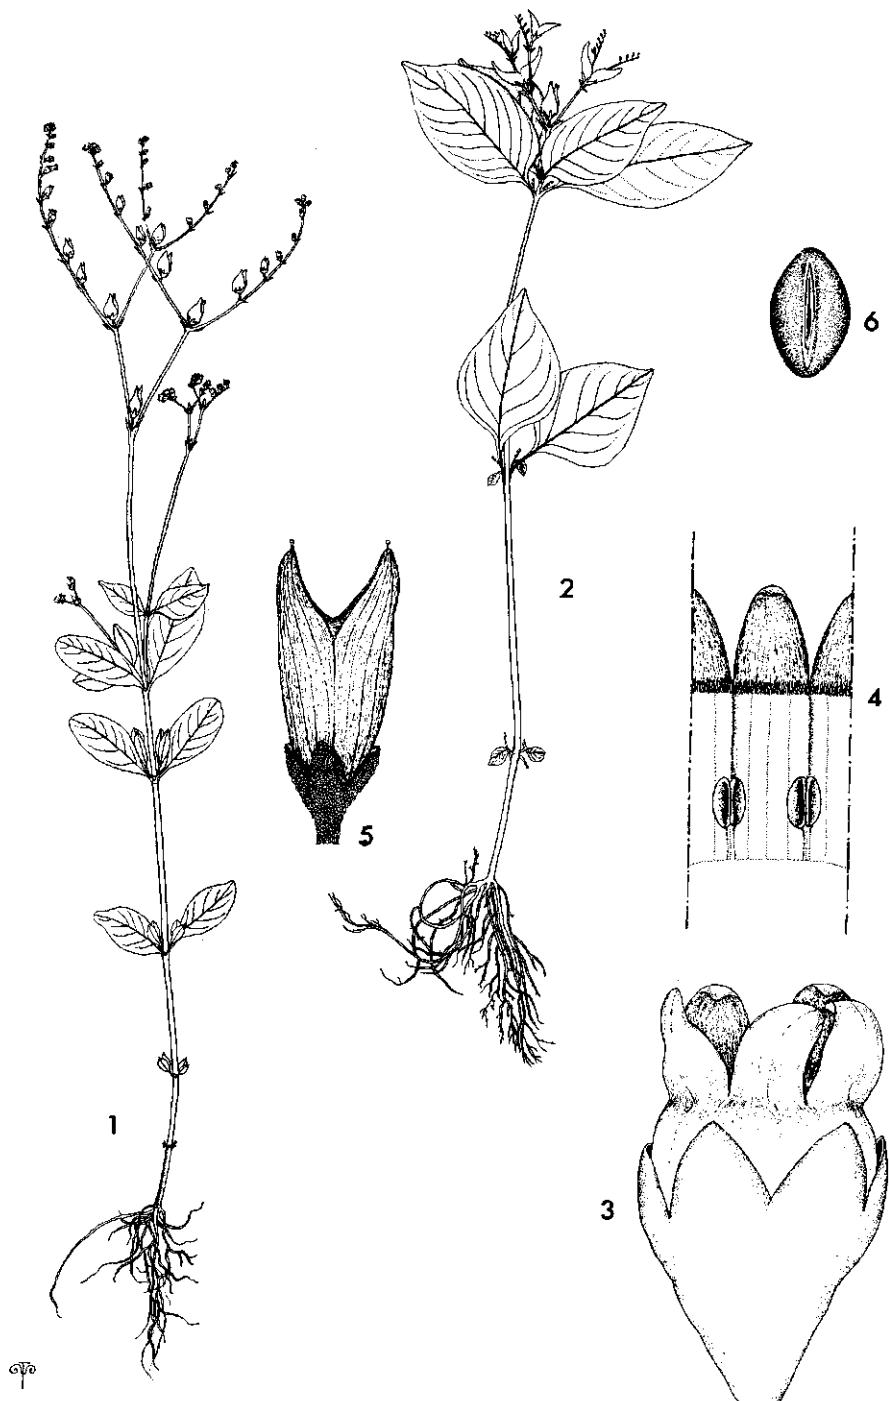

FIG. 6. *Mitreola turgida* P. Jovet: 1-2. habit, $\frac{2}{3} \times$; 3. flower, $24 \times$; 4. portion of opened corolla, $24 \times$; 5. fruit, $24 \times$; 6. seed, $20 \times$ (1, 3-4. Perrier 17268; 2. Perrier 847; 5-6. Perrier 9079).

Annual erect herb 5–25 cm high. Stems quadrangular, with 4 narrow wings, glabrous. Leaves shortly petiolate; petiole 1–7 mm long, glabrous; blade membranaceous when dry, ovate or elliptic, 1.3–2 × as long as wide, 6–46 × 4–23 mm, acute or obtuse at the apex, more or less abruptly narrowed into the petiole, glabrous on both sides, minutely ciliate. Inflorescence very variable in size, terminal and often also axillary, rather lax. Peduncle and branches slender, glabrous. Calyx 1 mm long; lobes 0.5 × 0.4 mm, acute. Corolla white 1.5–2.2 mm long; in throat penicillate ring; tube inside glabrous, 0.8–1.3 × 1–1.2 mm; lobes oblong, 0.7–1 × 0.4–0.6 mm, acute. Filaments inserted 0.1 mm above the corolla base, 0.2 mm long; anthers 0.2 mm in diameter. Ovary 0.5–0.6 mm in diameter; style with stigma 0.2 mm long. Capsule 5–6 × 2–5 × 1.5 mm, glabrous (minutely pilose when immature), with longitudinal veins; horns shorter or longer than the remaining portion, erect or divergent; seed dark brown, shining, ellipsoid, 0.5–0.6 × 0.2–0.3 × 0.15–0.2 mm, smooth, with an indented line at one side.

Distribution: Only known from Majunga and south to Maevatanana and the Ankara Plateau, Madagascar.

Ecology: On limestone, creek banks.

Madagascar: Ouest: Majunga (fl. Apr., fr. Aug.) Perrier de la Bâthie 17268 (P, paratype), 17268 bis (K, P, paratype); Mahvaram, near Majunga (fl., fr. Apr.) Perrier de la Bâthie 9057 (P, holotype; isotypes: BM, L); Katsepe, Majunga Province (fl., fr. July) Waterlot 163 (P); Ambalandiky (fl., fr. June) Bosser 6977 (P); Moratraita, right bank Betsiboka R., near Maevatanana (fl., fr. Mar.) Perrier de la Bâthie 847 (P, type of *M. perrieri*); Ankara Plateau (fr. May) Perrier de la Bâthie 9079 (P).

After comparing the types of *Mitreola turgida* and *M. perrieri* and the other specimens cited the present author concluded that they all belong to a single species. The leaves of the type of *M. perrieri* are ovate or elliptic and acute or obtuse at the apex, like those of the type and the paratypes of *M. turgida*. The blades which have been strongly pressed are smoother than when slightly pressed. The type of *M. perrieri* has one mature fruit, as it is a sample from a population of young plants from a rather shady place. That of *M. turgida* is a sample from a population of fruiting full-grown plants from an open place. Therefore the latter has more numerous fruiting pedicels 1–4 mm long. The flower of the type of *M. perrieri* is not 0.75 but 1.5 mm long, that of herb. Perrier 17268 2.2 mm, and that of Waterlot 163 2 mm long. The corolla is always penicillate in the throat. The horns of the capsule are erect or divergent, as in *M. petiolata*.

NOMEN NUDUM

Ophiorrhiza ovatifolia Muehlenberg, Cat. 20. 1813. = *M. sessilifolia* (J. F. Gmel.) G. Don. Specimen with this name: Gates s.n. (NY).

EXCLUDED SPECIES

Mitreola bodinieri Léveillé, Fl. Kouy-Tchéou 1: 262. 1914. = *Omphalodes bodinieri* Léveillé, Boraginaceae.

ACKNOWLEDGEMENTS

The present author is greatly indebted to the directors and curators of the herbaria cited for putting their material at his disposal. He is also very grateful to Miss YUEN FANG, TAN for the fine drawings and to Prof. dr. K. U. KRAMER for correcting the text. He also wants to express his gratitude to Dr. P. W. LEENHOUTS, the Flora Malesiana Foundation, and Mr. J. E. VIDAL for putting published drawings at his disposal.

The author received a grant from the Netherlands Organisation for the Advancement of Tropical Research (WOTRO) for the last visit to the herbaria of Cambridge, Kew, London, and Oxford.
