FOREWORD

National Soil Reference Collection and Database of Cuba

The objective of this Country Report is to provide comprehensive field and analytical data of a number of reference soils representative for the major soil types of Cuba. The soils were carefully selected, described and sampled. Soil samples are analyzed by INICA and ISRIC laboratories. Additional information on the reference soils is provided in a series of Soil Briefs, comprising information on the environment and soils. The soil information include characterization, classification, evaluation of soil/land qualities and fertilizer recommendation for sugarcane.

The soils described are located throughout the country. Dominant land use in most sites is sugar cane. Some sites situated in mountains support a tropical pine forest (*Pinus caribaea*).

The sites were selected on a number of criteria, such as major soil type, production potential, a high water table (in the Central Region), high salt content (in the Guantanamo Valley), and advanced stage of weathering (e.g. the Nipe clay in the oriental mountain region).

At present the collection comprises 23 soil reference profiles. From each reference soil two undisturbed columns were taken, and specially preserved and prepared into monoliths, ready for exposition. The monolith exposition is housed in Villa Clara in the centre of the country. Duplicate monoliths are included in ISRIC's world soil collection in the Netherlands. It is INICA's intention that the collection will become the "Regional Reference and Information Centre" with reference soils of Latin America and the Caribbean.

The plans for a national collection existed already a long time. It could be realized as a joint cooperation project of INICA and ISRIC in the period 1990 to 1994. The joint project functioned within ISRIC's National Soil Reference Collection Programme (NASREC).

The establishment of the soil reference collection, comprising exposition, database and accompanying documentation has been made possible with the support of many persons, some are mentioned here: Dr. W.G. Sombroek (former director of ISRIC), Dr. L.R. Oldeman (director ISRIC), Drs. J.H.V. van Baren (dep. director ISRIC), Ir. J.H. Kauffman (coordinator NASREC programme), Mr. N. Noguera (University of Zulia, Venezuela), staff of the Soil Department of INICA and the Provincial Sugarcane Experiment Station of Villa Clara.

Rafael Villegas Delgado, Dep. Director INICA

International Soil Reference Collection and Database

The International Soil Reference and Information Centre (ISRIC), founded in 1966 as an initiative of the International Society of Soil Science (ISSS) has a mandate to collect and disseminate scientific knowledge about soils for the purpose of a better understanding of their formation, characterization, classification, distribution and capability for sustained land use at local, national, and global scales. One of ISRIC's main objectives is to assemble soil profiles, soil samples and associated information to illustrate the units of the FAO-Unesco Soil Map of the World. To date, the world soil collection consists of over 800 reference soils from 60 countries, accompanied by soil and environmental data. The collection is supported by a soil map collection, soil reports library, a thin section collection and a slide collection.

The National Soil Reference Collection Programme (NASREC), supported by the Directorate General for International Cooperation of the Netherlands within the Action Plan of National Soil Policies of UNEP, and through ISRIC's own budget has been instrumental to achieve this objective. ISRIC greatly appreciates the cooperation of INICA in their efforts to bring together a National Soil Reference Collection of Cuba.

The collected information of the reference soil profiles is stored in ISRIC's Soil Information System (ISIS), a database management system for storing and retrieving data on geology, geomorphology, hydrology, soil morphology, soil chemical and physical characteristics, and climate.

To disseminate its data, ISRIC has combined the different types of information into several publication series. Each series aims to address the varying needs of those working in one of many fields of research using soils data and soil related data. One of this series is the Country Reports.

The Country Reports, containing all ISRIC held data on soils and associated information of a specific country are generated by ISIS. Additional information on literature references, small scale maps, and a list of slides available in the ISRIC Slide Database is included. The country reports are jointly published by the national institution involved in the collection and ISRIC. A list of Country Reports (in press) is given on the back cover of this report. We are very pleased to release the draft Cuba Country Report at the occasion of the XVth World Congress of Soil Science.

Dr. L.R. Oldeman, director ISRIC

Country Reports can be purchased through ISRIC or the national institution of the country concerned. Publications based on the Country Reports should explicitly indicate the information source. To order Country Reports please contact:

ADDITIONAL REMARKS :

Short field description

Deep, poorly to imperfectly drained, grayish brown clay. The subsoil is strongly mottled, a wedge-shaped angular blocky structure and slickensides.

Water table is present during the rainy season at a depth of about 50 to 100 cm (verbal communications).

Geology: Quaternary Era, Pleistocene; Guevarra Formation: Clays and sandy clay.

Geomorphology: marine plain and terrace, abrasive and accumulative abrasive, slightly undulating.

The poor drainage is somewhat compensated by the cultivation of sugarcane on machine prepared large ridges with a height of 40 to 50 cm.

CLIMATE : Köppen: Aw
 Station: 22 46 N/ 82 8 W 25 m a.s.l 10 km NE of site Relevance: very good

ADDITIONAL REMARKS :

Short field description:

Deep, moderately well drained, yellowish brown, clay. Subsoil is mottled. The soil show slickensides in the subsoil. This site was cultivated with rice before 1979; now the sugarcane variety is Ja 60-5, age 19 months, first ratoon.

Geology: Pleistocene, Guevarra Formation: variegated clays and clayey sand with gravels, sometimes guijarros.

Geomorphology: fluvio-marine plain, plain, slightly undulated and undulated deltaics.

CLIMATE :	Köppen: Aw	Station: 22 33 N / 83 18 W	43 m a.s.l	24 km ENE of site	Relevance: good

PROFILE DESCRIPTION :

Ap 0 - 15 cm. very dark grayish brown (10YR 3.0/2.0, moist) clay; moderate medium subangular blocky structure; sticky, plastic, friable, hard; none mottles; no cutans; common fine pores and few medium pores; moderately porous; many fine roots throughout; no inclusions; no fragments; frequent worm channels ; non calcareous (10% HCL) throughout; abrupt smooth boundary to

Bw 15 - 75 cm. yellowish brown (10YR 5.0/4.0, moist) clay; moderate very coarse subangular blocky into moderate medium subangular blocky structure; sticky, plastic, firm; many medium prominent clear mottles (10YR 6.0/6.0); no cutans; common very fine pores and few medium pores; common fine roots throughout; very few medium spherical hard manganeseiferous concretions; no fragments; few worm channels; diffuse smooth boundary to

Bc 75 - 140 cm. brownish yellow (10YR 6.0/6.0, moist) clay; moderate coarse angular blocky structure; sticky, very plastic, firm; few fine distinct clear mottles (10YR 5.0/2.0); patchy moderately thick cutans on pedfaces; few fine pores; few fine roots throughout; few large irregular hard calcareous concretions; no fragments; gradual smooth boundary to

Cg 140 - 190 cm. yellowish brown (10YR 5.0/8.0, moist) sandy clay; weak to moderate coarse angular blocky structure; sticky, plastic, friable; many coarse prominent clear mottles (10YR 6.0/2.0); no cutans ; few very fine pores;; no inclusions; no fragments;

ADDITIONAL REMARKS :

Short field description

Deep, poorly to imperfectly drained, brownish grey, clay. The subsoil is strongly mottled, has a strong prismatic structure and slickensides.

Geology: Quarternary Era, Higher Pleistocene. Camacho Formation: grey-green and brown clays and sandy clay, sometimes with gravels and small 'guijarros'.

Geomorphology: fluvio-marine deltaic plain, very flat.

CLIMATE : Köppen: Aw

ADDITIONAL REMARKS :

Short field description:

Very deep, well drained, red clay. Diffuse horizon boundaries and moderately structured. From 3 meter starts the hard rock.

The profile was studied and sampled after a heavy rainy season, which ended about 10 days ago.

Geology: mid-low Miocene, Neogene Era. Guines Formation: biogenous limestone, detritic, dolomitic.

Geomorphology: marine plain, abrasive and accumulative abrasive, slightly undulated and plain.

CLIMATE : Köppen: Aw
 Station: 22 47 N/ 81 11 W 25 m a.s.l 1 km NNE of site Relevance: very good

 VEGETATION Type : shrub Status : secondary

ADDITIONAL REMARKS :

Short field description:

Deep, moderately well drained, dark yellowish brown clay with gravel. The soil is moderately porous and has a strong angular blocky structure, showing slickensides on the tilted shearplanes.

Undulating site with different slope gradient toward the lowest parts. The site is flooded during the raining season. There is a not well defined prismatic structure in the third horizon. Small gravels throughout the profile; increasing gravel size with depth.

Geology: Aptiano-Albiano lower Cretaceous. Ataguá formation: calcareous tuff, basic and intermediate lavas, limestone and clastic rock. Geomorphology: abrasive, erosive, undulating marine plains.

PROFILE DESCRIPTION :

Ap 0 - 21 cm. strong brown (7.5YR 4.0/6.0, moist) clay loam; strong very fine granular and strong medium subangular blocky structure; slightly sticky, slightly plastic, firm; none mottles; no cutans; common very fine pores; moderately porous; few medium roots throughout; few small spherical soft manganiferous concretions; no fragments; few worm channels; non calcareous (10% HCl) throughout; gradual smooth boundary to

AB 21 - 48 cm. strong brown (7.5YR 4.0/6.0, moist) clay loam; moderate fine subangular blocky structure; sticky, slightly plastic, firm; none mottles; no cutans; few medium pores and common very fine pores; moderately porous; few medium roots throughout; frequent small spherical soft manganiferous concretions; no fragments; few channels and worm channels; non calcareous (10% HCl) throughout; gradual smooth boundary to

Bs 48 - 75 cm. strong brown (7.5YR 5.0/8.0, moist) clay; moderate medium subangular blocky to weak to moderate fine angular blocky structure; sticky, plastic, firm; none mottles; patchy thin clay and sesquioxides cutans throughout; few medium pores and common very fine pores; moderately porous; few medium roots throughout; frequent small spherical soft manganiferous nodules; no fragments; few channels; non calcareous (10% HCl) throughout; gradual smooth boundary to

Bc1 75 - 118 cm. strong brown (7.5YR 5.0/8.0, moist) clay; moderate fine to medium angular blocky and moderate medium subangular blocky structure; sticky, plastic, very firm; none mottles; broken moderately thick clay cutans throughout; few very fine pores; moderately porous; few fine roots throughout; frequent medium spherical soft manganiferous nodules; no fragments; few channels; non calcareous (10% HCl) throughout; gradual smooth boundary to

Bc2 118 - 160 cm. yellowish brown (10YR 5.0/8.0, moist) clay loam; weak to moderate medium angular blocky and weak to moderate medium subangular blocky structure; slightly sticky, slightly plastic, firm; none mottles; patchy thin clay cutans throughout; few very fine pores; moderately porous; nil roots; very frequent medium spherical soft manganiferous nodules; no fragments; few channels; non calcareous (10% HCl);

PROFILE DESCRIPTION :

Ap 0 - 20 cm. dark brown (10YR 3.0/3.0, moist) clay; strong fine to medium granular and strong medium subangular blocky structure; slightly sticky, slightly plastic, firm, slightly hard; none mottles; no cutans; common fine pores and few medium pores; highly porous; common very fine to coarse roots throughout ; no inclusions; no fragments; frequent worm channels and channels; slightly calcareous (10% HCL) throughout; clear irregular boundary to
 Bw 20 - 50 cm. dark brown (10YR 4.0/3.0, moist) clay; strong fine to medium granular and strong medium to coarse subangular blocky structure; slightly sticky, plastic, firm, hard; none mottles; no cutans; common fine pores and few medium pores; highly porous; few medium roots throughout; no inclusions; no fragments; frequent worm channels and channels; slightly calcareous (10% HCL) throughout; clear irregular boundary to
 CB 50 - 80 cm. very pale brown (10YR 7.0/4.0, moist) loam; weak irregular structure; slightly sticky, slightly plastic, friable, soft; none mottles; no cutans; many fine pores and common medium pores; moderately porous; nil roots; frequent medium spherical hard calcareous nodules and frequent medium irregular hard calcareous nodules; few coarse strongly weathered fragments; calcareous (10% HCL) throughout; abrupt smooth boundary to
 CRK 80 - 130 cm. very pale brown (10YR 7.0/4.0, moist) slightly stony loam; irregular and rock structure; slightly sticky, slightly plastic, friable, slightly hard; none mottles; no cutans; common fine pores and common coarse pores; moderately porous; nil roots; very frequent medium spherical hard calcareous nodules and very frequent medium irregular hard calcareous nodules; no fragments; calcareous (10% HCL) throughout; gradual smooth boundary to
 R 130 - 180 cm. dark brown (10YR 4.0/3.0, moist) very stony coarse loamy sand; rock structure; non sticky, non plastic, firm, very hard; none mottles; no cutans; none pores; nil roots; frequent medium spherical hard calcareous nodules and frequent medium irregular hard calcareous nodules; dominant coarse strongly weathered fragments; calcareous (10% HCL) throughout;

ANNEX 2 FIELD METHODS

The soils were described in the field according to ISRIC's Guidelines for the description and coding of soil data (Van Waveren & Bos, 1988; 1994). These guidelines follow closely those for soil description given by FAO (1977, 1990). Soil columns were taken for monolith preparation using the methods described by Van Baren & Bomer (1979). In addition, disturbed and undisturbed samples are collected for physical, chemical and mineralogical analyses and for thin section preparation, where possible using the guidelines for the sampling of soil horizons for a soil reference collection (NASREC Newsletter no. 1 (March, 1991).

Of all sites slides and photographs were taken showing, the landscape, vegetation, land use, soil profile and important profile details. Furthermore, data are collected with each pedon on climate, land use history, crops and crop yields, soil management practices, etc.

Soils are classified according to the FAO-Unesco Legend of the Soil Map of the World (1974) and its Revised Legend (FAO-Unesco-ISRIC, 1988). Soil subunit modifiers ("third level") were added using the guidelines described by Nachtergael *et al.* (1994). In addition soil were given their classification according to Soil Taxonomy (Soil Survey Staff, 1975; 1992), and, if available, the local classification.

All data are stored in ISIS version 4.0 (ISRIC, 1994), ISRIC's soil pedon data management system for micro computers. The information given on the soil data sheets in this publication have been generated from the ISIS files.

ANNEX 3 ANALYTICAL METHODS

Abstract from ISRIC TP 9 (Van Reeuwijk, 1993).

Preparation

Each sample is air-dried, cleaned, crushed (not ground), passed through 2 mm sieve, homogenized. Moisture content is determined at 105° C.

pH H₂O

(1:2.5): 20 g of soil is shaken with 50 ml of deionised water for 2 hours, electrode in upper part of suspension.

pH-KCl

likewise but shaken with 1 M KCl.

EC

(1:2.5): Conductivity of pH-H₂O suspension.

Particle-size distribution

Soil is treated with 15% hydrogen peroxide overnight in the cold, then on waterbath at about 80°C. Then boiled on hot plate for 1 hour. Washings until dispersion. Dispersing agent is added (20 ml solution of 4% Na-hexametaphosphate and 1% soda) and suspension shaken overnight. Suspension sieved through 50 µm sieve. Sand fraction remaining on sieve dried and weighed. Clay and silt determined by pipetting from sedimentation cylinder.

Water-dispersable clay

Pipetting after shaking 20 g of soil overnight (16 hours) with deionized water.

Exchangeable bases and CEC

Percolation with 1M ammonium acetate pH7 using automatic extractor.

(If EC > 0.5 mS pre-leaching with ethanol 80%). Cations are determined in the leachate by AAS.

CEC: saturation with sodium acetate 1M pH7; washed with ethanol 80% and then leached with ammonium acetate 1M pH7. Na determined by FES.

Exchangeable acidity and Aluminium

The sample is extracted with 1 M KCl solution and the exchange acidity (H+Al) titrated with NaOH. Al is measured by AAS.

Carbonate

Piper's procedure. Sample is treated with dilute acid and the residual acid is titrated.

Organic carbon

Walkley-Black procedure. The sample is treated with a mixture of potassium dichromate and sulphuric acid at about 125°C. The residual dichromate is titrated with ferrous sulphate. The result expressed in % carbon (because of incomplete oxidation a correction factor of 1.3 is applied).

Total nitrogen

Micro-Kjeldahl. Digested in H₂SO₄ with Se as catalyst. Then ammonia is distilled, trapped in boric acid and titrated with standard acid.

P-Bray 1

Phosphate is extracted with a mixture of 0.025 M HCl + 0.03 M NH₄F and determined colorimetrically.

P-Olsen

Phosphate is extracted with 0.5 M NaHCO₃ solution pH 8.5 and determined colorimetrically.

P-Retention

Blakemore *et al.* Shaken with (KH_2PO_4 + NaAc) solution, 1000 mg/L P pH 4.6 for 16 hours.

Determination of residual P colorimetrically after centrifuging.

pH-NaF

To 1g of soil 50 ml of NaF 1M is added and stirred for 1 minute.

Reading pH by continuous stirring exactly 2 minutes after adding NaF solution.

Extractable Iron, Aluminium, Manganese and Silicon

All determinations by AAS.

1. "Free" (Fe, Al, Mn): Holmgren Shaken with sodium citrate (17%) + sodium dithionite (1.7%) solution for 16 hours.
2. "Active" (Fe, Al, Si): Shaken with acid ammonium acetate 0.2 M pH 3 for 4 hours in the dark.
3. "Organically bound" (Fe, Al): Shaken with sodium pyrophosphate 0.1 M for 16 hours.

Clay mineralogy

Clay is separated as indicated for particle-size analysis.

about 10-20 mg of clay is brought on porous ceramic tile by suction and analyzed using a Philips diffractometer.

Soluble salts

Measuring pH, EC, cations and anions in water extracts.

1. 1:5 extract. Shaking 30 g of fine earth + 150 ml of water for 2 hours.

2. saturation extract. Adding to 200-1000 g fine earth just enough water to saturate the sample.

Standing overnight.

After filtration Ca, Mg, Na, K are measured by AAS. Cl with the Chlorocounter and SO_4 turbidimetrically.

Gypsum

To 10 g of fine earth 100 ml of water is added, shaken overnight and centrifuged.

Precipitation by adding acetone. Precipitate redissolved in water and determination of Ca by AAS.

Elemental composition

The fine earth is dried, ignited and fused with lithium tetraborate.

The formed bead is analyzed by X-ray fluorescence spectroscopy.

Moisture retention

Moisture determinations on undisturbed core samples in silt box (pF1.0;1.5;2.0) and kaolinite box (pF2.3;2.7) respectively and on disturbed samples in high pressure pan (pF3.4;4.2).

Bulk density obtained from dry weight of core sample.
