**Delta management: what is it about?**

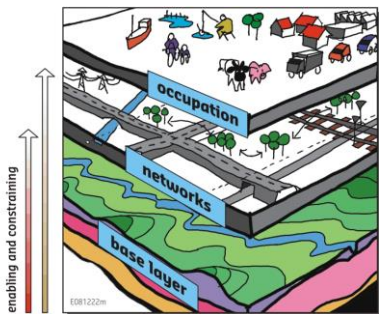

Deltas are complex dynamic human-environment systems

Evolving over centuries through interaction between occupation, infrastructure and physical conditions.

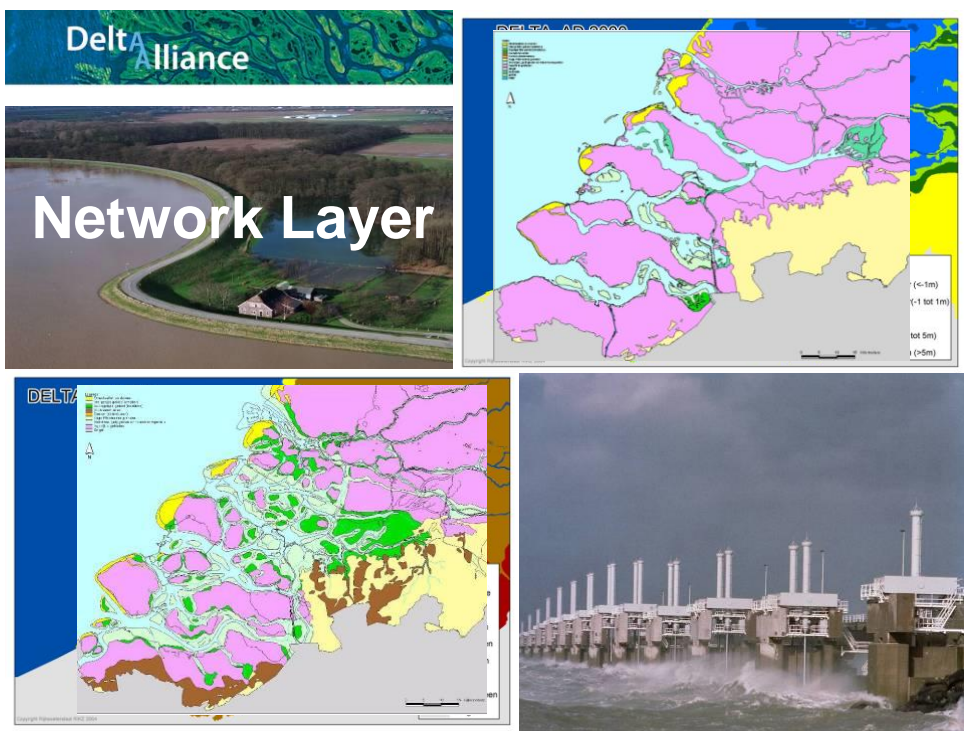

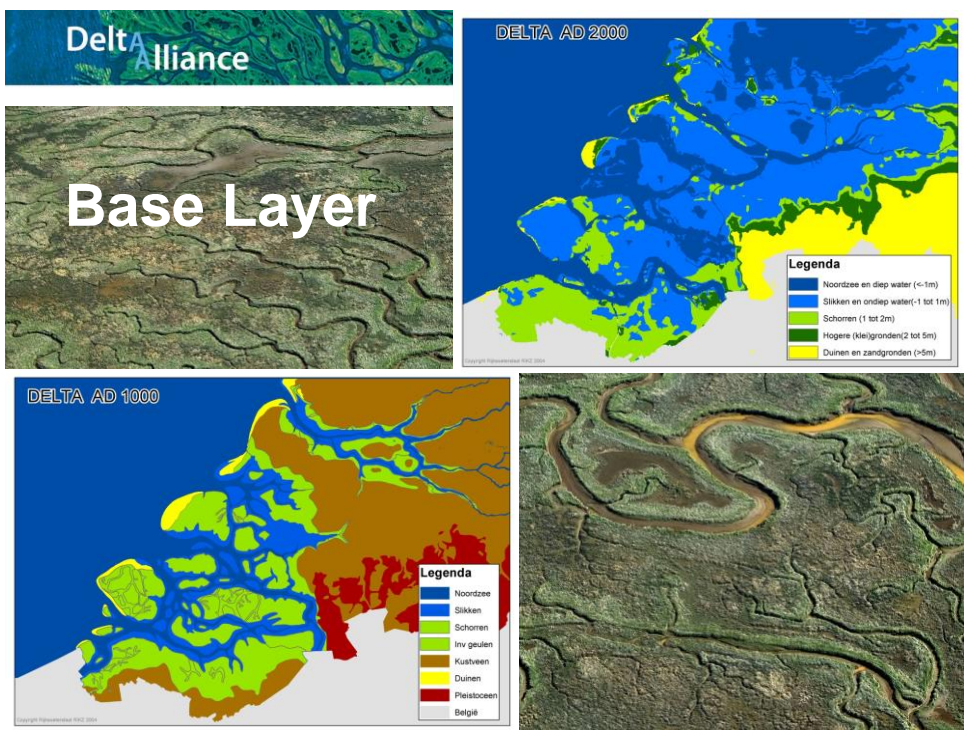

So delta management is not new!

It is our core business for centuries already

Still: complexity often pinpointed as key to ADM

The diagram illustrates the layers of delta management. It shows a cross-section of a delta with three main layers: 'occupation' (top, with buildings and people), 'networks' (middle, with roads and waterways), and 'base layer' (bottom, with natural terrain). A vertical axis on the left is labeled 'enabling and constraining' with an upward arrow. The diagram is credited to 'EOR1222m'.

## Adaptive then?

- We have adapted to changing circumstances for more than 1000 years already, to floods and droughts
  - Mounds, embankments, storm surge barriers (Delta works)
  - River training, irrigation and drainage
- But:
  - Used to be in response to disasters (1916, 1953, 1976)
  - Often caused unintended side-effects
  - Disadvantages of continuation of current practice become clear: need for a transition? (e.g. Room for Rivers)

## Delta Alliance

- So what is new?
  - If we intend to anticipate change we need new approaches and methods for policy analysis and planning
  - Especially because the future is uncertain
  
- Dealing with ‘fundamental uncertainties’ is the key issue of ADM:
  - “what to do and when to do it?”
  - “not too much, not too little”
  - “not too early, nor too late”
  
- How?
  1. Scenarios (> 3 decades)
  2. Adaptation tipping points (recent; Kwadijk et al.)
  3. Flexibility / adaptation pathways (Haasnoot et al.)

[www.delta-alliance.org](http://www.delta-alliance.org)

## Example Adaptation tipping points for Rhine Meuse Estuary

**Note:** Red bullets indicate endpoints of a strategy, blue arrows indicate the strategy can cope with higher sea levels. The climate scenarios used in the Netherlands are marked with dotted lines.

**Source:** Jeuken et al., 2010. EEA, 2013

## Adaptation pathway = a sequence of policy actions to achieve targets under changing conditions

(Haasnoot et al. 2012 Climatic change. DOI: 10.1007/s10584-012-0444-2)

16 juni 2011

Adaptation Pathways Map

## Adaptation pathways show...

- Alternative ways when a policy tipping point approaches
- When action should be taken/ how long we can carry on
- Which pathways are dead-ended (*lock in*)
- Which leave many other options open
- Which options are cut off when a certain direction is chosen
- Key is: prevent regrets and remain flexible (keep options open, precaution)

[www.delta-alliance.org](http://www.delta-alliance.org)

## Example from Bangladesh

Given the **Accelerated Sea Level Rise**,

what is a sustainable coastal management strategy?

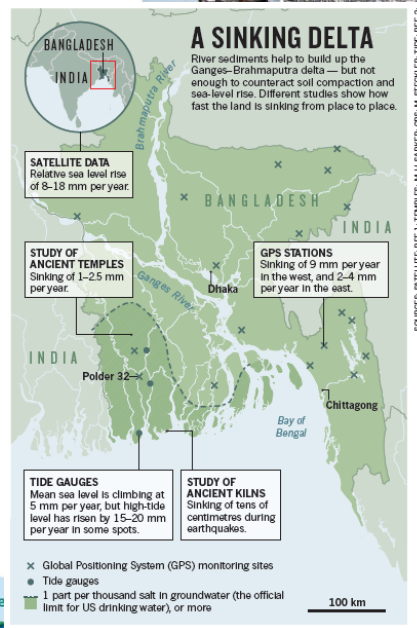

[www.delta-alliance.org](http://www.delta-alliance.org)

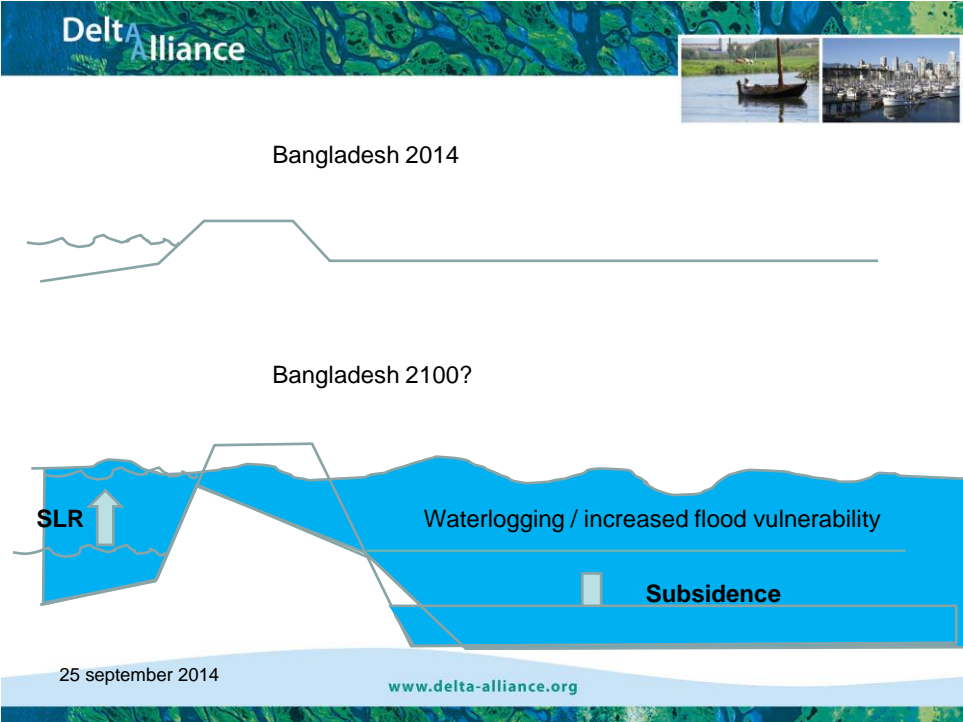

## Are polders adaptive to sea level rise?

- River sediments help to build up the G-B delta, but not enough to counteract compaction and sea level rise.
- Polders keep out the water AND sediments.
- Tidal channels outside polders started to silt up leading to impeded drainage in polder
- Periodic flooding (tidal river management) could solve the problems.
