## Preface

A research project started at the Centre for Agrobiological Research (CABO-DLO) in collaboration with the Department of Theoretical Production Ecology of the Agricultural University in Wageningen (TPE) at 1-3-1988 to study yield formation and stability of winter oilseed rape. Till 1-1-1991 research was financed by the Netherlands Grain Centre in Wageningen. Research facilities and assistance were provided by CABO-DLO. In 1991 and part of 1992, the research was financed by CABO-DLO. In this report experimental data of two field experiments carried out in 1988/89 and 1989/90 are presented and documented. Part of these data and further results of this project are shown and discussed in three publications (Habekotté, in prep.). The authors wish to thank J.H. Hartholt, M. C. Albers and M. ten Broeke for their assistance with field sampling, F.H.M. de Bekker and W. de Jager for advise and carrying out of crop protection measurements and fertilization, the personnel of the chemical laboratory of CABO-DLO for the chemical analyses, ing. J.C.M. Withagen for help with statistical analyses, ir. W.J.M. Meijer and dr.ir. A.J. Haverkort for valuable advise and correction of the English and miss J.P. Huisman for editing the layout of this report.

# 1 Introduction

The area grown with oilseed rape has increased from about 700 to 1700 thousand hectares in the European Community during the last decade (LEI, 1989). This increase is mainly the result of the support measures of the EC to stimulate domestic oilseed production for edible markets. Besides these support measures, yield level and yield stability are basic requirements for the economic success of the crop. Seed yields of winter oilseed rape are still relatively low and variable compared to for example winter wheat (Leterme, 1985; Daniels, 1986) also when taking into account the higher energy content of the rape seeds compared to the grains of wheat. Two field experiments were carried out to increase the quantitative insight in the yield formation processes of winter oilseed rape (variety Jet Neuf). In this report the objectives of the experiments and materials and methods are described, the experimental data are presented in tables (mean values and LSD.05) and reference is made to the original computer data files. The objectives of the first field experiment (1988/89) were:

- a. To analyse the influence of assimilate availability on pod and seed set and seed filling.
- b. To analyse the influence of the position of the pods in the canopy (height and branch) and of the moment of flower opening during flowering on seed set per pod.
- c. To analyse light interception, total dry matter production, distribution of dry matter to various plant organs, the area indeces of leaves, stems and pods and the oil content of the seeds.
- d. To analyse formation and redistribution of reserve carbohydrates.
- e. To measure contents of nitrogen, carbon and ash of various plant organs to calculate growth and maintenance respiration (Vertregt & Penning de Vries, 1987; Penning de Vries & Van Laar, 1982).

In the second field experiment (1989/90) additional data were obtained for the objectives (a) and (c).

## 2 Materials and methods

### 2.1 Location, trial design and crop husbandry

Two field experiments were carried out in 1988/89 (Experiment 1) and in 1989/90 (Experiment 2) with the variety Jet Neuf on a heavy clay soil near Wageningen at the experimental farm De Bouwing in Randwijk, Netherlands ( $5^{\circ} 40' E$ ,  $51^{\circ} 58' N$ ). The experiments were laid down in a split plot design with the treatments in the main plots and the harvest dates in sub-plots. Details of the experiments are presented in Table 1. Treatments were such that the amount of intercepted radiation and the number of pods per  $m^2$  varied through varying seed rates, plant densities, sowing dates and the application of shading. The first experiment consisted of four treatments and five replicates. Low plant density was obtained by thinning by hand in autumn and again in early spring. Experiment 2 consisted of four treatments and four replicates. Only the first treatment was carried out with eight replicates. Shading took place with black plastic netting. Fertilization took place according to the current recommendations for optimal yields and several treatments were carried out to protect the crop against pests and diseases (Table 2). Crop damage due to pests and diseases was negligible in both years. Irrigation (25 mm) was carried out twice in the first growing season to prevent the crop of drought. Bird netting was placed during seed ripening.

### 2.2 Crop growth analyses, light interception and crop development

Gross sub-plot sizes were  $8.64 m^2$  of which  $1.92 m^2$  (net) was harvested periodically from early spring till early July to record total dry weight of the crop and the number of plants per  $m^2$ . Total fresh weight of the crop (without roots) of the whole sub-plot was measured. A sample was taken to determine the standing dry weight of the harvested plants and to calculate the ratio between fresh and dry weight and the total standing dry weight of the crop per sub-plot. Dry weight was determined after a drying period of 24 hours at  $105^{\circ}C$ .

Five plants per plot were taken at random to collect data of the division of dry matter into various plant organs and the green area index of leaves, stems and pods. The dry weights per  $m^2$  of roots, green leaves, dead leaves (yellow coloured (parts of) leaves), main stem, side branches, flower buds, flowers, pod hulls and seeds were calculated as the organ weight of five plants divided by the total weight of five plants, multiplied with the total weight of the crop per  $m^2$ . The pods were threshed by hand and the seeds separated and weighed to determine mean seed weight. Dry weight of the pod hull (pod wall + septum) was calculated from the difference between total pod dry weight and total seed dry weight.

Table 1. Details of the field trials

Detail	Experiment 1	Experiment 2
Treatments :	1) Low plant density (lpd) 2) High plant density (hpd) 3) Low plant density and removal at flowering of all side branches except the highest (rsb) 4) Low plant density and shading, leaving 40 percent of full light from the first week of flowering till final harvest (sha)	1) Low seed rate (lsr) 2) High seed rate (hsr) 3) Low seed rate and later sowing (Iso) 4) Low seed rate and shading (sha, see Treatment 4, exp. 1)
Sowing dates :	August 23, 1988	August 24, 1989 (early) September 9, 1989 (late)
Sowing rates :	10 kg/ha	6 kg/ha (low seed rate) 10 kg/ha (high seed rate)
Date of start of shading:	20- 4-1989	24- 4-1990
Row distance :	24 cm	24 cm
Plant density in spring :	tr. 1 : ca. 24 (n/m <sup>2</sup> ) tr. 2 : ca. 68 (n/m <sup>2</sup> ) tr. 3 : ca. 23 (n/m <sup>2</sup> ) tr. 4 : ca. 27 (n/m <sup>2</sup> )	tr. 1 : ca. 42 (n/m <sup>2</sup> ) tr. 2 : ca. 50 (n/m <sup>2</sup> ) tr. 3 : ca. 57 (n/m <sup>2</sup> ) tr. 4 : ca. 41 (n/m <sup>2</sup> )
Harvest dates:	13-3, 28-3, 10-4, 24-4, 8-5, 16-5, 22-5, 29-5, 5-6, 12-6, 19-6, 26-6, 3-7, 10-7	22-3, 18-4, 1-5, 14-5, 28-5, 18-6, 9-7
Soil type :	40 % lutum 1.9 % humus 0.1 % lime pH-KCL=6.8	52 % lutum 2.5 % humus 0.8 % lime pH-KCL= 7.4
Soil reserves:	35 kg/ha N (1-100 cm)	36 kg/ha N (0-60 cm)
Fertiliser :	13-3-1989: - 180 kg/ha N	13-3-1989: - 150 kg/ha N
Crop protection:	against: weeds (2.5 kg/ha Butisan S), stem flea beetle (2 l/ha Di-thios), slugs (1.5 kg/ha Methio-carb), pollen beetle and stem weevil (0.2 l/ha Deltamethrin), sclerotinia and botrytus (1kg/ha Vinchozolin), altenaria (1 kg/ha Rovral), cylindrosporium ( 1kg/ha Prochloraz)	
Irrigation :	27-5-'89 and 26-6-'89: 25 mm	

The area and weight of samples of green leaves, side branches and pods were recorded to determine the specific area of these plant organs (Specific area= area/weight). The areas were measured with a Licor 3100 area meter (Li-Cor Inc., Lincoln, Nebraska, USA). The length and cross section (in the middle) of the main stem was measured to determine the flat area of the main stem (length x cross section). The area indices of these plant organs were calculated by the product of the specific area and the organ dry weight per square meter. In the first experiment two crop layers were distinguished (A: above 60 cm height; B: below 60 cm height). For the measurement and calculation of dry weight, specific area and area indeces of green leaves, different leaf-groups were distinguished in Experiment 1 (Figure 1) :

Crop layer-B (0 - 60 cm height):

- the lowest two leaves of the main stem
- the highest young leaves of the main stem (about 4 leaves, when the plants are lower than 60 cm height)
- the leaves of the main stem between the lowest and highest leaves
- the leaves of the side branches

Crop layer-A (> 60 cm height):

- all leaves of the main stem and side branches

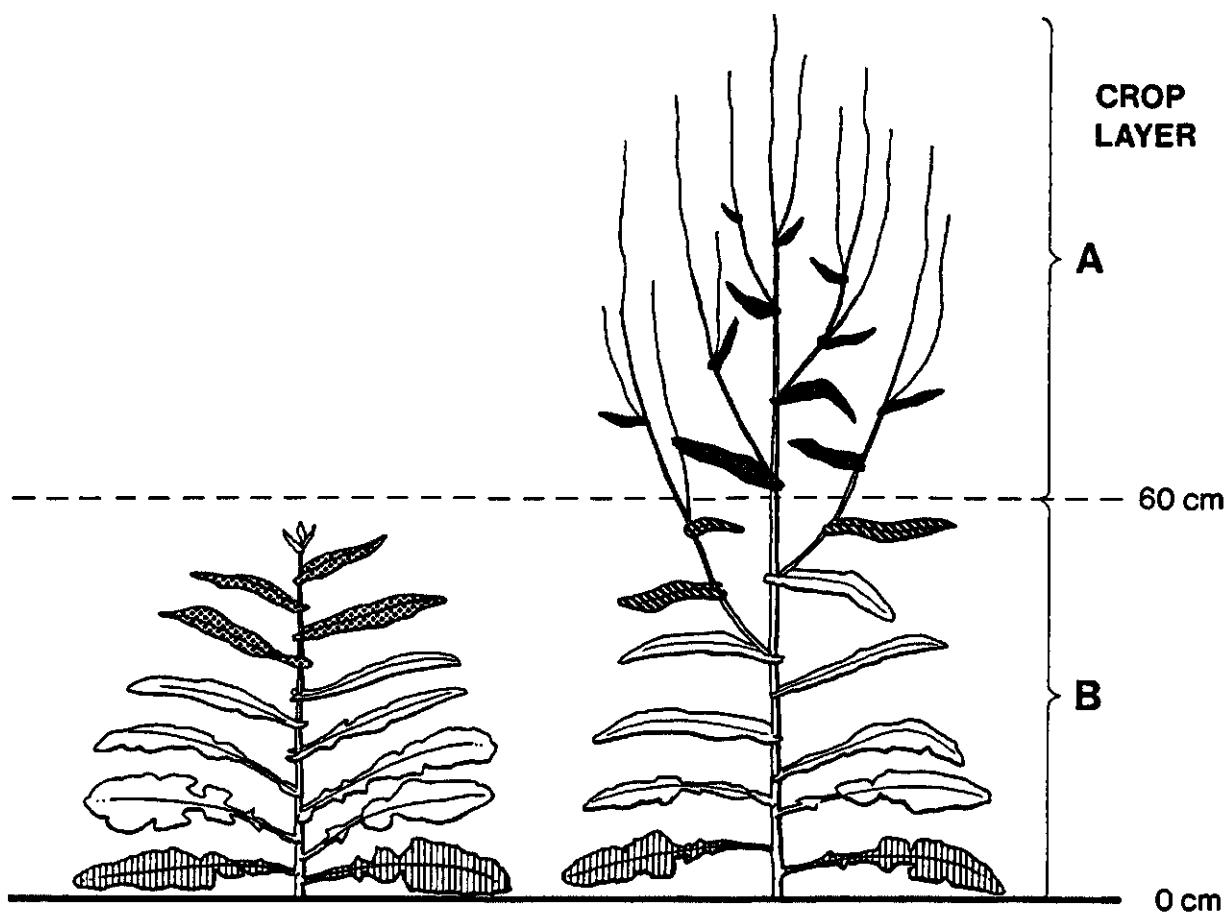

Per crop layer-A and B, the dry weight, specific area and area index of the main stem and side branches were measured and calculated.

Per five plants also the number of pods with seeds, pods without seeds (aborted pods), the number of peduncles (aborted flower buds, flowers or pods) and the number of open pods (shattered) were counted. The potential number of pods was defined as the sum of pods, peduncles and open pods. The (potential) number of pods per m<sup>2</sup> was calculated as the (potential) number of pods per five plants divided by the dry weight of pods per five plants, multiplied with the total pod dry weight per m<sup>2</sup>.

The number of seeds per m<sup>2</sup> was calculated by dividing total seed weight by individual seed weight and the number of seeds per pod was calculated by dividing total number of seeds per m<sup>2</sup> by total number of pods per m<sup>2</sup>.

The percentage light interception of the crop was measured periodically at noon, at 5 cm above the ground in both experiments and in the first experiment also at 60 cm above ground (just under the crop layer with pods and flowers) with a portable tube solarimeter (TFDL, Wageningen) which measures only photosynthetically active radiation (PAR) between 400 and 700 nm. In the shading treatments also the light interception of the netting was recorded. Crop development was recorded periodically, according the development scale of Habekotté (1978). After flowering the development stages were also recorded according the development scale of Sylvester-Bradley (1984).

Data file information of crop growth analysis and light measurements are shown in the appendices 3, 4, 8 and 9.

**Figure 1** Crop layers and leaf-groups distinguished in experiment 1.

**Crop layer-B (0-60 cm height):-** the lowest two leaves of the main stem

- the highest young leaves of the main stem  
(about 4 leaves, when the plants are lower than 60 cm height)
- the leaves of the main stem between the lowest and highest leaves
- the leaves of the side branches

**Crop layer-A (> 60 cm height):** - all leaves of the main stem and side branches

## 2.3 Number of pods and seeds per pod and position in the canopy

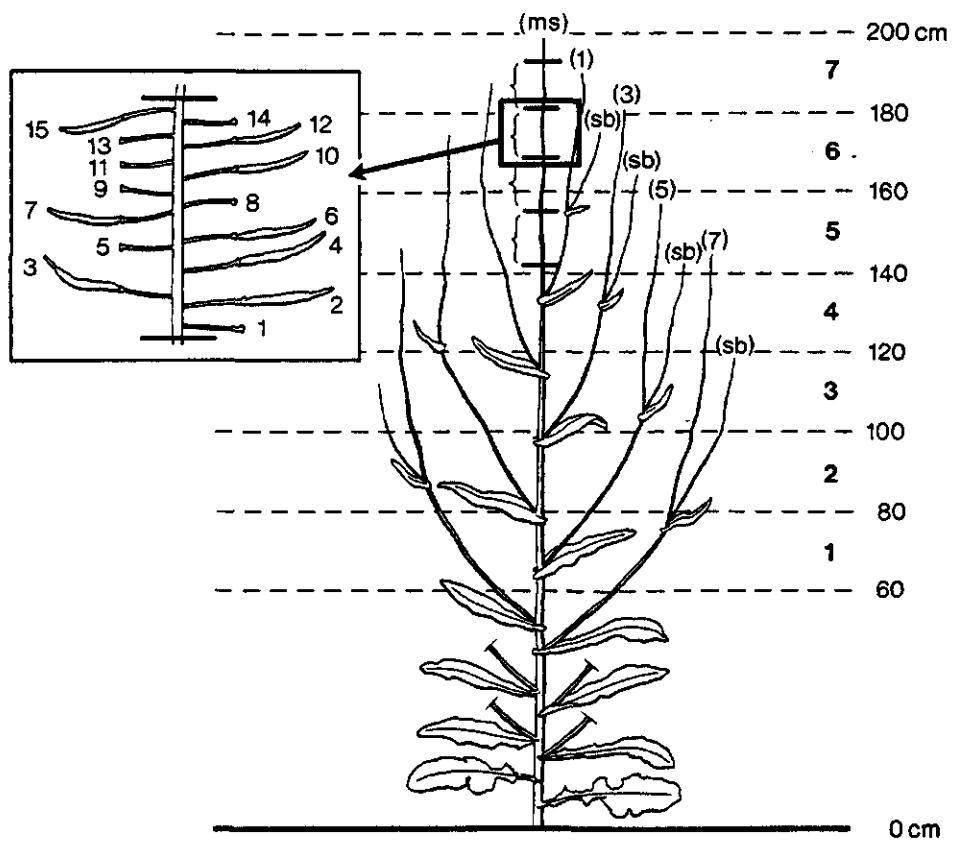

In Experiment 1 the (potential) number of pods and seeds was also counted per branch in successive groups of 15 peduncles (after flowering, whether a pod was present or not; Figure 2). Two plants per sub plot were taken at 29-5-'89 and 26-6-'89 to determine the height in the canopy of the peduncle groups (Figure 2). A crop layer was recorded if more than 60 percent of the peduncles were present between the bounds of the layer. When 50 percent of the peduncles were present in one layer, and 50 percent in an other crop layer, two crop layers were recorded. The mean height per peduncle-group was determined as the average of two harvest dates, four treatments, five replicates and two plants per sub plot, because there were only small differences between the harvest dates and treatments, (Appendix 1). Three periods between the successive harvests during flowering were distinguished and per treatment and peduncle-group the period was determined in which more than 50 percent of the peduncles were counted. The periods of flower opening of the peduncle-groups were determined by the harvest dates minus the duration of flowering of an individual flower (data not shown: 64.5 degree days per flower; Table 2; Appendix 2). Data file information is presented in Appendix 6.

Table 2. Periods of flower opening during flowering in Experiment 1.

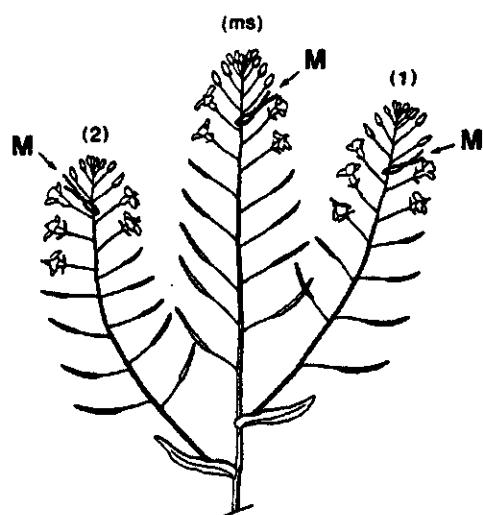

Period	Julian Harvest	day number flower opening	duration per period	
			days	degree days
Period 1	before 128	104 - 122	18	120
Period 2	128 - 136	123 - 130	8	79
Period 3	after 136	131 - 142	11	192

## 2.4 Measurements of individual pod and seed growth

In Experiment 1, two plants per sub plot were marked with coloured wire on the main stem and first two primary branches at the onset of flowering of individual buds (Figure 3) at three dates during flowering of the whole crop: 21st April , 28st April and 3rd May. Each week two plants were harvested and the first 4 pods above the marker were taken to measure pod hull dry weight, seed dry weight, mean seed dry weight and number of seeds per pod. Data file information can be found in Appendix 4.

**Figure 2.** Distinguished groups of 15 peduncles (with or without a pod) on the main stem (ms) and odd primary branches (1,3,5,...) and height (in cm above soil level) in the canopy for measurements to the (potential) number of pods and seeds per pod on different positions in the canopy (sb: secundary branches; see 2.3; Experiment 1)

**Figure 3.** Marking with (m) coloured wire on the main stem (ms) and first two primary branches at the onset of flowering of individual buds for measurements of individual pod and seed growth (Experiment 1)

## 2.5 Chemical analysis

Reserve carbohydrates (starch and sugars) were measured in the first experiment only, in roots, leaves, stems and pod hulls. Sugars were analysed according to Shaeffer & Somogyi, 1970 (NEN 3574). Starch after enzymatic hydrolysis was analysed similarly to sugars. The oil content of the seed was determined by the Soxtec method with petroleum ether extraction at 40-60 °C. Total N and C concentration of the plant material was determined with the Heraeus C and N rapid method. N-nitrate content was determined with an auto-analyser with sulfanilamide. The ash concentration was determined after drying for one hour at 550 °C. Data file information can be found in Appendix 7.

## 2.6 Soil water content and weather conditions

From early spring onwards, the moisture content of two soil layers (0-20 cm and 20-40 cm depth) was measured periodically. A pF-curve of a similar soil type was used to estimate the water availability of the crop (Appendix 10). The depth of the ground water level was recorded with vertical soil tubes.

Maximum and minimum daily temperature and daily global solar radiation, were obtained from the meteorological weather station in Wageningen (Haarweg) situated about 10 km from the location of the experimental farm, de Bouwing (Appendix 11). At the location of the field experiments, the temperature and humidity of the air were measured continuously in the open air and under the black plastic netting for shading (Appendix 5). These data were used to get an idea of the influence of these nettings on the weather conditions experienced by the crop.

## 2.7 Statistical methods

Analyses of variance (ANOVA) were carried out with the statistical program package GENSTAT (Payne et al., 1987). The analyses were carried out per harvest date and for the combined harvests (see Chapter 3).

The standard error of differences of means (SED) and the lowest significant difference (LSD<sub>x</sub>) are calculated according the following formulae:

$$\text{SED} = \sqrt{(\delta^2/r_x + \delta^2/r_y)} \quad \delta^2 : \text{residual mean square, per analysis of variance}$$

$r_{x,y} :$  number of replicates per mean value

$$\text{LSD.05} = t.05 * \text{SED} \quad t_x : \text{t-test for a given number of degrees of freedom}$$

and a given level of significance (= 0.05).

### 3 Crop growth analysis and field measurements

#### 3.1 Crop development

Table 3.1.1 Crop development according the development scale of Habekotte (1978) and seed development of the lowest third part of the main stem according to Sylvester Bradley (1984) in 1988/89 (Experiment 1). The temperature sum (in degree days) was calculated with a basic temperature of 0 °C

Date	Julian day- number	Temperature		Development stage	Sylvester- Bradley
		sum (from 1-1-'89)	Habekotté		
23- 8-'88	235	-	0	(sowing)	-

68	weight of side branches, including the cut side branches of Treatment 3	"
69	total dry weight of the crop, including dead leaves (c66), the cut side branches of Treatment 3 (c67) and roots	"
70	number of pods	(n/m <sup>2</sup> )
71	number of open pods	(n/m <sup>2</sup> )
72	number of pods (+open pods; c69+c70)	(n/m <sup>2</sup> )
73	number of potential pods	"
74	number of seeds	"
75	number of seeds per pod (c74/c70)	(n/n)
76	number of seeds per (pod+open pods) (c74/c72)	(n/n)
77	mean seed weight	(g)

#### **Appendix 4 Light interception, Experiment 1**

##### **Experimental data of Experiment 1 (file information)**

file-naam exp1b.dat  
 number of rows: 260  
 number of columns: 11  
 column experimental data  
 1 harvest number (1,2,3,4,5,6,7,8,9,10,12,14)  
 2 blok number (1-5)  
 3 treatment number (1-4)  
 4 light interception (%) under the netting above the crop (only Treatment 4)  
 5 plight interception (%) at 60 cm above ground (for Treatment 4, percentage of light compared to light intensity above the crop, under the netting)  
 6 light interception (%) at 5 cm above ground (for Treatment 4, percentage of light compared to light intensity above the crop, under the netting)  
 7 light interception (%) at 5 cm above ground (Harvest 11,12,14; compared to light intensity above the crop, above the netting)

#### **Individual pod and seed growth, Experiment 1**

##### **Experimental data of Experiment 1 (file information)**

file-name exp1c.dat  
 number of rows 600  
 number of columns 28  
 column experimental data  
 1 block number (1 - 5)  
 2 treatment number (1 - 4)  
 3 period number (1 - 3)  
 4 measurement number (1 - 10)  
 5 length of the pods (mm)  
 6 cross section of the pods (mm)  
 7 mean flat surface per pod (cm<sup>2</sup>/pod)  
 8 mean weight per pod (mg/pod)  
 9 mean weight of the pod hull -  
 10 mean seed weight per pod -  
 11 thousand kernel weight (g)  
 12 number of seeds per pod (n/n)

**Appendix 5 Mean day temperature in the open field and under the netting for shading, Experiment 1**

Experimental data of Experiment 1 (file information)

file-name exp1d.dat

number of rows 77

number of columns 9

column experimental data

- 1 Day number (since 1-1-1989)
- 2 Minimum temperature per day ( C ) measured in Treatment 1 (open field)
- 3 Maximum temperature per day ( C ) measured in Treatment 1 (open field)
- 4 Minimum temperature per day ( C ) measured in Treatment 4 (under netting for shading)
- 5 Maximum temperature per day ( C ) measured in Treatment 4 (under netting for shading)
- 6 Period number
- 7 Mean temperature per day in Treatment 1 (  $(c2 + c3)/2$  )
- 8 Mean temperature per day in Treatment 4 (  $(c4 + c5)/2$  )
- 9 The differene in mean temperature per day (  $c7-c8$  )

**Appendix 6 Pod and seed set and growth and the position in the canopy,  
Experiment 1**

Experimental data of Experiment 1 (file information)

file-name exp1H5.dat t/m exp1H15.dat

number of rows 1620

number of columns 21 for H7,9,11 and H13  
25 for H5,6,8,10,12,14 and H15

column	experimental data	
1	harvest number (5,6,7,8,9,10,11,12,14,15)	
2	block number ( 1 - 5 )	
3	treatment number ( 1 - 4 )	
4	branch number ( 1 - 9 )	
5	peduncle group (pedg) ( 1 - 9 )	
6	height in the canopy ( 1 - 8 )	
7	weight of the pods per dg, per 5 plants	(g/pedg,5p)
8	weight of the pod hull per dg, per 5 plants	"
9	weight of the seeds per dg, per 5 plants	"
10	number of pods per dg, per 5 plants	(n/pedg,5p)
11	number of potential pods per dg, per 5 plants	"
12	number of open pods per dg, per 5 plants	"
13	flat surface of the pods per dg, per 5 plants	(cm <sup>2</sup> )
14	weight of 100 seeds per dg	(g)
15	total weight of the pods per 5 plants	(g/5p)
16	total weight of the seeds per 5 plants	"
17	total weight of the pods per m <sup>2</sup>	(g/m <sup>2</sup> )
18	total weight of the seeds per m <sup>2</sup>	"
19	number of plants per m <sup>2</sup>	(n/m <sup>2</sup> )
20	total weight of pods of even and odd branches	
	divided by the pods of the odd branches, per 5 plants	(g/g)
21	total weight of seeds of even and odd branches	
	divided by the seeds of the odd branches, per 5 plants	(g/g)

only for H5,6,8,10,12,14 and H15 :

22	total number of pods per 5 plants	(n/5p)
23	total potential pods per 5 plants ..	"
24	total number of seeds per 5 plants ..	"
25	total number of pods per m <sup>2</sup>	(n/m <sup>2</sup> )

**continuation of Appendix 6**

Per block and treatment:

**branch (column 4)**

- 1 main stem
- 2 primary side branch number 1
- 3 primary side branch number 3
- 4 primary side branch number 5
- 5 primary side branch number 7
- 6 primary side branch number 9
- 7 primary side branch number 11
- 8 primary side branch number 13
- 9

**peduncle groups (column 5)**

- (1 - 9)
- (1 - 9)
- (1 - 9)
- (1 - 9)
- (1 - 9)
- (1 - 9)
- (1 - 9)
- (1 - 9)

**no peduncle groups in column 5**

- 1: even branches
- 2: secondary branches of the prim. side branches 1 and 3
- 3: secondary branches of the prim. odd side branches > 3
- 4: open pods of the other branches
- 5: sub sample of even pods for flat surface and weight
- 6: rest branches (Treatment 3): secondary and primary branches, others than the main stem and the first pirm.branch
- 7: rest odd branches, H7,9,11,13 secondary and primary odd branches others than the main stem and prim. branches 1,3,5,7.
- 8: ..
- 9: ..

## **Appendix 7 Chemical analyses of various plant organs, Experiment 1**

## file-information

number of rows 285

16	quantity of starch in the pod hulls	"
17	quantity of sugars in the pod hulls	"
18	quantity of starch in the roots	"
19	quantity of sugars in the roots	"
20	quantity of starch in the whole crop	"
21	quantity of sugars in the whole crop	"

## Appendix 8 Crop growth analysis, Experiment 2

### Experimental data of Experiment 2 (file information)

file-naam exp2a.dat

number of rows : 140

number of columns : 53

column experimental data

1	harvest number ( 1 - 7 )	
2	block number ( 1 - 4 )	
3	treatment number ( 1 - 4 )	
4	fresh dry weight (kg) of the crop without roots per sub plot (1,92 m <sup>2</sup> )	
5	percentage dry weight of column 4	
6	total above ground dry matter (kg/ha)	
7	number of plants per sub plot (1.92 m <sup>2</sup> )	
8	plantdensity (n/m <sup>2</sup> )	
9	dry weight of the green leaves per 5 plants	(kg/5pl)
10	dry weight of the yellow leaves per 5 plants	"
11	dry weight of the main stem per 5 plants	"
12	dry weight of the side branches per 5 plants	"
13	dry weight of the rootsper 5 plants	"
14	dry weight of the flower buds and flowersper 5 plants	"
15	dry weight of the pods (pod hull + seeds) per 5 plants	"
16	dry weight of the seeds per 5 plants	"
17	dry weight of the aborted pods per 5 plants	"
18	dry weight of the pod hullsper 5 plants	"
19	total above ground dry weight of 5 plants ..	"
20	dry weight of yellow leaves	(kg/ha)
21	total above ground dry weight without yellow leaves	("")
22	total above ground dry weight without yellow leaves per 5 plants	(kg/5pl).
23	dry weight of the green leaves	(kg/ha)
24	dry weight of the main stem	(kg/ha)
25	dry weight of the side branches	(kg/ha)
26	dry weight of the flower buds and flowers	(kg/ha)
27	dry weight of the pods (pod hull and seeds)	(kg/ha)
28	dry weight of the pod hulls	(kg/ha)
29	dry weight of the seeds	(kg/ha)
30	dry weight of the aborted pods	(kg/ha)
31	dry weight of the roots	(kg/ha)
32	number of pods per 5 plants	(n/5pl)
33	number of potential pods per 5 plants	(n/5pl)
34	number of pods	(n/m <sup>2</sup> )
35	number of potential pods	(n/m <sup>2</sup> )
36	mean seed weight (g)	
37	number of seeds per pod	(n/n)
38	number of seeds (n/m <sup>2</sup> )	

**continuation of Appendix 8**

39	maximum dry weight of leaves (kept constant after maximum weight, per treatment and harvest)	(kg/ha)
40	total dry weight of crop (c21-c23+c39+c31) with maximum dry weight of leaves	(kg/ha)
41	specific area of the leaves	(cm <sup>2</sup> /g)
42	specific area of the side branches	(cm <sup>2</sup> /g)
43	specific area of the pods	(cm <sup>2</sup> /g)
44	mean length of the main stem	(cm)
45	mean cross section of the main stem	(mm)
46	dry weight of the main stem, per 5 plants	(g/5 pl)
47	surface of the main stem, per 5 plants	(cm <sup>2</sup> /5 pl)
48	specific area of the main stem	(cm <sup>2</sup> /g)
49	area index of the green leaves	(cm <sup>2</sup> /cm <sup>2</sup> )
50	area index of the main stem	("")
51	area index of the side branches	("")
52	area index of the pods	("")
53	area index of leaves, stems and pods	("")

**Appendix 9 Light interception, Experiment 2**

Experimental data of Experiment 2 (file information)

file-naam exp2b.dat

number of rows : 260

number of columns : 8

column experimental data

1 treatment number

2 block number

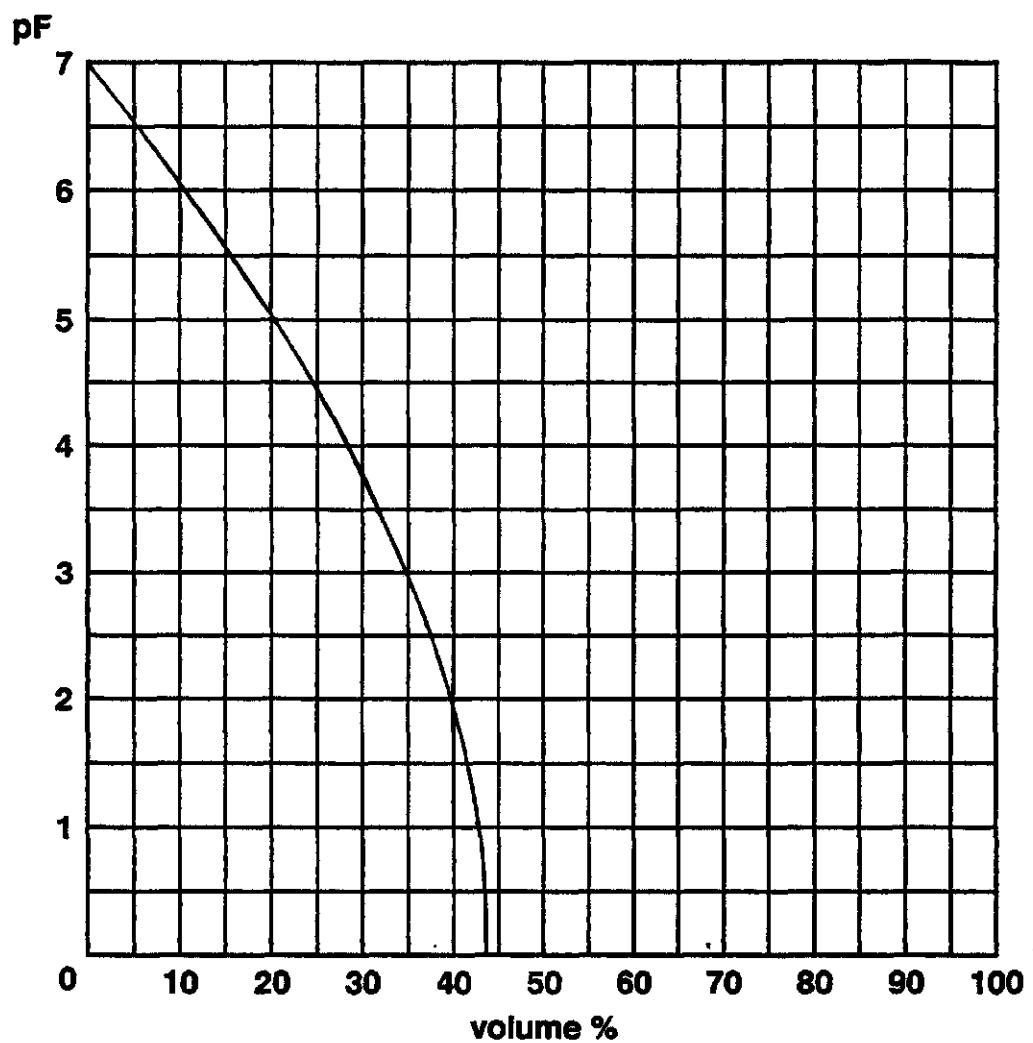

3 date of measurement of light interception

4 light interception (%) at 60 cm above ground

(for Treatment 4, percentage of light compared to light intensity  
above the crop, under the netting)

5 light interception (%) at 5 cm above ground

(for Treatment 4, percentage of light compared to light intensity  
above the crop, under the netting)

**Appendix 10 Soil water content: pF-curve**

## Appendix 11 Weather data of the meteorological station in Wageningen

column	data														
		1	2	3	4	5	6	7	8
