## Summary

This report contains the results of the ongoing monitoring programme on the incidental bycatch of cetaceans in Dutch pelagic fisheries under EU Council Regulation 812/2004 for the period January to December 2006. The regulation requires 10% observer coverage in ICES area's VI, VII and VIII in the period 1 December – 31 March. In the Dutch situation the monitoring is integrated with the collection of discards data under the EC Data Collection Regulations 1543/2000 and 1639/2001. In 2006, during 5 fishing trips, lasting 87 days in total, 135 hauls were observed. (In fact 97 days and 141 hauls were covered, but part of one trip was in an area not covered by the EU regulation observer scheme).

The required period and area was covered as follows: from January to March 2 trips of 21 and 5 days, were targeting horse mackerel (*Trachurus trachurus*) and mackerel (*Scomber scombrus*) in the Channel; two trips of 21 and 17 days, were targeting blue whiting (*Micromesistius poutassou*) west of Ireland; in December one trip of 23 days targeted herring (*Clupea harengus*) and horse mackerel west of the British Isles and in the Channel. With a total 685 days for the whole fleet in the area, the coverage was 12.7%.

One bycatch incident in which one specimen of the Atlantic white-sided dolphin (*Lagenorynchus acutus*) was involved, has been recorded in the horse mackerel - mackerel fishery. The incident occurred in a haul at night, when the trawl was hauled early in the morning while it was still dark. The catch was 70 tons of mackerel (1% horse mackerel).

The number of recorded bycatch incidents is too low to make a reliable estimate of the annual mortality. The observed bycatch rate of 0.01 dolphins per day, is in line with the findings in 2005. The EU Council Regulation itself indicates that a clear season and area of bycatch, apparently across a number of fisheries, is recognized. It is therefore recommended to report in the future under the EU Council Regulation 812/2004 by season, and not by year.

## Samenvatting

Dit rapport bevat de resultaten van het doorlopende waarnemerprogramma naar de bijvangst van dolfijnen in de Nederlandse pelagische visserij onder EU Verordening 812/2004 in de periode januari tot en met december 2006. De verordening vereist dat 10% van de vlootinspanning gedekt wordt in de ICES gebieden VI, VII en VIII in de periode van 1 december tot en met 31 maart. In de Nederlandse situatie is het waarnemersprogramma geïntegreerd met het verzamelen van vangsten discards-gegevens onder EU Verordeningen 1543/2000 en 1639/2001.

In 2006 zijn waarnemingen uitgevoerd van in totaal 135 trekken tijdens 5 visreizen van in totaal 87 dagen (de totale lengte van deze reizen bedroeg 97 dagen en 141 trekken, maar een deel van de reizen viel buiten het in de verordening bepaalde gebied en tijdsbestek). De periode en het gebied werd als volgt gedekt: van januari tot maart twee reizen van 21 en 5 dagen gericht op horsmakrel (*Trachurus trachurus*) en makrel (*Scomber scombrus*) in het Kanaal, de Golf van Biskaje en ten westen van Ierland; twee reizen, van 21 en 17 dagen, waren gericht op blauwe wijting (*Micromesistius poutassou*) bij Porcupine Bank ten westen van Ierland; een reis van 23 dagen was gericht op haring (*Clupea harengus*), horsmakrel en makrel, ten westen van de Britse eilanden en in het Kanaal. De dekking ten opzichte van de hele vloot in het gebied (685 dagen) was 12.7%.

Er werd een bijvangst-incident gerapporteerd in de visserij op horsmakrel en makrel. Hierbij werd een witflankdolfijn (*Lagenorhynchus acutus*) gevangen. Het betrof een nacht-trek, waarbij in de vroege ochtend, terwijl het nog helemaal donker was, werd gehaald. De vangst bestond uit 70 ton makrel (1% horsmakrel).

Het aantal gerapporteerde bijvangst incidenten is te laag om een betrouwbare schatting te maken van de jaarlijkse mortaliteit. De waargenomen bijvangst van 0.01 dolfijn per dag, is van dezelfde orde van grote als in 2005.

De inhoud van EU Verordening 812/2004 geeft aan dat er sprake is van een bijvangstseizoen van december tot en met maart. Het zou derhalve voor de hand liggen om de rapportage over de voortgang van het waarnemersprogramma, in de toekomst per seizoen te laten plaatsvinden en niet per jaar.

## Introduction

Council Regulation No 812/2004<sup>1</sup> is obliging Member States to monitor bycatches of cetaceans in certain fisheries, certain periods of the year and in certain European Waters and to report on the results of the monitoring to the European Commission. In the Netherlands, the monitoring was commissioned by the Ministry of Agriculture, Nature Conservation and Food Quality to IMARES, the former Netherlands Institute for Fisheries Research and started on 1 January 2005.

The aim of this study is to assess the incidental bycatch of cetaceans in the Dutch pelagic fisheries. This report covers the ongoing monitoring of Dutch pelagic fisheries over the period January – December 2006. Under the regulation 10% of the fleet effort in the period of 1 December till 31 March in ICES area VI, VII and VIII has to be covered. In the Dutch situation the monitoring is integrated with the collection of discards data under the EC Data Collection

---

<sup>1</sup> Council Regulation (EC) No 812/2004 of 26.4.2004 laying down measures concerning incidental catches of cetaceans in fisheries and amending Regulation (EC) No 88/98

Regulations: C.R. 1543/2000<sup>2</sup> and C.R. 1639/2001<sup>3</sup> amended by C.R. 1581/2004<sup>4</sup> (EC, 2000; EC, 2001).

Earlier studies on the incidental bycatch of cetaceans have been reported by (Couperus, 1995; Couperus, 1997; Couperus, 2006), covering the period 1992-1996 and 2004 - 2005.

## Description of the fleet

A description of the Dutch pelagic fleet is given in (Couperus *et al.*, 2004). However, an important feature of the pelagic fishery is that it changes rapidly over time. These changes are caused by developments in the fish market, quota regulations and variation in the stock distribution and migration patterns over time. The number of Dutch freezer trawlers in 2006 was 14 plus two pair-trawlers. Landings from Mauritanian waters decreased from 41% in January 2003 to 29% in 2004. In 2005 the landings were 23% and in 2006 26 %, which seems to indicate stabilisation around 25% (National logbook database). Landings in 2002 were more or less equally divided between horse mackerel, herring and blue whiting and a small part mackerel. In 2004, blue whiting became more important and in 2006 the landings were dominated by blue whiting (Figure 1).

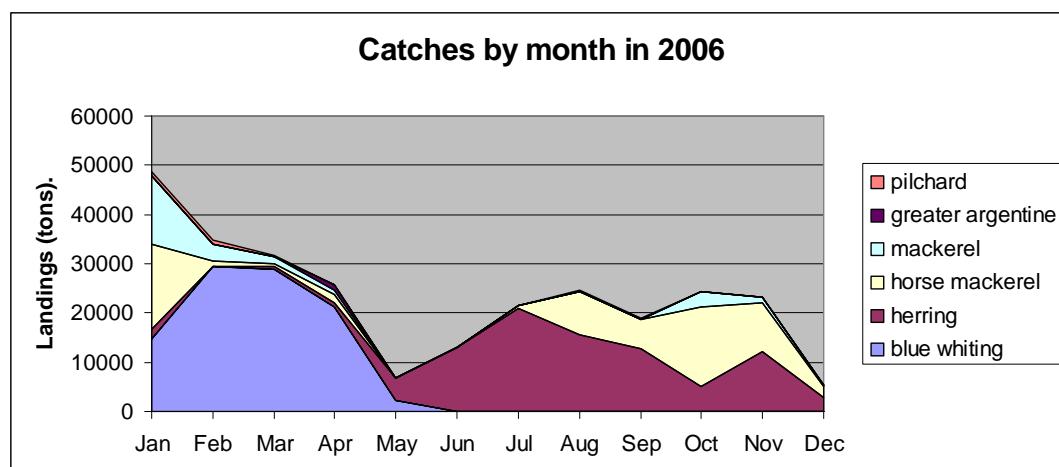

Figure 1. Registered landings from European waters by Dutch freezer trawlers in 2006.

## Fishing effort in 2006

<sup>2</sup> Council Regulation (EC) No 1543/2000 of 29 June 2000 establishing a Community framework for the collection and management of the data needed to conduct the common fisheries policy

<sup>3</sup> Commission Regulation (EC) No 1639/2001 of 25 July 2001 establishing the minimum and extended Community programmes for the collection of data in the fisheries sector and laying down detailed rules for the application of Council Regulation (EC) No 1543/2000

<sup>4</sup> Commission Regulation (EC) No 1581/2004 of 27 August 2004 amending Regulation (EC) No 1639/2001 establishing the minimum and extended Community programmes for the collection of data in the fisheries sector and laying down detailed rules for the application of Council Regulation (EC) No 1543/2000

The changes in target species mentioned above, caused changes in distribution of effort. Compared to 2004 the fishing effort in 2005 and 2006 was more concentrated off the west of Ireland compared to the preceding years. The overall effort in 2006 (278.000 tons landed, 2174 fishing dayss) was somewhat lower than in 2005 (313.000 tons, 2401 fishing days). Annex 1 shows the "fish calendar" of 2006.

# Methods

## Observer effort

The monitoring is integrated with the collection of discards data under EC Data Collection Regulations 1543/2000 and 1639/2001 (EC, 2000, 2001). In this programme the observer effort is spread quasi random over the year. Internally the observer trips are scheduled equally over the year and observers join the first trawler that comes in. However, the choice of area and target species are often last minute decisions of the owner of the vessel and may even alter during the trip itself. Therefore it is impossible to foresee or plan the exact effort in the area that has to be monitored under EC Regulation No 812/2004.

In total, 5 trips have (partly) covered the study area and period. Table 2 provides the period and target species covered in this observer programme.

*Table 1. Period, target species and ICES areas covered during the trips conducted in this observer programme. \*Number of days of the observed fishing trip; \*\*number of days within the period and area to be covered under EC regulation No 812/2004: 1 December till 31 March, area VI, VII and VIII.*

Trip no	period	trip days*	observer days**	target species	bycatch and/or second target	ICES areas
1	2/1 to 22/1/2006	21	21	horse mackerel	mackerel	VIIb,h, j VIIia, d
2	30/1 to 19/2/2006	21	21	blue whiting	mackerel/ horse mackerel	VIIb,c,j
3	18/2 to 7/3/2006	17	17	blue whiting	mackerel/ horse mackerel	VIIb VIIc,j
4	27/3 to 8/4/2006	13	5	mackerel horse mackerel	none	VIIia
5	29/11 to 23/12/2006	25	23	herring horse mackerel	mackerel	VIIa, VIIb,d,j

According to the national logbook database, the number of fleet days in area VI, VII and VIII during season 2006 was 685. With 87 observer days the coverage was 12.7%. The overall coverage during the period was still 11.6%, showing that most vessels have been operating in area VI, VII and VIII (table 3).

*Table 2. Observer coverage by area and by total fleet effort.*

	coverage by area	coverage by fleet	observer days	fleetdays total	fleet days VI VII VIII
2006	12.7%	11.6%	87	752	685

Table 3 provides information on the vessels on which the observations were made. These vessels are assumed to be representative for the fleet. The vessel during trip no. 4 was one of two pair trawlers.

*Table 3. Information on the vessels.*

tripnr	built in	length (m)	power (kW)	comment
1	1988	114	13000	
2	1993	120	12200	
3	1990	111	12200	
4	2002	56	3900	pair
5	1989	115	13400	

## Registration of bycatch

For each tow, the observer was present on the bridge during shooting and hauling. Position and time were noted at the beginning of each haul. The time was noted again when hauling started. The rear window of the bridge gives a good view on the rear deck, so that possible bycatch of cetaceans can be recorded from there. Of any bycatch, length and sex were recorded. If the crew agreed, the animals were labeled and frozen for further examination at the institute.

# Results

## Haul information and bycatches

In total 141 hauls have been observed during the 5 observer trips. Figure 2 shows the plotted positions of all these hauls.

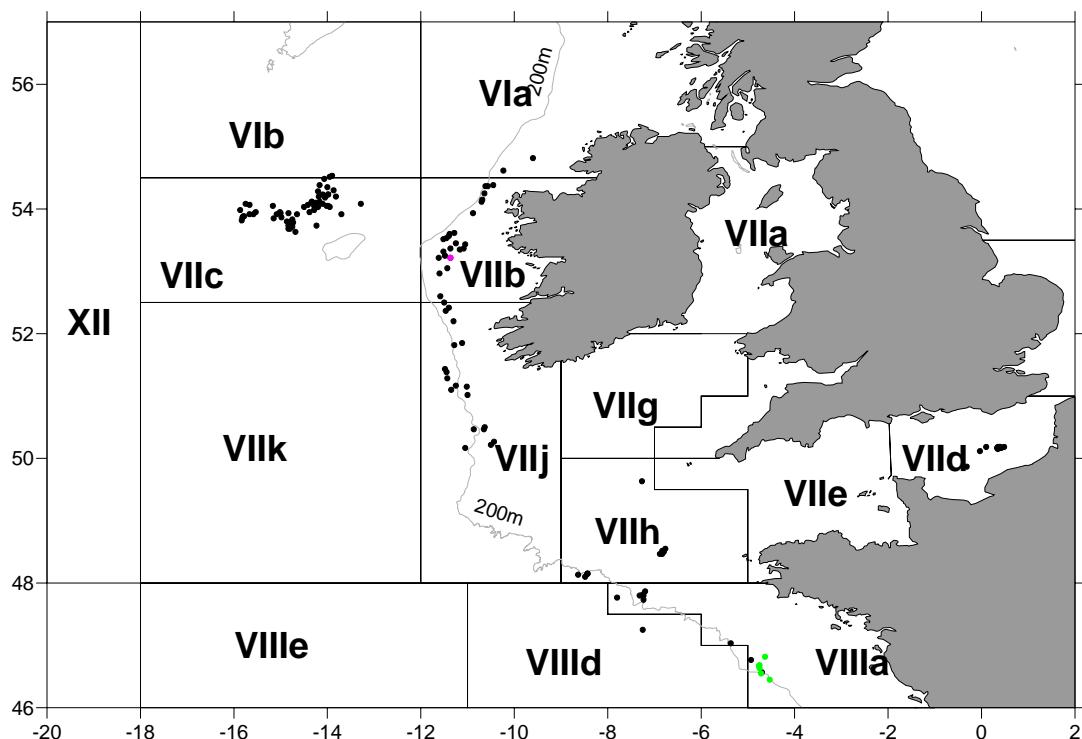

Figure 2. Map with plotted position of the observed trawl hauls during the 5 trips dealt with in this report. The black dots refer to hauls within the period-area which falls under EU council regulation No 812/2004. The pink dot refers to the only bycatch incident within the period-area. The green dots refer to hauls outside the period-area of the council regulation.

Of these hauls, 135 were from 1 December till 31 March in area VI, VII and VIII. In the hauls that fell outside the area and period dealt with here, no bycatch incidents were observed.

One Incidental catch was observed, during trip 2 on 15 February (haul no. 34). In this incident one Atlantic white-sided dolphin (*Lagenorhynchus acutus*) has been caught. Thus, the bycatch rate by haul in the area and period covered here is approximately 0.7 dolphins per 100 hauls. Table 4 provides data on length en sex of the specimen.

The bycatch occurred in a trawl haul which was carried out in darkness. The gear had been hauled up at 6.45 o'clock (Dutch time), when it was still dark. The animal was discovered when the entrance of the fish pump was disconnected from the codend after the catch had been pumped on board. The animal was dead.

The catch consisted of 70 tons mackerel with some horse mackerel (1%). The animal was collected for further examination at the Institute, funded by another project.

*Table 4. Catch data of the only bycaught dolphin (*Lagenorhynchus actus*).*

bycatch no.	trip no.	haul no.	date	latitude	longitude	sex	length (cm)
1	2	34	15-2-2006	53°13'N	11°22'W	M	253

## Discussion

The number of reported bycatches was too small to necessitate further analysis. The overall bycatch rate is similar to rates from an earlier project in the 90ies. (Couperus, 2006) evaluated bycatch rates more extensively in the light of developments in the fishery from the nineties till 2005.

Table 5 shows the bycatch rates from observer trips in the 90ies and the seasons 2004/2005 and 2005/2006. The catch rate, for example of dolphins per day, is highly variable due to the low number of incidents. From the number of days in the area (685 in 2006) one may carefully conclude from these figures that the number of bycaught animals is in the range of tens per year, in the same order of magnitude as in 2005.

In the Dutch fishery, bycatches of dolphins occur mainly in the fishery for horse mackerel and mackerel west of Ireland in February and March (Couperus, 1997). The relatively low bycatch rates in 2005 and 2006 compared to the rates in the nineties are probably related to the increased observer and fishery effort in the blue whiting fishery (Couperus, 2006) and the extension of the season with the month December since 2004.

*Table 5. Bycatch rates by haul and day between 1 January and 31 March in 1993-1996 and between 1 December and 31 March in the seasons 2004/2005 and 2005/2006 in ICES area's VI, VII and VIII. Data from the period 1993-1996 are from 6 observer trips reported in (Couperus, 1994; Couperus, 1995; Couperus, 1997). Dolphin species involved were Atlantic white-sided dolphin (*Lagenorhynchus acutus*; n=7), short beaked common dolphin (*Delphinus delphis*; n=6) and long-finned pilotwhale (*Globicephala melas*; n=1).*

	hauls	days	Incidents	dolphins	inc/ haul	dolphins/ haul	inc/day	dolphins/day
1993	75	25	0	0	0.00	0.00	0.00	0.00
1994	105	48	5	6	0.05	0.06	0.10	0.13
1995	37	13	1	3	0.03	0.08	0.08	0.23
1996	47	26	4	5	0.09	0.11	0.15	0.19
04/05	143	63	2	3	0.01	0.02	0.03	0.05
05/06	135	66	1	1	0.01	0.01	0.02	0.02

It is not possible to estimate the bycatch rate with any accuracy with the current observer effort, due to the high number of hauls without bycatches. The total mortality caused by Dutch pelagic freezer trawlers in the 2005-2006 season is in the order of magnitude of several tens. However, data from the 90ies suggest that the bycatch rate may vary, partly induced by changes in the quota's of pelagic target species.

As noted already by Couperus (2006), there is a clear season and area during which the probability of bycatch is increased, apparently across a number of fisheries. It is therefore recommended to report in the future under the EU council regulation 812/2004 by season, and not by year.

Also, as noted by Couperus (2006), catch rates are usually expressed as dolphins or incidents per haul (i.e. in the ICES Working Group for Marine Mammal Ecology - WGMME) which enables comparisons between observed rates in different fisheries. However, direct extrapolation to the national fleet(s) is difficult because the official records of the fishery effort and landings, is

expressed as days at sea and not as number of hauls per day or hours of hauling. It should be emphasized that, in the pelagic fishery, the search of fish concentrations is also part of the effort.

## Acknowledgements

I would like to thank the skippers and crew of the sampled vessels for their co-operation with the project. I would also like to thank the observers Ronald Bol, Mario Stoker, Martien Warmerdam, and Thomas Pasterkamp for their hard work on board of the vessels.

This project is funded under EU Regulation 812/2004; collection of fisheries data under the Common Fisheries Policy.
