1. Background of the Governance in Tools project

This project generates tools, tested and developed in practice, for behavioural change and decision-making options to support the transition towards a circular society:

- (i) to guide the **transition process** towards circular society in a just and responsible way,
- (ii) to better understand circular **behaviour** of all market actors: from supplier to farmer to processor to consumer
- (iii) to select **instruments and incentives** that stimulate actors to move towards a circular society in a responsible way
- (iv) to build **new circular business models**.
- (v) to understand the concept of a just and responsible **phasing out process**

To facilitate a **just and responsible transition** towards a circular society, this research project aims:

- To provide a **guidance** for a just and responsible transition based on the understanding of the complexity of transition processes with a focus on “gebiedsgerichte aanpak”, the role of government and research; the guidance includes several tools which can support the process, such as a set of leverage points, a trade off scheme.
- To understand individual and cooperative behaviour processes of market actors in the context of circularity resulting in a **checklist** of *relevant factors and determinants for circular behaviour; these factors and determinants form the base of the circular behaviour change wheel (see the third bullet)*
- To elaborate a model (“**a circular behaviour change wheel**” based on (i) Michie et al. (2011)) that identifies (the most) promising interventions and incentives supporting circular behaviour in different settings, in different situations and (ii) the factors and determinants for circular behaviour (see the second bullet) – including external factors.
- To assess and conceptually build a **circular business model (CBM)** in which principles of a circular society are put in practice.
- To formulate lesson learned for a just and responsible **phasing out** process.

Casus: reducing food waste in households

2. Food Waste Free United - combatting Food Waste in NL

Food Waste Free United (Dutch: Stichting Samen Tegen Voedselverspilling [STV]) aims to prevent and reduce food waste across the full agri-food system in the Netherlands. Via a multi-actor platform approach, STV is the nexus in the Netherlands to support stakeholder members with knowledge, tools, and action plans on Monitoring, Innovative Solutions, Consumer behaviour and Governmental instruments to reduce food waste. Within the Governance in Tools project, WFBR collaborates with STV and the Dutch Nutrition Center to develop, improve and implement a series of tools, based on scientific foundation & practitioner's experiences to support municipalities and cities to support their citizens (households) with lowering food waste levels at home.

Outputs of the Case study:

- 2023: DCS.1 Conclusions and recommendations for cities to lower food waste in **households**
- 2024: DCS.2: Set of tools to support municipalities in designing, implementing, and evaluating consumer-facing food waste interventions in line with circularity targets in collaboration with relevant business and societal organisations.

WHY JOIN FORCES TO COMBAT FOOD WASTE?

A third of the world's food is lost or wasted every year.¹

1/3

Food waste in Europe causes **6%** of all greenhouse gases emitted through human activity.²

That is equal to **105-152 KG** per capita annually in the Netherlands.³

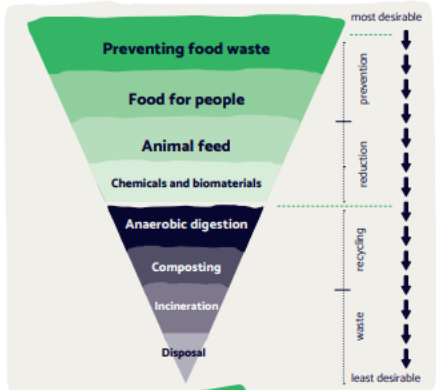

Wasting less food = helping to achieve climate goals and ensuring there is enough valuable food for the growing global population.

OUR OBJECTIVES

In a joint effort, we aim to make the Netherlands one of the first countries to cut food waste in half. We will make the Netherlands a leader and a global role model in terms of realizing Sustainable Development Goal 12.3.

The focus of the Taskforce

The Taskforce focuses on reducing food waste throughout the entire food chain. We will accomplish this by preventing and reducing as much food waste as possible and creating value from side flows according to the "Moerman Food Use Hierarchy".

The diagram shows a funnel with levels from top to bottom: Preventing food waste, Food for people, Animal feed, Chemicals and biomaterials, Anaerobic digestion, Composting, Incineration, and Disposal. To the right, arrows indicate 'prevention' (top), 'reduction' (middle), and 'recycling' (bottom), with 'waste' and 'disposal' at the very bottom. A vertical scale on the right indicates 'most desirable' at the top and 'least desirable' at the bottom.

2015 - 2030

50% reduction

1. Monitoring progress and impact: The Taskforce measures the effects of its individual and joint approach.

2. Joining forces to combat food waste across the food supply chain: Taskforce members and leaders combine their strengths, networks and knowledge to develop innovative solutions.

3. Joining forces to combat food waste by consumers: The Taskforce aims to achieve sustainable changes in behaviour through campaigns, interventions and living labs.

4. Changing the rules: The Taskforce promotes the legislation and instruments needed to create a circular economy.

3. Legacy from Governance in Transition

Designing business interventions for changing consumer behaviour

Our main theoretical frameworks underpinning the understanding of consumer behaviour, its drivers and how it connects with developing behaviour change instruments, are best illustrated by the MOA-model (Geffen et al., 2016) and the Wheel of Michie (2011). Further described in Zeinstra et al. (2022)

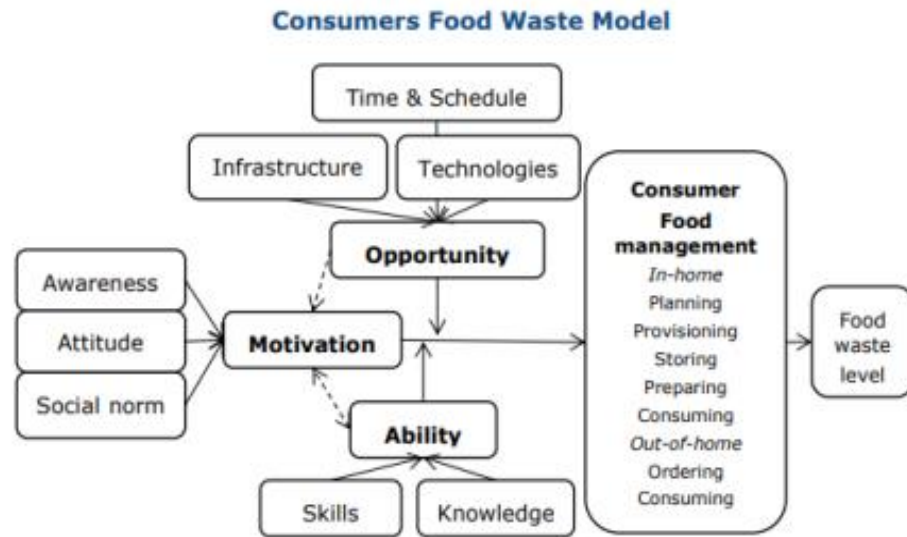

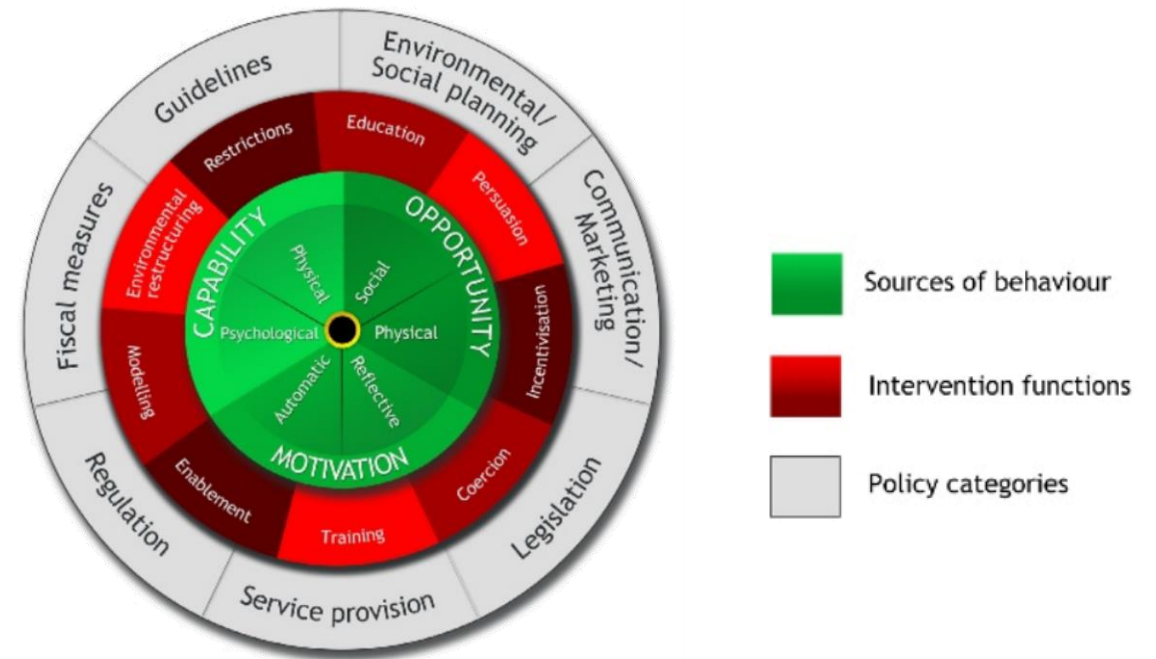

Figure 3 Consumers Food Waste Model (MOA), van Geffen et al 2016.

The Behaviour Change Wheel

Michie et al. Implementation Science, 2011.

3. Legacy from Governance in Transition

Intervention types by Van Geffen et al. (2020)

Based on the MOA-model, Van Geffen et al. (2020) designed a framework to identify different intervention types (shown in the table), which differentiate by goal-intention and goal- striving settings. 10 types were identified, most related to Motivation-factors driving behavioural change. Starting with awareness and willingness to change as a first step into successful behavioural change.

Food waste: how to avoid it?

		Intervention type	Motivation	Ab
Goal-intention setting	1	Information campaigns	✓	
	2	Emotional appeal campaigns	✓	
	3	Social influences	✓	
	4	Commitment	✓	
	5	Regulations	✓	
Goal striving	6	Prompts	✓	
	7	Implementation intention setting	✓	
	8	Instructions		
	9	Feedback	✓	
	10	Making it easy		

3. Legacy from Governance in Transition

Intervention types by Michie et al., 2011

The intervention wheel approach by Michie categorises different types of interventions and policy measures, as described in the table.

Although not derived from food waste research, these intervention types resonate with consumer behavioural change within food related topics.

	Definition	Examples
Interventions		
Education	Increasing knowledge or understanding	Providing information to promote healthy eating
Persuasion	Using communication to induce positive or negative feelings or stimulate action	Using imagery to motivate increases in physical activity
Incentivisation	Creating expectation of reward	Using prize draws to induce attempts to stop smoking
Coercion	Creating expectation of punishment or cost	Raising the financial cost to reduce excessive alcohol consumption
Training	Imparting skills	Advanced driver training to increase safe driving
Restriction	Using rules to reduce the opportunity to engage in the target behaviour (or to increase the target behaviour by reducing the opportunity to engage in competing behaviours)	Prohibiting sales of solvents to people under 18 to reduce use for intoxication
Environmental restructuring	Changing the physical or social context	Providing on-screen prompts for GPs to ask about smoking behaviour
Modelling	Providing an example for people to aspire to or imitate	Using TV drama scenes involving safe-sex practices to increase condom use
Enablement	Increasing means/reducing barriers to increase capability or opportunity ¹	Behavioural support for smoking cessation, medication for cognitive deficits, surgery to reduce obesity, prostheses to promote physical activity
Policies		
Communication/marketing	Using print, electronic, telephonic or broadcast media	Conducting mass media campaigns
Guidelines	Creating documents that recommend or mandate practice. This includes all changes to service provision	Producing and disseminating treatment protocols
Fiscal	Using the tax system to reduce or increase the financial cost	Increasing duty or increasing anti-smuggling activities
Regulation	Establishing rules or principles of behaviour or practice	Establishing voluntary agreements on advertising
Legislation	Making or changing laws	Prohibiting sale or use
Environmental/social planning	Designing and/or controlling the physical or social environment	Using town planning
Service provision	Delivering a service	Establishing support services in workplaces, communities etc.

Deliverable result 2022:

The practical checklist for businesses to include behavioural incentives in designing food waste reducing interventions.

The checklist was tested with entrepreneurs from the STV network. It is also published via STV and in use during intervention workshops of the foundation.

4. Case study introduction: the city's perspective on lowering food waste in households

Currently, the existing approach of STV with regards reducing FW in urban areas and municipalities can be described as follows:

Step 1

- Identify & map urban hotspots of food waste
- Designing effective monitoring approaches
- Analyse current urban policies/initiatives

Step 2

- Develop protocols & guidance for municipalities/cities to implement a target-measure-act approach, in alignment with national governmental support and policy.

This approach allows:

- 1) Identification of relevant urban level food system actors, hotspots of food waste & policy/technological and market-based interventions
- 2) Collaborations to develop municipal policies & regulations to valorise side flows
- 3) Develop local / place-based food policy that is integrated with other political agendas (e.g., climate change, energy, mobility, housing, etc.)

Cities differ in size, demographics, supply chains and other factors, therefore, food waste approaches need to be context specific and meeting local needs.

4: Case study - introduction

In 2023, STV initiated the municipality/city project to add to their existing toolbox of supporting stakeholders in (co-) developing FLW reducing interventions for cities and municipalities.

WFBR will support this initiative from the KB Governance in Tools project by increasing the scientific knowledge base on incentives for behaviour change, and the role of municipalities and cities to lower food waste within households, and thereby translating the knowledge into practical recommendations (governance tools) for city and municipal stakeholders.

Lead coordinator on behalf of STV is the Dutch Nutrition Center (Dutch: Voedingcentrum [VC]), responsible for the Consumer Behaviour Action line of STV. In this initiative, VC has formulated a project-approach, supervised and supported by a stakeholder group, including WFBR.

The main question guiding the initiative is *to identify the mix of interventions that municipalities can & want to implement, that support them lowering the food waste levels of households.*

Recognising that there are in fact many interventions that target household level food waste, the objective for the initiative is to support municipalities in selecting appropriate interventions that are fitting to their context and ambitions.

5. Case study - work structure

To coordinate the initiative, the following work packages have been formulated:

To guide the initiative, the following supporting questions have been formulated:

- Which interventions can be implemented by municipalities
- What differentiates municipalities in selecting & implementing interventions?
- Do the selected (mix of) interventions deliver food waste reduction results at household level?
- Are the interventions also effective on the longer term?
- Which factors influence implementation and effectivity results within municipal interventions?

6. Case study – project activities & conditions

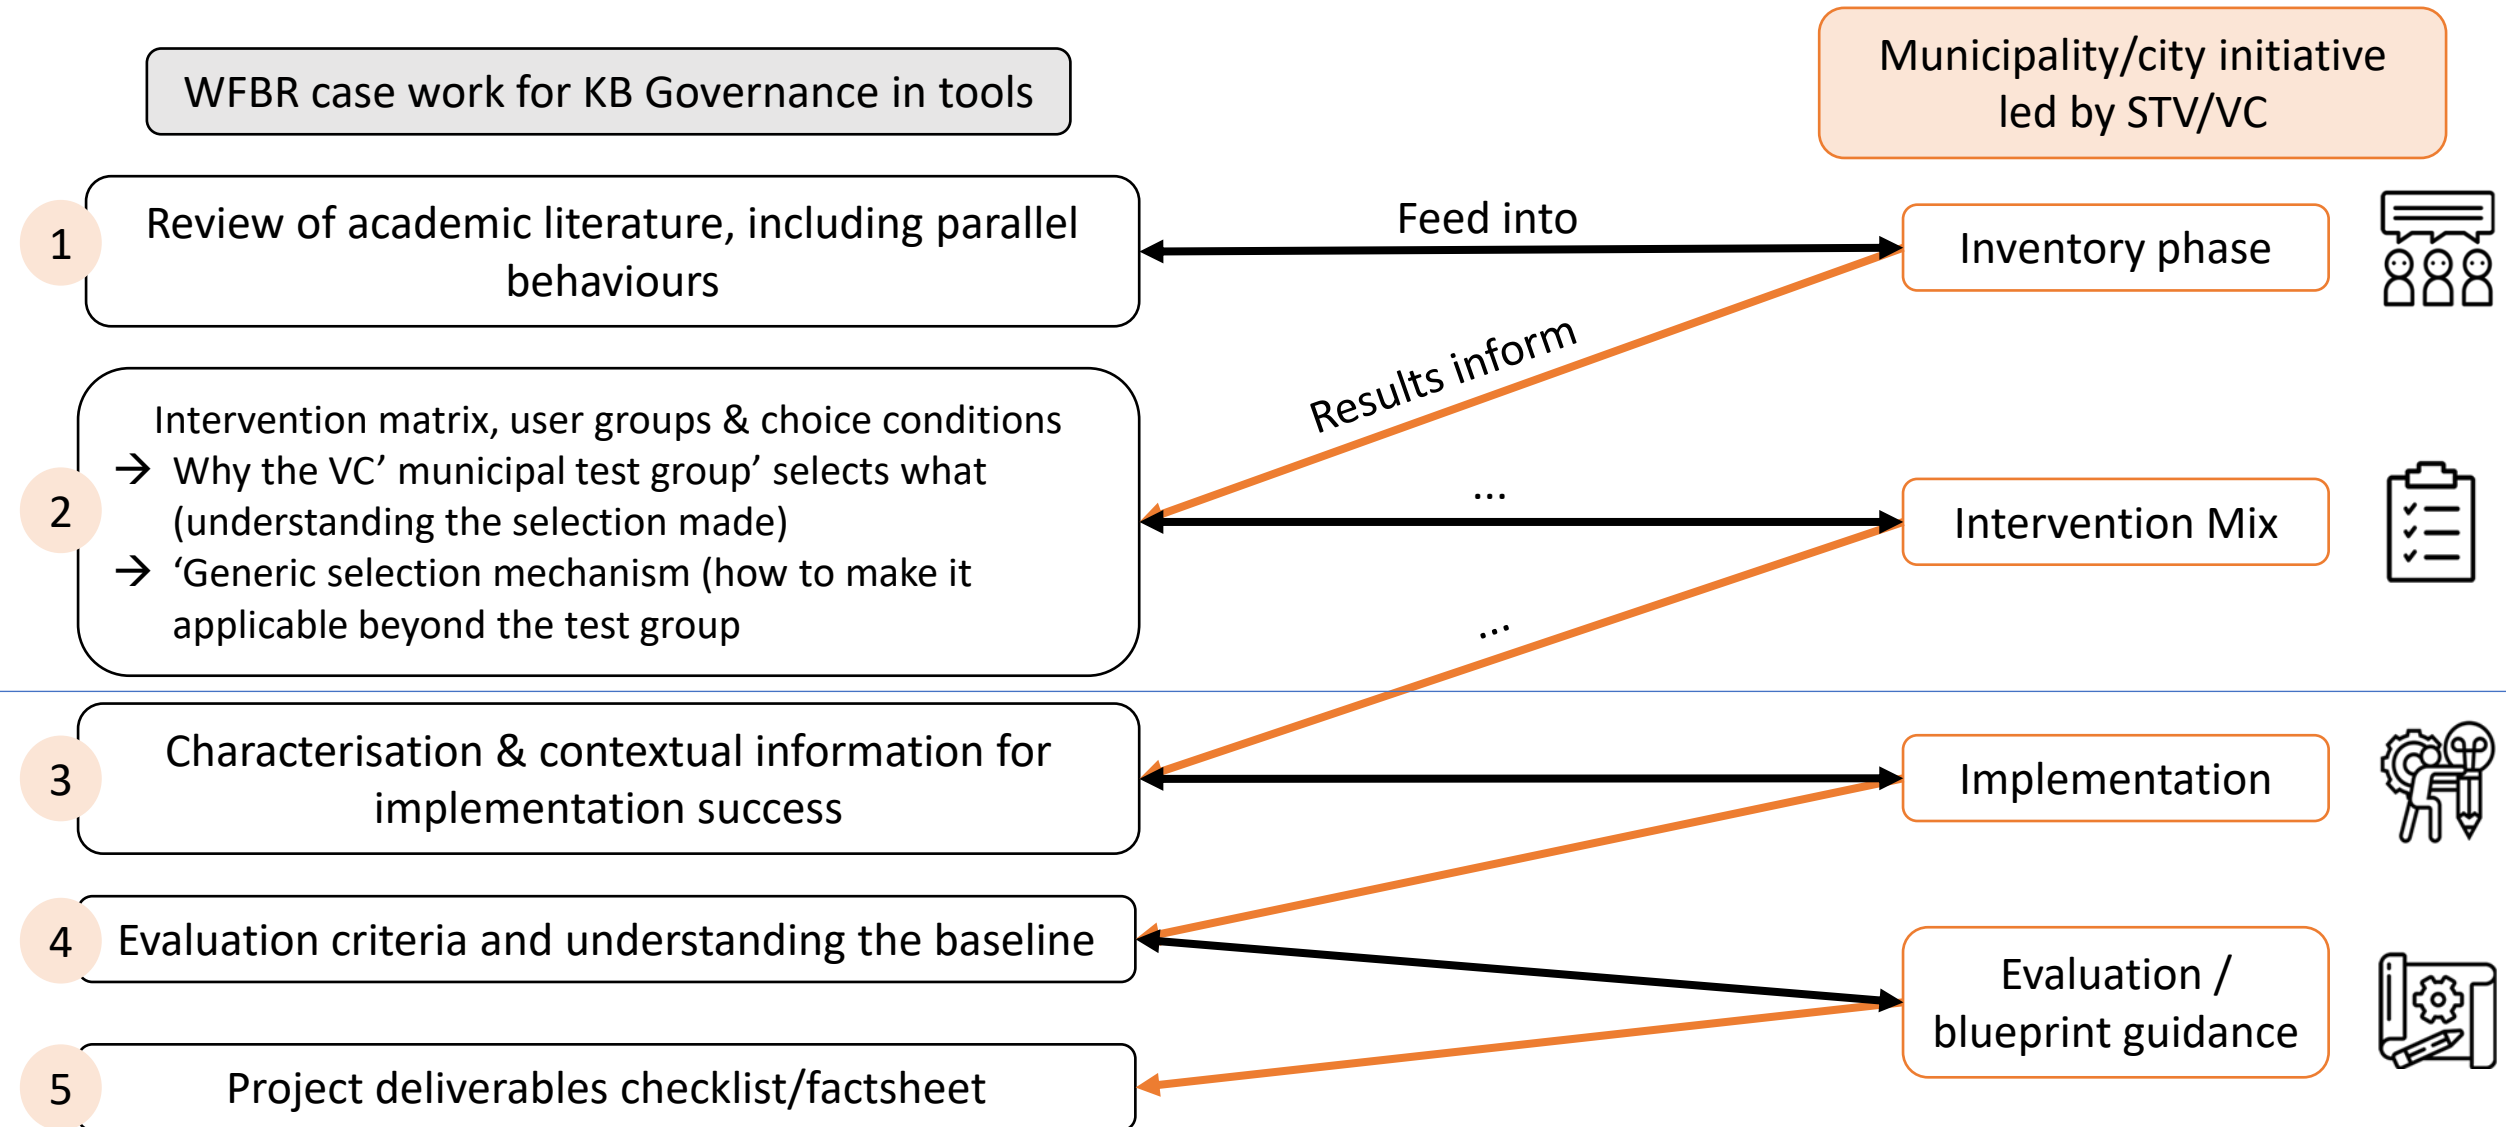

Project activities

Project activities	General planning
Inventory in municipalities	2023-Q2
Selecting the intervention mix	2023-Q3/4
Production of interventions	2024-Q1
Baseline measurement	2024-Q2
Implementing interventions	2024-Q2
Effectivity analysis short & long term	2024-Q2/3
Analysis of results	2024-Q4
Blueprint development & publication	2025-Q1/2

Conditions

- Connecting with existing activities within municipalities
 - Is there existing policy / ambitions?
 - Is there operational capacity available?
- Establishing operational conditions
 - Limitations in practice (available funding, capacity, time)
 - Channels used for communication & implementation
 - Collaborations with stakeholders at local level
 - Extent of measurement efforts
 - Not (over)burdening citizens
- Supportive for the actual needs from municipalities

7. Connecting WFBR & the Municipality/city initiative by STV

8. Overview of results WFBR activities 2023

1. **Review of scientific literature**, including parallel behaviours

Aims:

- To describe current scientific state of the art on food waste prevention and reduction interventions at city/municipality level, aimed at households.
- To gain new insights on how municipalities (cities/urban areas) aim to change the behaviour of their citizens towards less food waste + (broader) their pro-environmental behaviour

2. **Developing an analytical framework** for the analysis of the intervention mix (matrix) for municipalities.

Aim: understanding the choice conditions and parameters on the VC's municipality test group, on selected interventions for further testing. Translating the insights into a 'generic' selection mechanism, that is applicable beyond the test group, including international relevance.

8a. Review of scientific literature - approach

1. Search strategy scientific literature

- Define search queries
- Search relevant data bases (Web of Science, Scopus, PsychInfo)
- Relevance scan (scope) & prioritization (in case of too many relevant articles)

2. Search keywords

- Municipalities interventions/ activities/ initiatives/programs
- Behaviour/ behaviour change among consumers/ citizens/ inhabitants -> households

Focused on food waste, but looking broader at

- 1) pro-environmental behaviours (water, energy, waste separation) or even broader
- 2) healthy lifestyle (food, physical activity, mental wellbeing), meal planning
- 3) Financial gains of waste reduction

3. Classification of intervention articles

- Characterization of interventions
- Evaluation of interventions

4. Guiding analysis questions:

- How can municipalities influence the behaviour of their consumers/ citizens/ inhabitants?
 - Which intervention strategies are used, and for which target groups?
 - How effective and feasible were these interventions?
 - How did the municipality decide on this intervention: can we get insight into their decision-making arguments?
 - How are these municipality approaches different (or similar) to direct consumer/ household interventions?
 - What are success factors and barriers (for the implementation) of these interventions?
 - What are drivers/levers in the context of the interventions?

5. Summarize findings

- Which interventions are effective / most promising?
- Which promising household-level interventions allow for municipal-level implementation?

6. Conclusions and recommendations

8b. Review of scientific literature – search results

Search keywords used in the literature query

Term actor: Municipality	Term: Food waste/ pro-environmental behaviour	Term: intervention	Term: Consumer/ inhabitants	Other?

8c. Review of scientific literature – analysis of results

Due to capacity issues, the analysis of findings has not been completed within 2023; this report draft will be updated within Q1-2024.

First impressions:

- There are many FW interventions described in scientific literature, but actually very little that cover fully the combination of food waste x households x municipality (or city level) and includes an evaluation of the intervention effect/impact (on the long term). This is a considerable caveat in literature.
- In the remainder of this case study, we will capture findings from parallel transitions related to sustainable (food) behaviour to draw lessons in designing, implementing & evaluating city-based/municipality-led interventions to lower household food waste levels.

8c. Review of scientific literature – analysis of results

Developing an analytical framework for intervention selection

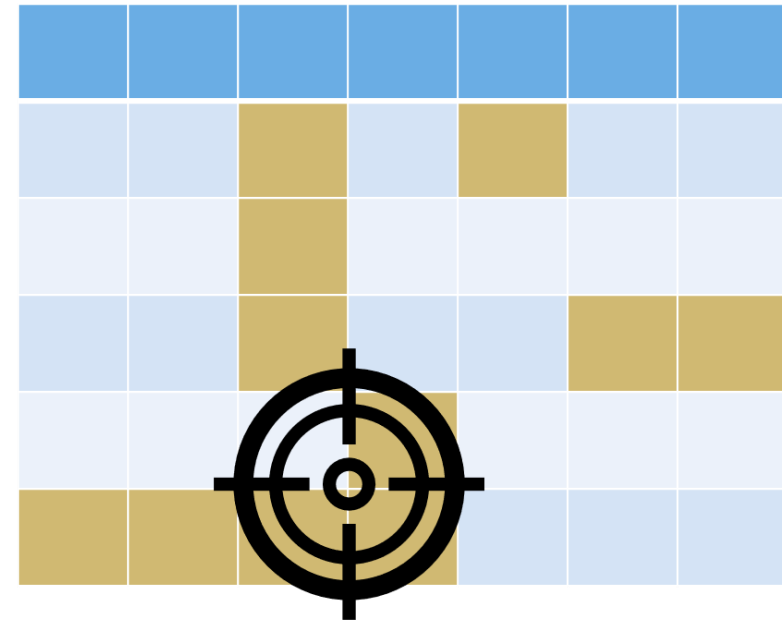

There are many possible and potential interventions that can be carried out by municipalities. All options represent the 'intervention matrix'.

Selecting interventions is a process that is both directly and indirectly driven by many factors, including amongst others:

- Direct & indirect effect on FW levels
- User characteristics
- Contextual information
- Positioning of the target neighbourhood/municipality on Societal Readiness level in the transition towards circular economy

And, it depends on the understanding the baseline and potential of the city/municipality, as well as the connection to existing activities and ambitions

Intervention matrix

8c. Review of scientific literature – analysis of results

To use an analysis metaphor: Changing behaviour = 'lifestyle' change

- What to learn from behaviour psychology behind lifestyle changes
- How to help municipalities drive change?
- What can be learned/used from parallel behaviours that are related to the 'common' good? And how do they relate to city/municipal level action
 - Energy
 - Waste
 - Mobility
 - Water
 - Health
