

Animal resilience: Health, Disease & Animal centred husbandry systems

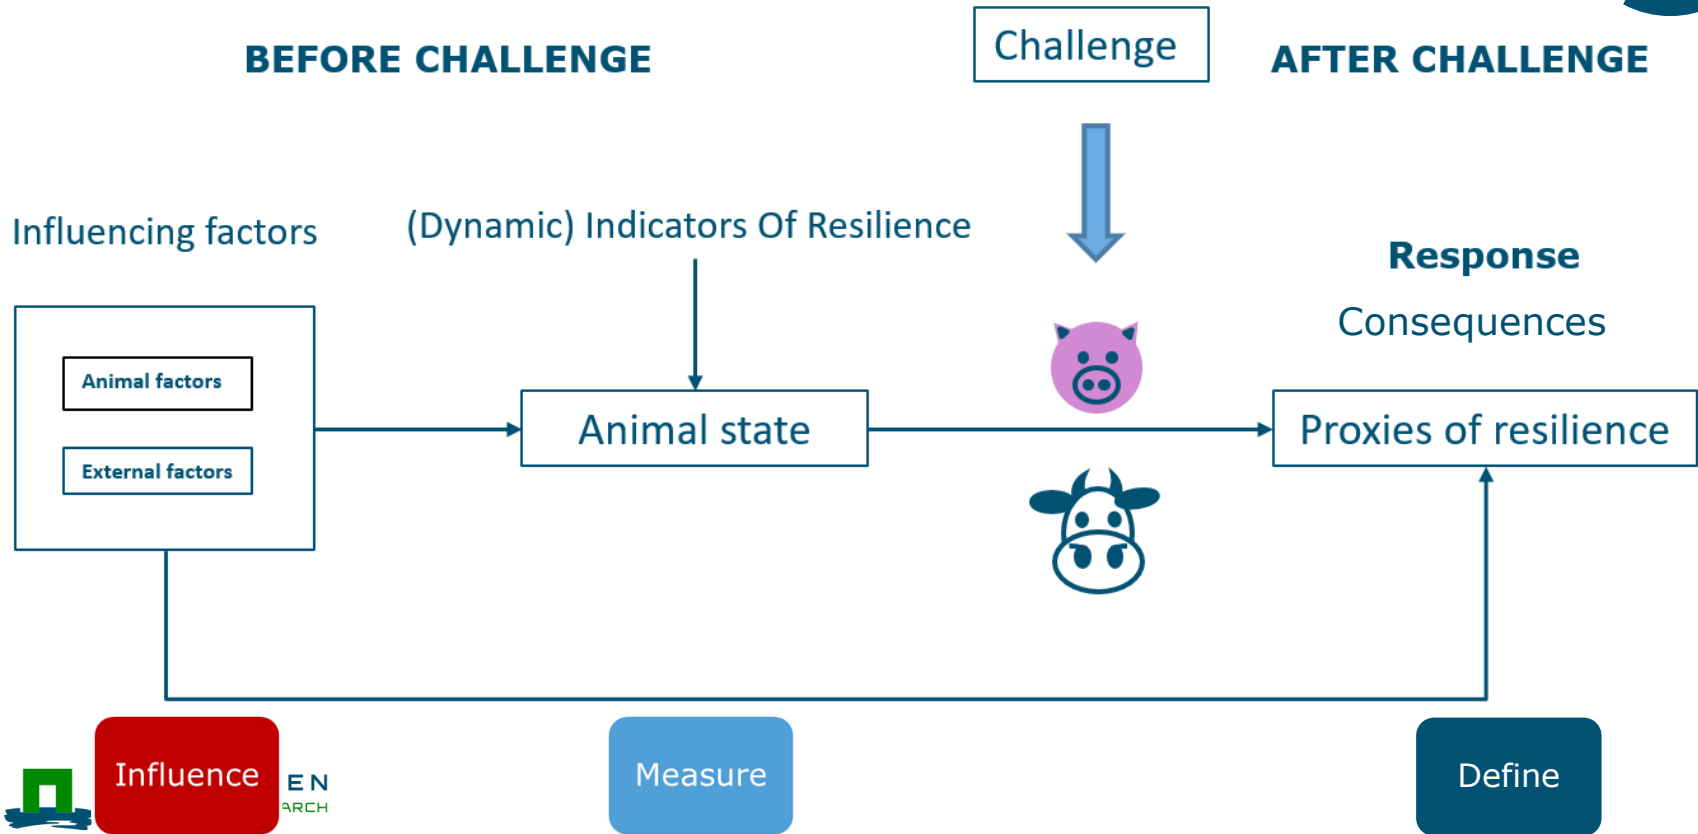

Ingrid van Dixhoorn, Kees van Reenen, Jan ten Napel, Fleur Hoorweg (WLR)
Simon van Mourik (ABE), Liesbeth Bolhuis (ADP), Annemarie Rebel (ADP, WBVR)

Control -> Adaptation

How to operationalise animal resilience

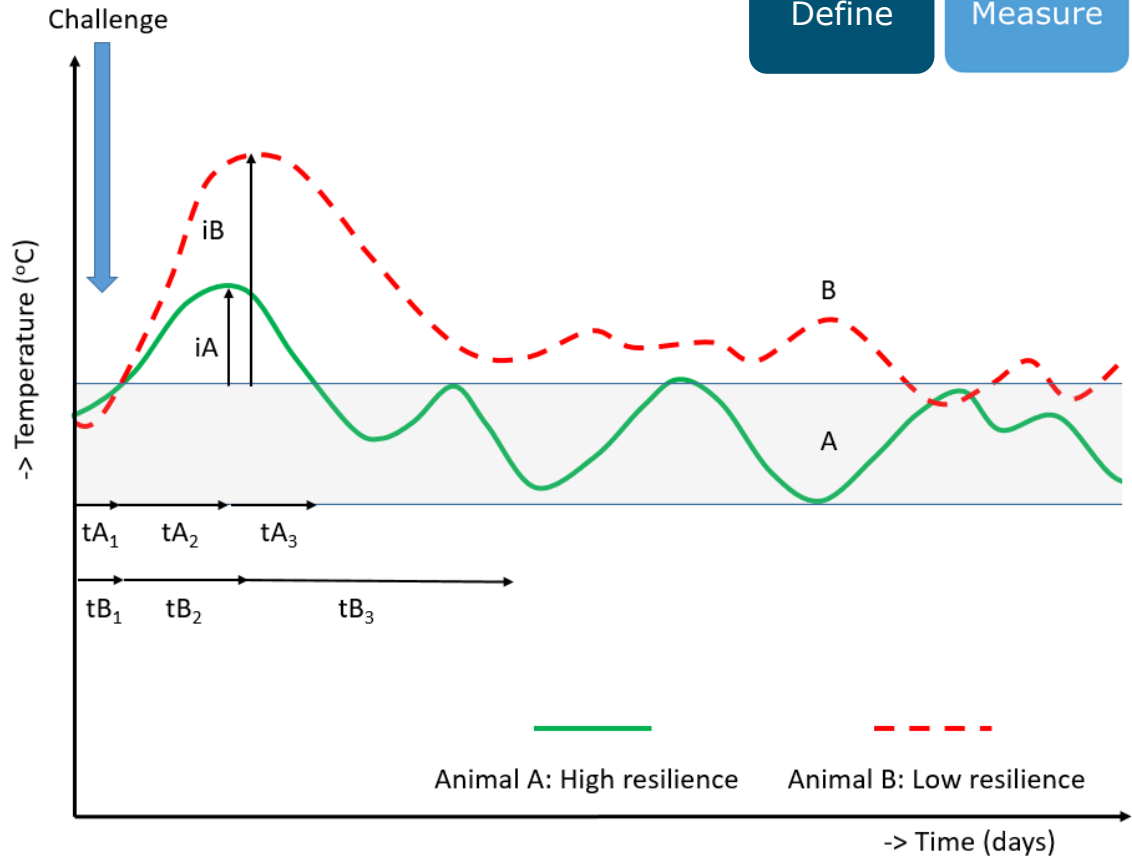

How to assess resilience (response after challenge)

Define

Measure

Temperature example

- Degree of response
- Recovery time
- Level after recovery

Examples of proxies of disease resilience

Measure

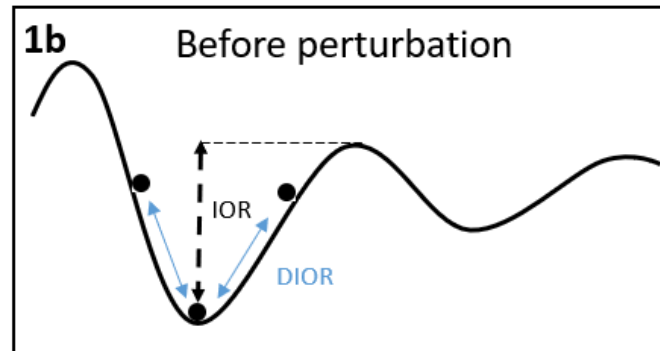

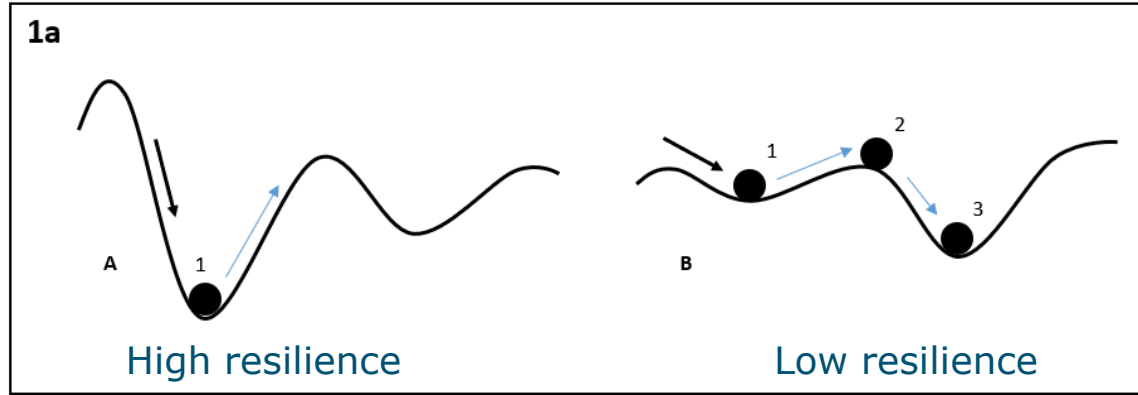

- Body Temperature
- Viral clearance
- Pathological findings
- (Sickness) behaviour
- Longevity
- Morbidity
- Total Deficit Score (TDS)

Stability landscapes

Define

Measure

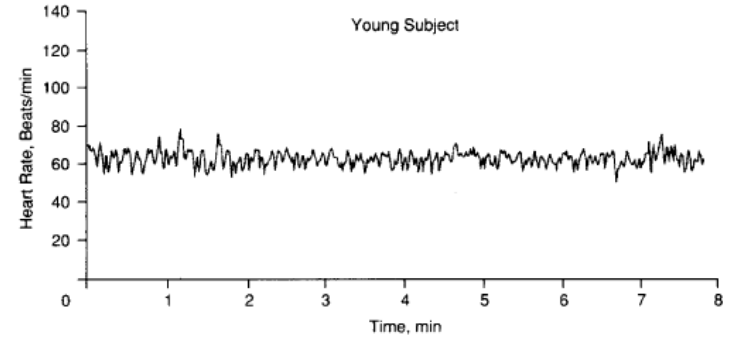

(Dynamic) Indicators of Resilience
Before challenge
(D)IORS

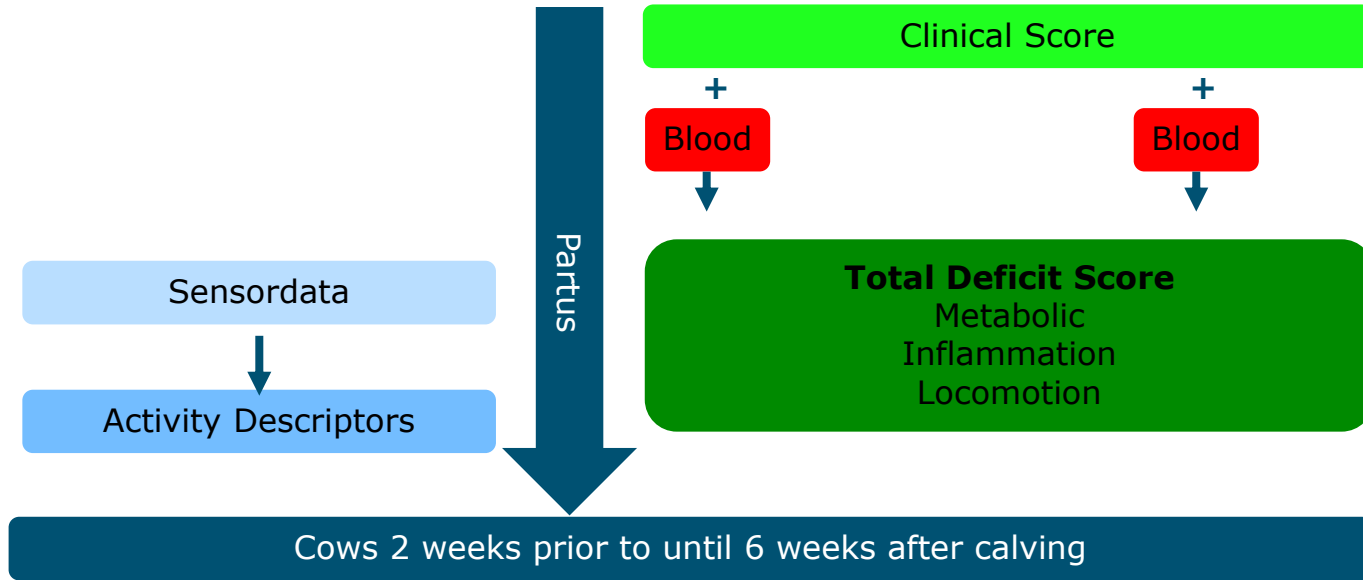

Dynamics of variables reveal more information

Average Heartbeat/min
young person 64.7; SD 3.9
old person 64.5; SD 3.8

Lipsitz & Goldberger, 1992

DIORs in dairy cows (185 cows, scored 'healthy' in dry period)

More resilient cows

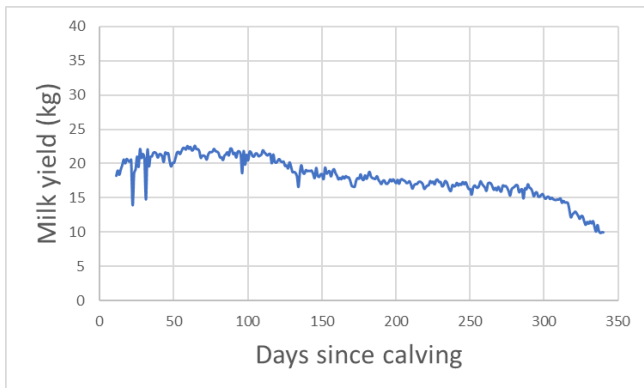

Measure

- Higher variance of ear temperature
- More active, eat and ruminate more
- Distinct active periods, alternated with resting periods in **regular diurnal patterns**
 - To be able to live a regular life may prove difficult for dairy cows
- Sensordata can help to detect cows at risk

Daily milk yield fluctuations

Measure

Low variance
&
Low autocorrelation

Resilient

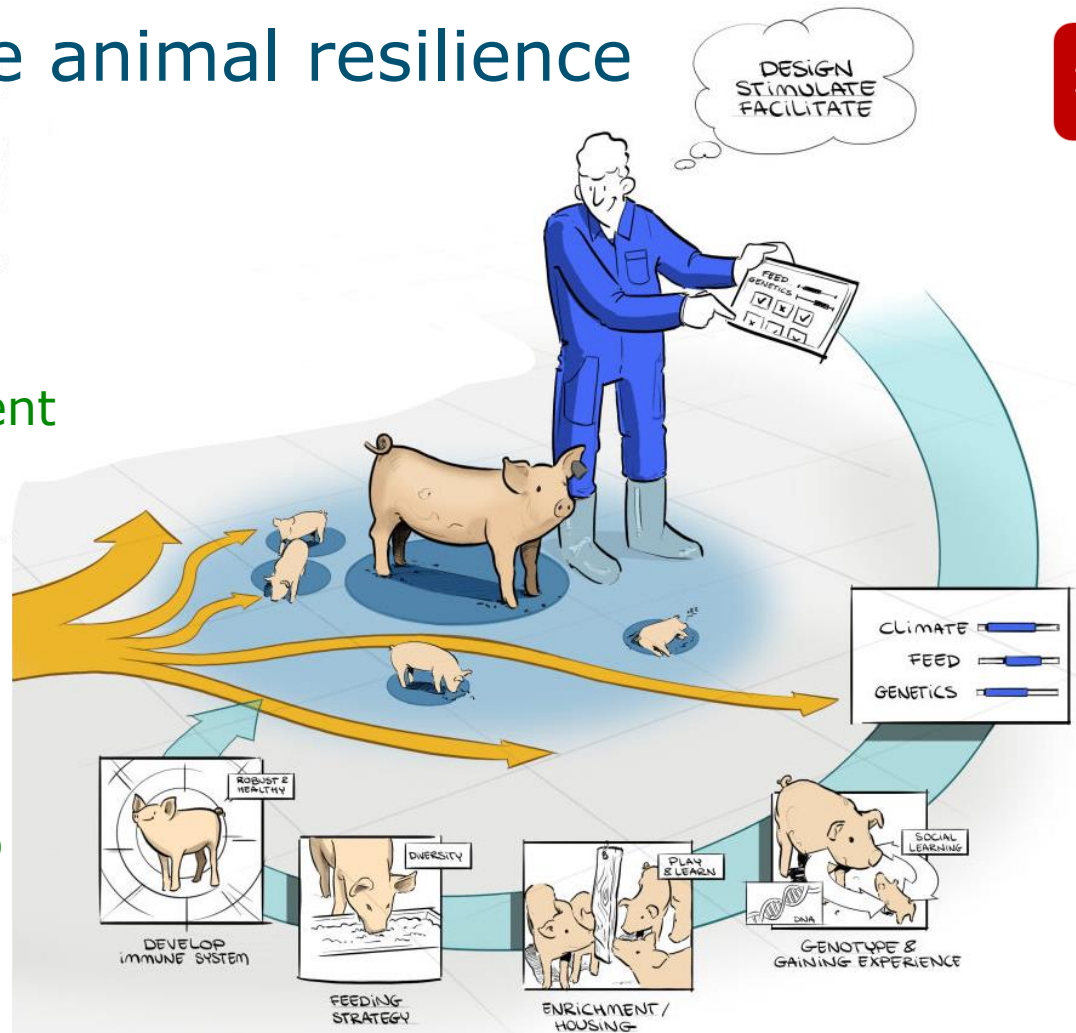

High variance
&
High autocorrelation

Not resilient

Ways to influence animal resilience

Influence

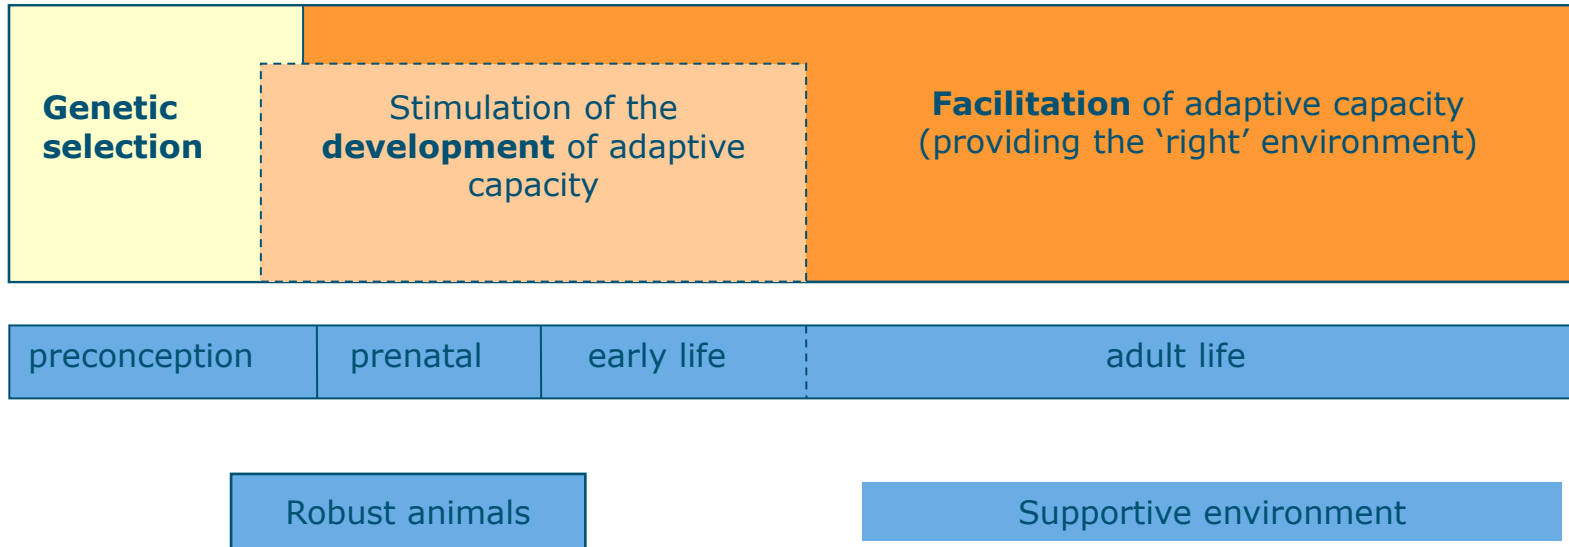

- Genotype
- Experience
- Housing & Enrichment
- Feeding & strategy
- Immune system
- Microbiome
- Meet specific needs
- **ANIMAL CENTRED**

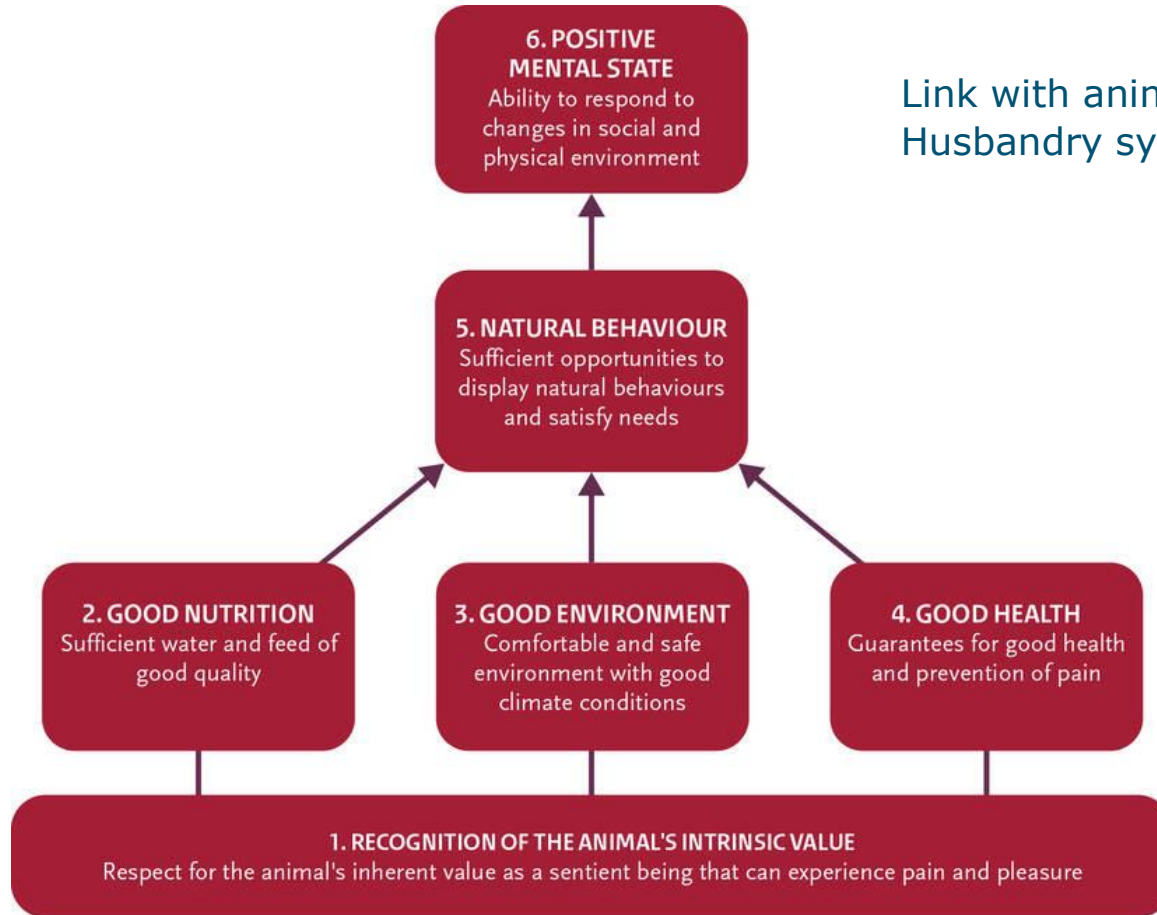

Influencing factors of Resilience

Influence

Overview of different methods (**selection, development, facilitation**) to improve resilience of animals

Link with animal centred Husbandry systems

Influence

Enrichment enhances
disease resilience in pigs

Enriched housing enhances disease resilience

More interactions with the sow

Influence

- In the presence of the sow
 - Reduced food neophobia
 - faster to touch the food
 - consumed more food items

Loose-housed sow

- Higher preweaning growth
- Less damaging behaviours & more play behaviour after weaning

Observation

Participation

Enrichment

Location of feeder

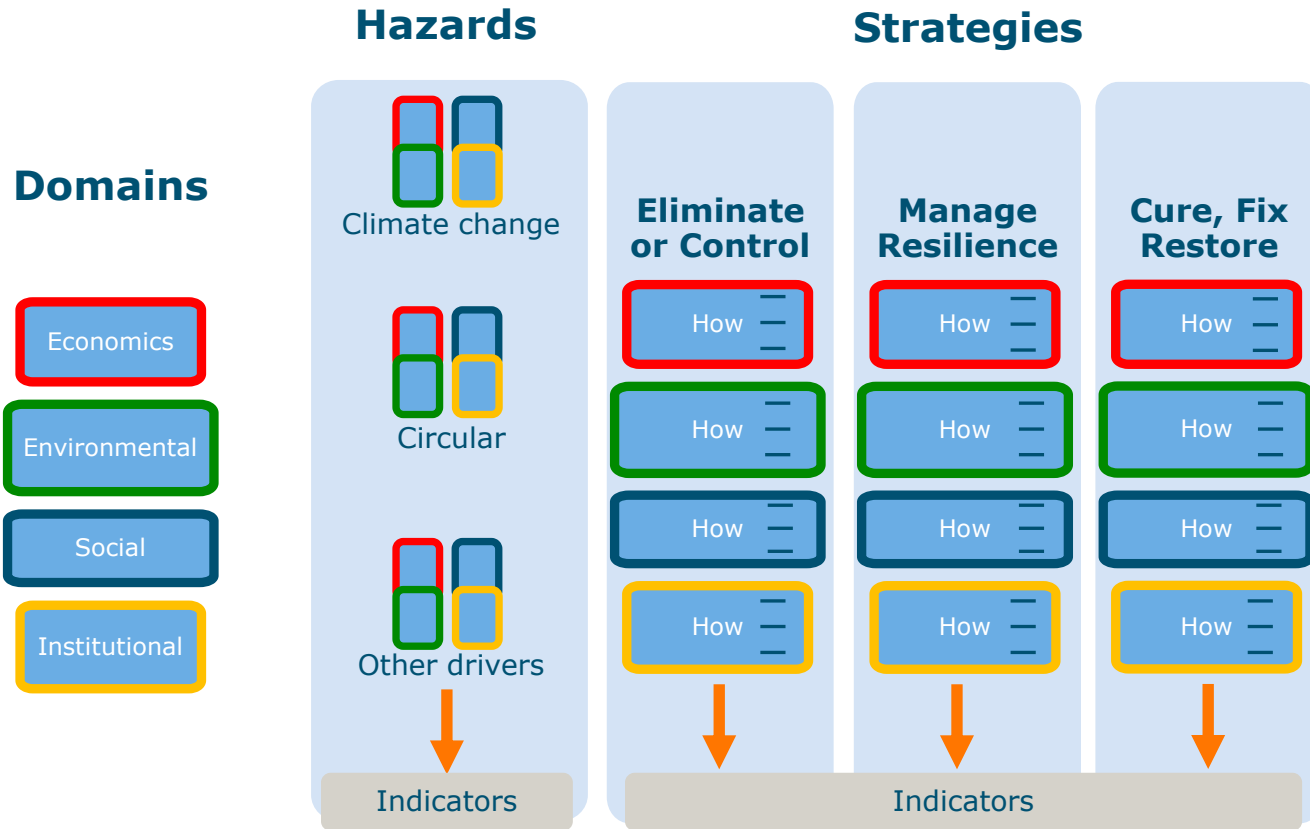

Prenatal flavour learning

Strategy Shift

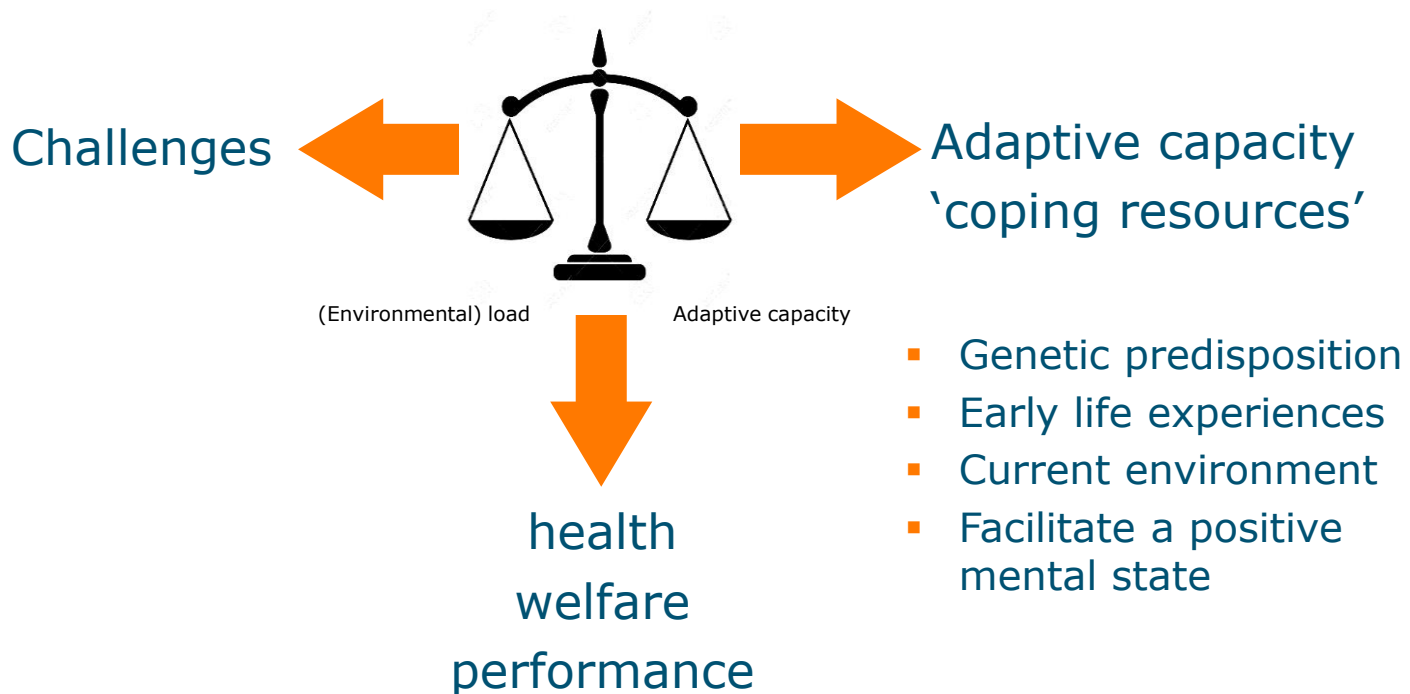

From minimizing perturbations towards
minimizing the consequences of the perturbations
